## EDITORIAL

What do Atari users do in the summer? No, it isn't a conundrum, merely a comment, that judging by the almost empty postbag, the one thing you do not do is compute. Still we have had some fine days and maybe when the summer is over—all too soon—you will start writing in again. PAGE 6 goes on come rain or shine and this issue brings you some more good programs and articles. A couple of items deserve special mention and the first is Mark Hutchinson's article on your chance of fame, if not fortune. Do read it, it sums up nicely what PAGE 6 is trying to achieve. Look out for a couple of articles from Mark in coming issues. Next take a look at the second part of Phil Griffin's article on Memory Mapped Screens and in particular the demo program. It is a bit long for a demo but if you type it in, you will find the basis for what could be a very fine game. How about one of you adding some Players and Missiles and letting us have a new game for a future issue.

What gets you excited about Atari computing? As far as I am concerned, getting new programs in the Public Domain from America and elsewhere is one of the most enjoyable things which has come from starting PAGE 6. They may not be as good as commercial programs, but they bring new programming ideas and what's more they are free (well almost). Evidently you, the readers, do not share the same enthusiasm for not one person has, as yet, responded to the plea in the last issue for some programs to exchange. So what does get you excited Atari-wise?

Last issue I mentioned that we would be publishing a definitive list of Atari related books but you will not find it here. I did not realise just how many books there are—the list is now over 50. That would take up too much valuable space in the magazine but if any reader would like a copy of the list, please send 50p to cover the photocopying costs and a large stamped addressed envelope. A list of over 50 Atari books will then be yours.

## BACK ISSUES

Issue 1 sold out.

Issues 2 & 3 70p. each inc. p. & p.

Issue 4 £1.00 inc. p. & p.

Deduct 15p for any two copies or 25p for three.

## NEWS and VIEWS

First the BAD news. Remember those super new machines mentioned in the last issue? Well, according to one of the trade papers, Atari (UK) have no plans to introduce the 1400XL or the 1200XL in the U.K. That's not too bad but the real stunner is that when they introduce the 1400KLD they are going to strip out the modem and voice synthesiser. Apparently they say there are compatibility problems with the modem (comments please from Atari owning GPO technicians) and voice synthesis is not something that the British market wants! Atari thereby deal themselves another body blow as far as the British market is concerned. Communication between computers is going to be a big thing in the next couple of years and another manufacturer is going to introduce a machine with voice synthesis. In fact I believe that the BBC already has the facility although I don't know if the chip is currently available. New buyers are impressed by technology which hits them in the eye and what could be more impressive than a machine telling you of it's own features? What happens when all the software using voice synthesis starts appearing in the States? Atari surely cannot realise the amount of Third Party software that is bought by U.K. owners. Think again, Atari.

Recent software which is NOW available in the U.K. includes **BLUE MAX** (32K)—a WW1 flying game with 3-D graphics like Zaxxon, and **SHADOW WORLD** (32K) both from Synapse. From Datasoft, **O'RILEY'S MINE** (16K)—a Dig-Dug type game. A new one from Infocom—**WITNESS** (48K) which is a follow-up to **Deadline**. This one is a whodunnit based around the classic murder mystery novels of the 1930's. From ANIMATOR from Don't Ask—reputed to be the finest player-missile utility yet. From Santa Cruz, **TRICKY TUTORIALS 8/9/10** (all 16K) on Character Graphics, GTIA and Sound Effects.

Coming soon . . . Word Wizard, Script Wizard and Money Wizard, all on ROM from Datasoft and six new titles from First Star Software who brought you the excellent **Astro Chase**. These are **BRISTLES**, **RENT WARS**, **FLIP-FLOP**, **TOP SECRET**, **SAVIOUR 1** and **DANGEROUS CARGO**. At the time of writing, none of these products were available, even in the States, so be patient.

## User Groups/Contact

There is a new Atari User Group in Nottingham, or rather an Atari sub-group of the Nottingham Micro-Computer Club. Meetings are held fortnightly on Mondays at 7.30 p.m. at **THE OLD CHURCH, CASTLEGATE, NOTTINGHAM**. If you would like more details contact Dana Carty on 021-378 2235.

Merseyside Atari Computer Club now meet at the Holiday Inn in Liverpool still on every other Tuesday. Phone Roy Gibson on 051-608 9563 for further details.

ALEXANDER KILLS of 50 MONTGOMERY HOUSE, CLAREMONT ROAD, SEAFORTH, LIVERPOOL L21 1AU, would like to correspond with anyone interested in Adventures and would like some advice on how to program one. Write to him if you can help or want to share ideas.

Someone phoned a while back to ask how to get out of the Black Room or Stone Cell in Escape from Trozn. but I have mislaid his name and phone number. If you are still in there please phone again and if any readers know the answer, please write in.

ATTENTION USER GROUP SECRETARIES. Why not write an account of what goes on in your group so that others will have an idea of what they can do in setting up a group of their own? It does not matter how large or small you are, other users will be interested in what you do.

## ★★★From U.S.A.★★★

We are pleased to be able to feature in this issue a column written specially for PAGE 6 by Michael Leckun of Michigan Atari Computer Enthusiasts, one of the biggest User Groups in the U.S.A. Hopefully, this will become a regular column bringing us news and views from "Across the Pond".

I will be sending back a column to M.A.C.E. and if any readers have any news or views which they feel would be of interest to fellow Atari Users in the U.S., please let me know.

Turn to page 14.

## INPUT

Dear Lee,

May I ask you to correct an error in the Basic Timing listing in my article in issue 4? Line 1000 should read 1000 X=0:M1=1234. The actual number that M1 equals does not matter since on the first run, when X=0, a new line 1000 is put up on the screen which when entered makes M1 equal to the FRE(0) at the time of the first run. This takes care of different memory sizes, DOS usage, etc., and makes lines 1-7 unnecessary.

May I also suggest a small improvement. Add 1025 ? CHR\$(126) IF X=0 THEN 1059 which gets rid of the 'Loop now running' before printing the results and cuts out irrelevancies on the first run.

David Harry,  
Solihull

\*\*I changed line 1050 for testing purposes and forgot to change it back! I am also responsible for adding lines 1-7. Sorry!—Ed.

□ □ □ □ □ □ □ □

Dear Lee,

Firstly, let me congratulate you on an excellent Atari only magazine.

With regard to Tony Amesbury's letter concerning 'lock-up', my experience has proved to me that lock-up only occurs whilst typing in a program and then only after extensive editing particularly INSERTing or DELETEing lines. The solution seems obvious, be extremely careful

when typing in new programs and use the CTRL INSERT/DELETE keys as little as possible.

Tony Amesbury said that after he POKEd location 832 with 6 a program that frequently crashed his machine was OK. Well, location 832 controls the IOCB and when the machine is turned on it is already set to 6. Any other number may crash the computer.

John Fallon,  
Birmingham

Dear Lee,

I read with great excitement, the letter from Tony Amesbury 'could POKE 832,6 be the answer to the famous Atari lock-up?'. No such luck!!

If you type PEEK(832) when you power up, the computer tells you that 6 is already there.

Why isn't the Revision B chip available in England? I believe this chip solves the problem.

Stephen Taylor,  
London

\*\*ATARI do admit to the lock-up problem but do not offer a solution. In an update to the BASIC Reference Manual they say "Note: Large amounts of editing may lock-up the system. It's recommended that programs under development be stored to cassette or diskette periodically (every 30 or 40 edits) with

the SAVE or CSAVE command."

□ □ □ □ □ □ □ □

Dear Sir,

I received the first three issues of PAGE 6 and found them to be of great value.

I think that the information needed by the majority of Atarians is the simple tutorial-type articles and hence I would like to suggest you dedicate more space to the Getting Started and First Steps sections. Your in-depth software reviews are excellent, congratulations and good luck.

Alan Chaloner,  
Chester

\*\*I try to make sure that the articles and programs in PAGE 6 can be understood by beginners but it is very difficult sometimes to strike a balance. Beginners soon become advanced users and then want more advanced articles. First Steps is the most difficult column to write in the magazine as it is now very hard to recall all those little things that gave me problems in the beginning. The best way to get an answer to a particular problem is to write to PAGE 6. Any questions received will be published, with answers, in the next First Steps column. You may have found the answer yourself by then but your question will help someone else. Stuck on something? It doesn't matter how simple it is, write to FIRST STEPS at PAGE 6. ■

# What's Wrong with Fame?

Mark Hutchinson, Belfast

A magazine survives because people like it enough to buy it. The magazine has to align itself with the needs or wishes of its readership. In respect of a computer magazine one of these wishes is free games, another is programming tips. Both are important, especially to beginners. Many magazines do however tend to get too professional, or too in-depth and so cause the amateur to feel left out or unwanted. The feeling is then 'My little listing is childish compared to that' and so another contributor is lost and the great sadness is that with a bit of encouragement and lots of tips on technique, that programmer could well be a future Chris Crawford or a new Scott Adams. New techniques do not always originate from the masters of the art, sometimes you get too tied down with the norm and it takes a question such as 'What if...?', born out of innocence, to open others' eyes.

A professional programmer needs a long time to write and debug a new program and often does not have the time to experiment. He has to rely on people who have the time finding out odd tidbits for him to use. Guess who has the time to fiddle about on the keyboard? Why us—you and me—the amateurs.

I will admit that in some respects I am still a child. I really miss those 5 or 8 line programs with flashing colours and zaps or bangs. Where have they all gone? I remember seeing them in ANALOG not so long ago. Will PAGE 6 and its readers help to save this endangered species?

I have included a small listing for this article, not with flashes and bangs, just a case of putting my bytes where my mouth is! I hope that this will stimulate the rest of you to write in. After all, it's a chance to see your name in print and what's wrong with fame anyway?

No apologies are made for the lack of neatness in flow, even though I should have known better. If you decide to try it out, don't write in to the Editor with "He should have done..." Send in your own program instead. I am sure the Editor will forgive you if the line numbers are not neatly spaced. The listing was condensed from another of my programs thus

explaining the odd line numbers. That's my excuse and I am sticking to it!

## Atari I/O

Atari's own U.K. magazine I/O gets better each issue and is available free of charge to all Atari 400/800 owners. If you do not receive a copy send the serial number of your machine together with details of when and where you purchased it to Atari (UK) Inc., Atari House, Railway Terrace, Slough, Berks. This will apply even if you bought your machine second-hand.

I/O would also like articles, reviews and programs from YOU. Write to the Editor, Mary Ann Bark—she is longing to hear from you.

# Target

Ken Woodward, Abertillery, Gwent

You are represented in this game by a player on the right-hand side of the screen and the object is to obtain the best score possible by carefully aiming and firing each of your ten arrows at the target on the left. If you miss the board altogether you are given the opportunity to retrieve your arrow.

A hit in the outer ring records 200 points and the red ring scores 300. A bulls-eye is worth 500 but it is protected by a low-scoring green area worth only 100 points. Sounds easy, doesn't it? Oh, I forgot to mention that you are in constant motion and to make things even harder there are random speed changes at the extremes of your travel.

Press SELECT to choose one of the ten levels and START to begin to play. Press OPTION to review the highest score between games.

## HOW IT WORKS

The main problem I encountered in writing this program was how to move Player Missiles up and down the screen at a reasonable speed in Basic. I found that it just could not be done and I have therefore used a machine language subroutine from an American magazine which moves Players during the Vertical Blank Interrupt. The code is poked into page six and is called only once with X=USR(1898). The subroutine then executes automatically every 50th of a second whilst the screen is off prior to being redrawn. Locations 1780-1783 become registers which hold the Y positions of each Player. If for example a 5 is POKed into location 1780 then Player 1 will be moved to position X,5 instantly. Four players are supported but as you will see from the listing I have used only two (PLY and PLY+1). Horizontal movement is covered by using the normal X registers at 53248 and 53249 (PLX and PLX+1).

The program is well REMARKed so you should have no trouble in following the code. Lines 19-21 create the custom screen by altering the display list. The main loop of the program is between lines 160 and 195. Note the use of the POP command which should be used whenever

you jump out of a FOR...NEXT loop before the loop completes.

When writing programs I tend to use long variable names to make the listing easier to read. A couple of extra bytes are used when defining the variable but thereafter only one byte is used for any variable no matter what the length of the name.

I hope that you enjoy Target and that you learn a little from the listing. I have sent in my program, how about sending in one of yours? I like to type them in as well.

# Memory Mapped Screens..2

Phil Griffin, West Midlands

In the last issue, I introduced the concept of the memory mapped screen and dealt with Graphics 0, 1 and 2. In this article I shall look at Graphics Modes 3 to 8 and show a simple animation sequence achieved by using POKE statements.

When values between 0 and 255 are POKEd into screen locations using Graphics Modes 3 to 8, a pattern of coloured pixels is produced at the selected screen location. Graphics Modes 3, 5 and 7 allow three foreground colours plus background whilst Graphics Modes 4, 6 and 8 allow only one foreground colour plus background. The colours obtained are the normal default colours for each mode but they can be manipulated by using the SETCOLOR command or by POKing the relevant COLOR register.

## GRAPHICS MODES 3, 5 and 7

These are the '3 colour' Modes and if you compare the horizontal resolution from the table at the back of your Basic Manual with the Screen Memory Locations per Mode Line shown in Table 1 of the first part of this article, you will see that each screen memory location is equivalent to a horizontal block of 4 pixels.

```
10 GRAPHICS 3:POKE 752,1
20 TL3=PEEK(88)+254*POKE(89)
30 FOR I=0 TO 255
40 POKE TL3,117*CHR(125)+I
50 PRINT "POKE VALUE OF "I;"=";" HIT ANY K
60 GOTO CONTINUE:POKE 744,255
70 IF PEEK(744)=255 THEN 50
80 NEXT I
```

Program 1 shows the resultant display for each POKE value between 0 and 255. Graphics 3 has been used for the display, but similar effects occur with Graphics modes 5 and 7.

A coloured reference chart can easily be prepared using this program and I have found mine invaluable for programming animation sequences.

1440	1441	1442	1443	1444	1445	1446	1447	1448	1449	1450	1451	1452	1453	1454	1455	1456	1457	1458	1459	
1460		1468		1476		1484		1492		1500		1508		1516		1524		1532		1540

Figure 2

## GRAPHICS MODES 4, 6 and 8

These are the 'single colour' Modes and each screen memory location is equivalent to a horizontal block of 8 pixels. The range of POKE values, 0 to 255, is again available but this time the resultant 'block' is a representation of the binary equivalent of the number POKed. Each 0 becomes a pixel plotted in the background colour and each 1 becomes a pixel plotted in the foreground colour. Figure 1 should make things a little clearer.

Decimal	Binary Equivalent	Display Block
255	1 1 1 1 1 1 1 1	
0	0 0 0 0 0 0 0 0	
247	1 1 1 1 0 0 1 0	
187	1 0 0 1 1 1 0 1	
75	0 1 0 0 1 0 0 1	

Figure 1

Program 1 can be amended to a 'single colour' mode by substituting GRAPHICS 4 for GRAPHICS 3 in line 10 and TL4 for TL3 in lines 20 and 40.

Graphics Mode 8 is the highest resolution Graphics Mode available. The pixel size is so small that multicolour effects are possible by careful selection of the pixels to be plotted. This process is known as aliasing and is used quite extensively in America although it doesn't work very well on U.K. televisions. For the purposes of this article Graphics 8 can be considered as a 'single colour' mode.

## GRAPHICS 9, 10 and 11

These are the additional modes available with the GTIA chip and each screen memory location is equivalent to a block of 2 pixels. The use of screen memory locations is limited in these modes due to the size of the pixels and animation techniques are best executed by use of the colour registers, particularly in Graphics 10.

## DEMONSTRATION PROGRAM

Program 2 uses a modified Graphics 6 screen to display six 'cities' together with a landscape which utilizes the text window. The last seven lines of the Graphics 6 display have been replaced with Graphics 7 in order to record the cities and the landscape in different colours.

Twenty randomly selected laser-bolts are produced and if a city is struck, the city explodes and is then rebuilt. A score of 555 points is awarded for each hit and any necessary updating of 'score' and 'missiles remaining' is carried out before the next missile is launched. When all the missiles have been fired, a high score is shown and an invitation to re-run the program is displayed.

Every item in the screen display with the exception of the laser-bolt is produced by F0KEing to the screen. Although the majority of the routines are reasonably straightforward, the following notes may help.

### 1. Screen Memory Locations for the Cities

Figure 3 shows the screen memory locations for the last line of Graphics 6 and the first line of Graphics 7 in the screen display used.

The numbers shown are the numbers of screen memory locations from the top left of the screen (TL6). Locations 1406, 1470, 1474, 1484, 1488 and 1492 are the start locations for the cities and they are held in the array C(1-6). Locations 1443, 1445, 1447, 1452, 1454 and 1456 are used to check whether a city has been hit and are held in the array CHK(1-6).

### 2. Animation Sequence

The animation sequence for the city explosion is shown in the series of Figures 3(a) onwards. Each phase of the explosion is drawn on a 7 by 8 grid. The eight horizontal pixels are actually made up of two blocks each of four pixels width. The values shown by the side of each figure are the F0KE values to obtain the pattern of pixels shown in the default colour 'yellow/green'. The SETCOLOR statement in line 40 of the program changes this colour to the 'purple/blue' colour of the city. The expressions containing XP in Figure 3(a) relate

to the explosion routine in lines 1080 to 1160.

### 3. Score, Hi-Score and Missiles Remaining

The variables S, H and M (line 30) contain the start addresses for the score, hi-score and missiles remaining screen memory locations. The arrays SC(1-5), HSC(1-5) and M(1-3) contain the actual numerical values. The mechanics of updating these values is a little complicated but should be easier to follow if you know that the first element in the array contains the units, the second element the 10's and the third element the 100's and so on.

XP	8									0	XP+1
XP+40	8									128	XP+41
XP+80	16									136	XP+81
XP+120	42									168	XP+121
XP+160	42									170	XP+161
XP+200	170									170	XP+201

## THE PAGE 6 AWARDS

**YOUR PROGRAM, ARTICLE OR REVIEW COULD BE WORTH £50 IN SOFTWARE!**

In the last issue we announced a readers' poll to be conducted at the end of our first year to find the best programs, articles and reviews from the first six issues. Since then we have been talking to a few retailers and distributors and hope to be able to offer more prizes by way of sponsorship—details will be announced in issue 6. In the meantime, if you want to have the chance of winning and would like to get your name in print, send us a program, article or an in-depth review. Don't be shy, your work is probably better than you think!

**SEND YOUR CONTRIBUTION NOW**

*Keith G. Hyem, and*  
MANAGING DIRECTOR, BRITISH SOCIETY OF FINANCIAL AND INVESTMENT ADVISERS

**EVEN THE BEST HOME COMPUTER  
 CAN'T TELL YOU THE BEST WAY  
 TO SECURE YOUR FUTURE**

In some areas there is no substitute for human experience and if you require advice on investment, life insurance, savings schemes or pensions, you need the right advice built on years of experience.

**BETWEENS**—Protect your business by wise investment. Protect your complexion with pension and medical schemes.

**PROGBANKERS**—Are started your own company? Make sure you safeguard your profits and give security to your family.

**LEGERS**—Why not put some of your money into a savings scheme and be prepared for all the new Atari technology?

For free and confidential advice on all aspects of financial investment, pensions and life cover write or phone 021-475 5597 (24 hours).

## Across the Pond

by

Michael Lechun

(Michigan Atari Computer Enthusiast)

He/lo from Michigan! We're anxious to hear about our fellow Atarians in the UK. We also want to let you know what's going on here in the U.S.

So, what's the latest from the U.S.A.? I had the pleasure of attending the International Summer Consumer Electronics Show held this past June in the City of Chicago. On display were the latest in exciting electronics including telephones, satellite-TV technology, audio disk players, computers and some new introductions by your friends and mine from Sunnyvale, ATARI Inc.

At the show ATARI introduced four (yes, four!) new computers. They are the 800XL, 800XL, 1400XL and 1400XLD. The 800XL is a 16K machine upgradeable to 64K. It has a full-stroke keyboard and more membrane keys—yeah! The 800XL is a 64K featuring built-in disk like all the new machines and also a monitor output. The 1400XL features built-in modem and speech synthesis via a Voice chip. It has 64K and like the 800XL and 800XL is in similar style to the 1200XL.

What of the 1200XL? Seemed strange, but I didn't see too many there. In fact in three days the only one I saw was the one ATARI used for demonstration. Anyone who displayed ATARI software used an 800. I overheard that changes were to be made to physically accept third party cartridges and the OS changed to run third party software. Another rumour is complete phasing out of the unit, but don't quote me on any of this.

The ATARI 1400XLD. Ah, yes. With built-in disk drive, it's the ultimate in integrated computer capabilities. Or so say the boys from California. Double-sided dual density built-in disk drive, 64K and CP/M upgradeable through access to the serial bus and expansion modules. ATARI you HAVE been listening to us after all! The 1400XLD also sports the built-in phone modem and speech synthesis capabilities of the 1400XL. All the

continued on page 12

## The Sting

There are many ways to produce music on your Atari but this one is very different. I don't mind admitting it gave me quite a shock when I ran it! Try it yourself.

# Squares

John Massara, Five Dock,  
New South Wales

Squares is an arcade-type game which requires a lot of skill and very little luck. The object of the game is to guide an ever-growing white line using your joystick and cause it to run over the black squares to score 'hits'. Each hit gives you points according to the frame as well as adding another square to the playfield. Points are also awarded just for keeping the white line moving without hitting any squares. After one or two games you will realise that you can score a lot more hits by running along the side of a square rather than just passing through the middle, however this requires more skill. You get bonus points at the completion of each frame.

As you progress through the frames, the squares get smaller and the line moves faster until you reach the dreaded 8th frame where the size of the square is the same as a GRAPHICS 7 pixel! The game will finish if you hit the border or run into yourself. If you run into a 'dead end' situation, you can use the 'escape' option by pressing and holding the fire button. The line will stop moving so that you can have a good look at the screen. When you are ready, let go the button and the line will reappear in a new location for you to carry on.

Finally, if you wish to skip frames, just press the OPTION key while playing.

# ARCADE ACTION . . . MINER 2049er

Harvey Kong Tin, Hull

If I were to choose just one game to show that the Atari was superior to all other machines, Miner 2049er would be it. I would just leave the game running unattended for it cycles through an introductory title sequence, accompanied by the music of 'Dementine' and then gives a demo of how you might clear Station One and a high score table.

The game is a derivative of the arcade game Donkey Kong but is totally different. Miner requires you to jump confidently and know where to jump to next because you only have a limited amount of time to clear each station. The theme is that of a space age miner who must claim all sections of the framework of each station in a mine. The mine is patrolled by deadly alien mutants but these can be banished in PacMan style by picking up an object from the many scattered about and touching them quickly. When you pick up an object the mutants change into a harmless vulnerable form but only temporarily so you must be quick. There are ten stations altogether, each different and each with their own particular hazards. If you plan your journey carefully, you do not need to jump over any deadly mutants except on Station Ten where you are forced to jump them to clear the Station.

Let's go through the various Stations.

**STATION ONE—The Mine Shaft.** An easy screen to conquer, just get used to climbing ladders and banishing mutants. There is even one jump to make to prepare you for the next levels.

**STATION TWO—The Slides.** A difficult screen for beginners. There are ladders, jumping and jumping over slides. Going down slides unnecessarily is the real killer because you can run out of time.

**STATION THREE—The Transporters.** An easy screen after the last one, just ladders and the transporters—Beam me up, Scotty! There are some safe drops you can use to save time.

**STATION FOUR—The Lilypads.** Another difficult screen. At first you will have trouble knowing where to go to cover the pads, there

are so many of them. Once you know the directions to take, jumping practically all the way, you have only one difficult jump to make but it will really test how far you can jump.

**STATION FIVE—Advanced Lilypads.** Similar to Station Four with many pads to cover but with slides at the top. You'll have to tread and jump carefully to cover them. Finally, there is a moving piece to land on—best jump for it—to cover the remainder. A word of warning, there is one object here you can't have.

**STATION SIX—The Radioactive Waste.** At first this is another difficult one for having got used to running jumps, you here have to make standing jumps. There is an all important moving piece to ride on to cover an isolated part of the screen. Going there is no problem, it's getting back, the moving piece is so small.

**STATION SEVEN—Advanced Transporters.** As the instruction book says 'This round has got it all' Transporters, slides, moving pieces and lilypads. Mapping out this one is very difficult as there are so many places to go. Only experience will get you through this one.

**STATION EIGHT—The Lift.** The first thing you notice is the Lift dominating the centre of the screen. This is used to access the areas out of reach. The layout seems simple enough but there are many traps here—places you can't get out of once you have landed there.

**STATION NINE—The Pulverisers.** Another easy layout on first sight but you have to get used to the parked moving pieces—jumping off is not easy—and going under the pulverisers. There is a safe way to negotiate them.

**STATION TEN—The Cannon.** You have a giant cannon at your disposal. To use it you need the correct amount of dynamite to blast you to the appropriate storey you wish to cover. Storeys 2 and 3 are not too bad but the first storey is difficult. Here on Station Ten you are forced to jump the mutants and the major factor against you is time, but once the different storeys are clear you can confidently gather the remaining TNT and thereby start Miner all over again but at the next difficulty level—ZONE 2. There are TEN zones in all!

The really good thing about Miner is that it is playable many times over but you do have to go through all the earlier stations if you are stuck on a difficult one. You will need the practice anyway to conquer Station Ten.

Even past Station Ten you will find the game challenging, you can proselect the more difficult zones 2-10 and see how far you can get on these. It is possible to get yourself up to Station Ten on Zone 5 but you do need to change your tactics entirely as the mutants speed up considerably and they don't remain in a harmless state when you want to zap them. On Zone 10 it becomes impossible to clear Station Three, there is no way I know of clearing it!

Jumping has become a part of some of the latest games out—Donkey Kong, Pharaoh's Curse, Shamus Case II and Jumpman, but Miner 2048er ranks as the best. Miner is the cleverest, most imaginative game out. The animation is superb as it uses high resolution graphics and even the colours of the framework of the mine change. Atari's Mario the Carpenter in Donkey Kong does not match Bounty Bob in quality.

Bill Hague founded Big Five and started producing arcade games for TRS-80 computers. Miner for the Atari was a complete surprise but with the undoubted success of this game, Big Five is ready to release more than one new title for its Miner followers. Believe it or not it will soon be one year since the release of Miner 2048er.

**FOOTNOTE:** I have since discovered that you can type in Big Five's phone number during play and then press **SHIFT** followed by the Station you wish to go to rather than go through all the Stations. On zone 10 you can only clear Stations 1, 2, 5, 8, 7, 8 so the challenges to this game are always present even for the experienced player. ■

# Vertical P/M Movement

Andrew Jones, Birmingham

Moving Players and Missiles horizontally is quite easy from Basic using the horizontal registers 53248-53256, but vertical movement is a problem as there are no registers for vertical movement. Using Basic to redraw the image is agonisingly slow and unsatisfactory, so here is a machine language routine to move Players and Missiles vertically. There are plenty of REMarks in the listing to enable you to follow the procedure for setting up Players.

This is the first article PAGE 6 has had on Player-Missile Graphics, one of the most powerful features of the Atari. It is also a feature which causes much anxiety in beginners. How about some more articles and listings from those of you who have got to grips with PM Graphics?

## Across the Pond continued

new models incorporate the HELP key and are expandable via the new 7080 expansion module (get out your 80 column boards again!)

Also new from sunny California are ATARI's letter quality printer (1027), dot-matrix printer (1025) and printer/ploter in four colours (1020). A new cassette recorder (101D), direct connect phone modem (1020), dual density disk drive in the slim-line styling (1050) and DCS 3.0 to support it. Also a track-ball, touch graphics tablet and VCS 2600 keyboard and computer adaptor—called "My First Computer" and under \$90—all proud additions to the ATARI line.

You want PAC-MAN but don't have an ATARI computer? Well, ATARI won't deprive you of it much longer. It's exclusive titles are now

coming out for the IBM-PC, TMS80 as well as the VIC 20. ATARI owners will also see DAG-DUG, Joust and DONKEY KONG JR coming out for the world's best computer.

Some other show stoppers at (SCS): Coleco's new ADAM computer system and Mattel's ADLANTIS 3cm compact systems for a low, low price. Also AMDEK had a complete display of monitors and their new 31 inch 31/2 mean 3cm cartridge-disk drive for the ATARI.

If all these surprises aren't enough for you, you'll have to wait for next winter's show in Las Vegas, if you can't get away, watch for my report following the show.

Michael Lechin

# Typo

by

William Wilkinson

One of the biggest problems in typing in magazine listings is to make sure that you have typed in the program correctly. Many readers have asked if there is a solution to this problem but there is no magic answer, a lot of care and hard work are involved even if you use a utility such as TYPO.

TYP0 is used by ANTIC magazine and was first published by them in August 1982. It is reprinted here with their permission. In future we will include a TYP0 chart with all but the shortest listings in PAGE 6 which will hopefully help you to correct those bugs.

TYP0 will produce a chart which you then compare with the chart printed in the magazine. BE WARNED though, TYP0 is very fussy and you must type in the listing exactly as shown—every REM, space and comma, lower case etc, must be the same. TYP0 will help you get an identical listing but you still have to search out and correct mistakes. At least the line numbers will be narrowed down.

Here's how to type in the listing. First type in the program exactly as shown (including the REM) and LIST it to disk (LIST'D:TYP0) or cassette (LIST'C:'). Next type NEW and then ENTER the program again (ENTER'D:TYP0) or (ENTER'C:'). Now change the number 32000 in lines 32180 and 32200 to 32500 and RUN the program. Compare the chart with the printed chart. If they are different, check through the listing, make any corrections and go through the procedure again. When the charts agree, change the numbers 32500 back to 32000 in the above lines and LIST the program to a new disk or tape. This is your master TYP0 program.

## TYP0 IN USE

Follow this procedure exactly:

1. Type in a listing from the magazine.
2. LIST the program to disk (LIST'D:NAME) or cassette (LIST'C:').
3. Type NEW.
4. ENTER the program (ENTER'D:NAME) or (ENTER'C:').

5. Change to the disk or cassette with TYP0 on and enter TYP0 (ENTER'D:TYP0) or (ENTER'C:').

6. Type GOT0 32000. Type S for output to the screen or P for printer. The program will produce a chart. If the chart agrees with the one in the magazine, you have an identical listing. Well done!

7. The chart doesn't agree, does it! Examine the lines which do not agree and correct any errors.

8. If THE VARIABLE CHECKSUM AGREES go to step 6.

9. If the variable checksum does not agree, you MUST go to step 2 but you can skip step 5 as TYP0 will already be on the end of your program.

## HINTS ON FINDING ERRORS

If the variable checksum does not agree, you have either typed in lines in wrong order or misspelled a variable name. See the next paragraph to narrow down the area of error, and make the corrections. You must now go through the LIST/NEW/ENTER procedure again to put the variable name table in correct order.

The Length shown is the number of bytes within the program lines shown. The two letter code is essentially a checksum of "length" bytes within that range. If the length is correct and the code is wrong, you have made a spelling or punctuation error. Be careful though, as all keywords and operators are stored as one byte and the length might stay the same even though you type COLOR instead of SETCOLOR. If the length disagrees, you have added or deleted characters or spaces. If nothing obvious shows, pay special attention to REM statements, every space must be there.

TYP0 will get you an identical listing (eventually) but don't think it will do it automatically. You still have to search for errors and correct them but at least you will have an idea where they are. ▶

TYP0 is Copyright 1982 ANTIC magazine. Reproduced with permission.

## THE SOFTWARE REVIEWS

### A.C.E. The Atari Cassette Enhancer

ENGLISH SOFTWARE CO. 4K CASS.

If you write programs or type in listings from magazines and use a cassette, **BUY THIS PROGRAM** before you buy another piece of software. Your £7.95 will be the best investment you made since you bought your Atari.

What? You want to know why? Well, of prime consideration, A.C.E. verifies programs saved to tape, that is, you can save a program and then check to see if the recording is good without losing the program from memory. That's not all it does, A.C.E. has a host of other features. The program is in three sections which need not all be loaded if you do not require the facilities of a particular section. Option A gives you the facilities of saving and loading named programs, verifying, searching a tape for a specific program, getting a catalog of all programs on a tape and flashing the cursor. This section will take 2398 bytes of memory. Option B will give, in addition, a list of all variables and their current values at any stage, automatic line numbering and renumbering. This will take 3496 bytes in all. Finally, Option C gives you the ability to save and load binary files and hex/decimal conversions. This will bring memory usage up to 4148 bytes. As I said, you only need to load Option A if you want but you can't get the other options without having the previous one.

When you start a program session, boot in A.C.E. first and just leave it there. A.C.E. will remain resident until power-off and can be called at any time by preceding a command with @ (above the figure 8 on the keyboard). When you want to save your program you can name it as you would with a disk drive by typing @SAVE "Program Name" and then ask A.C.E. to verify that the SAVE was good by typing @VERIFY "Program Name". Your original program will remain in memory so if the save was bad, by again. No more lost programs. When you want to load a program, there is no need to know where it is on tape, just wind the tape back to the beginning and type @LOAD "Program Name" or @CRUN

"Program Name" and A.C.E. will go through the tape until it finds the program and will then load or load and RUN it automatically. No more problems in positioning the tape exactly.

The Option B facilities work just as well. Automatic line numbering may seem a luxury but can be quite a time saver when you get used to it, but the real power of this section is in the DUMP and RENUMBER routines. Renumber is so fast that you have to double check that it has been done. It can't change variables if they are used as line numbers but a REPORT facility allows you to identify all such variables in the program and change them manually. The DUMP routine will give you a full list of all variables with their current values to enable you to tidy up or keep track of your programs.

The Option C facilities are perhaps the least useful as you are most likely to have a disk drive if your programming is advanced enough to use binary files.

Taking into account that the majority of users, in this country at least, will not have disk drives, this is without doubt the finest Atari utility yet produced. It cannot be recommended too highly. Buy one now before English Software realise that they have a real gem they are selling at a ridiculous price!

### DOODLEBUG

SOFLOW SOFTWARE 16K/48K CASS.

Doodlebug is a drawing program which is suited to children of all ages (including middle-aged) as well as artistically inclined adults. With a little bit of knowledge in loading files, it could also serve as a very useful utility to add graphics to your programs. The program uses Graphics 11 to allow you 16 colours on the screen and drawings are made by using the joystick to move a cursor to the drawing position and then pressing the fire button to mark a point. Move the cursor to a new position and a line will be drawn connecting the two points. If you want continuous drawing, press the SELECT button. Along the bottom of the screen are 16 "paint pots" and you change colours by "dipping" your cursor in a pot and

pressing the fire button. One very useful facility is being able to change the whole background colour by dipping your cursor in a pot and pressing OPTION.

Drawings made are saved to tape or disk as files. If Soflow could supply a short listing to purchasers which would enable these files to be loaded into other programs, then Doodlebug would become a very useful graphics utility at a very reasonable price.

If you are at all artistically inclined, Doodlebug will allow you to compose some very sophisticated pictures and then save them to impress your family and friends later. If you have kids, just load in the program and give them a joystick, it will keep them quiet for hours.

A couple of minor criticisms are the lack of a fill command for covering areas you have boxed in and the fact that the cursor moves very slowly. Perhaps I am too impatient. The company sent me a tape with a ready-made picture and very impressive it was. With a little time you should be able to produce similar drawings.

Soflow promise to bring out a range of Atari programs at about £8.50 which must be good news. Doodlebug is a promising start. It does not claim to give all the facilities of Atari's new Paint, but then it does not cost £30.

## MAGIC WINDOW

QUICKSILVA

16K CASS.

Would you buy an Atari program from a company whose main products are for the ZX81 and the Spectrum? No, neither would I, but in the case of Magic Window from Quicksilva, both you and I would be missing out on a really excellent program.

Magic Window is a Character Generator controlled entirely by the joystick which enables you to create any number of character sets and save them to tape to be merged into your own programs. The program creates a routine which occupies lines 0 to 11 of a program and you need to only make sure that

you don't use these lines in your program. Ready the cassette with you character set on and type "ENTER'C:". That's it. Nothing more to do. When you run your program, the character set will be automatically changed, there is nothing for you to work out.

The screen display gives you a large 8 x 8 grid on the upper left in which you plot or unplot points by pressing the joystick fire button, and a range of menu options to enable you to edit characters from the existing set. You choose an option by moving the cursor over the item and pressing the trigger. Two character sets are shown on the screen, the standard Atari character set and the new set you have created. You can place images you have created anywhere in the new set. In the centre top is a small grid which holds 16 characters altogether so that you can see how your redefined characters will look when printed next to or above each other. This is particularly useful if you need to create an image which is too big for a single character. You can mix characters quite freely in this grid.

One of the real joys of this program is that it supports the Antic modes 4 and 5 which give you the equivalent of five colours on a Graphics 0 screen. There are limitations though and characters are very difficult to design in these modes as you are effectively limited to 4 pixels width in each character. Using Magic Window however takes away all the problems although you still need some imagination to produce good images. One of the menu options gives you Data for the image and this is particularly useful in Antic modes 4 and 5 where you will probably need only a few characters redefined to include in your own program. You don't have to use Magic Window's save and load facilities if you know the data make-up of your new character.

I find that using character editors still leaves problems in design. For example, just where do you put all those tails and squiggles to get script writing? It is not easy if you are not artistically inclined. No problem with Magic Window, there are three character sets already defined on the tape, just load one in and take a look. The character sets are script, a

demonstration of artifacting in Graphics 8 and a full-blown demonstration of combining characters in Artic 4 or 5 to produce space invaders, animals or little men. Even if you never design a character set of your own, Magic Window is worth the money just to be able to include one of its ready defined sets in your own program.

I picked this up out of curiosity and have ended up writing games which I would not have attempted before. It really is that easy to use that anyone who can write simple programs can have a whole new programming world opened up to them. Another one highly recommended at a very reasonable price.

## VENUS VOYAGER 16K CASS.

ENGLISH SOFTWARE CO.

### 1 PLAYER

Venus Voyager is a space navigation and rescue game in which you have to navigate your spacecraft down fissures in the planet's surface in order to rescue six men who are stranded in underground caverns. The screen display uses display list interrupts to give graduated bands of colour which gives a nice effect but the graphics of the fissures are a bit blocky. There are a good number of hazards about including space mines, power stations and an orbiting supply ship which often gets in the way.

The game seems simple enough but is in fact very difficult to play. You control your craft by moving the joystick left or right and by pressing the fire button to apply thrust to slow down your descent. Gravity has quite a strong effect on this planet. The problems come in trying to get down the fissures for the spacecraft seems to float about a little too freely. There is only just enough room in the fissures to navigate and they all have little twists and turns. If you do manage to get to the bottom of a fissure, the screen changes to give you an enlarged view of the lower part of the cavern with your stranded compatriots in an underground bunker. There are a couple of landing pad protectors floating about but these do not give too much trouble. The landing pad however is only just big

enough for your craft and you must land at the right speed as well as squeeze onto the pad. If you land, the man to be rescued will come to your craft and wave goodbye to enable you to start another rescue. Do this six times in all and you will progress to the next level although goodness knows how difficult that is.

As well as navigating problems, you have to keep an eye on your fuel and either dock with the supply ship or land on a pad to refuel. Again, watch your speed—it must be precise. With all of the hazards and the difficulty in precisely controlling your craft, Venus Voyager is a very difficult game to play and this has been confirmed by someone who has scored over 3 million on Defender! Try it if you dare.

## Listing Conventions

From this issue the program listings have a different format making them hopefully easier to follow.

As far as possible, the listings will be 38 characters wide to allow you to match up to the screen, but where control characters are explained in a line this will not be possible.

Three types of characters are difficult to reproduce in a listing—Inverse, Control and Inverse Control.

**INVERSE**—all characters to be typed in inverse are underlined.

**CONTROL**—characters which require the CTRL key to be pressed are shown in square brackets [ ]. Press CTRL and the key shown in the bracket. Characters which require the ESC key to be pressed first will show ESC CTRL followed by a word or words to describe the key to be pressed. You may have to refer to your Basic Reference Manual if you do not understand some of the keys.

**INVERSE CONTROL**—characters will be shown in pointed brackets <>. Follow the instructions for control characters but press the Atal key first.

The listings should be typed as accurately as possible and **MUST** be typed exactly if TYPO is used to check them.

All programs featured in PAGE 5 will run in 16K unless otherwise stated.

# First Steps

Les Ellingham

No-one sent in any suggestions for improving John Dimmer's program in Issue 4 and I can therefore only assume that readers of this column are either not advanced enough to attempt changes in programs or else nobody reads the column because it is too basic (pardon the pun). Unless readers really do want a column on hints and tips when first starting and show it by writing in, this may be the last First Steps.

As nobody else was brave enough, I will see if I can find any areas for improvement in John's program. Firstly though let's look at the good points of the program.

Any program should have some sort of introduction to show that something is happening once you hit return. With short programs this may not be too important, but once you get to writing programs which require a lot of initialisation, there may be quite a wait with a blank screen before the user realises that the program is actually running. Not so good. John's program has a title and line 9 is an excellent idea as, whilst the words are not strictly true (i.e. the main program is not actually loading), the user is expecting to wait a short while. Further on, line 75 opens the keyboard for getting characters without pressing RETURN. This can be important for non-computerists, for if they are asked to press a key, why should they think of pressing another key as well? Write your programs with others in mind. Redefining the character set was a brave step in a simple program but is well worth trying. The £ sign produced is perhaps too large though—try using DATA 0,62,64,48,120,64,120,0.

The main limitation in the program is in actually defining fixed categories within the program code which requires you to actually change the code if you want different categories. There is an advantage in that you can SAVE the program without learning about printing strings etc. so tape and you do not have to know about string manipulation. There is a better way though of including the categories

without resorting to string storage and that is to use READ and DATA. If you also place the figures for each category in an array, changing the categories would require only changes in one or two lines. Take lines 83-90 and try this. Change line 81 to

```
81 DIM D(12),H(20),R(20),J(10):FOR I=
  1 TO 8:J(I)=0:NEXT I
```

and then replace lines 83-90 with the following

```
83 RESTORE 99:FOR J=1 TO 8:READ A$:POS
  ITION 2,J:50? A$:POSITION 27,J:50? " "
  GOTO 94:94? " " :NEXT J
  98 DATA MORTGAGE REPAYMENTS,SHOPMENT
  INSURANCE,LOCAL RATES,BANK PERSONAL LO
  AN,VIDEO HIRE,TV HIRE
  99 DATA HIRE PURCHASE LOAN,HISCELLANED
  US
```

You will of course need to put the appropriate figures in the array J and this can be done by altering lines 102 to 110. There is an easy way to eliminate all those IF... THEN statements as follows.

```
102 GET K4,I:DAT=2-64
  103 ? CHR$(I) 2" = "":INPUT S$(K4):CAT
  =S$(K)
```

Note that 8 program lines have been reduced to two lines and only three variables are used instead of 9. Note also the introduction of more meaningful variable names which help to make the program more readable and easier to remember. Finally change line 125 to

```
125 FOR I=1 TO 8:HH=J(I):NEXT I
```

Note that there is no error checking in the program so that if you press the wrong key you will get an error

By using an array like this, it is very easy to add further categories simply by increasing the size of the array.

There you have a few possible changes, but there are many more that could be made. I hope though that these few examples have given you just a bit more insight into programming. ■

## UP, UP AND AWAY

A 16k MACHINE CODE GAME FOR THE ATARI FAMILY

### £14.95

(DISK OR CASSETTE)

"Incorporating just the right blend of humour, skill, graphics and sound—quite likely to start a trend towards less violent, high quality graphic games." PERSONAL COMPUTER NEWS

"When you are tired of Star Raiders, Space Invaders and Pacmen, why not get quietly frustrated with Up, Up and Away?"

PERSONAL COMPUTER GAMES

"Graphically superb—this game shows that there are in Britain at last programmers capable of producing the goods for the Atari."

PAGE 6 INTERNATIONAL

"Among the best graphics seen. The five skill levels should provide a long lasting challenge."

HOME COMPUTING WEEKLY

Coming shortly . . .

## SAVAGE POND

A truly remarkable depiction of life cycles in a freshwater environment. A semi-educational programme with high resolution graphics, crammed with thrills, spills and excitement.

also

## SENTINEL

Stand fast over the plains and mountains of our beloved Earth, as we guard our planet against the awesome might of the Sirian invaders. Computer warfare at it's most savage brilliance.

# Colour Selector

Les Ellingham

One of the simplest ways to achieve a professional polish to your programs is to use colour effectively. Even the simplest of programs in Graphics 1 or 2 can be made to look special by carefully choosing the colours of the text. Remember, in these modes you can have five colours including background on the screen without resorting to fancy tricks—just use upper and lower case and inverse.

Various books and manuals have charts of SETCOLOR values and some even have printed colour charts, but no printed page can convey the full range of Atari's 256 colours, particularly as the colours can look different depending on the background and will vary from television to television. The usual way to achieve the right balance is to experiment and change colours one by one until the desired result is obtained. As this can be a long process, I decided to write a short Utility which would take away the guesswork and show colours in close relation to each other as well as providing all the important SETCOLOR and POKE values. The result is Colour Selector.

The utility itself is very easy to use. Just choose a Setcolor statement by pressing keys 0-4 and a marker will indicate which statement you will be changing. Press the right and left arrow keys to cycle up and down through the colours available. To change to another register, press SELECT and choose again. When you have achieved the balance you require, note down the SETCOLOR or POKE values to use in your own programs.

The program, although relatively simple, is interesting in that it introduces both the concepts of custom display lists and display list interrupts. Lines 1000-1050 set up a display list which comprises three lines of Graphics 0 followed by two blank lines, four lines of Graphics 1, two blank lines, four lines of Graphics 2, two blank lines, one line of Graphics 3 followed by two more blank lines, five lines of Graphics 0, two blank lines and finally two lines of Graphics 0. This may sound quite complicated but all the information to build this display list is in line 1550 and the whole display list routine only takes five program lines. The introduction of blank lines

in the display gives a very pleasing effect and also helps to balance out the display list to the required 192 scan lines and assists in overcoming a small problem in the display list interrupt which does not always give a clean separation of colours when the keyboard is in use.

Now, display lists are one thing but Display List Interrupts are an entirely different proposition. Altering the display list itself is easily accomplished from Basic but Interrupts require the use of machine language and my understanding of machine language is about as deep as the average man's knowledge of nuclear physics! What I required was a way to keep the bottom half of the screen the same colour irrespective of what was being done to the registers which would normally control the background and text. Without this there would be problems in reading the information when the colours were changed. I remembered a routine in *De Re Atari* which does just this and duly typed it in. There was just one small problem, the routine on page 5-3 of *De Re Atari* does not work! Experimentation, they say, is the secret of learning programming techniques and after a few hours I had some small understanding of the routine, despite starting from absolute scratch. I can now proudly present in lines 1110-1130, a corrected version of a routine from *De Re Atari*!

To enable display list interrupts you must add 128 to the line before the one you wish to change, which is why in line 1030 a 128 follows the three 7's. Try changing this back to 7 and adding 128 to another number and see what happens. I won't explain the machine language routine (I can't!) but if you want to change the colour of the bottom half of the screen, just change the figure 18 in line 1120 to change the background and the figure 14 to change the text. The numbers to use are the same as you would use to POKE a colour register.

That's it then—Colour Selector—a simple utility which ended up teaching me quite a lot about display lists. Don't be afraid to experiment, you may surprise yourself. I would never have dreamed of presenting a correction to *De Re Atari*. What next? ■

## Line Lister

L. A. Lawson, Suffolk

This short addition to any program will enable the user to check for typing errors and to correct any errors found.

After you have typed in your program listing, add the following lines:

```

32500 FOR I=0 TO 9999
32510 ? CHR$(125);I:LIST I
32520 IF PEEK(744)=3 THEN NEXT I
32530 POKE 744,255
32540 IF PEEK(744)=255 THEN 32560
32550 NEXT I

```

The 9999 in line 32500 should be replaced with the highest line number of the program you wish to be checked. Start off by typing GOTO 32500 and the first line of your program will be displayed on an otherwise clear screen. For each subsequent line, just hit the space bar.

If a typing error is found, hit the 'BREAK' key and make the correction in the usual way. To resume checking, type I=xxxx, where xxxx is the number of the line just corrected.

Remember to delete lines 32500 to 32560 before saving your program to tape or disk. ■

## A SHORT ONE

```

10 GRAPHICS 23
15 FOR X=1 TO 47:FOR Y=1 TO 47
18 COLOR RND(0)*3
20 PLOT 60=X,40=Y:PLT 60=Y,40=X:PLT
   60=X,40-Y:PLT 60=Y,40-X:PLT 60-X,40+
   Y:PLT 60=Y,40+X:PLT 60-X,40+Y
35 PLOT 60-Y,40-X:PLT 60-X,40-Y
38 NEXT Y:NEXT X
40 GOTO 15

```

This page is put aside each issue for the exclusive use of Birmingham User Group

# Bug Club Call

## BEGINNERS BASIC COURSES

Mike Aston's Basic Course will be starting again around about the second meeting in September and if you did not attend the previous course make sure that you get along to this one if you want to make a start on writing your own programs. The course is aimed at the absolute novice so don't stay away thinking you are not clever enough. There will be something like seven talks altogether beginning with an understanding of the Basic commands and building up to more complex applications. If you have a little knowledge of Basic, why not sit in on the later talks?

## FUTURE TALKS

If you have a reasonable knowledge about a particular subject and perhaps can write a few demonstration programs why not consider giving a talk at a future meeting? It may seem daunting but remember that many of the Club members would like to see and hear practical demonstrations of many of the things they read in the magazines. Perhaps Display Lists, Player-Missiles, Game Design, Sound Effects are your forte? Whatever, other Club members would like to hear from you. Please have a word with Mike Aston at the next meeting to organise a little talk. We seem to have run a little short of ideas over the summer. YOU can help.

## MODEMS

Does any member have a Modem? We would be interested in discussing future projects involving communication and again please see Mike Aston in the first instance if you are interested. There are several GPO engineers in the membership who could no doubt give some good technical advice. How about it?

## SOFTWARE LIBRARY

This report from Steve Gould:

Having now dropped my position as Treasurer, I can devote all my attention to the Software Library and second-hand software board.

I must say that both of these have been very successful, more so than I imagined. We now have approx. 80 items in the Library with new

programs/books arriving every meeting. Latest additions include Zaxxon, Defender and Miner 2048r which have all been graciously donated by members as their 'membership fee' of the Library or purchased from funds generated at the meetings. All programs are only purchased for the scheme as unwanted software from members as we do not wish to offend retailers who provide members with generous discounts.

For the benefit of any Club members who are not members of the Library, the rules are quite simple. A Club member may join the Library by donating a program or paying a once only fee of £5.00. Thereafter, cassettes or disks can be hired for £1.50 per 2 week period with a maximum loan of 1 month. ROMs are £2.00 for 2 weeks and books 50p. If you have not joined why not do so, but remember you must be a Club Member.

The second-hand software board is working very well and most programs don't stay 'pinned up' for long. Such bargains as Star Raiders for £10.00 and Jumbo Jet Pilot for £15.00 have been seen in recent weeks. We don't charge for this scheme, it's simply another service for members.

As far as the Software Library is concerned there is enthusiasm amongst the members, it just needs the right spark to light the fire.

Signing off for now—see you all at the next meeting.

Steve Gould.

**PLEASE NOTE THAT AT PRESENT THE LIBRARY FACILITIES ARE ONLY AVAILABLE TO MEMBERS WHO ATTEND CLUB MEETINGS.**

## TECHNICAL LIBRARY

The Club has almost all of the technical reference books for the Atari which are available for members' consultation. Please see Colin Boswell who can also supply you with disks at a very reasonable cost.

**SHARE IT WITH OTHERS—THAT'S WHAT THE CLUB IS ALL ABOUT.**

## THE FILING CLERK

Complete Form for  
 Capital Gains Tax  
 Annual Return Computer  
 with Home Information

**£14.95**

The Filing Clerk is a simple to operate filing system for use on your Atari. Only 10k RAM is required but the program operates to the extent of available memory up to 48k. Information is clearly displayed on your TV or monitor. Touch release to the number of data categories that you can create, up limit to the number of user. The program has been set up with categories for the most popular use:

• Small scale Accounts • Tax • Job • Salary Payments  
 • Loan • Personal or Job Statement Information

• Investment Accounts • Savings Bonds  
 • Long Term Capital Gains • Interest on Loan for  
 • Interest on Loan

Enter the category by one easy routine and create:

- Your own software catalogue • Library records
- Loan Inventory • Hobby statistics • Collections records

Information can be stored in data order to set up:

- Your appointments diary • Birthday Anniversaries records
- Car maintenance records • Budgeting records

Lots of uses for storing information:

- Cost sheets and receipts • Sporting results and records

In fact—all of your own applications. An excellent aid.

Clear instructions are provided for you so get the best results from this super value program.

## SUPER CATALOG

Just **£4.95**

Software Counter is the Mail Order Service from your Home Entertainment Atari Centre. We dedicated to Atari and associated products, we are the specialist—and we know, we have you on the Super Catalog. Information to the Super Catalog. You can check for a Title, or read screen. You can check for a Title, or read screen through a Publications Range. You can view items through a given RAM requirement and to display a list of a selected media. Choose within a price range as required.
