FEATURES

8

The ROBOX Incident . . . and Bryan Schappel 8

At least the alien computer that crashed in your backyard can understand English—but you've still got plenty to figure out.

Castaway Rick Graves 19

Washed ashore on a deserted island, you must find a way to be rescued. But first, you're *determined* to discover the secret the island holds.

A look at Computalk Andy Eddy 33

This feature-packed BBS from Texas stands out in more ways than one.

The Wizard Part I Clayton Walnum 41

You're not a programmer, but you've always wanted to write an adventure game? No problem with this unique system of programs.

89

Artificial Intelligence Dr. Ron Schaefer ST 69

Expand your ST's knowledge base—and save the results for its reference in future use.

Troll War II Scott Langston 89

The second half of the listing—what you've been anxiously awaiting to begin the game.

PERMISSIONS

No portion of this magazine may be reproduced in any form, without written permission from the publisher. Many programs are copyrighted and not public domain.

Due, however, to many requests from Atari club libraries and bulletin board systems, our new policy allows club libraries or individually-run BBSs to make certain programs from **ANALOG Computing** available during the month printed on that issue's cover. For example, software from the July issue can be made available July 1.

This does not apply to programs which specifically state that they are not public domain and, thus, are not for public distribution.

In addition, any programs used must state that they are taken from **ANALOG Computing** magazine. For further information, contact **ANALOG Computing** at (617) 892-3488.

SUBSCRIPTIONS

ANALOG Computing, P.O. Box 625, Holmes, PA 19043; or call toll-free: 1-800-345-8112. Payable in U.S. funds only. U.S.: \$28-1 yr.; \$52-2 yrs.; \$76-3 yrs. Canada: \$36-1 yr.; \$68-2 yrs.; \$99-3 yrs. Foreign: \$39-1 yr.; \$72-2 yrs.; \$104-3 yrs. For disk subscriptions, see the cards at the back of this issue.

AUTHORS

When submitting articles and programs, both program listings and text should be provided in printed and magnetic form, if possible. Typed or printed text copy is mandatory, and should be in upper- and lowercase, with double spacing. If a submission is to be returned, please send a self-addressed, stamped envelope.

Editorial

It seems fitting that, in this adventure issue of **ANALOG Computing**, we begin a new section: the *Video Digest*, devoted to coverage of the “new generation” of video game machines and software. To bring readers the most complete news and reviews possible, our *Digest* will cover all the makes of games and machines now on the market.

The writers of *Video Digest*—Joyce Worley, Arnie Katz and Bill Kunkel—are known to those of you who read **ST-Log**, where they cover news of the entertainment software out for the Atari ST line. Having tried their collective hand at nearly every form of gamesmanship on the market, they are uniquely qualified to bring us all up to date on the current equipment and revived interest in video games.

We hope our readers will enjoy—and profit from—this new section, in continuing on the road of the Atari Adventure.

Also in this issue is the second M/L listing for “Troll Wars II.” Now, you can dig in and play to your heart’s content.

Worlds of fantasy in our hearts, we’re proud to bring you the first installment of Clayton Walnum’s “The Wizard.” For those of you who’ve always wanted to write a text adventure—but who’ve never wanted to learn how to do the actual programming—this is for you! It’s an adventure construction set that’ll have your

ideas on disk in no time, to delight and confuse your friends.

Go out for a midnight stroll in “Castaway,” and you’ll find yourself stranded on the proverbial island. This text adventure was written by Rick Graves, using tips from Clayton Walnum, too, as presented for programmers in our “Adventurous Programming” series last year.

Games. . . you thought you’d sworn off the things, eh? Well, “The ROBOX Incident” will have you back at your monitor in no time. . . playing on an alien computer that has crash-landed in your backyard. Sworn off? Not yet!

And, for reality’s sake, we’ve included a look at the Texan BBS, Computalk. With its creator’s energy and drive, this BBS is one to watch.

As fall gets us back into the swing of things, we’re occupied with getting our magazines out on time for you. (No, we haven’t disappeared; we’ve just changed printers and are getting back on schedule. I hate it when Murphy’s Law strikes—over and over and over.) We’re also continuing to work on the Columbus Day weekend’s Atari fair planned in our area.

It may seem old hat to those on the West Coast, but this is exciting for us—we’ve attended fairs and shows all over the country, and this is the first Atari fair that’s been held in the Northeast.

We think it’s long overdue; the area is,

after all, one of the centers of computer expertise in the U.S., as well as a hotbed of college campuses. Atari needs more representation here, and this will be a good chance for Atarians on the East Coast to show themselves, and for dealers to make themselves better known to a whole section of the marketplace.

We’re looking forward to playing host to those of you who’ll be able to make the trip. With the goings-on in the desktop publishing and MIDI worlds of computing, this fall has many promises to keep. It will be our pleasure to bring you the latest news for the coming holiday season.

See you in October!

Reader comment

The case of the missing case.

Astute readers have probably noticed that the "Streamliner" article (issue 56) claims there are "three cases in which binary files contain unnecessary information that can be removed by "Streamliner"—but lists only two. Yes, there's a third case, but . . .uh . . . my dog ate it.

Here's case 3: binary files which have been appended to. Basically, the way this works is that, if a binary file which already exists is opened for an append operation (so that data can be added to the end of the file), the new data is put in a new sector, even if the last sector of the file has some room in it.

Suppose you create a file containing 1 byte. Then, you open the file for an append operation, add 1 byte to the end of the file, close the file, and repeat this "append and close" bit 99 times. Believe it or not, you'd end up with a 100-byte file which requires 100 sectors on disk! Something similar happens if you type in a machine language program using "M/L Editor" in more than one sitting. (This is not "M/L Editor's" fault; blame it on DOS.)

If "Streamliner" processes a file like this that doesn't contain any extra bytes, via case 1 or 2, then it would determine that the file was in perfect order. (If the file did contain such bytes, the unused disk space would be removed when the file is rewritten.) This is not a bug in "Streamliner" because it is designed to look for extraneous bytes, not unused space which is not part of a file.

The solution is easy. Just use option C,

"Copy file" from the DOS menu to copy the file in question to itself by entering the same filename for both the source and destination. Even though most programs in **ANALOG Computing** don't need any Streamlining, you should use this little trick after typing in a program with "M/L Editor" or any other program you believe to contain "dead space." I hope this hasn't caused too much confusion.

James Hague
Author of "Streamliner"
Richardson, TX

How about it, EA?

I would like to respond to an item in issue 56 of your magazine, concerning Electronic Arts. In the "ST notes" section, EA President Trip Hawkins was quoted as saying that the Atari 8-bit line would probably lose the support of EA, due to poor sales of new products last year. I've looked at those products from EA, and only one, Chessmaster 2000, impressed me to the point where I'd buy it.

However, there is an EA software package that I'd buy immediately—if only they'd port it over to the 8-bit. The package I'm referring to is The Bard's Tale. I feel it has the quality that everyone wants in a software package for their computer and consider it the best EA has to offer.

I wonder why EA is so critical of Atari without showing us *their* best. Software companies should just port their top products to the Atari 8-bit line. If they find that Atari owners won't buy products that Apple and Commodore owners make top

sellers, then forget us. Until they try us, and see that we'll buy quality, I guess we're sunk.

So how about it, Mr. Hawkins? Give us a shot at the good stuff. Give us a shot at The Bard's Tale. If we don't buy that one, or other quality "port overs," then we won't buy anything. Maybe you'll find that, while we might not be the place for new products, we'll buy what sells on other systems. This may not give us products the others don't have, but we'll get more than we have now.

Duke T. Matlock
St. Louis, MO

Lightspeed C manual improved.

I'm writing to inform you that the manual to our product, Lightspeed C, which was reviewed in the April issue of **ANALOG Computing**, has been revised, per the recommendation of reviewer Kurt Oestreich. The text size is significantly larger and the manual is now a pleasure to read. I would like to take this opportunity to thank Kurt for his honest and fair review of our product.

Also, I would like to introduce a revised, completely new edition of Elite Personal Accountant. Since the program was taken in by our company, it has undergone a major overhaul, including increased speed (nearly two times as fast) and a new manual.

Other new releases include our Brown Baggin It! line of games for the Atari 8-bit. The first of these is Classy Chassy, a full-

The ROBOX Incident

Try out the alien computer that just crashed into your life.

by Barry Kolbe and Bryan Schappel

Your bed still likes you, even if you have been gone a long time—and you still like your bed. You hit the sack at about 10:00 p.m. and have been snoozing comfortably for nearly five hours, when . . . there's a crash and a bright flash of white light. Amazing how none of your neighbors have been awakened, isn't it?

You leap from bed, as best you can, don your robe and slippers, step on the dog, trip over your stuffed Komodo dragon doll and stumble down the stairs. The back door opens, even though you wanted it to, and you're outside.

Over in the vegetable garden, right on top of the corn that just started to come in, between the carrots and the peas, is a crater the size of your pumpkin patch. [Hey, where did the pumpkin patch go?]

Against your best judgment, you approach this crater—waiting for a big green thing with scales to jump at your throat, but no such luck. There's just a blackened box, with a panel and a button, sitting there. You're about to re-enter your humble abode and pass this occurrence off as a normal everyday kinda thing, when you notice the words *Press START* on the panel.

Well, you thought that addiction to computer games was cured, didn't you? Not quite. Against your will you press *START* and . . .

Typing it in.

Listing 1 contains the BASIC data statements used to create the *ROBOX.COM* file on your disk. Please refer to the "M/L Editor," found elsewhere in this issue for instructions on keying in *ROBOX*.

Once the *ROBOX.COM* file has been created, simply binary load it from DOS. If you're not sure how to do this, please refer to your DOS manual for instructions.

Playing ROBOX.

You are now the proud owner of a slightly used alien computer, sent to Earth for reasons unknown. One nice thing about these aliens is that they speak the English tongue.

The computer uses the universal QWERTY keyboard as an input device and has a built-in CRT terminal for output. There also must be a disk in drive 1 at *all times* during play.

ROBOX has a total of 42 points. There is a point display at the bottom of the screen; keep a close eye on it, because it tells you if you did something right or wrong. For each new thing you discover, you receive 1 point. If you then do the thing wrong, after having done it right, you will loose 1 point.

Learning how to save/load a game also gives you points, so you may want to figure out how to do these operations first.

Program options.

There are a couple of options available to you, that just make playing more fun. You will notice messages are printed to the screen slowly; to speed things up, press the inverse (Atari logo) key. Pressing it again will toggle it back to slow mode.

The other option is a key-click toggle. There is normally no click, so if you like the click, just press *CTRL-CAPS*. Press *CTRL-CAPS* again to turn off the click.

Technical notes.

ROBOX operates in graphics mode 0, on a narrow playfield. The wonderful moving graphs at the bottom of the screen were accomplished by defining a pair of characters with a pattern that would meet at both ends if folded over (like a sine wave). Then, every three vertical blanks, the character definition is shifted to the left with the *ROL*, *LSR* instructions, checking to see if the carry was set. If so, bit 7 of the rightmost character is set.

WHAT IS ST-CHECK?

Most ST BASIC program listings in this magazine are followed by a table of numbers appearing as data statements, called "ST CHECKSUM DATA." These numbers are to be used in conjunction with **ST-Check** (which appeared in **ANALOG Computing** issue 41).

ST-Check, written by Clayton Walnum, is designed to find and correct typing errors when readers are entering programs from the magazine. For those readers who would like copies of the article, you may send for back issue 41 of **ANALOG Computing** for \$4.00.

ATARI 8-BIT POWER

These products are custom built to work with Atari 400, 800, 1200XL, 800XL, 65XE, 130XE

NEW BOOKS FOR ATARI OWNERS

BASIC TURBOCHARGER NOW for the first time a BASIC programmer can get the power, flexibility and incredible speed of machine language. **BASIC TURBOCHARGER** is a **book and disk package** that contains over 150 ready to use machine language routines. Complete instructions show how to add them to your own BASIC programs to get these features and more: • Smooth Scrolling • Load & Save Picture files • Special Effects Graphics • Much, Much More • Player/Missile control • Sorting and Searching • Incredible Speed • Over 150 programs **Only \$24.95**

YOUR ATARI COMES ALIVE

SAVE MONEY. Finally an alternative to buying expensive computer add-ons. Your Atari Comes Alive shows you how to **build them yourself.** This "How to" **book and disk package** gives you complete step by step instructions and programs needed to build and control these exciting devices and MORE: • Light Pen • Alarm Systems • Environmental Sensors • More than 150 pages • Light & Motor Controllers • Voice Recognition • Data Decorators **Your Atari Comes Alive \$24.95**

Atari Software Protection Techniques Vol I & II

These Book and Disk packages detail the most advanced copy protection methods in use today. They guide you through the methods used to create the protection as well as the copying techniques to get around them. They include information on Phreaking • Hacking • On-line security • Black boxes • Self-destructing programs • Pirate bulletin board systems • Logic bombs • New piracy laws • Hardware data keys • Weak sectoring (Phantom, Fuzzy and unstable sectors) • Overfilled tracks • CRC errors • Bank Select cartridges and MUCH, MUCH MORE. The disks include automatic program protectors, Protection Scanners, directory hiding and more.

BOOK I and DISK I \$24.95
BOOK II (Advanced protection) and DISK II \$24.95
Special Offer, Order both sets for Only \$39.95

NEW from Alpha Systems **Chipmunk**

Automatic Disk Back-Up System. Make perfectly running unprotected back-up copies of hundreds of the most popular Atari programs and Chipmunk's sophisticated programming Automatically finds and **REMOVES** copy protection from most Atari programs. Back-up even heavily protected programs with ease. Finally, a back-up system that needs no special hardware or skills. **\$34.95**

COMPUTEREYES™ & MAGNIPRINT II+

Turn your computer into a digital portrait studio. This complete package lets you **capture, save & print** digital images from your **Video Camera, VCR or TV.** **COMPUTEREYES** hardware plugs directly into your joystick ports for easy use. Print your picture on a 6 foot poster. **\$119.95**

ComputerEyes camera system Comes complete with everything above, plus a black and white video camera and connecting cable. **\$329.95**

Graphics 9 Software Add a new dimension to your **COMPUTEREYES** pictures - captures images in 16 shades of grey. **\$12.00**

Magniprint II+ Easily the most powerful print program available today. Print graphics, from almost any format in hundreds of shapes, sizes, and shades. Supports **color printing** and lets you create **giant posters.** Magniprint II+ lets you stretch and squeeze, invert, add text, adjust shading and much more. **\$24.95**

Works with EPSON, NEC, Citoh, Panasonic, Gemini, Star, XMM801, and compatible printers. (850 interface or equivalent required).

Graphics Transformer Now you can combine the most powerful features of all your graphics programs. Create print shop icons from a Koala pad picture, from a photo digitized with Computereyes, or any picture file. Graphics transformer lets you **shrink, enlarge and Merge** pictures for unequal flexibility. **\$22.95**

PERSONALIOR Cartridge to Disk back up system. Create running back-up copies of any cartridge (up to 16k) **\$29.95**

The hardware & software you need to digitize real world sounds - play them on your computer. Make your Atari speak in your own voice or record and play sounds from a complete orchestra. Play the digitized instruments and sounds from your keyboard, or put them in your own BASIC programs.

PARROT is now being used for special effects by professional musicians. Turn your Atari into a digital sound sampler and keyboard. This package is better than those costing more than twice as much. Everything you need to record and play digital sounds **\$39.95**

Additional pre-recorded sound tracks **\$4.95** with purchase of **PARROT**

Scanalyzer CIRCLE #104 ON READER SERVICE CARD
Extract the programming secrets for any Atari program. Scanalyzer easily breaks through protection to let you list and study programs. Works with programs on Disk or Cartridge, finds hidden directories, detects copy protection methods and more. **ONLY \$29.95**

ROBOX *continued*

We used a custom screen print routine (the OS will not do narrow playfields) that accesses screen memory directly—this bugger can fill a screen with straight ATASCII text in the wink of an eye. Try that with CIO someday. (Our print routine also does word wraps, making the text easier to read.) There's a custom input routine used that will allow only sixty-four character inputs, alphanumeric only.

All game messages are tokenized to save memory. This also means that you can't look at the disk file for clues. By tokenizing the messages, we probably saved upwards of fifteen sectors. The Scott Adams adventures also used a technique similar to this, so all his adventures could fit into 16K.

We hope **ROBOX** keeps you busy for the next month. You may want to schedule an appointment at the Hair Transplant Salon in the near future [you could be pulling out quite a bit].

ANALOG Computing will not give clues over the phone. If you'd like a copy of the game's solution, send a stamped, self-addressed envelope to: **ROBOX Solution**, c/o **ANALOG Computing**, P.O. Box 23, Worcester, MA 01603. **A**

Barry Kolbe is a mathematics teacher in Madison, WI. He uses the Atari to demonstrate graphing in his classroom. His former student, Bryan Schappel, is studying Computer Science at the University of Wisconsin. This is their fourth team project for ANALOG Computing.

by Steve Panak

A long, long time ago, on a computer not far enough away, Infocom gave us, the computing public, a game so wild, so off the wall, that it was a preordained best-seller. 'Round about the same time, they also gave us interactive fiction plus and universes so large as to escape the confines of low memory systems. This new product was also greeted warmly and embraced by the public. But now they've gone too far. How can the populace resist a game combining the two? They can't.

Bureaucracy is the latest comedy from Infocom. Written by Douglas Adams, author of the popular Hitchhiker's Guide to the Galaxy series, this new work takes aim at the bureaucracy and bureaucrats we must all deal with in our daily lives. And, with uncanny accuracy, it scores a direct hit. It makes us laugh, while cynically pointing out the frustrations we've created for ourselves in this modern world in which we live.

The story starts innocently enough. Having just gotten a new job and moved to a new home, you seem ready to start your life anew. A fresh start, as it were. In fact, your first assignment is a training session in Paris, France. You feel as though you could just sink into your easy chair and relax your day away. That's if the moving company hadn't lost, misplaced, or otherwise eliminated all your possessions. To make things worse, your bank has turned on you as well, failing to properly process your change of address form and invalidating your charge card. By the time you get all these various problems straightened out and finally get to Paris, you'll have taken an adventure unlike any you've ever taken before — if you survive.

What could be so dangerous in this real-world game? Well, assuming the frustration doesn't force you into suicide, you've got that blood pressure problem to worry about. The status line in this game is unlike any of Infocom's other offerings. In the top right corner of the display is a readout of your blood pressure. Each of life's little annoyances cause this pressure to rise slightly. In this game, even ordering a meal or trying to withdraw money from your bank are tasks that quickly grow to monumental proportions. Taken alone, each frustration is merely an additional throb in your already aching head. But when accumulated, rest assured they're lethal.

The strange status line is only the first unique aspect of this Infocom work. A sample response from the SCORE command typifies the side-splitting prose each new frustration can unleash: *Your blood pressure is 144/88 in thirty-four moves. Your status is livid. Your score is 0 out of a possible 21, making you a victim.*

In another first, this program allows (rather, forces) the player to fill out those most infamous of the bureaucratic roadblocks: forms. At key places in the game, the screen display fills with a form, which must be filled out before you're allowed to proceed onward. In fact, the first form informs (rather, misinforms, in the spirit of true bureaucracy) the program of your name, sex and other vital statistics.

The documentation, likewise, is very distinctive. Containing a form (of course) and a booklet entitled "You're Ready to Move," (published by your very caring bank, the Fillmore Fiduciary Trust Company), the game materials foreshadow the mess you'll have to disentangle yourself from in order to complete the game. Also

included is a skinny pencil, a charter membership flyer for "Popular Paranoia Magazine" and a letter from your boss. Even the players' testimonies contained inside the front cover are different; they're complaints from players frustrated with Infocom bureaucracy.

While the game is frustrating to play, the program itself is simple to use. My favorite feature is the allowed abbreviation of EXAMINE to X; it just makes being nosy that much easier.

Even the save game feature is used much differently than in other Infocom games. Usually, you save your position before trying a dangerous task. In **Bureaucracy**, you'll find yourself saving your position after a particularly frustrating ordeal, so that it won't have to be suffered through again. Finally, even the constant responses in Infocom games (such as those elicited by an expletive or a word the program doesn't understand) are humorous and original.

Bureaucracy is quite possibly the most frustrating game Infocom has released. It's not hard to play, but, like the world in which we live, it's often hard to cope with. Like the little annoyances in life it pokes fun at, **Bureaucracy** gets under your skin. And once implanted, it'll tickle your funny bone for days to come. **A**

CIRCLE #106 ON READER SERVICE CARD

Attention Programmers!

ANALOG Computing is interested in programs, articles, and software review submissions dealing with the Atari home computers. If you feel that you can write as well as you can program, then submit those articles and reviews that have been floating around in your head, awaiting publication. This is your opportunity to share your knowledge with the growing family of Atari computer owners.

All submissions for publication, both program listings and text, should be provided in printed and magnetic form. Typed or printed copy of text is mandatory and should be in upper and lower case with double spacing. By submitting articles to **ANALOG Computing**, authors acknowledge that such materials, upon acceptance for publication, become the exclusive property of **ANALOG Computing**. If not accepted for publication, the articles and/or programs will remain the property of the author. If submissions are to be returned, please supply a self-addressed, stamped envelope. All submissions of any kind must be accompanied by the author's full address and telephone number.

Send programs to:
Editor, **ANALOG Computing**, P.O. Box 23, Worcester, MA 01603.

Castaway

**The island hides a secret
in this text adventure.**

by Rick Graves

From the moment I loaded my first Infocom adventure, I wondered what made it tick. I wondered what it would take to produce such a finely structured illusion.

One day last year I sat at my Atari 800, eagerly anticipating my monthly issue of **ANALOG Computing**. When it finally arrived, I opened it and haphazardly scanned the table of contents, trying to decide which program to key in first. Out of the corner of my eye, I spotted an article entitled "Adventurous Programming," by programmer extraordinaire Clayton Walnum. To make a long story short, Mr. Walnum led me step by step through the adventure-creating process. I couldn't believe it; it was easy. Once I understood what was going on inside an adventure, the difficulty was reduced to creating good puzzles. Several months and endless hours of debugging later, **Castaway** was complete.

The plot.

All you remember is a midnight stroll along the deck of a ship, an alarm sounding, a muffled explosion, and warm waters quickly closing over your head.

When you awaken, you discover you've washed ashore on a deserted island. You're alone, with no idea how you'll survive.

You realize you must find a means of rescue as soon as possible, but while gazing upon the island, you sense that it holds some dark secret to discover. With renewed purpose, you rise to your feet.

Typing it in.

Listing 1 is the main program. It handles all player input and the appropriate responses.

Listing 2 prints the room descriptions to disk. For each room in **Castaway**, one or more text files are created, so I suggest you save these programs on a clean disk.

When BASIC has been installed, type Listings 1 and 2 and save them. Be sure to check your typing with the "Basic Editor."

Load and run Listing 2. The message *Creating Room Descriptions* will appear. After a few minutes, the *READY* prompt will reappear on the screen.

Playing Castaway.

After the room descriptions have been created, run Listing 1. You'll be asked to wait, while the program initializes itself. After a few seconds, you'll be in the opening room.

In **Castaway**, the video screen is separated into two areas. The top line of the screen displays your current location, your score and the number of actions you've attempted so far. The remainder of the screen is used to display room

descriptions, to accept player input and to print necessary output. The top line of the display will remain intact, while the rest scrolls continuously underneath.

As you enter each new room, its description will be printed (this isn't always the case, as explained later), followed by the phrase *You see:*. Under this heading appears a list of the takeable objects, if any, currently in the room. There are other objects in individual room descriptions. Some can be manipulated with certain verbs, others can't.

Following the list of takeable objects, player input is accepted. Like most text adventures, **Castaway** only understands two-word sentences of the Verb-(space)-Noun form. You'll have to experiment to determine which verbs and nouns **Castaway** understands, but that's all part of the fun. If you enter an invalid sentence, or a nonexistent verb or noun, **Castaway** will inform you immediately.

Commands.

Castaway recognizes certain special commands that are vital to any adventure.

Movement Commands:		
N-North	NE-Northeast	U-Up
S-South	SE-Southeast	D-Down
E-East	NW-Northwest	
W-West	SW-Southwest	

Other commands used in **Castaway** are:

Inventory or I	Prints the objects currently in your possession.
Look or L	Reprints the room description and the takeable objects in case you forget the room's details.
Score	Prints your current rank and score.
Quit	Exits Castaway .
Restart	Restarts the game from the beginning.
Save	Saves your current game status.
Restore	Restores a game that's been saved.
Verbose	Verbose room descriptions.
Brief	Brief room descriptions.

Saving and restoring games.

Castaway lets you save your current game status and location to disk. This is particularly useful when you're about to attempt something dangerous. To save your game, type **SAVE** and hit **RETURN**. Be sure the disk you want the game saved on is in the disk drive, because no prompts are given. When the operation is complete, the game is reentered at the point at which it was saved.

To restore a previously saved game, type the command **RESTORE** and hit **RETURN**. The game will be reentered at the point where you last saved your game status. As with the **SAVE** command, make sure the desired save disk is in the disk drive.

The **BREAK** key has been disabled, so if you want to halt the program, simply hit the **SYSTEM RESET** key.

Room descriptions.

Castaway lets you select between verbose and brief room descriptions. When the program is set to verbose, the entire room description, as well as the takeable objects list, is displayed. If set to brief, the program will only display the takeable objects. This command comes in handy when you're moving through familiar territory and want to speed things up.

For verbose descriptions, enter the command **VERBOSE**, and for brief, type **BRIEF**.

Hints for solving **Castaway**.

- (1) Make a map of the island as you go along. Some of the areas can be pretty confusing, so you might get lost.
- (2) Save your game frequently—preferably before you attempt something that might be hazardous to your health—or you'll have to start over.
- (3) Try anything. You might be surprised to find out what you can do.
- (4) Watch your score. It can be used as a measure of your progress.
- (5) Examine everything. Clues have been included in certain descriptions to help you along.
- (6) Don't get frustrated. If one verb doesn't work, try to think of a synonym.

Credits.

I'd like to thank Clayton Walnum for getting me started. **Castaway** was developed around the adventure he used as an example in his adventure series. Needless to say, without his help and expertise, this adventure wouldn't have been possible.

Apologies.

For those readers who've already taken a look at the listings, you know what I'm about to apologize for. Some parts of Listing 1 and almost all of Listing 2 has been encrypted.

Come to

CENTRUM IN WORCESTER

I know this means hours of tedious typing, but I have a good reason. In adventures that aren't encrypted, it's easy for the reader to go through the listing and pick out clues. Encryption cuts down on this to some degree.

Well, do your best. **Castaway** can be solved. Believe me, I've done it many times.

ANALOG Computing will not give adventure hints over the phone. If you'd like a copy of this game's solution, send a stamped, self-addressed envelope to: **Castaway Solution**, c/o **ANALOG Computing**, P.O. Box 23, Worcester, MA 01603. ☐

Rick Graves is a student at the University of Oklahoma, majoring in Aerospace Engineering. He's been programming on his 800 for about four years. He enjoys puzzle-oriented software immensely and is looking forward to programming on a 520ST.

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the "BASIC Editor II," in issue 47.

ORDER LINE ONLY

P.O. BOX 493 - DAYTON, OHIO 45459
 For information, order inquiries, or for Ohio orders (513) 435-6888
 Order Lines Open 9 a.m. to 9 p.m. Mon-Fri. 10 a.m. to 4 p.m. Sat. (Eastern Standard Time) Minimum \$15 per order. C.O.D. (add \$3.00). Please specify computer system. Call toll free number to verify prices and availability of product. Prices and availability are subject to change without notice. We ship C.O.D. to Continental U.S. addresses only! Please include 4% shipping on all Hardware orders (min \$4.00). Software and accessories add \$3.00 shipping and handling in Continental U.S. Actual freight will be charged outside U.S. to include Canada, Alaska, Hawaii, Puerto Rico and APO. Ohio residents add 6% sales tax. Canadian orders 5% shipping. (Min \$5.00) All other foreign orders, please add 15% shipping. (Min \$10) For immediate delivery send cashier's check, money order or direct bank transfers. Personal and company checks allow 3 weeks to clear. School purchase orders welcome. Due to our low prices, all sales are final. NO CREDITS. All defective returns must have a return authorization number. Please call (513) 435-6888 to obtain an RA# or your return will not be accepted for replacement or repair.

CIRCLE #110 ON READER SERVICE CARD

M/L Editor

For use in machine language entry.

by Clayton Walnum

M/L Editor provides an easy method to enter our machine language listings. It won't allow you to skip lines or enter bad data. For convenience, you may enter listings in multiple sittings. When you're through typing a listing with M/L Editor, you'll have a complete, runnable object file on your disk.

There is one hitch: it's for disk users only. My apologies to those with cassette systems.

Listing 1 is M/L Editor's BASIC listing. Type it in and, when it's free of typos, save a copy to disk, then run it.

On a first run, you'll be asked if you're starting a new listing or continuing from a previously saved point. Press S to start, or C to continue.

You'll then be asked for a filename. If you're starting a new listing, type in the filename you want to save the program under, then press RETURN. If there's already a file by that name on the disk, you'll be asked if you wish to delete it. Press Y to delete the file, or N to enter a new filename.

If you're continuing a file, type in the name you gave the file when you started it. If the program can't find the file, you'll get an error message and be prompted for another filename. Otherwise, M/L Editor will calculate where you left off, then go on to the data entry screen.

Each machine language program in ANALOG Computing is represented by a list of BASIC data statements. Every line contains 16 bytes, plus a checksum. Only the numbers following the word DATA need be considered.

M/L Editor will display, at the top of the screen, the number of the line you're currently working on. As you go through the line, you'll be prompted for each entry. Simply type the number and press RETURN. If you press RETURN without a number, the default is the last value entered.

This feature provides a quick way to type in lines with repetitions of the same number. As an added convenience, the editor will not respond to the letter keys (except Q, for "quit"). You must either enter a number or press RETURN.

When you finish a line, M/L Editor will compare the entries' checksum with the magazine's checksum. If they match, the screen will clear, and you may go on to the next line.

If the checksums don't match, you'll hear a buzzing sound. The screen will turn red, and the cursor will be placed back at the first byte of data. Compare the magazine listing byte by byte with your entries. If a number's correct, press RETURN.

If you find an error, make the correction. When all data's valid, the screen will return to grey, and you'll be allowed to begin the next line.

Make sure you leave your disk in the drive while typing. The data is saved continuously.

You may stop at any time (except when you have a red screen) by entering the letter Q for byte #1. The file will be closed, and the program will return you to BASIC. When you've completed a file, exit M/L Editor in the same way.

When you've finished typing a program, the file you've created will be ready to run. In most cases, it should be loaded from DOS via the L option. Some programs may have special loading instructions; be sure to check the program's article.

If you want the program to run automatically when you boot the disk, simply name the file AUTORUN.SYS (make sure you have DOS on the disk).

That's M/L Editor. Use it in good health. **A**

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the "BASIC Editor II," in issue 47.

A look at Computalk

An above-average Texas bulletin board.

by Andy Eddy

In this day and age, personal computer telecommunications is a popular item, be it on free local bulletin boards (BBSs) or the potentially expensive on-line services like GENie and Delphi. With prices dropping on equipment such as modems, software and, especially, the computers themselves, plus increasing choices, many are catching "terminal fever." Since it's simple for someone to put together an inexpensive setup, many are doing it: getting additional phone lines in their homes to run inexpensive, bare-bones BBSs of their own making.

Every once in a while, you'll come across a BBS that displays an especially strong labor of love for sharing the telecommunications bug with other users. And there's no doubt that Kris Meier's Computalk in Fort Worth, Texas, fits that bill.

There are other ways his board stands out, both in innovation and the sheer quantity of available features, making it one of the more interesting independently run boards in the country.

The 25-year-old Meier is ambitious in his endeavors. He's taken an AMIS (Atari Message Information System) public domain BBS program and reworked it (he's

currently at version 6.0) to fit all the data and menus that make up the system, as well as all the features necessary to allow six users on-line simultaneously. A look at Meier's equipment list will bring back memories of the pre-Delphi, **ANALOG Computing** TCS board: 1 CORVUS 20-meg hard drive; 1 CORVUS multiplexor; 6 Atari 800 computers (48K); 6 Atari 850 interfaces; 1 Atari 1050 disk drive; 6 DAK 300/1200 modems; 1 ProWriter printer; 2 green monitors; and 1 color monitor.

The main attraction is, of course, what you have at your fingertips when you call Computalk. Claiming he "can't stand stagnation," Meier has packed the board with much variety; in fact, he's persistent in his ongoing quest for something new and fresh.

Some of the things which Computalk has on-line include: religion forum; games; electronic mail; libraries for downloading ST and 8-bit software; surveys; computer news and other information; thorough help screens for each section; an on-line newsletter, "Compu-Gabber"; and free file uploading.

The features follow along the lines of most standard BBSs, but there are some other niceties that are more innovative. Altogether, they help make Computalk a hybrid; something akin to crossbreeding

a BBS and an on-line network. Intercom mode is an example of one such function, letting users pass private, one-line messages amongst themselves in real time, much like the SEND command on Delphi, or GENie's NOTIFY.

In the same vein, Compu-Gab is Computalk's answer to the major on-line networks' conferencing mode. Perhaps the biggest draw to most telecommunications services, conferencing permits a number of users to gather for simultaneous discussion of the latest events, to ask and answer questions, or just to chat. Compu-Gab is no different; in it, you can converse with any or all of the five other users in real time. It's a nice touch, as, normally, things like this don't appear on BBSs.

Atari's Darryl May, a customer support representative, stops by once a week to field user queries. Meier hopes that May will be writing a column on Atari happenings for the board.

Easily one of the most refreshing and reassuring aspects for 8-bit users is that Computalk caters to their precious machines throughout the board. As noted in the equipment list above, the board is run entirely on 800s, and has enhanced graphic displays for those who log on in ATASCII mode (though any computer can access the system and run through it in

ASCII mode). Meier plans to institute a flag of sorts to tell users when a menu selection is ATASCII only, as is the case with the entry screen following log-on (which can be viewed from the database area).

Another ATASCII-enhanced product is an offshoot of the perennial "Star Trek" game. Called Computrek, it takes advantage of the 8-bit's graphics, with ships, planets and other extraterrestrial fare, each represented by its own display icon. To add even more excitement, Meier has added a multi-user Trek game. He compares it to a "mini Mega-wars," the very popular, multi-user contest which can be found on CompuServe.

And, on the subject of games, there's an adventure section for gamers to traipse through in search of challenging contests. The only annoying feature is that for all games except Computrek, you cannot re-enter the board and are immediately logged off when it's over. This is especial-

ly bothersome if you're experiencing line noise, which could alter your intended responses to game questions and bring up a less-than-timely demise to your session. Meier told me he was working on clearing up this problem, though it was intentionally implemented to discourage rapid solving of the easier games. To wit: you'll soon be able to exit from most games in mid-play, slipping back to the main board.

Meier does charge for access to the board, to cover his costs (phone and electric bills, for example), though it's only \$15 for a 6-month stint. Out-of-staters also face a toll call for accessing the system, though there's a way to limit the impact of that, as well.

Telenet, the packet switching network, offers a service called PC Pursuit, that provides telecomputing nuts local call access to twenty-five major cities across the nation for as little as \$25 per month. With a PC Pursuit subscription, you can call your local Telenet number, input your ID

and password, and have free rein over their public data network, to tie in with other computers and BBSs in any of the areas. It's an inexpensive method for keeping in touch with other computerphiles in major cities.

Computalk is accessible through PC Pursuit in the Dallas node (under area code 214), and, other than the subscription charges for these two services, the only fee you'll face is if the nearest Telenet node is a toll call. Otherwise, your call to Computalk is treated as a local call. For more information on PC Pursuit, call Telenet at 1-800-TELENET (voice) or 1-800-835-3001 (modem).

To access Computalk, you can dial direct to 1-817-589-2588 in either 300- or 1200-baud, and follow the prompts. If you type NEW at the ID prompt, you'll be allowed a 15-minute sample of the system, and can subscribe by credit card (MasterCard or Visa). Meier will answer questions on his voice line at 1-817-595-0094. **■**

Forem ST

by Matthew Singer
 COMMNET SYSTEMS
 24 Randy Road
 Framingham, MA 01701
 (617) 877-0257
 High or medium resolution \$59.95

by Blake Arnold

The Forem bulletin board system program for Atari 8-bits has been out for a few years now, and again Matthew Singer has remained ahead of the pack with one of the first Atari ST bulletin board programs. It wouldn't be fair to compare the ST version to the 8-bit version; the ST version is much more powerful and flexible (as it should be). **Forem ST** contains so many commands not in the 8-bit version that it's barely recognizable as the same BBS software.

The **Forem ST** BBS program requires at least two disk drives, either two floppy drives, or a floppy drive and a hard disk drive. It will recognize a RAMdisk as the second system drive, but, to me, it's more trouble than it's worth to configure the board that way. However, configuring the RAMdisk as a third or greater drive presents no real problems. (In fact, using a RAMdisk for the system text files, menu files, etc., will save you some wear on your drives, and also speed things up a little.)

Forem ST comes on two single-sided disks (with STTerm on one of them, which I'll explain later), and consists of about 600K worth of files. The actual BBS program is about 200K long; the rest of that space is taken up by **Forem's** related

system files. The disks are also unprotected, as any application/utility program should be.

The program will run in medium or high resolution, but you must specify which when configuring your system. There's a reason for this: if you're using a color monitor, **Forem ST** lets you set your background and text colors, then saves that information into one of its configuration files (there's no need for the control panel).

Other than needing two drives, the program has no special requirements, but I'd recommend a hard drive if you plan to have a bulletin board system of any appreciable size. As for modems, any Hayes-compatible modem will work (all the way up to and including 9600 baud).

The documentation consists of a 100-plus page booklet that explains all the setup procedures and program options in full, as well as how to maintain the BBS (userlog maintenance, etc.). If you read the book before trying to set up your system, you shouldn't have any problems (at least none that can't be solved by referring to the manual).

When I first opened the book, I was impressed by the amount of control available to the SYSOP. It's possible to limit just about anything a user can do, if that's necessary. Surprisingly, this power doesn't make **Forem ST** overly complex for either

the SYSOP or the users. (It does take a little getting used to, though.)

Forem ST's userlog is capable of containing up to 2000 users. In case you think that's not quite enough, pull out your telephone directory and count seven pages; that's what 2000 names look like in print. The userlog itself contains the information on each user, and, with the userlog editor (which is built in, as is the message base editor), it's possible to allow users access to only certain portions of the BBS, or the entire BBS.

Forem ST also has a terminal mode to allow the SYSOP to call out if he wishes. **Forem ST** loads STTerm (which is included) when it's put in terminal mode, and through this, it's possible to upload and download files—and even define macro keys. In short, it's a *full featured* terminal mode, allowing all the options you'd expect.

As I mentioned, **Forem ST** actually loads STTerm when put in terminal mode; the ability to load and execute TOS programs is also available with an EXEC (execute) command. With EXEC you can load a word processor (Micro Emacs, etc.) and edit text files, without taking the board down.

File transfers are one of **Forem ST's** strong points. Matthew Singer seems to be one of first to implement new types of protocols into his programs. The newest

Advan BASIC

"spectacular...an expanded BASIC with powerful new commands...brilliant work ...send away for your copy today. You will not regret it." Apr86 ANTIC magazine

"great...easy to use...I heartily recommend the package on the strength of Advan BASIC" Aug 86 ANALOG magazine

***FAST:** Compiles. Short programs run up to 20 times faster than in ATARI BASIC. Long programs up to 100 times faster.

***POWERFUL:** Real, integer, and string arrays and variables. Strings are not dimensioned. IF THEN ELSE, REPEAT, WHILE, CASE, and multi-line IF commands. Functions and subroutines with up to 4 arguments. 8 PM commands let you define and insert figures into PMs, auto. move them horizontal &/or vert. at rates you specify, & even auto. change PM figures for animation effects. 3 sound commands. You can set up and auto. play tunes. Built-in assembler. RAMDISK for 130XE.

***EASY TO USE:** Programs entered and edited as in ATARI BASIC. English error messages. KILL, RENAME, and DIR built into BASIC.

***ONLY \$39.95.** Includes 119 pg. manual & program which converts many ATARI BASIC programs to Advan form. Needs 1 disk drive & 800XL/XE/48K 800. VISA/MC accepted. Shipping \$3.95. COD add \$2.00

256K XL

\$69.95

This 256K ram memory upgrade is designed for the 800XL/1200XL computers. This upgrade gives you compatibility with the 130XE, plus gives you an additional 128K of ram for a total of 256K. With this upgrade, you can run software designed for the 130XE, including Basic XE, disk operating systems, etc. Internal Installation. Does not use expansion bus. Some soldering required. Mydos and manual included. Don't confuse our upgrade with others you may have heard about. Ours supports Antic CPU control. Our upgrade also protects the main memory, so you can't accidentally access the main memory bank and wipe it out. Installation available

CIRCLE #114 ON READER SERVICE CARD

//ST Review *continued*

protocol is Fmodem, which uses a 4K block (instead of a 128-byte block, like standard Xmodem). Fmodem is primarily for high baud rate transfers (**Forem ST** supports 9600 baud). **Forem ST** allows up to twenty file transfer areas, and each one may contain files of any access level, but only those files at and below a user's level will be shown to him.

When a user lists or scans the files, he'll also be shown a brief description of the file and other pertinent information. The LIST command is similar to the READ command on Delphi (full information on the file), and the SCAN command shows only the filename, length and description. **Forem ST** also has a NEW command that shows the user all the files uploaded since his last call.

As far as transfer protocols available, if **Forem ST** doesn't have it, chances are it's rare. Protocols currently supported are: ASCII (Xon-Xoff), Xmodem, Xmodem CRC (Cyclic Redundancy Checking), Ymodem, Ymodem CRC, Ymodem batch, Amodem, Kermit, Compuserve B and Fmodem. It also has a VERBOSE command in the files system; this allows a user to do a verbose list of any archived (ARC) file that he can view. It's extras like these that make this one of the best BBS programs I've seen.

Forem ST allows up to sixty-four separate message bases, each with a different maximum number of messages and its own name. The message bases also have separate security masks, so it's possible to allow a user access to all, one, or any combination of message boards.

For the user, this program offers a variety of options for reading or scanning messages. The message base has the standard READ and SCAN commands, along with others for reading messages in a particular sequence, or finding messages that are addressed to you.

One of the nicest features of the message base (at least from a SYSOP's standpoint) is the ability to send a message to all users at and below a certain download privilege level. If the SYSOP uses this option, all users at and above that download level will be shown the message as if it were addressed directly to them. Messages in a base can be locked by the sender, so that only the person the message is addressed to may read it. **Forem ST** also contains a completely separate E-mail (electronic mail) message base for private messages among users.

If I had to pick a favorite feature (aside from the amount of control given to the

SYSOP), it would be support of VT-52 cursor and color codes in messages and text files. With the VT-52 codes, it's possible to do animation and color changing, which can call attention to your messages. VT-52 animation seems to be the "in" thing on ST BBSs right now, and that may be one reason for **Forem ST**'s popularity; it's one of the few with this feature.

Forem ST also has several other interesting features, a few of which I'll explain here. (Keep in mind: the program is full of things like this.) Its prompt set (lines such as "Select" that the user sees after a menu, etc.) can be customized. This helps to keep every **Forem ST** BBS from looking like a clone. You can lower all users' access times during peak hours automatically, which lets more people use the BBS. **Forem** also lets you use the message editor on short text files, and a SYSOP can configure the BBS to lock out 300-baud callers. (If you run a large, busy BBS, this might be useful.)

I could find only one minor problem with the program. When logging on as a new user or uploading a file, you're asked several questions. After every one of the questions **Forem ST** echoes the users input, along with an *Is this correct?* question. It gets annoying! It seems to me that echoing the entire block of information, then asking the user if it's correct would be easier on everyone.

All things considered, I think **Forem ST** is a good BBS program (with a little room for improvement). It seems to be one of the most popular for the ST, so a lot of people are already used to a **Forem ST** board. And it offers excellent SYSOP control over the system, along with some powerful commands for the users. As far as updates are concerned, **Forem** is also one of the best in that field. Commnet Systems runs a bulletin board on which callers can make suggestions about new features or changes they'd like to see in the program. The next revision (which will probably be available by the time you read this) will include a function to allow users to execute TOS programs for on-line games, etc.

If you're already running a non-**Forem** BBS, or thinking about running a BBS, I don't think you could go wrong with **Forem ST**. If you'd like to take a tour of a **Forem** BBS in action, call Commnet Systems support BBS at 617-877-8756. ☐

The Wizard

PART 1

A text adventure construction set. This month: the editor and database printer.

by Clayton Walnum

Almost two years ago, I wrote a series of articles called "Adventurous Programming," to teach intermediate and expert BASIC programmers how to create text adventure games. Unfortunately, many of **ANALOG Computing's** faithful readers were left in the lurch; they wanted to design adventure games, but didn't know—and possibly didn't want to know—how to program.

There's a lot of creative talent out there just waiting to crawl free, a lot of entertaining adventure games trapped behind the brows of nonprogrammers who, nonetheless, have a contribution to make. I decided someone had to come up with the vehicle these people needed to transform their ideas into program code.

It was a tough challenge, but **The Wizard** is here.

The Wizard is a system of programs that lets you create your own BASIC text adventures without any knowledge of programming. It's actually made up of three modules: the editor and database printer, which are presented this month; and the compiler, which will be in next month's **ANALOG**.

The editor is used to create a database of all the information needed for the compiler to create your adventure. With the editor, you'll enter room, object and command data, as well as text for the game's title and introductory screens—all of which will be automatically saved to disk as you work. The database printer module reads data from the disk and sends it to the printer in a readable format, so you can print a record of your work. And, finally, the compiler reads the adventure data from the disk and creates a complete, ready-to-run BASIC adventure.

The resultant BASIC program is complete and freestanding in every way. It doesn't require other data to run, and may be handed out to friends as freely as any other BASIC program. Because **The Wizard** outputs standard BASIC, programmers have the added bonus of being able to create an adventure easily, then modify the generated program to suit their needs.

The listings.

Type in Listing 1, the editor module, using the "BASIC Editor II" (issue 47) to verify your work, then save it to disk under the filename WIZARD.BAS. Listing 2 is the database printer. Type it in and save it to disk under the filename WIZPRINT.BAS.

Writing an adventure.

I'm not going to discuss the art of designing adventure games. Anyone interested in learning more about plotting, mapping, characterization and the other essential elements of adventure design should refer to the first article in the "Adventurous Programming" series (issue 39), or to Michael Banks's "Designing an Adventure Game" in the October 1987 **ST-Log**. Here, we're more interested in the mechanical side of the process, using **The Wizard's** editor to get the elements of the game on disk for the compiler.

I'm going to explain **The Wizard's** editor in two sections. The following section is a detailed discussion, and serves as a reference manual for the system. After that is a tutorial section in which I'll take you step by step through the creation of a short adventure game. If you like, you can skip ahead to the tutorial, create the adventure (you won't be able to compile it until next month, though), then read the rest of the article for further clarification.

Creating a new game.

When you run **The Wizard's** editor module, you'll be presented with a title page, followed by the main menu. If this is the first time you've ever run the program, you'll not have stored any adventure data on your disk. Your first step, then, is to choose menu selection 1, "Create Game."

Here, you'll be asked to supply the editor with your name (as you'd like it to appear on the adventure's title screen), the game's title (keep it twenty characters or less) and the filename for the data. The filename should be eight characters or less, and should not include a device or extender (for example: MYGAME, rather than D1:MYGAME.DAT).

Once you've entered the required information, you'll be asked to verify your input. If you answer Y, the program will create the data files it needs—so make sure you have a blank, formatted disk in drive 1. You may have only one adventure database per disk.

Note: before any of the other menu items will work, you must have either created a new game, or loaded a game already in progress (more on this below).

Loading a game in progress.

You probably won't enter all your adventure data in one sitting—that's a lot of work! Even if you do manage to complete such a marathon session, you'll almost certainly have to go back to the editor at some point. The chances of a complex adventure game running properly the first time are slim indeed.

To reload an adventure database, choose menu selection number 2, "Load Game," from the main menu. You'll be asked if your adventure data disk is in the drive. If the disk is okay, the program will load the data, after which you can continue editing your game. If you insert the wrong disk (a disk not set up by **The Wizard**), or the computer encounters any type of file error, you'll receive an error message. If you don't wish to load a game, reply with an N to the prompt.

Entering room data.

Your adventure game may have up to thirty rooms, each of which can be interconnected with the rest in any way you please. You're allowed six exit directions: north, south, east, west, up and down. Additionally, some exits can be conditional, requiring that the player have a particular item before he may use them.

Some of the prompts have default values that can be selected by pressing RETURN without an entry. Other prompts require input and must be filled in. If you make a mistake during data entry, you can use the BACKSPACE key to make corrections.

To enter room data, choose menu selection number 3, "Work on Rooms," from the main menu. The room editing screen, including a graphic representation of your room and its exits, will be displayed. An important note: room number 1 is always where your player will begin his adventure.

You must first enter the room's name (limit of twenty-four characters), followed by a RETURN. There's no default for this entry; you must supply a name for each room.

You then need to enter information for each of your room's exits. The direction prompts require a number from 0 to 30. If you enter a 0, there will be no exit in your room for

that direction. This is the default, any other number being interpreted as the room number of that exit's destination, where the player will be moved when he chooses that exit. As you enter each exit, the on-screen graphic will be updated, showing each of the room's exits and where they lead.

Once you've entered all the exits, you must tell the editor if you want one of them to be restricted. Restricted exits are not usable unless the player has, either in the room or in his inventory, a particular item. (For instance, in the sample game found in the tutorial section, the player must have a coat before he's allowed to go outside.)

For the *RESTRICTED* prompt, enter a single letter direction (N, S, E, W, U or D) or the word *NONE*. The default is *NONE*. The direction you enter here must be a valid direction, one that was given a nonzero value in the exit data.

If you decided to have a restricted exit, you must then enter the name of the item that must be in the room (or in the player's inventory) for the exit to be active. The item name follows the same rules found in the "Entering item data" section below, and does not have a default value.

The required item must be found either in the room or in the player's inventory. Answer I (the default) or R for the I/R prompt, as appropriate.

Whenever a player attempts to use a restricted exit, he needs some textual feedback as to the outcome of his action. This is provided by the messages you enter following the *POS TEXT* and *NEG TEXT* prompts. The negative text is displayed when the player tries to use the exit without the required item. Positive text is displayed when the player succeeds in using the exit (in other words, he *does* have the required item). There are no defaults; if you have a restricted exit, you must enter the positive and negative text. Each of the lines must be no more than twenty-five characters in length.

When you're through entering the data for a room, you'll be asked to verify your work. A reply of Y will save the room to disk and set up the screen for the next. A reply of N will clear all data, allowing you to try again. To exit the room editing screen, press ESCAPE.

Editing existing room data.

You may, at any time, change previously entered room data. To do this, select "Work on Rooms" from the menu, then type the room number you wish to edit. The data will be loaded from disk, then displayed on the room editing screen. Defaults for all prompts become the displayed data (what you originally entered). Press RETURN till you get to the data you want to change, then make the correction.

Note: you cannot delete a room once it's created. You can, however, change all the data, transforming the room into a new location.

Entering item data.

Every object in your adventure must be entered into the editor as an item. If you fail to do so, when the player uses the item as the noun portion of a command, the game will return the message *No such noun*. To enter a list of items, choose menu selection 4, "Work on Items" from the main menu.

The first entry you must make is the item's name. There's no default value, and each item name must be unique. Mul-

multiple words are okay (i.e., WOODEN BOX), but you're limited to thirteen characters.

After entering the name, you must give the item a three-letter code (this entry also has no default). The code is used internally by the program to discern one object from another. It should consist of the first three letters of the item's name, though, in the case of multiple word items, you can choose which word to use as the basis for the code. Each three-letter code *must* be unique; you'll not be allowed to enter duplicates.

Keep in mind that, during game play, the first three letters of the noun portion of the player's command will be compared against these codes for a match. If you want a player to pick up a boulder with the command GET BOULDER, the three-letter code for the item must be *BOU*.

The next data needed is the room in which the item will be placed. This must be a number between 1 and 30 (the allowable range of room numbers); the letter *C* for items that will be created by an "item command" (see the section on item commands, page 44); or the word *ANY* (the default), which means the item will appear in the player's current room, once the proper command has been supplied. You should also enter *C* for objects used *only* as the noun portion of a command; that is, they don't actually appear in the game's object displays (see the tutorial section for an example of this usage).

Some game items are stationary; others may be picked up and moved by the player. The category your items fall into depends on your answer to the *GET* prompt. If you answer *Y* (the default), the item will be "gettable." If you answer *N*, the player won't be able to move the object.

Some items can be hidden from the player and made available to him only after he's completed a certain action. Others are accessible from the beginning of the game. The information you supply the *COMMAND* prompt will determine which type your item will be. If you respond to this prompt with the word *GET* (the default), the item is visible in its destination room (the room entered at the *ROOM* prompt) at the beginning of the game. Any other command entered here must be a two-word, verb/noun combination, limited to fifteen characters in length. In order to get access to the item, the player must type this command.

The command may require that a particular item be present in the room or in the player's inventory. Either enter the name of that item after the *ITEM NEEDED* prompt, or respond with the word *NONE* (the default).

Answer the *I/R* prompt in the same manner described in the "Entering room data" section above.

If you've entered something other than *NONE* for the item needed, you must supply the negative and positive text (as described in "Entering room data"). Otherwise, you need supply only the positive text.

Some program listings reproduced in *ANALOG Computing* may contain "strange" characters not shown on the keyboards of earlier Atari models. These are special characters which use the CTRL, ESC and "ATARI LOGO" (inverse) keys. Shown below is a list of these characters and the keystrokes used to get them.

␣	---	CTRL	,	␣	---	CTRL	Z	␣	---	INVERSE	CTRL	,	␣	---	INVERSE	CTRL	M

␣	---	CTRL	X															
␣	---	CTRL	Y															

Once a new item is stored on disk, the item screen will be cleared. You may then enter another item into the database, or press ESCAPE to return to the main menu. You may have no more than fifty items in your adventure.

Editing item data.

You can change previously entered item data at any time. To do this, select the "Work on Items" menu selection, then type the name of the item you wish to edit. The data will be loaded from the disk, then displayed on the item editing screen. Editing is accomplished in the same manner as described in "Editing room data" above, pressing RETURN for data you wish unchanged and retyping those you want to modify.

Entering command data.

A command is an input from the player that will result in some sort of action in the game. **The Wizard** allows five types of commands: simple, movement, item, fatal and final.

A simple command results only in the output of text to the player. A movement command moves the player to a new location. Item commands, the most complicated, allow the player to combine, create or delete items, based on rules you've set up. Fatal commands "kill" the player and end the game. Final commands also end the game, but with the player victorious, having completed all the actions necessary to solve the adventure.

To enter command data, choose menu selection 5, "Work on Commands," from the main menu. You'll then see a secondary menu. Here, you must choose which of the five types of commands you wish to work on.

Simple, movement, final and fatal commands.

When you make a selection from the command menu, the command editing screen will be displayed. This screen is similar for all command types except item commands which, because of their greater complexity, require many additional prompts. Because they're different from the other types, item commands will be explained in their own section. Here, we'll take a look at the other four.

First, you must enter the actual command. Type it in following the *COMMAND* prompt, keeping in mind that it must be a unique verb/noun phrase limited to fifteen characters in length. This is a required entry; there is no default.

In order for the command (the one you just entered at the *COMMAND* prompt) to be effective, the item entered at the *ITEM NEEDED* prompt must be present in the room or in the player's inventory. If you don't want to require an item, enter *NONE* (the default) for this prompt. Otherwise, enter an item name (this item must, of course, be entered into the database at some point).

You must then answer the *I/R*, *POS TEXT* and *NEG TEXT* prompts in the usual manner. There are no defaults for these entries and positive text is required. You may, if you want, leave the negative text blank by pressing RETURN with no entry.

The movement command data entry screen has one additional prompt: the number of the room to which the player will be moved when he types the command. This should be entered in response to the *DESTINATION* prompt and

must be a number in the range of 1 to 30. There's no default value.

After you've completed a command's data, it will be saved to disk and the screen cleared. You can then continue entering command data, or press ESCAPE to return to the main menu.

Entering item commands.

Item commands allow the player to combine game items in various ways, create new items and delete old ones. This is a powerful feature, and the imaginative game designer will find many uses for it. An example of its use will be given in the tutorial section of this article, so if, after reading this section, you're still not sure how item commands can be used, you'll find help there.

To set up an item command, you must first supply the database with the command itself, typing it in response to the *COMMAND* prompt.

You'll notice that there are two *ITEM NEEDED* prompts, rather than the single prompt used with the other command editing screens. Also, the items needed must be in the player's possession (in the room isn't good enough) for the command to take effect. Other than these differences, the same rules apply. The default for these prompts is *NONE*.

The *ROOM* prompt must be filled in with either a valid room number or the word *ANY*. The player must be in this room for the command to be effective.

The item to be created is entered in response to the *CREATE* prompt. This is the item that will be added to the game when the command is carried out. At some point before the game is compiled, this item must be entered into the adventure's data using the "Work on Items" selection of the main menu.

The *I/R* prompt here is different from its counterparts on the other screens. This one's asking if the new item, once it's created, should appear in the room the player is in, or in his inventory. The default is *I*.

The *GET* prompt works as explained in the section "Entering item data" above, indicating whether the new item will be movable by the player. If you selected *I* for the *I/R* prompt, this entry will automatically be filled in as *Y*, since an item already in the player's inventory obviously can be moved.

The two *DELETE* prompts allow you to choose either one, both or none of the needed items (or any other item, for that matter) to be deleted from the game. The default is *NONE*.

Finally, you must enter the usual positive and negative text. The negative text isn't required if you've entered *NONE* for the items needed.

As usual, to return to the main menu, press ESCAPE.

Editing command data.

You may change previously entered command data at any time. To do this, select "Work on Commands," then choose the type of command you want to edit from the command menu. When you respond to the *COMMAND* prompt with the command you wish to edit, the data will be loaded from the disk then displayed on the editing screen. Editing is accomplished in the usual manner—pressing RETURN for

data you wish unchanged and retyping those you want to modify.

Entering intro text.

When a program created by **The Wizard** is run, it first displays a title screen, after which a text screen displaying the game's background story is shown. The text for this screen is entered into the database using menu selection 6, "Intro Text."

The intro text editor is very limited. It has few options (none, if you want the truth) and requires, for the most part, that you enter your text with no errors. You can backspace over text on the same line as the cursor, but that's about the extent of the correction "features."

Text is formatted by padding lines with spaces; you don't end a line (or even a paragraph) by pressing RETURN. If you want a blank line, for example, you must fill the line with spaces. The RETURN key is used only when you've finished entering all text and are ready to save your intro screen to disk.

The text will appear in the final game exactly as you've typed it on this screen.

A tutorial.

Now that I've suitably frightened you with all the technicalities, let's create an adventure together. The process isn't

as complicated as it might seem, and I think you'll find that—once you get a little experience under your belt—the program is easy to use.

First, we need a plot. Let's say that a jewelry salesman just came to your door. Instead of buying something, you mention a diamond you want to get rid of. The salesman, always on the lookout for a bargain, agrees to buy the diamond. Now all you have to do is find it! The map of our adventure can be found in Figure 1. Use it for reference as we work.

In the following steps, I'll be showing you exactly what to type to create our game. For instance:

23 [R]

means to type the number 23, followed by a RETURN.

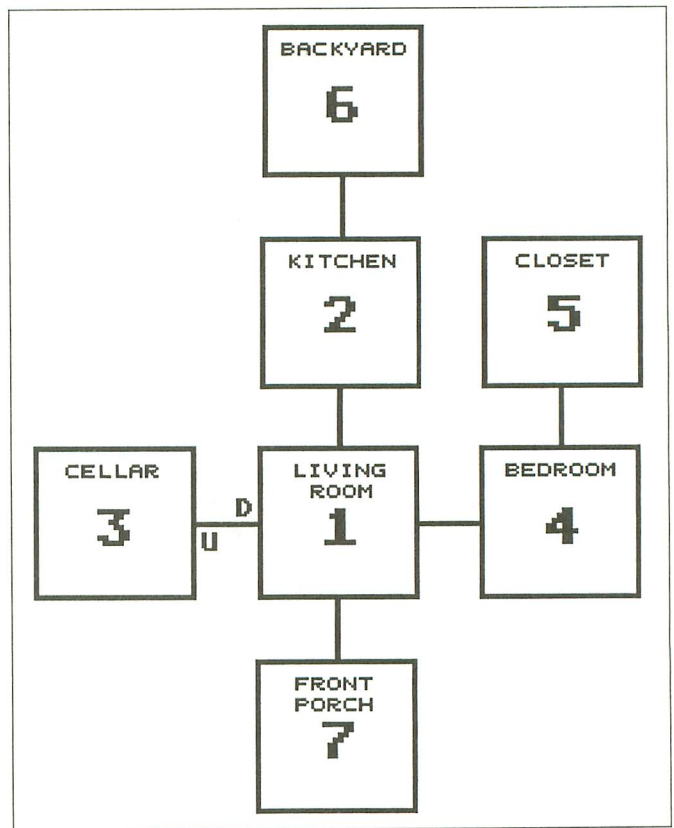

Figure 1.

Let's start by setting up a disk for our new adventure. Load **The Wizard** editor (Listing 1) and run it. When the menu appears, select the "Create a Game" option. Type the following:

ELMER FUDD [R] DIAMOND FOR SALE [R] DIAMOND [R] Y

The program should now create the files for our new adventure game, after which it'll return to the main menu.

Now we need to set up our rooms. Room number 1 is where our adventure game will start. Select the "Work on Rooms" option from the main menu and enter 1 for the room number. Now type:

LIVING ROOM [R] 2 [R] 7 [R] 4 [R] [R] 3 [R] [R] Y

By entering the above data, we've created a room called LIVING ROOM that has four exits. The exits go north, south,

**Get

plus \$1.50
shipping and handling

Call
(617) 892-9230

The Wizard *continued*

east and down, and their destinations are rooms 2, 7, 4 and 3, respectively.

Now enter the following data for room 2:

```
KITCHEN [R] 6 [R] 1 [R] [R] [R] [R] [R] N [R] COAT [R] [R] IT'S TOO COLD  
OUT THERE [R] THE COAT KEEPS YOU WARM [R] Y
```

Here, we've created a room that has a restricted exit to the north. If the player wants to use that exit, he must have the coat in his inventory. If he tries to use the exit without the coat, he'll receive the message *IT'S TOO COLD OUT THERE*. If he has the coat, he'll get the message *THE COAT KEEPS YOU WARM*, and be allowed to use the exit, ending up in room 6.

Now, enter the data for the rest of the rooms (in order) as follows:

```
CELLAR [R] [R] [R] [R] [R] 1 [R] [R] [R] Y  
BEDROOM [R] 5 [R] [R] [R] 1 [R] [R] [R] Y  
CLOSET [R] [R] 4 [R] [R] [R] [R] [R] Y  
BACKYARD [R] [R] 2 [R] [R] [R] [R] [R] Y  
FRONT PORCH [R] 1 [R] [R] [R] [R] [R] N [R] KEY [R] [R] THE DOOR  
IS LOCKED [R] THE KEY UNLOCKS THE DOOR [R] Y
```

All our rooms are now created and stored on disk. Next, let's create our item data. Press ESCAPE to return to the main menu, then choose the "Work on Items" selection.

Now type:

```
BULLET [R] BUL [R] 5 [R] [R] [R] Y
```

Here, we've created a movable object (one the player can pick up) named BULLET, that will be located in room 5 at the beginning of the game. The object's internal code (the way the program will recognize it) is BUL.

Let's do another one. Type:

```
KEY [R] KEY [R] 7 [R] [R] LOOK DOOR [R] [R] YOU SEE A KEY [R] Y
```

We've created an object that'll be invisible to the player until he types the command LOOK DOOR while in room 7, at which point he'll receive the message *YOU SEE A KEY*, and the key will be added to the list of visible items displayed on the screen. This item goes hand-in-hand with the room description for the front porch, where, in order to get back into the house, he must first have the key. We didn't have to enter negative text in this case, because the command doesn't require an item to be present.

Here are a couple of items that work together. Type:

```
ICE PICK [R] ICE [R] 3 [R] [R] LOOK TOOLBOX [R] BROKEN LOCK [R]  
R [R] YOU FOUND SOMETHING [R] IT'S LOCKED [R] Y  
BROKEN LOCK [R] BRO [R] 3 [R] N [R] KICK TOOLBOX [R] [R] YOU  
BROKE THE LOCK [R] Y
```

Can you see what's going on here? In order to get the ice pick, the player must type the command LOOK TOOLBOX while in room 3. Additionally, the broken lock must be in the room for the command to be effective. To get the broken lock in the room, the player must first kick the toolbox (note, also, that the broken lock is a stationary item—it cannot be moved by the player).

In this way, we're using the lock to signal to the program that the player has completed certain actions (kicking the toolbox). This is called a *flag*.

Finally, one more variation. Type:

```
LOADED GUN [R] LOA [R] C [R] Y
```

The C in place of the room number here means that the loaded gun is an item that will be created later on in the game. You should also enter an item this way when the ob-

ject doesn't actually appear in the game, but will be used as the noun portion of a command. For example, type:

```
DOOR [R] DOO [R] C [R] Y
```

If you look back at our data for the item named KEY, you'll notice that the player must first look at the door. Even though a door will never appear anywhere except in the room description, it must be entered into the database, because we need to use the noun in a command.

Create the rest of the items for our adventure as follows:

```
TOOLBOX [R] TOO [R] 3 [R] N [R] [R] Y  
GUN [R] GUN [R] 1 [R] [R] [R] Y  
FLASHLIGHT [R] FLA [R] 5 [R] [R] [R] Y  
COAT [R] COA [R] 5 [R] [R] [R] Y  
SALESMAN [R] SAL [R] 1 [R] N [R] [R] Y  
DIAMOND [R] DIA [R] 4 [R] [R] OPEN CHEST [R] OPENED LOCK [R] R  
[R] YOU FOUND SOMETHING [R] IT'S LOCKED TIGHT [R] Y  
CHEST [R] CHE [R] 4 [R] N [R] [R] Y  
OPENED LOCK [R] OPE [R] 4 [R] N [R] [R] PICK LOCK [R] ICE PICK [R] [R]  
YOU GET THE LOCK OPEN [R] YOU CAN'T [R] Y  
KITCHEN [R] KIT [R] C [R] Y  
CELLAR [R] CEL [R] C [R] Y  
BEDROOM [R] BED [R] C [R] Y  
PORCH [R] POR [R] C [R] Y  
LOCK [R] LOC [R] C [R] Y
```

A player completes a text adventure by typing in a predefined series of commands, all of which lead to the solution of the game's puzzle. We, of course, have to supply our adventure database with all the commands our game will respond to. Some commands—DROP, GET, LOAD and SAVE—are already built into the compiler, so you don't have to worry about them. Everything else is up to us. Anytime the player types a command that isn't in our database, he'll get the message *YOU CAN'T DO THAT*.

Choose the "Work on Commands" selection from the main menu, then the "Simple Commands" selection from the commands menu. Now type:

```
LOOK COAT [R] COAT [R] [R] [R] IT LOOKS WARM [R] YOU HAVE TO  
HAVE IT FIRST [R] Y  
LOOK PORCH [R] [R] 7 [R] YOU SEE THE FRONT DOOR [R] Y
```

Simple commands are those whose only result is to print a message to the player. When our player types LOOK COAT in any room and has the coat in his inventory, he'll get the message *IT LOOKS WARM*. If he doesn't have the coat, he'll see *YOU HAVE TO HAVE IT FIRST*.

Now, select "Movement Commands" from the command menu and type:

```
GO CELLAR [R] FLASHLIGHT [R] [R] [R] OKAY [R] THE STAIRS ARE TOO  
DARK [R] 3 [R] Y
```

The above command will move the player to the cellar from any room (thereby bypassing a long series of directional commands), by simply typing GO CELLAR. There's just one requirement: the player must have the flashlight in his inventory. If he tries this command without the flashlight, he'll get the message *THE STAIRS ARE TOO DARK*.

Movement commands don't have to be as explicit as the GO type. How about a command like WAVE WAND, that moves the player into a magician's laboratory? The player may not even know what'll happen when he waves the wand, adding an element of surprise to your game.

The final two movement commands for our adventure are set up as follows:

GO BEDROOM [R] [R] [R] OKAY [R] 4 [R] Y
 GO KITCHEN [R] [R] [R] OKAY [R] 2 [R] Y

Final commands are similar to simple commands, except that they end the game, with our struggling player victorious; they're the last step in the game's solution. Select "Final Commands" from the command menu, then type:

GIVE DIAMOND [R] DIAMOND [R] [R] 1 [R] MISSION ACCOMPLISHED!
 [R] YOU DON'T HAVE IT [R] Y

Fatal commands also end the game, but with the player the loser. Select "Fatal Commands" from the command menu. Now type:

SHOOT GUN [R] LOADED GUN [R] [R] [R] YOU SHOT YOURSELF! [R]
 YOU CAN'T DO THAT [R] Y

Now, if the player types *SHOOT GUN* in any room and he has the loaded gun in his inventory, the game will end with the message *YOU SHOT YOURSELF!*

The last type of command is the item command. These complicated constructs allow you to employ "object metamorphosis" in your game. Select "Item Commands" from the command menu and type:

LOAD GUN [R] GUN [R] BULLET [R] [R] LOADED GUN [R] [R] GUN [R]
 BULLET [R] BE CAREFUL NOW! [R] YOU NEED SOMETHING [R] Y

Now, if the player has both the gun and the bullet in his inventory and types *LOAD GUN*, he'll get the message *BE CAREFUL NOW!*; the loaded gun will appear in his inventory; and the gun and the bullet will be deleted from the game. In a sense, we're allowing the player to combine two items, to create a third, new item. This command type has dozens of variations.

Last, we need to enter the text for the game's intro screen. Select "Intro Text" from the main menu, then type the following text as it appears here, using spaces for formatting.

NOW'S YOUR CHANCE TO MAKE A LITTLE
 EXTRA CASH. A COUPLE OF MINUTES AGO,
 A JEWELRY SALESMAN CAME TO CALL. IN
 FACT, HE'S SITTING IN YOUR LIVING
 ROOM RIGHT NOW. HE WAS AT FIRST IN-
 TERESTED IN SELLING YOU SOME OF HIS
 WARES, BUT THEN YOU TOLD HIM ABOUT THE
 UNSET DIAMOND YOU'VE BEEN TRYING TO
 SELL. HE WANTS TO BUY IT FROM YOU,
 BUT FIRST YOU HAVE TO FIND IT.
 GOOD LUCK!

After typing the text, press RETURN, then save the text to disk by responding to the *EVERYTHING OK?* prompt with Y.

That finishes up our sample adventure. That wasn't so hard, was it? It'll be a little tougher when you have to organize your own, original game—it's always easier to follow examples—but with practice, you'll be cranking out adventure games like a pro. Hold on to the data files we've created in the tutorial; next month we'll be compiling them into a complete game.

The database printer.

Listing 2 is the *The Wizard's* database printer module. Whenever you want a hard copy of your adventure's data, just run this with your adventure database in drive 1.

As it's printed here, the program is set up for any Epson-compatible printer, but if your printer doesn't meet this requirement, don't panic. There's only one printer control code (? #2;CHR\$(15)) in the program, located in Line 90, that sets the printer for compressed print. Those without compati-

ble printers should check their manuals for the proper code to insert here. If your printer isn't capable of compressed print, you can still use the program (though the output won't be nicely formatted). Just remove the printer control from Line 90.

Coming soon: the compiler.

Next month, in these very pages, we'll present *The Wizard's* compiler module, completing the package. That gives you plenty of time to design your own game and enter the data into the editor. Use your imagination. I'm sure there are dozens of possibilities offered by *The Wizard* that even I, the author, haven't thought of yet. Surprise me. ☐

Since 1981

Lyco Computer Marketing & Consultants

Lyco Means Total Service.

Mark "Mac" Bowser, Sales Manager

I would personally like to thank all of our past customers for helping to make Lyco Computer one of the largest mail order companies and a leader in the industry. Also, I would like to extend my personal invitation to all computer enthusiasts who have not experienced the services that we provide. Please call our trained sales staff at our toll-free number to inquire about our diverse product line and weekly specials.

First and foremost our philosophy is to keep abreast of the changing market so that we can provide you with not only factory-fresh merchandise but also the newest models offered by the manufacturers at the absolute best possible prices. We offer the widest selection of computer hardware, software and accessories.

Feel free to call Lyco if you want to know more about a particular item. We can't stress enough that our toll-free number is not just for orders. Many companies have a toll-free number for ordering, but if you just want to ask a question about a product, you have to make a toll call. Not at Lyco. Our trained sales staff is knowledgeable about all the products we stock and is happy to answer any questions you may have. We will do our best to make sure that the product you select will fit your application. We also have Saturday hours — one more reason to call us for all your computer needs.

Once you've placed your order with Lyco, we don't forget about you. Our friendly, professional customer service representatives will find answers to your questions about the status of an order, warranties, product availability, or prices.

Lyco Computer stocks a multimillion dollar inventory of factory-fresh merchandise. Chances are we have exactly what you want right in our warehouse. And that means you'll get it fast. In fact, orders are normally shipped within 24 hours. Shipping on prepaid cash orders is free in the U.S., and there is no deposit required on C.O.D. orders. Air freight or UPS Blue/Red Label shipping is available, too. And all products carry the full manufacturers' warranties.

I can't see why anyone would shop anywhere else. Selection from our huge in-stock inventory, best price, service that can't be beat—we've got it all here at Lyco Computer.

TO ORDER, CALL TOLL-FREE: 1-800-233-8760

In PA: 1-717-494-1030

Hours: 9AM to 8PM, Mon. - Thurs.

9AM to 6PM, Friday — 10AM to 6PM, Saturday

For Customer Service, call 1-717-494-1670,

9AM to 5PM, Mon. - Fri.

Or write: Lyco Computer, Inc.

P.O. Box 5088, Jersey Shore, PA 17740

Risk-Free Policy: • full manufacturers' warranties • no sales tax outside PA
• prices show 4% cash discount; add 4% for credit cards • APO, FPO,
international: add \$5 plus 3% for priority • 4-week clearance on personal checks
• we check for credit card theft • compatibility not guaranteed • return
authorization required • price availability subject to change

PRICE GUARANTEE

Since 1981, we have led the industry by continuing to offer the lowest national prices while providing quality service. Many companies have come and gone trying to imitate our quality and service. If by some oversight we do not have the lowest prices advertised on the products you desire, then we would appreciate the opportunity to rectify this oversight.

Panak strikes!

Reviews of the latest software.

by Steve Panak

If there's one thing I'll remember the most about the June 1987 Summer CES, it would have to be that it was one week-end that was full of surprises. Fickle weather, at one moment bathed us in blindingly bright sunlight—the next moment, my car almost spun out of control in a six-lane highway, a victim of hydroplaning during a sudden, torrential downpour. Surviving the storm, I was again surprised—this time pleasantly—by a floor full of new software, nestled in a dense nucleus around a healthy, airplane-capped Atari display.

The two-story black plastic structure played home to a number of software developers, in addition to the full and expanding line of Atari hardware. And a couple of software producers erected equally impressive displays, to hype their own new products.

Infocom was showing their two new games, **The Lurking Horror** (which we'll get to shortly) and **Stationfall**, a sequel to an earlier Infocom game, whose title I'll reveal later, if you find yourself unable to guess it at this point.

The Lurking Horror

by Dave Lebling

INFOCOM

125 CambridgePark Drive
Cambridge, MA 02140
48K Disk \$34.95

In the years since they began the interactive fiction biz, Infocom has introduced works in such diverse genres as adventure, mystery, science fiction, fantasy and comedy. But somehow, one of the most popular of all types of fiction got left out: the kind of story that you dare not read with the lights turned low, the stories populated with creatures and incidents of unspeakable terror. Well, much to our nightmarish dismay, they have rectified that oversight.

The Lurking Horror is one of the latest releases from Infocom, and the first to boldly barge into the world dominated by the dread poetic ravings of Edgar Allen Poe and the shudder-inducing tales of Stephen King. And, while its sales might not surpass those of either of these authors' works, it is destined to become yet another jewel in the Infocom crown. As the main character, if you're not careful, it could prove to be the nail in your coffin.

A procrastinating student at good old George Underwood Edwards Institute of

Technology (GUE Tech), you find yourself battling with a terminal, trying to pound out that twenty-page term paper that's suddenly due tomorrow. It would not have been quite so bad if the cursed computer hadn't corrupted all your files, filling them with unintelligible and disconcerting gobbledy-gook, hinting at spooks and spirits and horrors beyond belief.

And that was *before* you fell asleep (passed out?) and had that dream . . . about the pit and finding the stone, and the hoards of people chanting and crushing in on you, and then there's the horrible creature that shocked you back into consciousness. Of course, can you really call it a dream, since, when you awoke, the small stone was still in your hand? The strangely inscribed (clawed?) rock is the least of your troubles, though, as you muster up your courage and begin to explore the vast network of old, underground tunnels connecting the various buildings of GUE. You see, they've been closed for a reason. Rumor has it, a not-so-pleasant reason.

So, as the wind blows up a winter blizzard, sealing you into the university's science complex, you find yourself drawn to

the old tunnels, confronting supernatural beings of all descriptions. Just don't forget to carry your common sense with you—as well as that fire axe in the hallway.

The puzzles in this game are logical and well designed (I hoped I'd find a reason to use the forklift), the prose horrific and seasoned with dashes of patented Infocom humor. For instance, I've been waiting for the kind of response I got when I used one of my favorite commands, "kill man with axe," on the maintenance man. The outcome: *The fire axe chops into his chest, where it sticks. Ed Ames would be proud. He looks down at the axe with a certain perplexity, then pulls it free, the wound making a sickening sucking sound.*

While this is a peculiar response, it's nowhere near as surprising as the feel of his icy hands as they strangle you to death. Fortunately, there's always a rebirth, thanks to the save and restore commands. The standard Infocom program is superb and features a large vocabulary, as well as allowing abbreviations of the most often used commands, such as *X* for examine and *I* for inventory.

In addition to assaulting a new genre, in a major shift in strategy, Infocom has also adopted a new packaging design. Continuing the evolution of their always-creative containers (remember the original Starcross plastic spacecraft?), they have refined their book-shaped box, eliminating the page-filled cover and substituting a removable inner box, which slides in opposite the spine. This narrow box contains a technical manual (that tells how to run the program, and is supplemented with a machine-specific reference card), a student I.D., and a creepy creature. Also included is a freshman guide to the University, chock-full of background and hints. As always, you'll have to pay attention to all these details to get through the chilling, thrilling adventure.

The Lurking Horror is a fine addition to your Infocom library, and a must for horror fans. While it probably won't scare you out of a night's sleep, its entertaining prose and challenging puzzles will provide you with many sleepless hours. With **The Lurking Horror**, the masters at Infocom have laid waste to yet another genre.

Night Mission Pinball

by Bruce Artwick
subLOGIC
713 Edgebrook Drive
Champaign, IL 61820
32K Disk \$29.95

When I bought my first 8-bit Atari (an 800, at the incredible cost of \$1200), there was little software available, and even less that was any good. But one of the first games I owned and loved was a pinball simulation, **Night Mission Pinball**, from subLOGIC. It is only now, nearly three years later, that I've gotten around to bringing it to you. I only hope that you find it to be as enjoyable the second time around as I did the first.

This classic simulation shows just what can be done with 32K of efficient and compact code. It was the first program to capture the look and feel of a pinball machine—from the banks of drop targets to the infuriating "tilt" light, this game is as close as you can get without leaving your keyboard. There have been others since, but even now, almost five years after its initial release, this program can still hold its own against them.

Designed around the theme of a WWII bombing run, this game allows multiple-ball play of up to four silver spheres. The playfield is jam-packed with five bumpers, seven drop targets, and enough rollovers and ball-captures to keep it interesting and challenging for months to come. Even with a television as a monitor, the board is crystal clear. After careful adjustment of the color controls, you'll be able to distinctly make out the letters and score values associated with the various rollovers and targets. Dual-channel sound is achieved by driving the internal speaker of the 800 along with the monitor's speaker, and the speed of play is oftentimes incredible.

You can control play with joysticks or the keyboard. The SHIFT and START keys control the left and right flippers, respectively, while hitting any key on the left half of the board simulates bumping the machine to the left, the right keys bumping the board to the right.

Although I prefer the keyboard, note that the position of the START key along the top of the XE makes play on this new model rather awkward. I usually find the use of two sticks (one to control each flipper) likewise clumsy, since slapping the keyboard to jostle the machine typically causes me to fumble with one of the sticks. Other active keys read and write to a high-score disk, and freeze play.

The program also supports a large degree of customization. Typing *FIX* while in the "game over" mode accesses the fix menu, which allows adjustment of such parameters as ball speed, bounce and randomness of motion (otherwise, each game

might be the same, at least until you hit the ball). As in real pinball machines, you have control over the incline, the balls per game, tilt sensitivity and the free game score. Other settings make the game more difficult by limiting the amount of bonus and the ease of activating multiball play. The impulses given the ball by the various traps and bumpers can be preset, as can flipper power.

And, to make sure your new design is playable, you can test it via a self-play mode (a good idea, since some settings can crash the game or freeze play, as when a ball sticks in a kickhole which lacks the power to dislodge it). Using all these options, it's possible to simulate the game as it exists on this planet—or on any other which might lack gravity or friction. You can save up to 110 different modes (17 if you should be so unfortunate as to have only 32K of memory) for future use. However, a drawback of the game is the fact that, unlike some of its competitors, this program will not allow you to design a new playfield.

Night Mission boasts a new packaging scheme which is quite an improvement over the plain zip-lock bag my original copy arrived in. Inside the bulky but colorful box is an equally bulky and colorful manual. Unwilling to be satisfied by good looks alone, the 24-page booklet goes on to cover such diverse topics as customization, program statistics and pinball jargon. Its table of contents bounces you rapidly to the correct page, and a separate reference card keeps important commands, as well as the scores assigned to the various drop targets, lights and rollovers, in easy view. Finally, a label is provided to identify your high-score disk.

Overall, while this program is nearly five years old, it does not look dated at all. Although it lacks some of the features of its competitors, it is an amazingly fast and challenging pinball simulation, and is an exemplary example of efficient assembly language coding. It is a classic that's destined to endure.

As for next month, look for **Stationfall**, the sequel to Infocom's Planetfall mentioned a number of paragraphs ago. We'll also take a look at SSI's **Rebel Charge at Chickamauga**, and perhaps there'll be a couple more surprises. Until then, get down to your favorite dealer and take a look at the new Atari software and hardware filling up the shelves. And get them off the shelves and into good homes, where they belong. **A**

The Informer™

"Why can't there be a great database file manager for the ST?"

We weren't looking for a small improvement over the existing database file managers for the Atari ST. We were shooting for a major new system that pushed the ST's powerful features to the limit. No other database for the ST has The Informer's impressive graphics ability or its ease-of-use.

Other databases restrict your Atari ST's incredible graphics capabilities. With The Informer you can easily use text *and* graphics in your databases. Point-and-click to use pictures, graphs, and drawings from Degas™ and Neochrome™.

No programming is required to use The Informer. Easy point-and-click functions are used to create and

manipulate any of up to four databases simultaneously. Information is stored in a database like a spreadsheet.

Customizing reports is easy. Just point-and-click the mouse. Reports and graphics may be printed as they appear on the screen.

The Informer is compatible with data from Habaview™, Regent Base™, and dbMan™.

We even offer a Trial Pak including a demonstration disk with examples available for only \$19.95. The cost is good towards a purchase of The Informer.

The Informer, a graphic database of unprecedented power.

The Informer is a trademark of Regent Software.
Habaview is a trademark of Haba Systems.
dbMan is a trademark of Versasoft.
Degas is a trademark of Batteries Included.
Neochrome is a trademark of Atari Corp.

A buyer's guide
to the systems.

Video Games

by Joyce Worley,
Arnie Katz and Bill Kunkel

The experts said it would never happen. The experts were wrong. Video games are back, and they're better-looking, more intriguing and cheaper than ever.

Some basic information.

Video game systems connect to TV sets through adaptors included with the consoles. And, whether you use a black-and-white or a color TV, video games will not damage regular picture tubes in any way. (Projection TV owners should check their manuals before using video games.)

All of the systems use game cartridges, but different companies' games are not interchangeable. Cartridges are designed specifically for the system used.

In 1983-1984, thousands of game cartridges were sold at deep discount. They literally swamped the market, destroying retailers' profits, as well as their faith in the future of the games. These older games are long vanished, although elderly titles for older machines like the Atari 2600 sometimes turn up in bargain displays.

Games published for the first time in the last year are generating most of the excitement. Better game design and programming techniques, coupled with improved resolution and increased memory, deliver the best video games ever seen. Cartridges with up to 2 megabytes of game information are now available, and games with even more memory are on the horizon. Compare the "classics" like Space Invaders, a 2K memory product, and it's easy to see the potential inherent in a 2000K program.

Yet memory comparisons are misleading. The large memory of most of the current systems frees programmers from their former need to crunch every bit of information to squeeze it into the very smallest space. Now they can create designs which concede less to expediency. The coin-op translations look, sound and play much like the originals.

The Nintendo Entertainment System.

The Nintendo Entertainment System Control Deck package contains the NES game console, two hand-held rectangular pushbutton controllers, and a Super Mario Bros. game pack, for a \$99 suggested list price.

The NES Deluxe Set adds R.O.B., the "Robotic Operating Buddy," a light gun and two game packs that work with these peripheral devices, for \$179.95 list.

The Nintendo system features arcade-quality graphics of up to fifty-two colors, and NES game cartridges have up to 2 megabytes of information. Every game has audio backgrounds that compliment the visual splendors, including music and sound effects.

The Robotic Operating Buddy, a wireless ten-inch robot with photosensors, reads light signals from the TV to trigger movements. His best trick was to help Nintendo market this new gaming console, and R.O.B. deserves a place in the Video Game Hall of Fame for firing the enthusiasm of a new generation of video gamers. This hard-working little dude single-clawedly scratched out a place for video games in the computer age, by attracting the attention of kids. However, despite R.O.B.'s charms, veteran video gamers may want to pass on this accessory, since there are currently only two game packs that use the robot.

On the other hand, the light gun is a must-have item for NES-ers. Named the Zapper, it has light sensors which interact with flashes from the screen, and it's accurate within a fraction of an inch—even when fired from across the room. The four target-shooting games which use the Zapper are high-quality marksmanship tests, and the Zapper is definitely recommended to anyone who enjoys this sport.

There are currently about three dozen games available for the NES from Nintendo. An additional thirty-five are scheduled for release this year from thirteen third-party software developers, so there's plenty of variety. The catalog of game packs includes, in addition to the robotic and target gun titles, three games that allow

the user to customize the entertainment, eight sports contests, a half-dozen action games, five arcade classics, an educational game, and two adventures. More titles will be forthcoming throughout the next months.

The Nintendo system offers top quality visuals, audio and game play. The console itself is compact, sleek and attractive, and it appears to be very durable. The number of titles and peripherals already available—and on the drawing board—give the NES a bright future, which promises owners of the system many, many hours of prime entertainment.

The Sega Master System.

The Sega Master System, recently acquired by Tonka Toys, comes with the game unit, two Control Pads, Light Phaser and a two-game cartridge, for its retail price of \$150. The console uses Sega card and cartridge software.

The Sega system can present quite complex games. It employs superior high-resolution graphics, with up to sixty-four colors. The system is especially suitable for arcade-style games with high-speed animation. The video gun packed with the system is an excellent target-shooting pistol that every video marksman will enjoy using to blast away the on-screen targets.

The SMS accepts two kinds of games. The company introduced a new software medium, the Sega Card, in 1986. This slim credit-card sized game pack looks much like the guts of an Atari 2600 gaming cartridge when you crack off the plastic casing. But there's a big difference, since these elegant cards can hold up to 256K of memory.

The 256K Sega Card games are impressive, but the real top of the line Sega entertainments are packed on either the Sega Mega Cartridges (1048K of memory) or the company's Two Mega Cartridges (2096K).

Sega Cards retail for about \$25, and One Mega Cartridge games are \$30. Two Mega Cartridges will retail for \$40. There are currently about thirty games available, with more set for release before this holiday season.

In the past, Sega opted not to invite third-party software manufacturers to design games for the SMS. Instead, the company has licensed games from other software firms, to be produced under Sega's own banner. The recent change in ownership may make management reconsider this policy. Tonka's strategies have not yet been announced.

The Sega System incorporates top quality graphics, sound and action. Future peripherals—such as 3-D games and glasses—will keep the fun at a fever pitch for Sega owners.

Atari 7800.

Atari first unveiled the 7800 Pro System in 1984. The big innovation was its new "Maria" graphics chip, which totally replaced the player-missile graphics used on all previous Atari consoles. The new system made it possible to move any number of objects, of any size, in any combination of directions, simultaneously.

Unfortunately, the timing was disastrous. The video game slump kept this top-drawer system from getting its hour in the sun. Well, maybe it will now, as it represents an outstanding bargain for the arcade-style action game lover. Atari reintroduced the 7800 in 1986 at an attractive price, helping rekindle the enthusiasm of pay-for-play video gamers.

The Atari 7800 Video Game System comes with the console, two Proline controllers, and a Pole Position II cartridge, for \$79.95. Game cartridges cost about \$20. The 7800 also can play cartridges designed for the Atari 2600 Video Game System.

Atari plans to produce translations of popular arcade games for the 7800, and to acquire top computer action titles that were previously unavailable to the video game audience because of their high memory requirements. As with the other video game machines, new software techniques make upper memory designs possible for the Atari 7800. There should be almost twenty titles available this Christmas, and more 7800 games are planned for spring release. In addition, hundreds of 2600 games can be plugged into the 7800, with no extra attachments.

Ask the Game Doctor

Got a question about video game hardware or software? *Video Game Digest* has the man with all the answers, the Game Doctor. Yes, the celebrated software sawbones who once hung his shingle in *Electronic Games* is opening his office in these pages, beginning next month.

So, if you have a question for the megabyte medico, just send it to: Game Doctor, *Video Game Digest*, c/o ANALOG Computing, P.O. Box 23, Worcester, MA 01603.

The INTV III.

In January of 1983, Mattel Corporation sneak-previewed the Intellivision III for a few journalists and software mavens. The new machine ran smack into the plummeting video game market. Mattel subsequently abandoned the business before it actually put the Intellivision III on the retail market. The Intellivision III, once billed as the ultimate video game, was indefinitely delayed.

This machine proved to be just too good to die so young. In 1987, the long-awaited Intellivision III is finally a reality. The INTV Corporation is marketing titles from the original Intellivision software catalog, but—better still—is also actively publishing new titles.

The INTV System III Master Component lists for \$69.99. It comes with the gaming console and two nondetachable controllers. Cartridge prices range from \$10 to \$20.

The INTV III has a built-in voice syn-

thesizer, and about 12K of ROM and 10K of RAM memory. A larger range of available colors, plus the ability to manipulate sixty-four objects on-screen simultaneously, open up the options for Intellivision game designers.

The newer releases reflect this, with more complicated entertainments against strikingly handsome backgrounds, instead of against the solid black backgrounds seen in most low-memory video game systems.

The INTV III is not a state-of-the-art machine, but it does offer decent video game graphics, a tolerable sound system and a wide selection of cartridges—especially sports titles—at an economical price.

The Atari 2600.

The world's best-selling video game device, the Atari 2600, is the machine on which most home electro-gamers cut their teeth. Though newer game systems have stolen its thunder, the 2600 is still a great

entertainment bargain, and the only one of the original video game machines to survive into this new age of gaming.

The company retooled the unit to give it a more modern, sleek and handsome appearance, but it's still the same great entertainer.

It comes with the console and one joystick controller, for \$50. For head-to-head play, a second joystick sells separately for \$9.95.

There were thousands of games designed for the 2600 in the first video game era, and the old titles still have a lot of life. In addition, Atari Corp. is now releasing brand new 2600 game designs, as are third-party developers like Activision and Epyx. The new game cartridges cost about \$10.

While the Atari 2600 lacks the sophisticated sound and graphics capabilities of the upper memory machines, it is still a family pleaser, priced appreciably lower than other large kid's toys. **A**

Presenting... Video Game Digest

Video games are back—and **ANALOG Computing** has them. Beginning with this issue, *Video Game Digest* will present reviews, news and insights into the exciting, fast-changing world of cartridge games.

On hand to produce this magazine-within-a-magazine is the well-known team of Arnie Katz, Bill Kunkel and Joyce Worley. They will write and edit each issue of *Video Game Digest*, under the direction of **ANALOG Publishers** Lee H. Pappas and Michael J. DesChenes.

Katz, Kunkel and Worley were pioneers in video game journalism and created the first magazine exclusively devoted to the subject, *Electronic Games*. Their work appears regularly in **ST-Log** and other top computer and general interest publications.

The fate of *Video Game Digest* is in your hands. If you want a monthly video game magazine, perhaps even a bigger and better one, you've got to write and tell us so. We'd also like to hear from readers on any aspect of video gaming. Tell us what you'd like to see in the *Digest*. Just send your comments and suggestions to: *Video Game Digest*, c/o **ANALOG Computing**, P.O. Box 23, Worcester, MA 01603.

HOTLINE: Video Game News Update

Atari's new XE Game System includes a 64K console, attachable keyboard, video gun and joystick, plus three game cartridges, for about \$150. Games included are *Flight Simulator II* (from subLOGIC), *Missile Command* (Atari), and *Blast 'Em* (a new shooting game specifically developed for the XE system). Atari plans to convert to cartridge disk games written for their XE and XL computers.

Additional peripherals soon to be available from Nintendo can make gameplay even more exciting. The NES Advantage joystick is a full-size, arcade-style joystick with a weighted base. The stick features two adjusters, so the rapid-fire action of each button can be set individually, and a slow-motion feature which slows the game action on some Nintendo titles. The stick retails for \$49.99. The company also plans two different styles of 3-D glasses, with 3-D game titles, scheduled for release this winter.

Speaking of controllers, here's some good news for Intellivision owners: the Intellivision Attachable Joysticks sell for \$12.95 a pair, and go a long way toward ending the INTV controller blues. They snap onto the control disk and will make gameplay easier.

Slalom

NINTENDO

4820 150th Ave., N.E.

P.O. Box 957

Redmond, WA 98052

Nintendo Entertainment System

\$29.95

by Bill Kunkel

Although skiing simulations have been around for years, very few possess the sheer visceral power of **Slalom**. This impact results from the game's modified first-person perspective. There's a delightful, cartoon-style user surrogate who stands in the immediate foreground, and can be moved left or right, made to tuck (speed up) or snowplow (slow down) through the control pad. The action buttons inaugurate jumps and stunts.

Once the skier starts down the mountain, the game kicks into overdrive. **Slalom** impressively communicates the sheer exhilaration and the kinetic thrill of high-speed movement, as well as the abruptness of collisions. Obstacles like drone skiers, trees, snowmen and sledders pepper the mountainside, in addition to the flags which must be navigated and the ubiquitous moguls, rocky outcroppings which jut up through the snow to serve as launch pads for skiers. Hitting a mogul launches the skier skyward, and, if the player hits the action button while his skier is in the air, it's possible to do some hot-dogging and stunt skiing.

The graphics are simple enough to allow the program to handle high-speed movement, while sufficiently stylish to satisfy the user's aesthetic requirements. The play system is appropriately straightforward and easy to learn, though the left to right movement is occasionally sluggish.

While not a groundbreaker, **Slalom** is a solid entry in the Nintendo line, one to please most action game fans. **A**

Super Mario Bros.

NINTENDO

4820 150th Ave., N.E.

P.O. Box 957

Redmond, WA 98052

Nintendo Entertainment System

\$29.95

by Bill Kunkel

Super Mario Bros. is the game packed with the Nintendo Entertainment System, and it's an excellent choice on the man-

ufacturer's part. **Super Mario Bros.** stars one of Nintendo's most enduring characters, Mario, the parody of an organ grinder who became famous during his quest to recapture the escape-happy Donkey Kong. (I have no idea why they call it "Mario Bros.," since only Mario himself appears, albeit in a variety of forms: invincible, super, fireball-throwing, etc.)

Here's the story: the mushroom people have been invaded by the Koopa, a tribe of black-magic-practicing turtles (that's the worst kind), who transformed the peace-loving fungus folk into bricks, stones and "field horsehair plants" (surely a fate worse than death). Who can save them? Why Princess Toadstool, of course! Alas, she is a prisoner of the Koopa King, and it's up to the player, as Mario, to rescue her.

Mario can be moved along the easterly-scrolling playfields with the directional control pad. The A button lets Mario jump and swim, and the B button permits accelerated speed and fireball-throwing (when Mario has picked up a "fire flower"). The plucky paisan must travel over a series of scenarios, above and below ground, searching for the castles at each scenario's end, in hopes of locating the Princess.

The playfields contain not only the Koopas, but the dastardly Little Goombas (mushrooms who betrayed their own people to the Koopa, if you can imagine such a thing), Koopa Troopas (and Paratroopas), Buzzy Beetles (invulnerable to fireballs), the Hammer Brothers, Lakitu and his pet Spiny, Pirana Plants, Bowser, the Koopa King, and more—and one touch from any of them is deadly. But, if Mario can jump in the air and land on top of them, they're squashable; in fact, once a Koopa has been KO'd, its shell can be sent flying in either direction, in order to whomp any approaching nasties.

Meanwhile, the screens are just bristling with goodies, most of which have been placed within bricks inscribed with question marks. If Mario bounds and punches these bricks from underneath, their treasures come popping out the top. Treasures include not only gold coins (100 coins buy an extra life), but magic mushrooms (which bestow extra life and cause Mario to become Super Mario), fire flowers and stars (which make Mario invincible for several seconds).

Super Mario Bros. is a lot of fun, but the game's inability to scroll to the left is a real problem. Once an object has been passed by to its right, there's no return-

ing. Still, it does have save, pause and continue features.

Like the best of the Nintendo games, there are plenty of different creatures to fight, an assortment of prizes and bonus features, and lots and lots of pretty scenery. **Super Mario Bros.** is a super playable showcase for the Nintendo Entertainment System. **A**

Centipede and Robotron 2084

ATARI CORP.

1196 Borregas Ave.

Sunnyvale, CA 94086

(408) 745-2000

Atari 7800

\$19.95

by Arnie Katz

Atari created its 7800 with one primary aim: to present home versions of popular coin-op contests. Like Pole Position II, which comes with the console, both **Centipede** and **Robotron 2084** are superb home versions of games which have raked in millions upon millions of quarters in family amusement centers. Though no conventional television set can rival a coin-op monitor in visual resolution or audio fidelity, these cartridges are as close to the arcade originals as possible.

Centipede remains a brilliant variation on the "invasion game" play mechanic pioneered by Space Invaders. It banishes the aliens in favor of wave after wave of wriggling centipedes, spiders, and other similar creatures. And, instead of the trusty horizontal cannon, there's a bug sprayer which can move vertically within a limited area, as well as side-to-side.

The garden theme makes **Centipede** a perennial favorite of female video gamers. Evidently, women have less compunction about killing slimy bugs than about annihilating aliens from outer space.

Centipedes have twelve distinct attack modes. In the first wave, the insect has eleven body segments and an attached head. Each wave subtracts a segment and substitutes a detached head. The critters on the screen also move faster and faster as the game progresses, to insure that the challenge keeps pace with the player's growing mastery of the situation. A choice of four skill levels also promotes replayability.

The graphics and audio of this one- or two-player contest, as mentioned, are terrific. The symphony of sounds and con-

stantly shifting colors keep eyes riveted to the screen.

Williams Electronics introduced **Robotron 2084** as a sequel to *Defender* and *StarGate*. The relationship is purely thematic, since this nonstop blastathon is quite different from the two earlier titles, both of which were duo-directional scrolling shoot-outs.

When humanity created the robotron robots, no one had any idea of the threat they would eventually pose. The gamer, as the last defender of his species, zaps the enemy automotons and tries to rescue as many human clones as possible. Clearing a playfield of robotrons takes the computer user to the next playfield.

One of the things arcaders liked best about **Robotron 2084** was its two-stick control system. This allows the player to move in one direction while laying down a stream of withering fire in another. In the coin-op, it comes in mighty handy when the player wants to keep menaces like Indestructible Hulks, Sinister Spheroids, Enforcers, and the rest of the robotic rogue's gallery at arm's length while blowing them to smithereens with the anti-robot laser gun.

The control scheme employed in the 7800 edition is a reasonable compromise. The player moves the fighter around the nonscrolling playfield with the stick. Pressing the action button causes the laser to fire in the direction of movement. Purists may well yearn for the double-joystick configuration, but this alternative works fine, although it's not quite as easy to escape when the robotron mechanoids close in for the kill.

Robotron 2084 provides unlimited racks of truly frenetic action to delight every joystick jockey. The strategic challenge is admittedly minimal, but few video games can rival this classic shoot-'em-up for sheer excitement. **A**

The Legend of Zelda

NINTENDO
4820 150th Ave., N.E.
P.O. Box 957
Redmond, WA 98052
Nintendo Entertainment System
\$39.95

by Bill Kunkel

Ganon the usurper, Prince of Darkness (and all-around unpleasant guy) now rules in the land of Hyrule. The Princess Zelda, last keeper of the "Triforce," the golden triangles of mystical power, has been captured and imprisoned, but her faith-

ful maid Impa escaped Ganon's villainous clutches and fled, seeking a paladin to take up Zelda's cause.

The player in this action-strategy extravaganza is cast as Link, the brave young lad who agrees to help overthrow Ganon, rescue Zelda and reunite the eight triangles of the Triforce—which the Princess dispersed and hid in different locations, rather than see them fall into Ganon's hands.

The Legend of Zelda is a delightful, omni-directional scrolling adventure, in which the player moves over a wide variety of terrain and battles a collection of some of the weirdest adversaries this side of the fifth dimension: spidery Tektites, slimy Octoroks, burrowing Leever, bulldog-like Molblins, stone Armoses, spectral Ghinis, and more—and that's just the denizens of the Overworld! Head into the underground dungeons and meet an even stranger assortment of creepsters: Darknuts, Lanmolas, Wall Masters and worse. Work your way through this bestiary, and the old Prince of Darkness himself, Ganon, is waiting on you.

Not all the denizens of this land are hostile, however; Link also encounters wise men, little old ladies, merchants, and even fairies held prisoner by monsters (vanquish the beastie, and the grateful fairy will extend your lifespan). Still, the vast majority of the residents respond exclusively to a sword in the mush.

Its wide range of treasures and weaponry provides the meat of this game. There are three kinds of swords, two kinds of shields, precious stones, keys (magical and mundane), ladders, rafts (for travel over water), maps, compasses, enchanted rings, magic clocks and power bracelets. These are accessed through the A action button, while the B button controls a series of special weapons and gadgets which can be purchased from cave-dwelling merchants. These include boomerangs, bombs, bows and two kinds of arrows, two types of candles, a magic whistle, "enemy bait," water of life and a magic wand.

Then, of course, there are those eight pieces of the Triforce which must be collected and assembled. One piece awaits in each of the eight labyrinths; collect the set, blow the magic whistle and summon a whirlwind which warps you to the ninth labyrinth.

The graphics are delightful, making even tiny on-screen objects easily discernible. The perspective is slightly modified overhead, with physical landmarks fur-

ther distinguished by the skillful use of color. Special sound effects, ranging from soft tinkles to bomb blasts, are slickly executed.

Nintendo is, obviously, quite proud of **The Legend of Zelda**. Television commercials devoted entirely to this game have been running heavily in the New York area—the first single-subject video game TV ad in years. The game pack is beautifully documented (including lots of hints and strategy) and comes encased in a golden shell, further indicating its singular quality.

The game is a high-water mark in terms of video game design and programming. Sophisticated plot and gameplay combine with classic video game elements, to allow the user to learn while he plays—and play while he learns.

Zelda's outstanding. It leaves one hoping for more, more, more of the same. **A**

Choplifter!

SEGA c/o TONKA CORP.
6000 Clearwater Drive
Minnetonka, MN 55343
(800) 328-3628
Sega Master System
\$30.00

by Arnie Katz

Free the hostages! An unnamed country has seized sixty-four Americans and imprisoned them in heavily guarded barracks and caverns. Only a skilled helicopter pilot, daring the defenses by flying in low, can land near the detention centers, load as many hostages as possible into the chopper, and fly them to a safe landing on American soil.

The direction disk moves the Hawk helicopter in any of eight directions. The right-hand control button changes the direction the craft is facing. A quick press causes the whirlybird to face front, while a long push turns it from left to right, or vice versa. When the screen shows the chopper's side view, the left-hand button fires projectiles. The same button drops bombs when the helicopter faces front.

Those evil hostage-takers are well armed, too. The defenders have tanks, planes and ships to keep the gamer from saving the POWs. Naturally, the foe becomes more tenacious and aggressive as the game continues.

Choplifter! was designed by Dan Gorlin and published for home computers by Broderbund in 1982. Critics who proclaimed it an all-time great would be shocked to see the many improvements made in the Sega version. This video game edition isn't just a good translation; it is clearly superior to the original program. The detailed background graphics and more sophisticated artificial intelligence for the computer-controlled enemy are especially notable. The cartridge preserves the essence of Gorlin's triumph, while it brings the product up to 1987 standards, with audiovisual effects which surpass the capabilities of any of the low-memory home computer systems.

It takes coordination rather than blind speed to pilot the Hawk like a combat vet. **Choplifter!** is thus particularly suitable for all-family entertaining, since quick-fingered youngsters won't automatically show up their elders. This is a truly outstanding game, which every Sega owner will want to own. **A**

MaxPak

SOFTWERX
P.O. Box 71118
Murray, UT 84107
(801) 272-5623
All resolutions \$49.95

by Andy Eddy

Multiple function accessories are becoming the latest rage, with programs like Cornerman (MichTron), MacroDesk and MacroManager (both by the now-defunct Shanner), giving users the ability to have a calculator, set alarms and take notes, among other things. Another entry in that field has emerged, with the introduction of **MaxPak** by a new company on the ST scene, Softwerx.

What makes **MaxPak** helpful is that it combines many features employed by ST users in their regular sessions, but does so from only one accessory slot. Once you configure the program and place it on your boot disk, the program will load at boot-up with all those options in place.

The first thing you see when booting up is the **MaxPak** setup screen. Here, you see the size of the RAMdisk and print spooler configured in memory by the accessory. Both are variable in size, up to the limit of available memory, using a separate configuration program supplied by Softwerx. In this opening dialog box, you can also input the date and time, though if you have a clock cartridge or other hardware for that purpose, the time will be taken from there.

Other features on this menu include: a screen saver with variable delay time (to

prevent image burn-in; the screen will go blank if the mouse or keyboard aren't accessed for a time, much like the attract mode on the 8-bit); toggles for the on-screen clock; an option to enable or disable write verification (which will conserve time over normal operations); and a RAMdisk copy function. The latter will, given a configuration file in the **MaxPak** folder, automatically load whatever files you choose into the RAMdisk at boot-up.

The next option lets you vary the spooler functions. The spooler, for those uninitiated, allocates a section of memory for routing of printer data. When the spooler is in place, it frees up the computer for your use, while separately controlling the printer output. This spooler can be set to repeat the last thing printed as many times as needed, choose certain pages to print, or abort in midstream if you make a mistake. The spooler's contents can be sent to a disk file, also.

Working in conjunction with the spooler is Print Magic, which lets you embed printer control codes into any piece of text you want to print. This can be important for use outside a word processor, which most likely already has those features in place. The other nicety is the availability of the entire ST character set. In many situations, foreign, mathematical and other special characters may not be printable or used in a word processor like Word

Writer ST. With **MaxPak**, a dialog box allows you to click on a desired character and plug it into your document at the cursor location.

Perhaps the most eccentric option in this package is Math Magic. Let's say you're in the middle of putting together a large report. You don't have a calculator handy and need to get some figures compiled quickly. Bringing up Math Magic will display a dialog box with a long empty line and a bunch of button selections underneath. If you plug in your formula on the provided line and hit "Calculate," your answer will come up in the dialog box.

You can have the whole formula—or just the answer—automatically plugged into your report by clicking on the SEND ALL—or SEND—buttons, respectively. You also have the same options for direct-to-printer output.

Rounding out **MaxPak**'s offerings is an alarm function that allows up to eight different alarm times; a capture screen selection that grabs whatever's on-screen and routes it to the spooler, where you can print it or save it to disk as a DEGAS-compatible file; and a keyboard-activated macro system that lets you assign commonly used phrases to a single keystroke.

The most potentially powerful feature of **MaxPak** is its ability to be brought up using the command key in combination

with the number of the option you're interested in. This means you can utilize it from most non-GEM programs.

Of course, all this sounds good, but **MaxPak** is not without its problems. For example, when I placed it on my word processing disk, Thunder! refused to load its dictionary for the accessory version. This problem was mentioned in the **MaxPak** docs, but they claim you can "request" Thunder! to load the dictionary from the options menu. Unfortunately, this didn't work for me. When I called Mark Ostlund, **MaxPak's** programmer, he told me he's received other complaints and is contacting the people responsible for Thunder! to help come up with a solution.

Another annoyance is the implementation of macros. The program requires you to set up the command key that will be used to trigger the macros and that will call up the accessory from the keyboard.

The choices are the CONTROL, ALTERNATE, LEFT SHIFT or RIGHT SHIFT keys, and your choice is loaded at boot-up from your original configuration file. As mentioned in the manual, some programs might already use these keys, so your choice is important.

The problem is that **MaxPak** disables normal use of the chosen command key. This became apparent when I tried to select a macro while using Flash. Being a touch typist, use of either SHIFT key as the command key would have been impossible. Flash uses the ALTERNATE key for its commands. And many telecommunications services require CONTROL-key combinations; not much is left for **MaxPak's** macros.

In my conversation with Ostlund, he said they may change **MaxPak** to give the option of using a pair of keys, such as an ALT-SHIFT combination.

Given the overall quality of the product, the few flaws can be worked around. **MaxPak's** ability to be used with both GEM and non-GEM programs (in most cases) makes it a full-time employee for your ST, particularly if you do a lot of word processing or business applications, as its features are better tailored to those tasks. If Softwerx clears up the minor glitches apparent in this first release, **MaxPak** could end up being one of the better investments you can make for your ST. **A**

Andy Eddy works as a cable TV technician in Connecticut, but has been interested in computers since high school. While his family's Atari 800 is four years old, he's been avidly playing arcade games since Space Invaders and is a former record holder on Battlezone.

Megamax C for the Atari ST Featuring

- One pass Compile • In-Line Assembly • Smart Linker
- Full Access to GEM routines • Register Variable Support • Position Independent Code • and much more...

System Includes:

- Full K&R C Compiler (with common extensions)
- Linker • Librarian • Disassembler • C Specific Editor
- Code Improver • Documentation • Graphical Shell

Benchmark	Compile Time	Execute Time	Size
Sieve	70	2.78	5095
"Hello, world"	63	N/A	4691

*Times in seconds. Sieve with register variables.

Learning power for your ST.

by Dr. Ron Schaefer

While the Japanese are working furiously to develop a fifth-generation computer capable of true artificial intelligence (fondly known as AI), I thought I would see if I could come up with a short AI program of my own for the Atari 520ST, a mere third-generation machine.

The fifth generation.

First, a little background on AI. . . The idea of AI is not new; in fact, computer scientists have been working on it for decades. In essence, it is both a problem of software and of hardware.

Computers themselves have gone through a succession of generations; the first-generation computers built in the fifties were very slow by today's standards and were room sized. With the advent of the transistor, the smaller, faster second generation was born. In the sixties, the development of the semiconductor chip—which could do the job of hundreds of transistors—gave rise to the third-generation machines. In the seventies, the number of transistors that could fit on a chip increased to thousands. These very large scale integrated chips have given rise to a super-fast fourth generation. Each successive generation has been faster than the previous one, but all work essentially the same way, by processing one instruction at a time.

Fifth-generation computers will use large databases of knowledge and symbolic logic to mimic the human brain. Through the use of coprocessing, splitting up a task into parts and running each part simultaneously, today's speed limit of millions of arithmetic operations per second will be raised to billions of logical inferences per second, each logical inference a kind of symbolic if/then-type statement. This tremendous speed will be necessary if all the complex rules and exceptions are to be included for tasks such as true speech recognition.

Artificial Intelligence

AI, the program.

In a nutshell, my program, modestly enough called **Artificial Intelligence**, will read a set of rules from a separate knowledge base file and ask you a set of yes and no questions, using GEM alert boxes, until an answer is reached. If the answer is unknown to the database, you have the option of entering in new questions and answers, which will be added to the database. On request, this modified data is saved back onto the disk for future use, enabling the program to use any number of knowledge bases on different subjects, and to be able to learn new information as the program is used.

Creating a title.

This AI program makes extensive use of subroutines to perform many of the GEM and VDI calls. These subroutines can easily be modified for use in your own programs.

Let's go through some of the more interesting aspects of the program. Line 10 gives the string TITLE\$ a value, then calls the subroutine TITLE on Line 660. This will replace the word *OUTPUT* at the top of the output window with the contents of the string TITLE\$, giving the program a certain professional look. By the way, if you want to include the Atari logo in your titles, this can be entered from the keyboard in the BASIC editor by pressing CONTROL-period (.) and CONTROL-slash (/).

Alert boxes.

Lines 80 through 85 set up the first GEM-type alert box. This simplifies the use of the boxes through repeatedly employing the subroutine DOALERT on Line 1490.

First, a string called TYPE\$ is set equal to: 1, the exclamation mark; 2, the question mark; 3, the stop sign; or a blank, which prints nothing. Next, a string called TEXT\$ is set to the text that you want displayed in the alert box. According to the books, you can have up to five lines of text, each line up to forty characters long. However, when-

ever my text got over four lines or longer than about thirty characters, I started to get lots of errors and system crashes.

The string TEXT\$ that appears inside the alert box can be more than one line long, each line separated by a |, a character created by pressing SHIFT-backslash (\). This | serves the function of a carriage return, telling the alert box to start a new line. For an example of how this is done, see Lines 970 through 980. Text should not contain square brackets ([or]), and, for this particular application, no commas (,) are allowed in the knowledge base rule file data.

Finally, the string BUTTON\$ is set. There can be up to three buttons. If only one button is used, it can be up to twenty characters of text. These buttons, when activated with the mouse, will return a value in C obtained on Line 1550, which will be 1-3, depending on which button was pressed. The name of each button should be separated with a | as demonstrated in Line 830. One of these buttons can be set to be the default, so a return will have the same effect as activating that button. This is accomplished in Line 1530; in this program it's always the leftmost button or button number one.

Reading in the rules.

Next, the AI program reads in the rules, the knowledge base the program "thinks" with. In Line 70, the default knowledge base or rule filename is set equal to the string DBNAME\$. This can easily be modified by editing the program to the name of your favorite set of rules. I like to use folders, so, for this program to work properly, the rule files must be in their own folder, called AI. If you're not a folder fan—or would like to store your rule files in a folder with a different name—then change the default knowledge base folder variable ROOT\$ in Line 65. If you do not want to use a folder to store your rule files, set ROOT\$ = "".

A rule file consists of the following: the first line is the number of rules, a value which is stored in the variable FLEN and is used to dimension the arrays of the next four variables. The next line is a string containing the rule's number (Rule#). This string is stored in RULE\$(n,1). Following that is the text for the question or answer, which gets stored in RULE\$(n,2). Finally come two numbers that tell the program which rule to go to, based on the answer to the question. These values are stored in the variables CASE(n,1), and CASE(n,2), respectively. If yes is selected and CASE(n,1) is equal to 0, then that is the final answer; there are no further branch points. If, on the other hand, no is selected and CASE(n,2) is equal to negative 1, then the answer is unknown to the database. At this point, you're given the option of adding a new question and answer, thus creating a new branch point.

Here's an example of a short rule file that tries to figure out what type of car you drive.

Rule File	Comment
6	{number of rules}
Rule# 1	{set = rule\$(1,1)}
Does your vehicle have 4 wheels?	{text for 1st rule = rule\$(1,2)}
2, -1	{goto rule #2 for yes, ? for no}
Rule# 2	{set = rule\$(2,1)}
Do you drive a car?	{text for 2nd rule = rule\$(2,2)}
4, 3	{goto rule #4 for yes, #3 for no}
Rule# 3	{set = rule\$(3,1)}
You drive a pick-up truck.	{text for 3rd rule = rule\$(3,2)}

0, -1	{final answer for yes, ? for no}
Rule# 4	{set = rule\$(4,1)}
Do you drive a sports car?	{text for 4th rule = rule\$(4,2)}
5, 6	{goto rule #5 for yes, #6 for no}
Rule# 5	{set = rule\$(5,1)}
You drive a Lotus.	{text for 5th rule = rule\$(5,2)}
0, -1	{final answer for yes, ? for no}
Rule# 6	{set = rule\$(6,1)}
You drive a station wagon.	{text for 6th rule = rule\$(6,2)}
0, -1	{final answer for yes, ? for no}

Modifying the knowledge base.

There are two different subroutines for modifying the knowledge base, LEARNQ (learn question) and LEARNA (learn answer). LEARNQ, the simpler of the two, will append a new question and answer to the end of the knowledge base file. A question is defined as a rule in which a yes response is set equal to another rule number and a no response is set equal to -1, (see Rule #1 in the car knowledge base example, above).

LEARNA is a little more complex. This subroutine will be run if you disagree with a final answer. A final answer is defined as a rule in which a yes response is set equal to 0 and a no response is set equal to -1, (see Rule #5 in the car knowledge base example, above). In this instance, you must supply a new final answer, and a yes-no question that will differentiate between the old final answer and the new final answer. The old answer and the new answer are now appended to the end of the knowledge base, and the new question takes the place of the old answer. Confused? Well, perhaps the following examples will help.

Going back to the car knowledge base as an example, let's say you've loaded this knowledge base into the program. You start answering questions with Rule # 1, *Does your vehicle have 4 wheels?* Let's say you actually drive a motorcycle; this statement would be false. You answer no. Since the value assigned to a no response in the knowledge base is -1, (see line number 4 in the above example knowledge base), this tells the program that the answer to this question is unknown, and you're asked if you want to modify the knowledge base. If you do the modification, the program will ask you to enter the correct answer. At this point, you should type in *You drive a motorcycle*.

You will next be asked to enter a new question, such that a yes answer will lead to the conclusion *You drive a motorcycle*. This new question could be entered as *Does your vehicle have only two wheels?* If you now indicate that you want this modified knowledge base saved, there will be two new rules appended onto the end of the file, and the new knowledge base listing will be as follows:

```

8
Rule# 1
Does your vehicle|have 4 wheels?
2, 7
Rule# 2
Do you drive a|car?
4, 3
Rule# 3
You drive a|pick-up truck.
0, -1
Rule# 4
Do you drive a|sports car?
5, 6
Rule# 5
You drive a Lotus.
```

```

0 ,-1
Rule# 6
You drive a station|wagon.
0 ,-1
Rule# 7
Does your vehicle have|only 2 wheels?
8 ,-1
Rule# 8
You drive a motorcycle.
0 ,-1

```

Now, let's say that you drive a Mazda RX-7 rather than a Lotus. When you get to Rule #5, *You drive a Lotus*, you indicate *no*. The program will once again inform you that the answer to this question is unknown. If you want to modify the knowledge base, the program will ask you for a new answer. You type in *You drive a Mazda RX-7*.

You'll then be asked to supply a yes-no-type question, such that a yes answer will conclude that *You drive a Mazda RX-7* and a no answer will conclude that *You drive a Lotus*. Such a question might be: *Is the make of the car Japanese?* You're then asked if you want to modify the knowledge base. If you indicate yes, the new car knowledge base will look like this:

```

10
Rule# 1
Does your vehicle|have 4 wheels?
2 , 7
Rule# 2
Do you drive a|car?
4 , 3
Rule# 3
You drive a|pick-up truck.
0 ,-1
Rule# 4
Do you drive a|sports car?
5 , 6
Rule# 5
Is the car a |japanese|make?
9 , 10
Rule# 6
You drive a station|wagon.
0 ,-1
Rule# 7
Does your vehicle have|2 wheels?
8 ,-1
Rule# 8
You drive a motorcycle.
0 ,-1
Rule# 9
You drive a Mazda RX-7
0 ,-1
Rule# 10
You drive a Lotus.
0 ,-1

```

Error!

Occasionally, when using this program and calling up successive rule files, I would get an "Undefined Error." I was unable to trap this error using error-handling routines like the one on Lines 200 and 430 through 480.

I believe that this represents a disk-reading error. If it does occur, just restart the program; it will often read the file successfully on the second try. If you continue to have problems with a rule file, be sure to review the rules when the alert box asks you to, and see if there are any errors in the data.

Now, run and use **AI**—give your computer a chance to live and learn. 

Ron Schaefer, M.D. graduated from medical school at the University of California in San Francisco, and has just finished a residency at the University of Hawaii, specializing in Internal Medicine. He's been programming for almost seventeen years and has published research on three-dimensional molecular modeling of proteins and DNA, as well as numerous articles on programming the Atari ST. He recently started his own software company, called Schaefer Supergraphics. All his previous experience has been with mainframes, mostly VAX 11/70s, 11/750s and the Evans on Sutherland Picture System. The ST is his first personal computer.

Listing 1. ST BASIC listing.

"The most useful program for the Atari since Print Shop!"

FORMS GENERATOR

for the Atari 800, 800XL, 65XE, 130XE

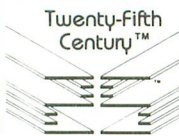

Designed by Jeff Brenner, columnist for *Computer Shopper* magazine, of "Applying The Atari" fame, and author of book and magazine articles in *COMPUTE!*, *ANALOG* and others.

LOOK WHAT YOU CAN DO WITH FORMS GENERATOR: Purchase merchandise by mail? Next time, send a customized purchase order form! Does your home or business ever need statements, invoices, proposals, job work orders, gift certificates, etc.? No problem! Use *FORMS GENERATOR's* scrolling spreadsheet-style screen to design almost any form to suit your exact needs. What you see on-screen is what you get on paper! Use the text mode with any 80-column printer, or the high-res graphics mode with the Epson, Gemini/Star, Okidata, Panasonic or Prowriter for remarkably realistic forms. BUT THAT'S JUST THE BEGINNING: Once you've designed a form, you can program *FORMS GENERATOR* to make all calculations automatically! Imagine: after you enter quantities, descriptions and prices, *FORMS GENERATOR* moves about the form calculating extended prices, subtotals, and even the sales tax! Like magic! (Sample invoices included). You can also use *FORMS GENERATOR* for record keeping, since you can save filled forms to disk!

Read what our customers have written: "Excellent... easy to use and ran perfect!(ly) ..." T.W. Wethersfield, Connecticut; "I was most impressed with your FORMS GENERATOR program ..." J.E. King, South Carolina; "Love it!" C.R. Cortland, Ohio. Our "down to planet Earth" price: Only \$23.95 (product #ATA611).

Boot Camp

Revenge of Macromania.

by Karl E. Wieggers

Last month's **Boot Camp** ended with a homework assignment. I asked you to write an INPUT macro that would read a string up to a specified maximum number of characters from a particular IOCB, and store the string at a particular address in RAM. Don't bother trying to tell me why you didn't get around to doing this assignment. I used to teach organic chemistry to pre-med students at the University of Illinois—I've heard all the excuses. I'll just assume you *did* do it, and we'll proceed from there.

Today I'll present my version of the INPUT macro, along with other macros and subroutines that do some pretty neat things. Would you believe a delay subroutine to do nothing for a precise period of time? How about a FOR/NEXT loop implementation in assembly language? Or a MOVE macro to copy a block of data of any length from one address to another? All this, and more, lies in the next few pages.

Perhaps you're among the readers who don't own a macro assembler. You flip to **Boot Camp** each month and groan, "When is this clown going to quit with the macros already and get back to something I can use?" Please don't feel left out.

Virtually everything we've discussed during the foray into macroland is useful to you, anyway. Remember, a macro is just a shorthand way to write assembly programs. You can adapt all the macros I've presented just by expanding the source code yourself when writing a program where you would otherwise invoke a macro. In fact, since you'll know exactly what your parameters are, you can skip all the conditional assembly (.IF/.ELSE/.ENDIF) code I've built into the general macro formats. And, of course, you can use the subroutines exactly as I've written them.

Philosophy of the month.

How about another programming philosophy discourse:

efficiency. I think of three kinds of programming efficiency: the time I spend developing the program; size of the resulting object code; and execution speed. Programming in assembly is a great way to come up with fast, compact object code. However, the act of designing and writing the source code is a lot slower than it is if you're using a high-level language like BASIC.

To make your programming more efficient, use good tools—like a fast assembler, a RAMdisk, macros and common subroutines. But all is still not roses. These shortcuts exact a toll in both size and speed. Consider the way we INCLUDE the subroutine library file we've been constructing, SUBS.LIB. Those subroutines get assembled into object code whether or not the main program calls any of them. This both slows the assembly process as the file is read and results in larger object files than we'd get if only the subroutines actually called were included in the source code.

Similarly, many of our macros are written to be flexible, handling a variety of parameters and situations. This sometimes results in more assembled instructions than does individually coding each instance. And more instructions to be executed mean slightly longer execution times. In essence, we've been building our own "high-level" language, with the accompanying benefits and drawbacks.

Are these compromises worth it? Assembly programs generally run fast enough that a few extra instructions don't do any harm. Our computers have a lot more RAM now than they used to, so a longer object file doesn't hurt much, either. And these shortcuts save a lot of *your* time. I usually prefer to program for ease of comprehension and maintainability, rather than for fastest or shortest code.

Format reprise.

Just one more thing before we get to the business at hand. Last month, I showed how to format a disk using an XIO macro. The CIO command value I mentioned, \$FE, will actually format a disk in an Atari 1050 disk drive in enhanced-

density mode. Drives other than the 1050 automatically format in single density with this command. If you're using a 1050 drive and want to format in single density, use command value \$FD instead. This is equivalent to option P at the DOS 2.5 menu, "Format Single."

New macros.

Please merge Listing 1 with the MACRO.LIB file you've been building over the past few months. Be sure to use the line numbers shown. Listing 1 contains a few more equates for some variables used in the new macros. Notice that I am using four zero-page locations (\$CB-\$CE); these bytes are free for your own needs, except when using the MOVE macro. Also, bytes \$0681-\$0687 are used by the FOR/NEXT and MOVE macros. MAC/65 gobbles up locations \$0600-\$067F, so I might as well keep consuming page 6 for these work variables.

Lines 845-915 of Listing 1 modify our existing POKE macro to accept either an address or a value as parameter 2. If parameter 2 is smaller than 256, it's assumed to be a value. Otherwise, it's assumed to be an address, and the contents of that address are copied into the address specified in parameter 1.

The rest of Listing 1 is the code for eight new macros: INPUT, PAUSE, ADD, SUBTRACT, DPOKE, FOR, NEXT and MOVE. Listing 2 contains two new subroutines that should be added to your SUBS.LIB file.

Let's start very simply. Lines 1970-2020 of Listing 2 define a subroutine called CLS, for clear screen. If you want to completely erase a graphics 0 screen, use a JSR CLS instruction. This simply prints character 125, the ATASCII clear screen character, on IOCB 0. The BASIC equivalent is: PRINT CHR\$(125).

Readin'.

Last month we talked about writin', so this time we'll do some readin'. My INPUT macro lives in Lines 3590-3950 of Listing 1. It takes three parameters: the IOCB number; the buffer address where the string read is to be stored; and the number of bytes to be read. Parameter 3 is optional. If absent, the buffer length is set to 255 bytes, although an end-of-line character (EOL) will also terminate the input step. The CIO command is GETREC (Lines 3760-3770). The rest of the macro just involves the familiar CIO activities of pointing to the buffer address (Lines 3780-3810) and setting the buffer length (Lines 3820-3920).

The easiest way to use INPUT is to reserve space for the string to be input, with a statement such as: `FILENAME .DS 17`, which will reserve 17 bytes at address FILENAME. To let the user enter a filename at the keyboard, then, you'd use a statement like: `INPUT 0,FILENAME,17`. There's another example in Listing 3, which is a sample program to exercise a bunch of our macros.

Take a break.

Sometimes you feel like giving the computer (or maybe its user) a breather, simply doing nothing for a period of time. In BASIC, the empty FOR/NEXT loop is often employed. Four hundred iterations consume about a second of time, but this is only approximate. The macro called PAUSE (Lines 3990-4290 of Listing 1) lets you suspend execution of your program for a precise period of time.

PAUSE takes one parameter, the number of "jiffies" that you want to wait before continuing execution of the program. A jiffy is 1/60th of a second, and the Atari has an internal real-time clock that increments a particular byte every jiffy. This is part of the system housekeeping performed during every vertical blank period, which you no doubt recall occurs sixty times per second. The PAUSE parameter can be either a value or an address (not zero-page).

The real-time clock is located in bytes \$12-\$14. The equate for RTCLOCK is in the first line in Listing 1. Address \$14 (RTCLOCK+2) is the one that gets incremented every jiffy. After 255 jiffies (about 4.27 seconds), RTCLOCK+2 is reset to 0 and RTCLOCK+1 is incremented. After 65,535 jiffies (18.2 minutes), RTCLOCK+1 is reset to 0 and RTCLOCK is incremented. The PAUSE macro uses only RTCLOCK+2, so you're limited to a delay of just over four seconds, precise to 1/60th of a second. To wait longer, you could call PAUSE several times in a row. If you're more ambitious, modify PAUSE to accept a 2-byte parameter, and you could then set wait times up to 18.2 minutes.

PAUSE simply stores the desired number of jiffies to wait at address @TIMER. Lines 4180-4190 use the contents of an address as the delay time, and Lines 4210-4220 use a value. RTCLOCK+2 must be initialized to 0 (Lines 4150-4160). Then a loop simply compares RTCLOCK+2 to @TIMER until they match. Of course, the computer really isn't doing "nothing" during the pause; computers don't know how to do nothing. It's frantically looping as fast as it can through Lines 4240-4270.

'Rithmetic.

Let's return to the roots of computing: mathematical operations. Lines 4330-4660 of Listing 1 define a macro called ADD. To preserve the symmetry of the universe (can you guess I'm a Libra?), SUBTRACT is found immediately following ADD.

Both macros need two parameters. The first is the address of a 2-byte number; the second, either a value or another address. In ADD, the contents of the first address are added to either the value or contents of the second address; the resulting 2-byte number is stored back at the first address. More concisely, $%1 = %1 + %2$. SUBTRACT can be summarized as $%1 = %1 - %2$. The algorithms are straightforward 2-byte binary arithmetic, processing first the low bytes and then the high bytes of each pair of operands. Notice that the carry flag is cleared (CLC) before the additions, and it's set (SEC) before a subtraction.

These macros can be very handy when working with customized mixed graphics mode displays. If you turn back to **Boot Camp** in issue 44, you'll recall that, to write in different graphics mode segments of the screen, we treated each segment as a separate little screen. We changed the pointer to the beginning of screen RAM (SAVMSC, \$58 and \$59) to point at the beginning of the RAM used by each segment. To accomplish this, we figured out how many bytes of screen RAM were consumed by the first segment and added that number to the contents of SAVMSC. SAVMSC then pointed to the second segment, and POSITION and PRINT statements were relative to the upper left corner of that segment. The ADD macro is perfect for such operations.

Conversely, if you write in, say, the fourth segment of a mixed-mode display and then need to write in the second segment, you can use SUBTRACT to reset SAVMSC to where you need it. If this discussion leaves you baffled, please review Lines 980-1210 of the listing in issue 44's **Boot Camp**.

Poke two, they're small.

A short macro called DPOKE (for double poke) is in Lines 5070-5250 of Listing 1. DPOKE is similar to POKE, except the first parameter is a 2-byte *address* and the second is a 2-byte *value*. DPOKE lets you store a value greater than 255 in the usual low/high format.

It would be nice to let parameter 2 take either a value or an address, but how could we tell them apart? In macros like POKE, if the parameter is larger than 255, we can safely conclude that it's an address. Things are not so simple in DPOKE. Actually, if you find it more useful to have DPOKE expect parameter 2 to be an address, just rewrite it. Or you could have two versions, say, DPOKEA and DPOKEV. Or you could add a third parameter, a "flag" to tell the macro if parameter 2 is a value or an address. The possibilities are endless; the decision is yours.

Loop-the-loop.

Ah, I like this one! I was very smug when I figured out how to simulate (at least in a simple way) the useful FOR/NEXT construct from BASIC. Lines 5290-5590 of Listing 1 are the FOR macro, and Lines 5630-5910 are the NEXT macro. Let's review how FOR/NEXT works.

Sample FOR/NEXT statements are: *FOR I=4 TO 12 STEP 2/NEXT I*. The FOR statement defines an "index variable" (*I*) that will be changed systematically each time we go through the loop. It also states the initial (*4*) and final (*12*) values of the index variable, and an optional increment (*2*) by which the index variable is changed on each iteration. If STEP is omitted, it's assumed to be 1. In BASIC, the initial, final and increment values can all be variables.

When a NEXT statement is encountered, the index variable is changed by the value of the increment. The result is compared to the final value. If the index variable is greater than the final value (for a loop in which it's increasing), the loop is terminated. Otherwise, the statement immediately following the FOR statement is executed again, and the process continues.

My FOR/NEXT macros simulate the BASIC situation reasonably well, with some restrictions. First, you can't have nested FOR/NEXT loops (that is, a loop having index variable *J* within a loop having index variable *I*). Also, I've reserved only 1 byte for the value of the index variable, limiting it to values from 0 through 255. The equates used by my FOR/NEXT macros are in Lines 351-354 of Listing 1. These are 1-byte integers. A statement like *FOR I=35.4 TO 114.6 STEP 0.2* is perfectly legal in BASIC, but not here. Also, as written, the FOR macro accepts only values for all parameters except the index variable, which is an address.

On the plus side, my FOR/NEXT macros do permit loops with negative increments. You could write more elaborate macros to overcome the limitations I mentioned, but you'll probably find that even these simple ones are very useful.

Now for the nitty-gritty. The FOR macro is invoked with

either three or four parameters. Parameter 1 is the name of the index variable (address). Parameter 2 is the initial index value, and parameter 3 is the final value. The optional parameter 4 is the increment. If absent, an increment of 1 is assumed, just as in BASIC. Lines 5420-5430 load the index variable with the initial value, and Lines 5440-5450 stash the final value at address ENDLOOP (\$0682). Lines 5460-5520 store the increment value at address INCLOOP (\$0683), based on the number of parameters supplied.

It would be nice to remember where the first executable statement in the loop is, so we can go back to the right place when the NEXT macro is executed. The 2 bytes at LOOPADD (\$0684) are used to store the address where code in the loop actually begins. If you think about it, you'll realize that this address is 1 byte past the end of the object code generated by the FOR macro. I called this @LOOPSTART (following my practice of beginning label names inside macros with an "at" sign).

The NOP instruction at address @LOOPSTART (Line 5580) means "no operation"; don't do anything, just continue on with the next instruction. I'm simply using this as a placeholder, and it's actually the first instruction inside the loop. Lines 5540-5570 store the actual address of @LOOPSTART in LOOPADD, which will be used by the NEXT macro. Naturally, the address of @LOOPSTART will be different every time the macro is invoked within a particular program.

The NEXT macro is responsible for changing the index variable, seeing if we're finished yet, and going back to @LOOPSTART to run through the loop again if it's not time to quit.

NEXT only needs one parameter, the name of the index variable. Lines 5740-5750 check to see if the increment is positive or negative. If positive, Line 5760 adds the increment value to the current value of the index variable, and Line 5770 compares the sum to the final value in ENDLOOP. The result of this comparison sets one or more flags in the 6502's processor status register; more about that later. Based on the results of the comparison, we either save the new value of the index variable and go back to the beginning of the loop (Lines 5810-5820), or terminate the whole process by branching to the last line of the macro, @LOOP-DONE.

Lines 5830-5880 handle the case in which the increment is negative. We can still add the increment to the current value, because adding a negative number is the same as subtracting.

The JMP instructions in Lines 5820 and 5880 look a little funny. Rather than using the normal absolute addressing, this is an "indirect absolute addressing" mode. JMP is the only 6502 operation that uses this mode. The JMP (LOOPADD) syntax means to jump to the *address* stored at address LOOPADD and continue execution. Contrast this with the usual JMP SOMEWHERE format, which means to jump to address SOMEWHERE and continue execution. Now you see why FOR stored the address of the first instruction in the loop in LOOPADD. NEXT refers to the contents of LOOPADD when deciding where to jump if it wants to go through the loop again.

Let's examine the comparison operation. Remember the processor status register in the 6502? That's the register with 7 bits that indicate, among other things, whether the result of the last operation was 0 or negative, and whether it caused a carry operation. The compare instructions, such as CMP 45, affect the 0, negative and carry flags.

Table 1 shows how these flags appear, based on whether (for a CMP operation) the contents of the accumulator are smaller than the operand (45 in the example above), equal to it, or greater than the operand. The results are the same for CPY and CPX operations.

Table 1.
Flags set by compare operations: CMP operand.

Situation	Negative	Zero	Carry
A < operand	1	0	0
A = operand	0	1	1
A > operand	0	0	1

You can use the branch instructions to control the flow of program execution, based on the results of a comparison. BEQ and BNE look at the zero flag (cleared or set, respectively), BPL and BMI use the negative flag (cleared or set), and BCC and BCS examine the carry flag (cleared or set). Since all three flags are affected, we might need a couple of branch operations in sequence, to get where we want to go.

Lines 5770-5790 of Listing 1 provide an illustration. We're comparing the contents of the accumulator (A) with the contents of ENDLOOP. If they're equal or if A is smaller than ENDLOOP, we want to loop again (go to @RELOOP). Otherwise we're done (go to @LOOPDONE). Table 1 shows that the carry flag is clear only if A is less than ENDLOOP, so we must use a second test to distinguish between A equaling ENDLOOP and A being greater than ENDLOOP.

In English, Line 5780 asks, "Does A equal ENDLOOP (is the zero flag set)?" If yes, go to @RELOOP. If no, Line 5790 asks, "Is A greater than ENDLOOP (is the carry flag set)?" If yes, go to @LOOPDONE. If no, fall through to @RELOOP. You'll have to use the old noodle to test these flags in the correct sequence when making such comparisons.

Head 'em out, move 'em up.

That's what my girlfriend said when we visited my home state of Idaho, trying to get into the spirit of the Old West. Close enough. Our final macro for today is called MOVE, and it lives in Lines 5950-6170 of Listing 1. Actually, the MOVE macro just handles the setup; the rather lengthy MOVESUB subroutine in Listing 2 does the hard part. The MOVE routines are great for such operations as copying the ROM character set into RAM or moving players vertically.

MOVE is used to transfer (copy, really) a block of bytes of any length from one part of memory (RAM or ROM) to another (RAM, obviously). The ranges can overlap, but of course, you'll overwrite part of the source range if they do. Three parameters are needed: the starting address of the block to be copied; the address to which it is to be copied; and the number of bytes to transfer, a value. The MOVE macro just loads some work registers with these parameters, using the DPOKE macro, and calls MOVESUB. The equates for the work registers are at the top of Listing 1.

MOVESUB first determines if the destination address is at a higher or lower address in memory than the source, using Lines 2100-2150 in Listing 2. This is important. If moving data to a lower address, you want to begin with the first byte in the source block (lowest address). However, if moving to a higher address, move the highest byte in the range first. This prevents you from overwriting data in the source block in case the ranges overlap. The routine to move data to a higher address is in Lines 2300-2590, and the copying to a lower address takes place in Lines 2630-2930.

These routines are a little complicated. To handle any arbitrary number of bytes, we need a 2-byte register (I called it HOWMANY) to store the number of bytes to move. When moving to higher addresses, I first move the number of bytes indicated by the low-byte of HOWMANY. Then I use another loop to transfer the number of pages (256 bytes each) indicated by the high-byte of HOWMANY. Conversely, I move data in one-page blocks first when shifting to lower addresses (Lines 2710-2800), and wrap up the partial page, if any, in Lines 2810-2930. You might want to walk through this code and convince yourself it makes sense.

A demo program.

So far, I've just given you a bunch of tools and some thoughts on how to use them. The program in Listing 3 applies most of these new routines—and some old ones—to give you an idea of how easy it is to write assembly programs using all these shortcuts. Experiment! 

Despite having a Ph.D. in organic chemistry, Karl Wieggers earns a living writing applications software for photographic research at Eastman Kodak Company, mostly on an IBM mainframe. He is also interested in educational applications of Atari 8-bit, Atari ST and Apple II computers.

Hold on to those Learning Phone cartridges.

I'm writing to let your readers know that they needn't trade in their Learning Phone cartridges just yet. Although Control Data Corporation has discontinued its Homelink service, PLATO® home service is alive and well at the University of Delaware. The University's Home Network is available at 1200 baud to anyone with a PLATO-compatible microcomputer system. For Atari users, compatible systems include the Atari 400, 600, 800 and 1200 series, and all of the XL and XE models. The Learning Phone requires the 850 interface; it will not work with the PR: Connection. The Atari ST series is not compatible with the Learning Phone; however, a Macintosh PLATO Access Disk is available, which will work with a 520 or 1040ST running Macintosh emulation via the Magic Sac.

The Home Network is available only through a Delaware phone number, so most readers will have to pay long distance phone rates. However, our off-peak connect time charges are low enough that some former Homelink customers have found it a reasonable way to keep their PLATO access. Home Network is available 24 hours a day, with the following rate schedule:

8:00 a.m.-5:00 p.m. . . . \$2.50 hr.

5:00 p.m.-11:00 p.m. . . . \$4.50 hr.

11:00 p.m.-8:00 a.m. . . . \$1.00 hr.

There's a one-time only fee of \$35. This covers the charge of the subscription package, which includes appropriate software (the Learning Phone or the Macintosh PLATO Access Disk) and a Home Network User's Manual.

The Home Network features over 1000 hours of educational software in over 100 subject areas. These include accounting, biology, business, chemistry, computer science, English, finance, fitness, languages, Latin, library skills, mathematics, nursing, psychology, real estate, statistics, and more. The children's catalog lists over 200 basic math and reading lessons, as well as dozens of lessons aimed at increasing skills in composition, grammar, word power and logic. Educational games abound on the children's menu.

For readers with more recreational

gaming tastes, Home Network offers inter-terminal war games, board games, dungeon games and games of choice.

Local and national PLATO bulletin boards are available on a wide range of subjects, including microcomputers (note-file "Antic" is a national forum especially for Atari users), movies, C programming language, recipes, religion, and more. PLATO notefiles are among the most sophisticated bulletin boards available on any network. Each notefile has easy access to notes and responses via title, number, date written or text search. And, for truly efficient note reading, users can make a list of notefiles and cycle through automatically, seeing only those notes or responses which have been written since the last time they cycled.

For more information, readers can call (302) 451-8161 and ask to speak to the Home Network Representative.

Although we have subscribers as far away as California, Delaware may be too far for many readers to call. The University of Illinois at Champaign-Urbana also offers a PLATO home service. To contact them, call (217) 333-6210. Florida State University offers PLATO home access via its "accesslink" service and may be contacted at (904) 644-2591.

Sincerely,

Rae D. Stabosz

PLATO Services Organization
University of Delaware

The Korean conflict.

I've been a subscriber to your excellent magazine for the last three years. I am currently stationed overseas and am having problems finding good books and programs for the Atari 130XE. Since Apple, Commodore and IBM computers are cloned here, they are more popular. This means that we Atari users must mail order our software/hardware because our military exchange doesn't stock any Atari items at all. I know for a fact that other exchanges around the world do sell Atari products, but in Korea, none.

I asked the store manager why they don't sell Atari-related products. His reply: "Atari is no longer in business." This comment got my goat, and I stated that he should get his facts straight; Atari does exist and always will exist!

After I told him the truth about Atari, his reply changed to, "Well, that particular product isn't popular." Again this angered me. Why? Because, (a) they stock software and hardware for those other computers and they've been sitting on the

shelf for months; (b) if you use the other computers, you can go off-base and buy the same software (pirated, of course) and the documentation at a cheaper price; and finally, (c) how can someone say a particular item is not popular when they haven't stocked that item for over two years? Shouldn't they at least give it a try?

This is my thought: because Korea clones these other computers and we are in Korea, the exchange is trying to limit our choice to help the Korean economy. I feel because we members of the military are away from the U.S., the exchange should market Atari products as much as they do those other computer-related items.

I know I can mail order, but it would be nice to walk into the store and purchase a product and take it home the same day to use it. Mail orders take four to eight weeks to arrive at an APO/FPO. (That's one to two months!) And if it's damaged you have to wait another four to eight weeks to receive a replacement. Luckily, I've been fortunate; I purchased my Atari 130XE and Batteries Included PaperClip XE through mail order with the wait, but no damage.

What I'd like to find out is: are other military members, who are Atari users, experiencing the same problems as we are here in Korea? If so, has the store manager's response been the same?

I urge all Atari users to help their fellow men and women in uniform by writing to Atari and to any military exchange, demanding equal billing for the Atari product line.

Sincerely,

William L. Carpinona
Osan AB, Korea

ST notes

by D.F. Scott

News-worthy happenings in the ST world.

Mega-pricing.

The new Mega STs are now being sold where 75 percent of all the current model STs have reportedly been purchased: Europe. What has held up distribution of the Megas in the U.S. appears to be the search for sales channels which meet Atari's new, more strict guidelines. A knowledgeable ST distributor tells us one of Atari's new rules is that distributors will sell the Megas on commission. Atari will handpick its commissioned Mega distributors for the U.S.

The first semi-official Mega retail price list from Atari shows these figures: Mega 2, monochrome system \$1699, color \$1899; Mega 4, mono \$2399, color \$2599. Atari stipulates these prices are not finalized, and may drop within the next few months.

The British publication *Personal Computer World* quotes Mega 2 and 4 monochrome system prices as 995 and 1295 pounds, respectively. Judging from mid-August currency exchange rates, a comparable U.S. list price for the Mega 4 may be as low as \$2300.

In Canada, the Megas are being introduced with Atari's first-ever one-year manufacturer's warranty. There, the Mega 2 and 4 monochrome systems list for \$2299.95 and \$2500 Canadian, respectively. Dealer qualifications in all of North America will be very strict, in an effort by Atari to improve quality control. Sources tell us a Mega dealer must: (1) have one ST serviceman attend a training seminar in California; (2) retain at least one outside salesman; and (3) meet a sales quota or else be erased from Atari's distribution list.

Such policies may be new to Atari, but are quite common for the microcomputer sales industry, especially where the targeted market is businesses which purchase them in large quantities as office terminals. These businesses aren't fond of 90-day warranties.

At an Atari show in Toronto, we're told, Mega ST 2s were on display, bearing the new keyboard mechanism originally discussed when the concept of the Mega was first introduced. The new keyboard has been said to have a "positive key click"—which, I suppose, is the opposite of a "negative key click," or typing on baked beans. The Mega 2s' pre-installed blitter chips were, however, de-installed at the end of the show, for unexplained reasons.

Mega STs have been available to registered high-level ST developers in the U.S. at a reduced cost. Improved-mechanism hard disk drives will also be available soon, according to an Atari Canada press release.

Atari's financial fountain is still spewing black ink. For the second quarter of '87, sales were up \$10 million over the same quarter in '86, totaling \$70.7 million. Earnings for second-quarter '87 were \$13.5 million, compared to \$9.7 million in '86. Sales margins were also up, reaching 21.2 percent in second-quarter '87 versus 11.7 percent the previous year. //

The ST's "OS II."

Whitesmiths, Ltd., of Westford, Massachusetts, is the developer of an operating system called *Idris*. It is designed for small- and large-scale computers not equipped internally to run AT&T's UNIX OS or its derivatives, in order that they may run UNIX

software, as well as function within a UNIX-based hardware environment. Previously, Whitesmiths has published versions of *Idris* and its cooperative sister OS, Co-*Idris*, for DEC PDP-11 and VAX mainframes, and the IBM PCs.

The company has been searching for a low-cost, 68000-based computer to have *Idris* ported to, in targeting the small business market. Wisely, it has chosen the ST.

Idris's programming, utilization and file-handling environment is based upon a proposed IEEE standard form of UNIX, called POSIX. This way, future cooperation between UNIX, POSIX and *Idris* systems is assured.

Idris achieves UNIX-like multitasking on the ST without necessarily having to have a standard Memory Management Unit installed. It does so by reshuffling elements and memory blocks—performing block memory moves, or blits—so that the programs literally come to the program counter, rather than the counter to them.

In a true multitasking environment such as UNIX or *Idris*, several programs can be run concurrently. On a UNIX system, each program resides in a specially-apportioned area of memory and stays there. Data is shared between programs by streaming them, literally, through "pipelines"—reserved memory caches. Control is passed between programs in order of their priority, but that type of control can only be achieved with the aid of a real Memory Management Unit. Neither the PDP-11 nor the Atari ST has one.

Idris is an operating system which doesn't need an MMU to run UNIX software. It juggles position-

independent programs around in memory, passing them by the program counter like platoons in a 4th of July parade past the reviewing stand.

The OS is not designed, however, to work with GEM, nor with the rest of TOS; and disks require their own specific formats. Nonetheless, Whitesmiths is currently collaborating with its partner companies worldwide —among them, Computer Tools of Seattle, Washington, which performed the actual ST port of **Idris**, and American Network Development of Westwego, Louisiana—to port over top-rated UNIX software to the ST. AND, for instance, has already released its “cash register” package for ST **Idris**, which lists for \$49.95 and handles inventory, invoicing and billing.

Idris is currently available for a list price of \$800, which doesn't seem so steep when put in perspective. A 1040ST with a 20Mb hard disk drive and **Idris** retails for around \$2500—considerably less than a standard 68000-based UNIX terminal. Networking hardware is reportedly forthcoming for the 520/1040s.

Ace Systems and EEC Systems, two British mainframe software firms, reportedly found their UNIX word processor, LEX, running faster on the ST than they had ever seen it run, after having been ported from the binary 68000 version here in the U.S.

Whitesmiths Vice President for Development, Telford B. Sartell, exclaims it is a myth that the ST cannot multitask. Our interview with Sartell will be featured as part of the first installment of “Vantage Point,” a new **ST-Log** regular series which will focus on ST developers outside Atari. Charles Bachand, our technical editor, will also have a review of **Idris**, soon to be published in **ST-Log**. //

Dial 1-800-RAY-GUNS! Operators are standing by. . .

Sierra, which has broken new grounds—for better or worse—with its graphic adventure game **Leisure Suit Larry in the Land of the Lounge Lizards**, promises to port to the ST the program which it says sold “over

500,000 units” in Japan, for an MS-DOS machine whose name Sierra for the moment cannot recall.

Thexder is a graphic arcade-style game where you portray a “Gobot”-like half-android/half-fighter-plane, traveling through caves, spaceships and rose gardens in search of twenty different forms of hostile aliens. The game is played on a 2D field with what is promised to be “hypnotic music”—in other words, this game is destined to be the “Slim Whitman's Greatest Hits” of the ST.

As for when Sierra intends to release the ST version, well, they're not saying. The MS-DOS version will be released first, for machines we're sure the company can name, followed by the Apple IIGS version. Expect a release date perhaps in the first quarter of '88, sometime after every man, woman and child in Japan owns a copy.

Those are the **notes** for this month. I'll see you on Delphi. //

TROLL WAR II

**Capture the king
and victory is yours
in this battle of trolls and wizards.**

by Scott Langston

As promised last month, we now bring you the second half of *Troll War II*. We explained in issue 57 that the object code for this game is a whopping 10K, leaving us no choice but to print the data in two parts.

A description of the game, along with a few helpful hints, can be found in issue 57. (Don't forget to refer to "M/L Editor" for typing instructions.) For those of you who'd rather bypass the tiresome task of typing it in, the listing is available in its entirety on this month's disk version.

We hope you didn't mind the inconvenience, but we're sure you'll find it was worth the wait.

Remember, you must have first typed in part 1, before you work on part 2. **A**

Listing 1 continued. "M/L Editor" data.

In the U.S.A. and in Canada

Call toll-free: 1-800-233-8950.

Outside the U.S.A. call 717-327-9575 Telex 5106017898 Fax 717-327-1217

Educational, Governmental and Corporate Organizations call toll-free 1-800-221-4283

CMO. 477 East Third Street, Dept. B710, Williamsport, PA 17701

ALL MAJOR CREDIT CARDS ACCEPTED.

POLICY: Add 3% (minimum \$7.00) shipping and handling. Larger shipments may require additional charges. Personal and company checks require 3 weeks to clear. For faster delivery use your credit card or send cashier's check or bank money order. Pennsylvania residents add 6% sales tax. All prices are U.S.A. prices and are subject to change and all items are subject to availability. Defective software will be replaced with the same item only. Hardware will be replaced or repaired at our discretion within the terms and limits of the manufacturer's warranty. We cannot guarantee compatibility. All sales are final and returned shipments are subject to a restocking fee.

CUT HERE

CUT HERE

CAN YOU CUT IT?

Can you handle the excitement of the hottest arcade megahits?

Then cut out these name plates, mount 'em on your monitors and boot up *Gauntlet*™ and *Paperboy*™ from Mindscape. That's all you need for absolutely outrageous arcade action, right at home.

You'll get real arcade graphics. Real arcade feel. Real arcade excitement.

After all, these are based on the real arcade classics. So get set, get psyched for the arcade to hit home. Just pick up new *Gauntlet* and *Paperboy*. That is, if you think you can cut it.

Mindscape takes the arcade home.

Visit your retailer or call 1-800-221-9884 for VISA or MasterCard orders. To purchase by mail, send your card number with expiration date, check or money order for \$34.95 each (C64/128 and Atari 800), or \$49.95 (Atari ST, Paperboy only) plus \$3.00 for handling to Mindscape, Inc., P.O. Box 1167,

Northbrook, IL 60065-1167. Allow 3-5 weeks for delivery. Legal eagles take note: © 1987 Mindscape, Inc. Mindscape is a trademark of Mindscape, Inc. Paperboy™ © 1984 Atari Games. All rights reserved. Gauntlet™ © 1985 Atari Games. All rights reserved.
