This manual is not intended to "teach" BASIC. It is a reference guide to the commands, statements functions, and special applications of ATARI ${ }^{\circ}$ BASIC.

Many of the programs and partial programming examples used in this manual are photostats of listings printed on an ATARI printer. Some of the special symbols in the ATARI character set do not appear the same on the printer, e.g., the clear screen symbol " $\rightarrow$ " appears as a " ${ }^{\prime \prime}$. The examples in the text were chosen to illustrate a particular function-not necessarily "good" programming techniques.

Each of the sections contains groups of commands, functions, or statements dealing with a particular aspect of ATARI BASIC. For instance, Section 9 contains all the statements pertaining to the unique graphics capabilities of ATARI Home Computers. The appendices include quick references to terms. error messages, BASIC keywords. memory locations, and the ATASCII character set.

As there is no one specified application for the ATARI Home Computer System, this manual is directed at general applications and the general user. Appendix H contains programs that illustrate a few of the ATARI computer system's capabilities.

This revision of the manual includes information on the ATARI 1200 XL Home Computer and the GTIA graphic modes. The ATARI 400/800 Home Computers may not contain all the features in this manual.

This section explains BASIC terminology, special notations, and abbreviations used in this manual, and the special keys on the ATARI Home Computer keyboard. It also points to other sections where BASIC commands deal with specific applications.

## TERMINOLOGY

BASIC: Beginner's All-purpose Symbolic Instruction Code.
BASIC Keyword: Any reserved word "legal" in the BASIC language. May be used in a statement, as a command, or for any other purpose. (See Appendix A for a list of all "reserved words" or keywords in ATARI BASIC.)
BASIC Statement: Usually begins with a keyword, like LET, PRINT, or RUN. Keywords are shown in heavy capital letters.
Command String: Multiple commands (or program statements) placed on the same numbered line if statement numbers are used, or the same logical line if direct mode is used. The commands must be separated by colons.
Constant: A constant is a value expressed as a number rather than represented by a variable name. For example, in the statement $X=100, X$ is a variable and 100 is a constant. (See Variable.)
Expression: An expression is any legal combination of variables, constants, operators, and functions used together to compute a value. Expressions can be either arithmetic, logical, or string.
Floating Point Number: A number containing an integer part, a decimal point, and a fractional part. The total number of significant digits in a floating point number, excluding the exponent, is nine.

Function: A function is a computation built into the computer so that it can be called for by the user's program. A function is NOT a statement; it is part of an expression. It is really a subroutine used to compute a value which is then "returned" to the main program when the subroutine returns. COS (Cosine), RND (random), FRE (unused memory space), and INT (integer) are examples of functions. In many cases the value is simply assigned to a variable (stored in a variable) for later use. In other cases it may be printed out on the screen immediately. See Section 6 for more on functions. Examples of functions as they might appear in programs are:

10 FRTNT RNO(0)<br>(print out the random<br>number returned)<br>$10 \times=100+\mathrm{COS}(46)$<br>(add the value re-returned to 100 and store the total in variable X )

Logical Line: A logical line consists of one to three physical lines, and is terminated either by the RETURN key or automatically when the maximum logical line limit is reached. Each numbered line in a BASIC program consists of one logical line when displayed on the screen. When entering a line which is longer than one physical line, the cursor will automatically go to the beginning of the next physical line when the end of the current physical line is reached. If RETURN is not entered, then both physical lines will be part of the same logical line.
Operator: Operators are used in expressions. Operators include addition ( + ), subtraction ( - ), multiplication (*), division ( $/$ ), exponentiation ( $\wedge$ ), greater than ( $>$ ), less than $(<)$, equal to $(=)$, greater than or equal to $(>=$ ), less than or equal to ( $<=$ ), and not equal to $(<>)$ ). The logical keywords AND, NOT and OR are also operators. The + and - operators can also be used as unary operators; e.g., -3. Do not put more than one unary operator in a row; e.g., --3, as the computer may interpret it incorrectly.
Physical Line: One line of characters as displayed on a television screen.
String: A string is a group of characters enclosed in quotation marks. "ABRACADABRA" is a string. So are "ATARI MAKES GREAT COMPUTERS" and " 123456789 ". A string is much like a constant, as it too, may be stored in a variable. A string variable is different, in that its name must end in the character $\boldsymbol{\$}$. For example, the string "ATARI COMPUTER" may be assigned to a variable called A\$ using (optional) LET like this:

> 1. 1 ET AD="ATABT COMFUTER" (note quotation marks) 20 AD:="ATABT COMPUTER"
(LET is optional; the quotes are required.)

Quotation marks may not be used within a string. However, the closing quotation can be omitted if it is the last character on a logical line. (See Section 7STRINGS)
Variable: A variable is the name for a numerical or other quantity, which may (or may not) change. Variable names may be up to 120 characters long. However, a variable name must start with an alphabetic letter, and may contain only capital letters and numerical digits. Do not use a keyword as a variable name or as the first part of a variable name as it is not interpreted correctly. Examples of storing a value in a variable:

| 10 | LET | CT230UE $=1.234$ |
| :---: | :---: | :---: |
| 20 | LET | VARTABLE $112=267.543$ |
| 30 | LET | $A=1$ |
| 40 | LET | F5TH=6.5 |
| 50 | L.ET | THISNO=59.009 |

Note: LET is optional and may be omitted.
Variable Name Limit: ATARI BASIC limits the user to 128 variable names. To bypass this problem, use individual elements of an array instead of having separate variable names. BASIC keeps all references to a variable that has been deleted from a program, and the name still remains in the variable name table.

If the screen displays an ERROR-4 (Too Many Variables) message, use the following procedure to make room for new variable names:
LTST filespec

NEW

ENTEF PAMESPe
The LIST filespec writes the untokenized version of the program onto a disk or cassette. NEW clears the program and the table areas. The program is then reentered, re-tokenized, and a new variable table is built. (The tokenized version is Atari BASIC's internal format. The untokenized version is in ATASCII, which is the version displayed on the screen).
Arrays and Array Variables: An array is a list of places where data can be filed for future use. Each of these places is called an element, and the whole array or any element is an array variable. For example, define "Array A" as having 6 elements. These elements are referred to by the use of subscripted variables such as $\mathbf{A}(2), \mathbf{A}(3), \mathbf{A}(4)$, etc. A number can be stored in each element. This may be accomplished element by element (using the LET statement), or as a part of a FOR/NEXT loop (see Chapter 8).
Note: Never leave blanks between the element number in parentheses and the name of the array.

| Correct | Incorrect |  |
| :--- | :--- | :--- |
| A(23) | A | (23) |
| ARRAY(3) | ARRAY | (3) |
| X123(38) | X123 | (38) |

## SPECIAL NOTATIONS USED IN THIS MANUAL

Line Format: In deferred mode, the format of a line in a BASIC program includes a line number (abbreviated to lineno) at the beginning of the line, followed by a statement keyword, followed by the body of the statement and ending with a line terminator command (RETURN key). In an actual program, the four elements might look like this:

STATEMENT

## Line Number 100

$\overbrace{$|  Keyword  |
| :---: |
|  PRINT  |}$^{\text {A/X * Body }(Z+4.567)}$

## Terminator

RETURN key
Several statements can be typed on the same line provided they are separated by colons (:). See IF/THEN in Section 4. In direct mode, the format is identical, except that no line number is used, and the statement is processed immediately after the RETURN key is pressed.
Bold Capital Letters: In this manual, denote keywords to be typed by the user in upper case form exactly as they are printed in this text. Here are a few examples:
PRINT INPUT LIST END GOTO GOSUB FOR NEXT IF
Capital Letters: In this manual, are used to identify keys on the keyboard, such as RETURN, SELECT, etc
Lower Case Letters: In this manual, lower case letters are used to denote the various classes of items which may be used in a program, such as variables (var), expressions (exp), and the like. The abbreviations used for these classes of items are shown in Table 1-1.
Items in Brackets: Brackets, [ ], contain optional items which may be used, but are not required. If the item enclosed in brackets is followed by three dots [,exp...], it means that any number of expressions may be entered, but none are required
Items stacked vertically in braces: Items stacked vertically in braces indicate that any one of the stacked items may be used, but that only one at a time is permissible. In the example below, type either the GOTO or the GOSUB.
$100\left\{\begin{array}{c}\text { GOTO } \\ \text { GOSUB }\end{array}\right\} 2000$
Command abbreviations in headings: If a command or statement has an abbreviation associated with it, the abbreviation is placed following the full name of the command in the heading; e.g., LET (L.)

## ABBREVIATIONS USED IN THIS MANUAL

The following table explains the abbreviations used throughout this manual:

## TABLE 1.1 ABBREVIATIONS

| AVAR | Arithmetic Variable: A location where a numeric value is stored. Variable <br> names may be from 1 to 120 alphanumeric characters, but must start with an <br> alphabetic character, and all characters must be unreversed and all alpha <br> characters must be upper case. |
| :--- | :--- |
| SVAR | String Variable: A location where a string of characters may be stored. The <br>  <br>  <br> same name rules as avar apply, except that the last character in the variable <br> name must be a $\$$ String variables may be subscripted. See Section 7, |
|  | STRINGS. |

VAR Variable: Any variable May be MVAR, AVAR, or SVAR
AOP Arithmetic operator. $(+-* / \wedge$ )
LOP Logical operator. (NOT AND OR)
AEXP Arithmetic Expression: Generally composed of a variable, function, constant, or two arithmetic expressions separated by an arithmetic operator.
LEXP Logical Expression: Generally composed of two arithmetic or string expressions separated by a logical operator. Such an expression evaluates to either a 1 (logical true) or a 0 (logical false).
For example, the expression $1<2$ evaluates to the value 1 (true) while the expression "LEMON" = "ORANGE" evaluates to a zero (false) as the two strings are not equal.
SEXP String Expression: Can consist of a string variable, string literal (constant), or a function that returns a string value
Exp Any expression, whether sexp or aexp
LINENO Line Number: A constant that identifies a particular program line in a deferred mode BASIC program. Must be any integer from 0 through 32767. Line numbering determines the order of program execution.
ADATA ATASCII Data: Any ATASCII character excluding commas and carriage returns. (See Appendix C.)
FILESPEC File Specification: A string expression that refers to a device such as the keyboard or to a disk file. It contains information on the type of I/O device, its number, a colon, an optional file name, and an optional filename extender (See OPEN, Section 5.)
Example filespec: "D1:NATALIE.ED"

## OPERATING MODES

Direct Mode: Uses no line numbers and executes instruction immediately after RETURN key is pressed.
Deferred Mode: Uses line numbers and delays execution of instruction(s) until the RUN command is entered.

Execute Mode: Sometimes called RUN mode. After RUN command is entered, each program line is processed and executed.
Memo Pad Mode: A non-programmable mode that allows the user to experiment with the keyboard or to leave messages on the screen. Nothing written while in Memo Pad mode affects the RAM-resident program.

## SPECIAL FUNCTION KEYS

CAPS

ESC

BREAK

SYSTEM RESET System Reset key: Similar to BREAK in that pressing this key stops program execution. Also returns the screen display to Graphics mode 0, clears the screen, and returns margins and other variables to their default values.
SET-CLR-TAB
Tab key: Press SHIFT and the SET-CLR-TAB keys simultaneously to set a tab. To clear a tab, press the CTRL and SET-CLR-TAB keys simultaneously. Used alone, the SET-CLR-TAB advances the cursor to the next tab position. In Deferred mode, set and clear tabs by preceding the above with a line number, the command PRINT, a quotation mark, and press the ESC key.

## Examples: <br> 100 PRINT "ESC SHIFT SET-CLR-TAB" 200 PRINT "ESC CTRL SET-CLR-TAB"

Default tab settings are placed at columns $7,15,23,31$, and 39. The leftmost screen position is column 0 , but entry begins in column 2. A total of 38 columns (or character positions) can be shown in one line on the screen.

## INSERT

Insert key: Press the SHIFT and INSERT keys simultaneously to insert a line. To insert a single character, press the CTRL and INSERT keys simultaneously.
DELETE BACK S Delete key: Press the SHIFT and DELETE keys simultaneously to delete a line. To delete a single character, press CTRL and DELETE simultaneously.
DELETE BACK S Back Space key: Pressing this key replaces the character to the left of the cursor with a space and moves cursor back one space.
CLEAR Clear key: Pressing this key while holding down the SHIFT or CTRL key blanks the screen and puts the cursor in the upper left corner.
RETURN
Return key: Terminator to indicate an end of a line of BASIC. Pressing this key causes a numbered line to be interpreted and added to a BASIC program RAM. An unnumbered line (in Direct mode) is interpreted and executed immediately. Any variables are placed in a variable table.

## 1200XL KEYS AND INDICATORS

The keys and indicators described in this section are for the 1200XL only.

POWER-ON INDICATOR
L1 INDICATOR
L2 INDICATOR
FUNCTION KEY F1 This key moves the cursor up in one-line increments. It repeats if held down. If used with the shift key, the cursor moves to the upper left corner (also called "home position') of the screen. If used with the control key, it acts as a toggle to enable or disable the keyboard. LED 1 is lighted when the keyboard is disabled.

FUNCTION KEY F2 This key moves the cursor down in one-line increments. It repeats if held down. If used with the shift key, the cursor moves to the lower left corner of the screen. If used with the control key, it acts as a toggle to enable or disable the video presentation. When the video presentation is disabled, the processing speed of the 1200XL is increased
FUNCTION KEY F3 This key moves the cursor to the left in one-space increments. It repeats if held down. If used with the shift key, the cursor moves to the left side of the screen. If used with the control key, it acts as a toggle to enable or disable the key click sound
FUNCTION KEY F4 This key moves the cursor to the right in one-space increments. It repeats if held down. If used with the shift key, the cursor moves to the right side of the screen. If used with the control key, it allows the user to select either the domestic or European character set. Each time the 1200XL is powered up, the domestic character set is selected by the operating system. When the European character set is selected (by the user), LED 2 is lighted.

## HELP KEY

This key provides user access to additional information on the operation currently in progress, if the programming for that function has been implemented.

## ATARI 1200XL SELF TEST

The self-test function allows the user to verify that the 1200XL is fully operational. To begin the test, remove any cartridge and turn off any disk drive. Press SYSTEM RESET. A dynamic rainbow ATARI should appear on the screen. Press HELP to view the self-test menu.

Use the SELECT key to pick any or all of the tests. The selection that is flashing is the current selection. Press START to begin the test. The test cycles repeatedly until either the HELP key or the SYSTEM RESET key is pressed. The HELP key returns to the menu; the SYSTEM RESET key reboots the system and displays the rainbow ATARI again

The memory test displays two long bars in line. Each bar represents one of the 8 K ROMs that contain the operating system. If a bar turns green, the corresponding ROM is good; if the bar turns red, the ROM is bad Immediately below the ROM test display, the RAM test is displayed in three segmented lines.

The RAM test displays a total of 48 color segments, each representing 1 K of RAM. As each 1 K segment is tested it is shown in white, and if it is good it turns to green. If a segment turns to red, the corresponding 1 K of RAM is bad. As each segment of RAM is tested, LED1 and LED2 are turned on alternately, providing a test for them also.

The keyboard test displays a keyboard on the screen. As each key is pressed, the "key" on the screen is shown in inverse video and a tone is generated.

The audio-visual test displays a musical staff containing six notes. The test cycles through four "voices" of six notes each, generating a tone as each note is displayed.

If the ALL TEST is selected, the 1200 cycles through the entire range of tests continuously. The keyboard test is performed by the computer using a random selection of 10 to 20 keys being tested on the screen.

## LOGICAL OPERATORS

The logical operators consist of two types: unary and binary. The unary operator is NOT. The binary operators are:

## AND Logical AND

OR Logical OR

## Examples:

If both expressions true.
$A=+1$ : otherwise
$A=0$.

If either expression true, $A=+1$ : otherwise $A=0$.

40 A№t ( $4+1$ )
If expression is false.
$A=+1$; otherwise
$A=0$.
The rest of the binary operators are relational.
$<\quad$ The first expression is less than the second expression.
$>\quad$ The first expression is greater than the second.
$=\quad$ The expressions are equal to each other.
$<=$ The first expression is less than or equal to the second
$>=$ The first expression is greater than or equal to the second.
$<>$ The two expressions are not equal to each other.
These operators are most frequently used in IF/THEN statements and logical
arithmetic.

## OPERATOR PRECEDENCE

Operations within the innermost set of parentheses are performed first and proceed out to the next level. When sets of parentheses are enclosed in another set, they are said to be "nested." Operations on the same nesting level are performed in the following order:
Highest $<,>=,<=,>=,<>$ Relational operators used in string expres. precedence sions have same precedence and are performed from left to right.

- Unary minus.
$\wedge$ Exponentiation.
*, 1 Multiplication and division have the same precedence level and are performed from left to right.
,+- Addition and subtraction have the same precedence level and are performed from left to right.
$<,>,=,<=,\rangle=,<>$ Relational operations in numeric expressions have the same precedence level from left to right.
NOT Unary operator
AND Logical AND
Lowest
OR Logical OR
precedence

## BUILT-IN FUNCTIONS

The section titled FUNCTION LIBRARY explains the arithmetic and special functions incorporated into ATARI BASIC.

## GRAPHICS

ATARI graphics include 16 graphics modes for the ATARI 1200, and 12 graphics modes for the ATARI 400 and 800 if the GTIA chip is installed, and 9 modes if the CTIA chip is installed. The commands have been designed to allow maximum flexibility in color choice and pattern variety. Section 9 explains each command and gives examples of the many ways to use each.

## SOUND AND GAMES CONTROLLERS

The ATARI Home Computer is capable of emitting a large variety of sounds including simulated explosions, electronic music, and "raspberries." Section 10 defines the commands for using the SOUND function and for controlling paddle, joystick, and keyboard controllers.

## WRAPAROUND, KEYBOARD ROLLOVER, AND KEY REPEAT

The ATARI Home Computer System has screen wraparound thus allowing greater flexibility. It also allows the user to type one key ahead. If the user presses and holds any key, it begins repeating after $1 / 2$ second.

## ERROR MESSAGES

If a data entry error is made, the screen display shows the line reprinted preceded by the message ERROR- and the offending character is highlighted. After correcting the character in the original line, delete the line containing the ERROR- before pressing RETURN. Appendix B contains a list of all the error messages and their definitions.

If the error line contains deferred screen edit function keys, the error message may become disoriented. Use the LIST command to edit error line.

Whenever the cursor ( $\square$ ) is displayed on the screen, the computer is ready to accept input. Type the command (in either Direct or Deferred mode), and press RETURN. This section describes the commands used to clear computer memory and other useful control commands. The commands explained in this section are the following:

| BYE | NEW |
| :--- | :--- |
| CONT | REM |
| END | RUN |
| LET | STOP |
| LIST |  |

## BYE (B.)

## Format: BYE <br> Example: BYE

If you have an ATARI 400/800 Home Computer, the BYE command exits BASIC and puts the computer in Memo Pad mode. This allows the user to experiment with the keyboard or to leave messages on the screen without disturbing any BASIC program in memory. To return to BASIC, press SYSTEM RESET.

If you have an ATARI 1200XL Home Computer, the BYE command exits to the power-up display, the rainbow ATARI symbol. At this time you can have the 1200XL perform SELF-TEST by pressing the HELP key.

## CONT (CON.)

## Format: CONT <br> Example: CONT

Typing this command followed by a RETURN causes program execution to resume. If a BREAK key is pressed, or a STOP, or END command is encountered, the program stops until CONT command is entered. Execution resumes at the next sequential line number following the statement at which the program stopped.
Note: If the statement at which the program is halted has other commands on the same numbered line which were not executed at the time of the BREAK, STOP, or END, they will not be executed. On CONT, execution resumes at the next numbered line. A loop may be incorrectly executed if the program is halted before the loop completes execution.

This command has no effect in a Deferred mode program.

## END

## Format: END <br> Example: 1000 END

This command terminates program execution and is used in Deferred mode. In ATARI BASIC, an END is not required at the end of a program. When the end of the program is reached, ATARI BASIC automatically closes all files and turns off sounds (if any). END may also be used in Direct mode to close files and turn off sounds.

## LET (LE.)

Format: [LET] var = exp
Example: LET $X=3.142$ * 16
LET $X=2$
The keyword LET in the example above is optional in defining variables. It can just as easily be left out of the statement. It is often used to set a variable name equal to a value.

## LIST (L.)

Format: LIST [lineno [, lineno] ]
LIST [filespec [,lineno [,lineno]]]

## Examples: <br> LIST

LIST 10
LIST 10,100
LIST " ${ }^{\text {P' }}$,20,100
LIST " $P$
LIST "D:DEMO.LST"
This command causes the computer to display the source version of all lines currently in memory if the command is entered without line number(s), or to display a specified line or lines. For example, LIST 10,100 displays lines 10 through 100 on the screen. If the user has not typed the lines into the computer in numerical order, a LIST will automatically place them in order.

Typing L." $P$ :" will print the RAM-resident program on the printer.
LIST can be used in Deferred mode as part of an error trapping routine (See TRAP in Section 4).

The LIST command is also used in recording programs on cassette tape. The second format is used and a filespec is entered. (See Section 5 for more details on peripheral devices.) If the entire program is to be listed on tape, no line numbers need be specified.
Example: LIST "C1"
1000 LIST "C1"

## NEW

## Format: NEW <br> Example: NEW

This command erases the program stored in RAM. Therefore, before typing NEW, either SAVE or CSAVE any programs to be recovered and used later. NEW clears BASIC's internal symbol table so that no arrays (See Section 8) or strings (See Section 7) are defined. Used in Direct mode.

## REM (R. OR SPACE.)

## Format: REM text

Examples: 10 REM ROUTINE TO CALCULATE X 10(SPACE). ROUTINE FOR DATA ("SPACE" means one press of the SPACE bar)
This command and the text following it are for the user's information only. It is ignored by the computer. However, it is included in a LIST along with the other numbered lines. Any statement on the same numbered line that occurs after a REM statement is ignored.

## RUN (RU.)

## Format: RUN [filespec]

Examples: RUN
RUN "D:MENU"
This command causes the computer to begin executing a program. If no filespec is specified, the current RAM-resident program begins execution. If a filespec is included, the computer retrieves the specified, tokenized program from the specified file and executes it.

All variables are set to zero and all open files and peripherals are closed. All arrays, strings, and matrices are eliminated and all sounds are turned off. Unless the TRAP command is used, an error message is displayed if any error is detected during execution and the program halts.

RUN can be used in Deferred mode.
Example: 10 PRINT "OVER AND OVER AGAIN."
20 RUN
Type RUN and press RETURN. To end, press BREAK.
To begin program execution at a point other than the first line number, type GOTO followed by the specific line number, then press RETURN.

## STOP (STO.)

## Format: STOP <br> Example: 100 STOP

When the STOP command is executed in a program, BASIC displays the message STOPPED AT LINE $\qquad$ terminates program execution, and returns to Direct mode. The STOP command does not close files or turn off sounds, so the program can be resumed by typing CONT and pressing the RETURN key.
In addition to the special function keys described in Section 1, there are cursor control keys that allow immediate editing capabilities. These keys are used in conjunction with the SHIFT or CTRL keys.
The following key functions are described in this section:

| CTRL | CTRL INSERT | CTRL 1 | CTRL F1 | SHIFT F1 |
| :--- | :--- | :--- | :--- | :--- |
| SHIFT | CTRL DELETE | CTRL 2 | CTRL F2 | SHIFT F2 |
| CTRL | SHIFT INSERT | CTRL 3 | CTRL F3 | SHIFT F3 |
| CTRL | SHIFT DELETE | BREAK | CTRL F4 | SHIFT F4 |
| CTRL | SHIFT CAPS/LOWR | ESC | F1 |  |
| CTRL |  |  | F2 |  |
|  |  |  | F3 |  |
|  |  |  | F4 |  |

## SCREEN EDITING

The keyboard and display are logically combined for a mode of operation known as screen editing. Each time a change is completed on the screen, the RETURN key must be pressed. Otherwise, the change is not made to the program in RAM.

## Example:

10 REM FFESS RETURN AFTER $\angle$ INE EDTT
20 FRTNT \&FRTNT
30 FRTNT "THTS TS LTNE 1 ON SCREEN."

To delete line 20 from the program, type the line number and press the RETURN key. Merely deleting the line from the screen display does not delete it from the program.

The screen and keyboard as I/O devices are described in Section 5.

CTRL

Control key. Striking this key in conjunction with the arrow keys produces the cursor control functions that allow the user to move the cursor anywhere on the screen without changing any characters already on the screen. Other key combinations control the setting and clearing of tabs, halting and restarting program lists, and the graphics control symbols. Striking a key while holding the CTRL key will produce the upper-left symbol on those keys having three functions
SHIFT
Shift key: This key is used in conjunction with the numeric keys to display the symbols shown on the upper half of those keys. It is also used in conjunction with other keys to insert and delete lines, return to a normal, upper case letter display, and to display the function symbols above the subtraction, equals, addition, and multiplication operators as well as the brackets, [ ], and question mark,?

## DOUBLE-KEY FUNCTIONS

| Cursor Control Keys |  |
| :--- | :--- |
| CTRL | Moves cursor up one physical line without changing the <br> program or display. |
| Moves cursor one space to the right without disturbing the |  |
| CTRL $\rightarrow$ | program or display. <br> Moves cursor down one physical line without changing the <br> program or display. <br> Moves cursor one space to the left without disturbing the <br> program or display. |
| CTRL - |  |

Like the other keys on the ATARI keyboard, holding the cursor control keys for more than $1 / 2$ second causes the keys to repeat

## Keys Used With CTRL

CTRL INSERT Inserts one character space.
CTRL DELETE Deletes one character or space.
CTRL 1 Stops temporarily and restarts screen display without
CTRL 2
"breaking out" of the program.
CTRL 3
Rings buzzer.
Indicates end-of-file.
Keys Used With SHIFT
SHIFT INSERT Inserts one physical line
SHIFT DELETE Deletes one physical line.
SHIFT CAPS/LOWR Returns screen display to upper-case alphabetic characters.

Special Function Keys
BREAK
ESC
Stops program execution or program list, prints a STOPPED AT LINE on the screen, and displays cursor. Allows commands normally used in Direct mode to be placed in Deferred mode; e.g., in Direct mode. CTRL CLEAR clears the screen display. To clear the screen in Deferred mode, type the following after the program line number. Press ESC then press CTRL and CLEAR together.
PRINT "ESC CTRL CLEAR"

## ATARI 1200XL KEY FUNCTIONS

## v Keys Used With CTRL

CTRL F1*
CTRL F2
CTRL F3
CTRL F4
Enables or disables keyboard.
Enables or disables display.
Enables or disables key click sound.
Selects domestic or European character set.
Keys Used Alone
F1 Moves cursor up in one-line increments.
F2
F3
F4
Moves cursor down in one-line increments.
Moves cursor to left in one-space increments.
Moves cursor to right in one-space increments.

## Keys Used With SHIFT

SHIFT F1
SHIFT F2
SHIFT F3
SHIFT F4
*Function Key

This section explains the commands associated with loops, conditional and unconditional branches, error traps, and subroutines and their retrieval. It also explains the means of accessing data and the optional command used for defining variables. The following commands are described in this section:

| FOR, TO, STEP/NEXT | IF/THEN | POP |
| :--- | :--- | :--- |
| GOSUB/RETURN | ON, GOSUB | RESTORE |
| GOTO | ON, GOTO | TRAP |

## FOR (F.), TO, STEP/NEXT (N.)

## Format: FOR avar = aexp1 TO aexp2 [STEP aexp3] NEXT avar

Examples: FOR $\mathrm{X}=1$ TO 10 NEXT X
FOR Y = 10 TO 20 STEP 2
NEXT Y
FOR INDEX = Z TO 100 * Z
NEXT INDEX
This command sets up a loop and determines how many times the loop is executed. The loop variable (avar) is initialized to the value of aexp1. Each time the NEXT avar statement is encountered, the loop variable is incremented by the aexp3 in the STEP statement. The aexp3 can be positive or negative integers, decimals, or fractional numbers. If there is no STEP aexp3 command, the loop increments by one. When the loop completes the limit as defined by aexp2, it stops and the program proceeds to the statement immediately following the NEXT statement; it may be on the same line or on the next sequential line

All loops are executed at least once. Loops can be nested, one within another In this case, the innermost loop is completed before returning to the outer loop. Figure 4-1 illustrates a nested loop program.

```
10 FOF X=1 TO 3
20 FRINT "OUTER LOOF"
30 z=0}
40 z=z+2
#0 FOF Y:=1 TO G STEF Z
60 FRTNT " TNNER LOOF"
70 NEXT Y
80 NEXT X
9 0 ~ E N D ~
```

Figure 4-1. Nested Loop Program

In Figure 4-1, the outer loop will complete three passes ( $X=1$ to 3 ). However, the inner loop. Note that the NEXT statement for the inner loop must precede the NEXT statement for the outer loop. In the example, the inner loop's number of passes is determined by the STEP statement (STEP Z). In this case, $\mathbf{Z}$ has been defined as 0 , then redefined as $\mathbf{Z}+2$. Using this data, the computer must complete three passes through the inner loop before returning to the outer loop. The aexp3 in the step statement could also have been defined as the numerical value 2 .

The program run is illustrated in Figure 4-2.

FFADY
Figure 4-2. Nested Loop Execution
The return address for the loops are placed in a special group of memory addresses referred to as a stack. The information is "pushed" on the stack and when used. the information is "popped" off the stack (see POP).

## GOSUB (GOS.), RETURN (RET.)

Format: GOSUB lineno
lineno
RETURN
Example: 100 GOSUB 2000
2000 PRINT "SUBROUTINE'
2010 RETURN

A subroutine* is a program or routine used to compute a certain value, etc. It is generally used when an operation must be replaced several times within a program sequence using the same or different values. This command allows the user to "call" the subroutine, if necessary. The last line of the subroutine must contain a RETURN statement. The RETURN statement goes back to the next logical statement following the GOSUB statement.

Like the preceding FOR/NEXT command, the GOSUB/RETURN command sequence uses a stack for its return address. If the subroutine is not allowed to complete normally; e.g., a GOTO lineno before a RETURN, the GOSUB address must be "popped" off the stack (see POP) or it could cause future errors.

To prevent accidental triggering of a subroutine (which normally follows the main program), place an END statement preceding the subroutine. Figure 4-3 demonstrates the use of subroutines.

Figure 4.3. GOSUB/RETURN Program Listing
In the above program, the subroutine, beginning at line 1000, is called three times to compute and print out different values of $X$ and $Y$. Figure 4-4 illustrates the results of executing this program.

| FUN |  |
| :--- | :--- |
|  |  |
| 400 | 300 |
| 480 | 360 |
| 200 | 150 |

FEADY
Figure 4.4. GOSUB/RETURN Program Run

[^0]
## GOTO (G.)

Format: $\left\{\begin{array}{l}\text { GO TO } \\ \text { GOTO }\end{array}\right\} \operatorname{aexp}$
Examples: 100 GOTO 50
500 GOTO (X + Y)
The GOTO command is an unconditional branch statement just like the GOSUB command. They both immediately transfer program control to a target line number or arbitrary expression. However, using anything other than a constant will make renumbering the program difficult. If the target line number is non-existent, an error results. Any GOTO statement that branches to a preceding line may result in an "endless" loop. Statements following a GOTO statement will not be executed. Note that a conditional branching statement (see IF/THEN) can be used to break out of a GOTO loop. Figure 4-5 illustrates two uses of the GOTO command.

Figure 4.5. GOTO Program Listing
Upon execution, the numbers in the above listing will be listed first followed by the three rows of symbols. The symbols listed on lines 70, 80, and 90 are ignored temporarily while the program executes the GOTO 100 command. It proceeds with the printing of the numbers "SIX" through "TEN", then executes the second GOTO statement which transfers program control back to line 70. (This is just an example. This program could be rewritten so that no GOTO statements were used.) The results of the program run are shown in Figure 4-6.

Figure 4.6. GOTO Program Run

## IFTHEN

Format: IF aexp THEN $\left\{\begin{array}{c}\text { lineno } \\ \text { statement [statement...] }\end{array}\right\}$
Examples: IF X = 100 THEN 150
IF AS = "ATARI" THEN 200
IF $A A=145$ and $B B=1$ THEN PRINT AA, BB
IF $X=100$ THEN $X=0$
The IF/THEN statement is a conditional branch statement. This type of branch occurs only if certain conditions are met. These conditions may be either arithmetic or logical. If the aexp following the IF statement is true (non-zero), the program executes the THEN part of the statement. If, however, the aexp is false (a logical 0), the rest of the statement is ignored and program control passes to the next numbered line.

In the format, IF aexp THEN lineno, lineno must be a constant, not an expression and specifies the line number to go to if the expression is true. If several statements occur after the THEN, separated by colons, then they will be executed if and only if the expression is true. Several IF statements may be nested on the same line. For example:

The statements $R=9$ : GOTO 100 will be executed only if $X=5$ and $Y=3$. The statement IF $Y=3$ will be executed if $X=5$.

The program in Figures 4.7 and 4.8 demonstrates the IFTHEN statement.

## ON/GOSUB/RETURN ON/GOTO

## Format: $\quad$ ON aexp $\left\{\begin{array}{c}\text { GOTO } \\ \text { GOSUB }\end{array}\right\}$ lineno [, lineno...] <br> Examples: 100 ON $\times$ GOTO 200, 300, 400 <br> 100 ON A GOSUB 1000, 2000 <br> 100 ON SQR(X) GOTO $30,10,100$

Note: GOSUB and GOTO may not be abbreviated.
These two statements are also conditional branch statements like the IF/THEN statement. However, these two are more powerful. The aexp must evaluate to a positive number, which is then rounded to the nearest positive integer (whole number) value up to 255 . If the resulting number is 1 , then program control passes to the first lineno in the list following the GOSUB or GOTO. If the resulting number is 2, program control passes to the second lineno in the list, and so on. If the resulting number is 0 or is greater than the number of linenos in the list, the conditions are not met and program control passes to the next statement which may or may not be located on the same line. With ON/GOSUB, the selected subroutine is executed and then control passes to the next statement. The program in Figures $4-9$ and $4-10$ demonstrates the ON/GOTO statement:

```
10 X=X+1
20 ON X GOTO 100,200,300,400,500
30 IF XOS THEN FRTNT "COMPLETE"&END
40 goto 10
50 END
100 FRTNT "NOW WORKING AT LTNE 100"

| NOW | WOFKTNG | AT | LINE: | $\cdots 00$ |

COMFIETE

FEADY
Figure 4-10 ON/GOTO Program Execution

## POP

## Format: POP <br> Example: 1000 POP

In the description of the FOR/NEXT statement, the stack was defined as a group of memory addresses reserved for return addresses. The top entry in the stack controls the number of loops to be executed and the RETURN target line for a GOSUB. If a subroutine is not terminated by a RETURN statement, the top memory location of the stack is still loaded with some numbers. If another GOSUB is executed, that top location needs to be cleared. To prepare the stack for a new GOSUB, use a POP to clear the data from the top location in the stack.

The POP command must be used according to the following rules:

1. It must be in the execution path of the program.
2. It must follow the execution of any GOSUB statement that is not brought back to the main program by a RETURN statement.
The program in Figure 4-11 demonstrates the use of the POP command with a GOSUB when the RETURN is not executed:

| 10 | REM THIS FROCRAM DEMONSTRATES THE |
| :---: | :---: |
| 20 | REM USE OF' 'FOF' WTTH A 'onsue' |

## RESTORE (RES.)

## Format: RESTORE [aexp]

## Example: 100 RESTORE

The ATARI Home Computer System contains an internal "pointer" that keeps track of the DATA statement item to be read next. Used without the optional aexp, the RESTORE statement resets that pointer to the first data item in the program. Used with the optional aexp, the RESTORE statement sets the pointer to the first data item on the line specified by the value of the aexp. This statement permits
repetitive use of the same data. (Figure 4-12)
10 FOF N=1 TO 2
20 EFAR A
30 FESTOFE
40 FEAD E
G0 M M A
60 FBTMT "TOTAL EQUAKG"?M
70 NEXX N
60 WD
90 DATA 30 , $1 \%$
Figure 4-12. Restore Program Listing
On the first pass through the loop. $\mathbf{A}$ will be 30 and $\mathbf{B}$ will be 30 so the total line 60 because of the RESTORE statement, will still equal 30. Therefore, the PRINT statement in line 60 will display TOTAL EQUALS 45.

The RESTORE statement will not generate an error if the line number referenced does not exist. Instead it will RESTORE to the next larger line number in the program. Care should be taken to update RESTORE statements when renumbering a BASIC program.

## TRAP (T.)

Format: TRAP aexp
Example: 100 TRAP 120
The TRAP statement is used to direct the program to a specified line number if an error is detected Without a TRAP statement. the program stops executing when an error is encountered and displays an error message on the screen.

The TRAP statement works on any error that may occur after it has been executed. but once an error has been detected and trapped, it is necessary to reset the trap with another TRAP command This TRAP command may be placed at the beginning of the section of code that handles input from the keyboard so that the TRAP is reset after each error. PEEK(195) will give you an error message (see Appendix B). 256*PEEK(187) + PEEK(186) will give you the number of the line where the error occurred. The TRAP may be cleared by executing a TRAP statement with an aexp whose value is from 32767 to 65535 (e.g. 40000)

# INPUT/OUTPUT COMMANDS AND DEVICES 

5

#### Abstract

This section describes the input/output devices and how data is moved between them. The commands explained in this section are those that allow access to the input/output devices. The input commands are those associated with getting data into the RAM and the devices geared for accepting input. The output commands are those associated with retrieving data from RAM and the devices geared for generating output.

The commands described in this section are: | CLOAD | INPUT | OPEN/CLOSE | READIDATA |
| :--- | :--- | :--- | :--- |
| CSAVE | LOAD | POINT | SAVE |
| DOS | LPRINT | PRINT | STATUS |
| ENTER | NOTE | PUT/GET | XIO |

## INPUT/OUTPUT DEVICES

The hardware configuration of each of the following devices is illustrated in the individual manuals furnished with each. The Central Input/Output (CIO) subsystem provides the user with a single interface to access all of the system peripheral devices in a (largely) independent manner. This means there is a single entry point and a device-independent calling sequence. Each device has a symbolic device name used to identify it; e.g., K: for the keyboard. Each device must be opened before access and each must be assigned to an Input/Output Control Block (IOCB). From then on, the device is referred to by its IOCB number.

ATARI BASIC contains 8 blocks in RAM which identifies to the Operating System the information it needs to perform an I/O operation. This information includes the command, buffer length, buffer address, and two auxiliary control variables. ATARI BASIC sets up the IOCBs, but the user must specify which IOCB to use. BASIC reserves IOCB \#O for I/O to the Screen Editor, therefore the user may not request IOCB \#0. The GRAPHICS statement (see Section 9) opens IOCB \#6 for input and output to the screen. (This is the graphics window S:). IOCB \#7 is used by BASIC for the LPRINT, CLOAD, and CSAVE commands. The IOCB number may also be referred to as the device (or file) number. IOCBs 1 through 5 are used in opening the other devices for input/output operations. If IOCB \#7 is in use, it prevents LPRINT or some of the other BASIC I/O statements from being performed
Keyboard: (K:) Input only device. The keyboard allows the user to read the converted (ATASCII) keyboard data as each key is pressed.
Line Printer: ( $\mathbf{P}:$ ) Output only device. The line printer prints ATASCII characters, a line at a time. It recognizes no control characters.
Program Recorder: (C:) Input and Output device. The recorder is a read/write device which can be used as either, but never as both simultaneously. The cassette has two tracks for sound and program recording purposes. The audio track cannot be recorded from the ATARI system, but may be played back through the television speaker.

Disk Drives: (D1:, D2:, D3:, D4:) Input and Output devices. If 16K of RAM is installed, the ATARI can use from one to four disk drives. If only one disk drive is attached, there is no need to add a number after the symbolic device code D . If D : is used, with no drive number specified, the ATARI system defaults to drive 1.
Screen Editor: (E:) Input and Output device. This device uses the keyboard and display (see TV Monitor) to simulate a screen editing terminal. Writing to this device causes data to appear on the display starting at the current cursor position. Reading from this device activates the screen editing process and allows the user to enter and edit data. Whenever the RETURN key is pressed, the entire logical line within which the cursor resides is selected as the current record to be transferred by CIO to the user program. (See Section 9).

TV Monitor: (S:) Input and Output device. This device allows the user to read characters from and write characters to the display, using the cursor as the screen addressing mechanism. Both text and graphics operations are supported. See Section 9 for a complete description of the graphics modes.
Interface, RS-232: (R:) The RS-232 device enables the ATARI system to interface with RS-232-compatible devices such as printers, terminals, and plotters. It contains a parallel port to which the 80 -column printer can be attached. If a printer is attached to the parallel port, the $R$ : is not required, and $P$ : can be used as it is with other printers.

## CLOAD (CLOA.)

## Format: CLOAD <br> Examples: CLOAD 100 CLOAD

This command can be used in either Direct or Deferred mode to load a program from cassette tape into RAM for execution. On entering CLOAD, a buzzer sounds to indicate that the PLAY button needs to be pressed followed by the RETURN key. However, do not press PLAY until after the tape has been positioned. Specific instructions for CLOADing a program are contained in the ATARI Program Recorder Manual. Steps for loading oversized programs are included in the paragraphs under CHAINING PROGRAMS at the end of this section.

## CSAVE (CS.)

## Format: CSAVE <br> Examples: CSAVE <br> 100 CSAVE <br> 100 CS

This command is usually used in Direct mode to save a RAM-resident program onto cassette tape. CSAVE saves the tokenized version of the program. On entering CSAVE two buzzers sound to indicate that the PLAY and RECORD buttons must be pressed followed by the RETURN key. Do not, however, press the buttons until the tape has been positioned. It is faster to save a program using this command rather than a SAVE "C" (see SAVE) because short inter-record gaps are used.
Notes: Tapes saved using the two commands, SAVE and CSAVE, are not compatible.

It may be necessary to enter an LPRINT (see LPRINT) before using CSAVE. Otherwise, CSAVE may not work properly.
For specific instructions on how to connect and operate the hardware, cue the tape, etc., see the ATARI Program Recorder Manual.

## DOS (DO.)

## Format: DOS <br> Example: DOS

The DOS command is used to go from BASIC to the Disk Operating System (DOS) If the Disk Operating System has not been booted into memory, the computer will go into Memo Pad mode (or power-on display in 1200 XL ) and the user must press SYSTEM RESET to return to Direct mode. If the Disk Operating System has been booted, the DOS Menu is displayed. To clear the DOS Menu from the screen, press SYSTEM RESET. Control then passes to BASIC. Control can also be returned to BASIC by selecting B (Run Cartridge) on the DOS Menu.

The DOS command is usually used in Direct mode; however, it may be used in a program. For more details on this, see the ATARI DOS Manual.

## ENTER (E.)

Format: ENTER filespec
Examples: ENTER "C ENTER "D:DEMOPR.INS"
This statement causes a cassette tape to play back a program originally recorded using LIST (see Section 2, LIST). The program is entered in unprocessed (untokenized) form, and is interpreted as the data is received. When the loading is complete, it may be run in the normal way. The ENTER command may also be used with the disk drive. Note that both LOAD and CLOAD (see Section 2) clear the old program from memory before loading the new one. ENTER merges the old and new programs. The ENTER statement is usually used in Direct mode.

## INPUT (I.)

## Format: INPUT $\left[\right.$ \#aexp $\left.\left\{\begin{array}{l}, \\ ;\end{array}\right\}\right]\left\{\begin{array}{l}\text { avar } \\ \text { svar }\end{array}\right\}\left[,\left\{\begin{array}{l}\text { avar } \\ \text { svar }\end{array}\right\} \ldots ..\right]$ <br> Examples: 100 INPUT $X$ <br> 100 INPUT N\$ <br> 100 PRINT "ENTER THE VALUE OF $X$ ": INPUT $X$ 110 INPUT $X$

This statement requests keyboard data from the user. In execution, the computer displays a ? prompt when the program encounters an INPUT statement. It is usually preceded by a PRINT statement that prompts the user as to the type of information being requested.

String variables are allowed only if they are not subscripted. Matrix variables are not allowed.

The \#aexp is optional and is used to specify the file or device number from which the data is to be input (see Input/Output Devices). If no \#aexp is specified, then input is from the screen editor ( $\mathbf{E}$ :).

If several strings are to be input from the screen editor, type one string, press RETURN, type the next string, RETURN, etc. Arithmetic numbers can be typed on the same line separated by commas. A typical input program is shown in Figure 5-1.
10 ? "ENTER 5 NUMEERS TO EE SUMMED"
20 FOR N 1 TO
30 TNFUT $X$
$40 C=C+X$
$50 ~ N E X T N ~$
$60 ? ~ T H E ~ S U M ~ O F ~ T H E ~ N U M E E R S ~ I S ~ " ~$

Figure 5-1 Input Program Listing
When executing an INPUT from the screen, avoid moving the cursor away from and then back to the same line; otherwise, the wrong data may be input.

If a string of 128-255 characters is INPUT, then RAM locations 1536-1664 will be overwritten. This area is normally reserved for storage of programs or data. To INPUT strings of more than 127 characters, use the GET command and store the values into a string (see Section 5, OPEN/CLOSE and PUT/GET commands).
Note: The maximum number of characters that can be INPUT from the screen is 120. The maximum for other devices is 255 .

## LOAD (LO.)

Format: LOAD filespec
Example: LOAD "D1:JANINE.BRY"
This command is similar to CLOAD except the full file name system can be used. LOAD uses long inter-record gaps on the tape (see CLOAD) and uses the tokenized version of the program. When using only one disk drive, it is not necessary to specify a number after the " $D$ " because the default is disk drive \#1.

## LPRINT (LP.)

This statement causes the computer to print data on the line printer rather than on the screen. It can be used in either Direct or Deferred modes. It requires no device specifier and no OPEN or CLOSE statement. (BASIC uses IOCB \#7.) To print a program listing on the line printer, see LIST.

Note: An LPRINT command with a semicolon at the end causes various results depending on the printer in use. To use the semicolon effectively, use the OPEN statement for the printer, then write to the printer with a PRINT statement (see OPEN/CLOSE and PRINT commands, Section 5).

## NOTE (NO.)

## Format: NOTE \#aexp, avar, avar <br> Example: 100 NOTE \#1, X, Y

This command is used to store the current disk sector number in the first avar and the current byte number within the sector in the second avar. This is the current read or write position in the specified file where the next byte to be read or written is located. This NOTE command is used when writing data to a disk file (see POINT). The information in the NOTE command can be written into a second file which is then used as an index into the first file.

## OPEN (O.), CLOSE (CL.)

Formats: OPEN \#aexp,aexp1,aexp2, filespec CLOSE \#aexp
Examples: 100 OPEN \#2,8,0,"D1:ATARI.BAS"
100 A $\$=$ "D1:ATARI.BAS"
110 OPEN \#2,8,0,A\$
150 CLOSE \#2
Before a device can be accessed, it must be opened. This "opening" process links a specific IOCB to the appropriate device handler, initializes any CIO-related control variables, and passes any device-specific options to the device handler. The parameters for the OPEN command are defined as follows:
\# Mandatory character that must be entered by the user.
aexp Reference IOCB or file number to same parameters for future use (as in CLOSE command). Number may be 1 through 7.
aexp1 Code number to determine input or output operation.
Code $4=$ input operation
$8=$ output operation
$12=$ input and output operation
$6=$ disk directory input operation (In this case, the filespec is the search specification.)
$9=$ end-of-file append (output) operation. Append is also used for a special screen editor input mode. This mode allows a program to input the next line from $E$ : without waiting for the user to press RETURN.
aexp2 Device-dependent auxiliary code. An 83 in this parameter indicates sideways printing on a printer (see appropriate manuals for control codes).
filespec Specific file designation. Must be enclosed in quotation marks. The format for the filespec parameter is shown in Figure 5-2.

Note: Filenames are not used with the program recorder.

Figure 5.2 Filename Breakdown
Note: Be sure to include the closing quotation marks on a filespec parameter. especially when putting multiple statements on one line For example.
OPEN \#1, 4. 0, "D:TEST":STOP will work, but
OPEN \#1. 4. 0. "D:TEST:STOP will not function correctly.
The CLOSE command simply closes files that have been previously opened with an OPEN command. Note in the example that the aexp following the mandatory \# character must be the same as the aexp reference number in the OPEN statement.

## POINT (P.)

Format: POINT \#aexp. avar, avar
Example: 100 POINT \#2, A,B
This command is used when reading a file into RAM or writing a file from RAM. The first avar specifies the sector number and the second avar specifies the byte within that sector where the next byte will be read or written. Essentially, it moves a software-controlled pointer to the specified location in the file. This gives the user "random" access to the data stored on a disk file. The POINT and NOTE commands are discussed in more detail in the DOS Manual.
Note: To update a file, you must open it with a 12 in aexp1.

## PRINT (PR. or ?)

## Format: PRINT [\#aexp] $\left[\left\{\begin{array}{l}; \\ ,\end{array}\right\}\right.$ exp... $]$ <br> Examples: PRINT X, Y, Z, A\$ <br> 100 PRINT "THE VALUE OF X IS "; X <br> 100 PRINT "COMMAS", "CAUSE", "COLUMN", "SPACING" <br> 100 PRINT \#3, A\$ <br> 100 PRINT $2+3+4$

A PRINT command can be used in either Direct or Deferred mode. In Direct mode, this command prints whatever information is contained between the quotation marks exactly as it appears. In the first example, PRINT $X, Y, Z, A \$$, the screen will display the current values of $X, Y, Z$, and $A \$$ as they appear in the RAM-resident program. In the example, PRINT \#3,A\$, the \#3 is the file specifier (may be any number between 1 and 7) that controls to which device the value of $A \$$ will be printed. (See Input/Output Devices.)

A comma tabs every ten spaces. Several commas in a row cause several tab jumps. A semicolon causes the next aexp or $\operatorname{sexp}$ to be placed immediately after the preceding expression with no spacing. Therefore, in the second example a space is placed before the ending quotation mark so the value of $X$ will not be placed immediately after the word "IS". If no comma or semicolon is used at the end of a PRINT statement, then a RETURN is output and the next PRINT starts on the following line.

However, if the last character to be printed (as in a string with quotation marks) is a CTRL R or CTRL $\mathbf{U}$, then the next PRINT begins at the end of the current line.

The PRINT command can be used as a one-line calculator in Direct mode, as shown in the last example above. In this case the value is computed when the RETURN key is pressed, and the value is printed on the next line.
Note: In rare circumstances data printed to a diskette may have part of the BASIC program embedded in it. If this occurs, retry the operation.

## PUT (PU.)/GET (GE.)

## Format: PUT \#aexp, aexp <br> GET \#aexp, aexp

Examples: 100 PUT \#6, ASC("A")
200 GET \#1,X
The PUT and GET are opposites. The PUT command outputs a single byte from $0-255$ to the file specified by \#aexp. (\# is a mandatory character in both these commands). The GET command reads one byte from 0-255 (using \#aexp to designate the file, etc. on diskette or elsewhere) and then stores the byte in the variable avar.

## READ (REA.), DATA (D.)

Format: READ var [, var...]<br>DATA adata [, adata...]<br>Examples: 100 READ A,B,C,D,E<br>110 DATA $12,13,14,15,16$<br>100 READ A\$,B\$,C\$,D\$,E\$<br>110 DATA EMBEE, EVELYN, CARLA, CORINNE, BARBARA

These two commands are always used together and the DATA statement is always used in Deferred mode ${ }^{1}$. The DATA statement can be located anywhere in the program, but must contain as many pieces of data as there are defined in the READ statement. Otherwise, an "out of data" error is displayed on the screen. Refer to RESTORE command.

String variables used in READ statements must be dimensioned and cannot be subscripted. (See STRINGS Section). Neither may array variables be used in a READ statement.

The DATA statement holds a number of string data for access by the READ statement. It cannot include arithmetical operations, functions, etc. Furthermore, the data type in the DATA statement must match the variable type defined in the corresponding READ statement. The program in Figure $5-3$ totals a list of numbers in a DATA statement:

```
10 FOK N=1 TO %
ZO EEAD D
30 M=:M+D
40 NEXT N
E0 FRTNT "SUM TOTAL.. EQUAL..S "多
60 END
70 DATA 30,1E,106,17,87
```

Figure 5-3 Read/Data Program Listing
The program, when executed, will print the statement:
SUM TOTAL EQUALS 255.

## SAVE (S.)

Format: SAVE filespec
Example: SAVE "D1:YVONNE.PAT"
The SAVE command is similar to the CSAVE command except that the full file name system can be used. The device code number is optional when using disk drive \#1, because the default is to disk drive \#1. SAVE, like LOAD, uses long interrecord gaps on the cassette (see CSAVE) and the tokenized form of the program.

## STATUS (ST.)

## Format: STATUS \#aexp,avar <br> Example: 350 STATUS \#1,Z

The STATUS command calls the STATUS routine for the specified device (aexp).
The routine checks the device for an error condition and stores the appropriate status data in the specified variable (avar). Refer to Appendix B. An error code of 1 is stored if the device is in a ready state and no error condition is detected.
'A Direct mode READ will only read data if a DATA statement was executed in the program

## XIO (X.)

## Format: XIO cmdno, \#aexp, aexp1, aexp2, filespec <br> Example: XIO 18,\#6,12,0,"S:"

The XIO command is a general input/output statement used for special operations. One example is its use to fill an area on the screen between plotted points and lines with a color (see Section 9). When a STATUS REQUEST operation is done on an OPEN device, the aexp 1 used in the STATUS REQUEST must be the same as the IOCB number used in the OPEN statement for that device; e.g., if the OPEN was OPEN \#1,9,0,"D:TEMP.BAS" then the STATUS REQUEST must be XIO $13, \# 1,9,0$, "D:TEMP.BAS". The parameters for the XIO command are defined as follows:
(cmdno $=$ Number that stands for the particular command to be performed.)

XIO
STATUS REQUEST
DRAW LINE
RENAME FILE
DELETE FILE
LOCK FILE
UNLOCK FILE FORMAT must be preceded by \#.

## EXAMPLE

XIO 3,\#1,4,0,"D:TEMP.BAS"
XIO 12,\#1,0,0,"D:"

XIO 13,\#1,4,0,"D:TEMP.BAS"
XIO 17,\#6,12,0,"S:"
XIO 18,\#6,12,0,"S:"
XIO 32,\#1,0,0,"D:TEMP,CAROL"
XIO 33,\#1,0,0,"D:TEMP.BAS"
XIO 35,\#1,0,0,"D:TEMP.BAS"
XIO 36,\#1,0,0,"D:TEMP.BAS"
XIO 254,\#1,0,0,"D:"

## COMMENTS

Same as BASIC OPEN
Same as BASIC CLOSE
See note below
See Section 9
See Section 9
See note below

Device number (same as in OPEN). Most of the time it is ignored, but
Two auxiliary control bytes. Their usage depends on the particular device and command. In most cases, they are unused and are set to 0 . Aexp 1 should be set to 12 for a DRAW LINE or a FILL operation to allow color checking later in the program.
filespec String expression that specifies the device. Must be enclosed in quotation marks. Although some commands, like FILL (Section 9), do not look at the filespec, it must still be included in the statement. XIO commands $5,7,9$, and 11,37, and 38 , should not be used, because they are undefined and unpredictable errors might occur.
NOTE: When using the RENAME operation, the device code D: should only be used once.

D:TEMP, CAROL is correct
D:TEMP,D:CAROL is incorrect
Status Request performs the same action as the BASIC STATUS but does not return the error code in a variable. If an error condition is detected, it stops the program and prints an error message. To prevent the stopping of the program use a TRAP before using XIO 13. The only advantage XIO 13 has over STATUS is that a specific file on a disk drive can be checked by XIO 13 but not by STATUS.

## CHAINING PROGRAMS

If a program requires more memory than is available, use the following steps to string programs of less than the maximum memory available into one program.

1. Type in the first part of the program in the normal way.
2. The last line of the first part of the program should contain only the line number and the command RUN"C:"'
3. Cue the tape to the blank section. Write down the program counter number for later RUN purposes. Press PLAY and RECORD buttons on the deck so that both remain down.
4. Type SAVE"C:" and press the RETURN key.
5. When the beeping sound occurs, press RETURN again.
6. When the screen displays "READY", do not move tape. Type NEW and press RETURN.
7. Repeat the above instructions for the second part of the program.
8. As the second part of the program is essentially a totally new program, it is possible to re-use the line numbers used in the first part of the program.
9. If there is a third part of the program, make sure the last line of the second part is a RUN"C:" command.
To execute a "chained" program, use the following steps:
10. Cue the tape to the beginning of part 1 of the program.
11. Press PLAY button on the recorder.
12. Type RUN"C:'RETURN.
13. When the "beep" sounds, press RETURN again.

The computer automatically loads the first part of the program, runs it, and sounds a "beep" to indicate when to hit the space bar or RETURN to trigger the tape motor for the second LOAD/RUN. The loading takes a few seconds.
Note: A one-part program can be recorded and reloaded in the same way or CSAVE and CLOAD can be used.
Note: Remember to boot DOS before typing in your program if you wish to store the program on diskette.

## MODIFYING A BASIC PROGRAM ON DISK

The procedure for modifying an existing BASIC program stored on a diskette is demonstrated in the following steps:

1. Turn off ATARI console and insert BASIC cartridge.
2. Connect disk drive and turn it on-without inserting diskette.
3. Wait for Busy Light to go out and for the drive to stop. Open disk drive door.
4. Insert diskette (with DOS) and close door.
5. Turn on console. DOS should boot in and the screen show READY.
6. To load program from disk, type

LOAD "D:filename.ext
7. Modify program (or type in new program).
8. To save program on disk, type

SAVE "D:filename.ext
9. Always wait for the Busy light to go out before removing diskette.
10. To get a Directory listing, leave the diskette in and type DOS
Press RETURN, and the DOS Menu is displayed. Select command letter A, type it, and press RETURN twice to list the directory on the screen: or type $\mathbf{A}$ followed by pressing RETURN then type $\mathbf{P}$ : and press RETURN to list directory on the printer.
11. To return to BASIC, type $\mathbf{B}$ and press RETURN or press SYSTEM RESET.

## FUNCTION LIBRARY

This section describes the arithmetic. trigonometric, and special purpose functions incorporated into the ATARI BASIC. A function performs a computation and returns the result (usually a number) for either a print-out or additional computational use. Included in the trigonometric functions are two statements, radians (RAD) and degrees (DEG), that are frequently used with trigonometric functions. Each function described in this section may be used in either Direct or Deferred mode. Multiple functions are perfectly legal.

The following functions and statements are described in this section:

| ABS | ATN | ADR |
| :--- | :--- | :--- |
| CLOG | COS | FRE |
| EXP | SIN | PEEK |
| INT | DEG/RAD | POKE |
| LOG |  | USR |

RND
SGN
SQR

## ARITHMETIC FUNCTIONS

## ABS

$\begin{array}{ll}\text { Format: } & \text { ABS (aexp) } \\ \text { Example: } & 100 \mathrm{AB}=\mathbf{A B S}(-190)\end{array}$
Returns the absolute value of a number without regard to whether it is positive or negative. The returned value is always positive.

## CLOG

Format: CLOG (aexp)
Example: $100 \mathrm{C}=\mathrm{CLOG}(83)$
Returns the logarithm to the base 10 of the variable or expression in parentheses. CLOG(0) gives an error and CLOG(1) equals 0 .

EXP
Format: EXP (aexp)
Example: 100 PRINT EXP(3)
Returns the value of e (approximately 2.71828283 ), raised to the power specified by the expression in parentheses. In the example given above, the number returned is 20.0855365 . In some cases, EXP is accurate only to six significant digits.

## INT

Format: INT (aexp)
Examples: $1001=\operatorname{INT}(3.445) \quad$ (3 would be stored in 1) $100 X=\operatorname{INT}(-14.66778) \quad(-15$ would be stored in $X$ )
Returns the greatest integer less than or equal to the value of the expression. This is true whether the expression evaluates to a positive or negative number. Thus, in our first example above, $I$ is used to store the number 3 . In the second example, $X$ is used to store the number - 15 (the first whole number that is less than or equal to - 14.66778). This INT function should not be confused with the function used on calculators that simply truncates (cuts off) all decimal places.

## LOG

## Format: LOG(aexp)

Example: $100 \mathrm{~L}=\mathrm{LOG}(67.89 / 2.57)$
Returns the natural logarithm of the number or expression in parentheses. LOG(0) gives an error and LOG(1) equals 0 .

## RND

Format: RND(aexp)
Example: $10 \mathrm{~A}=$ RND (0)
Returns a hardware-generated random number between 0 and 1, but never returns 1. The variable or expression in parentheses following RND is a dummy and has no effect on the numbers returned. However, the dummy variable must be used. Generally, the RND function is used in combination with other BASIC statements or functions to return a number for games, decision making, and the like. The following is a simple routine that returns a random number between 0 and 999.
$10 \mathrm{X}=\mathrm{RND}(0)$
20 RX $=\operatorname{INT}(1000 * X)$
30 PRINT RX
( 0 is the dummy variable)
SGN
Format: $\quad$ SGN(aexp)
Example: $100 \times=\mathbf{S G N}(-199) \quad$ ( -1 would be returned)
Returns a - 1 if aexp evaluates to a negative number; a 0 if aexp evaluates to 0 , or a 1 if aexp evaluates to a positive number.

## SQR

Format: SQR(aexp)
Example: 100 PRINT SQR(100) (10 would be printed)
Returns the square root of the aexp which must be positive.

## TRIGONOMETRIC FUNCTIONS

ATN
Format: ATN(aexp)
Example: $100 \mathrm{X}=$ ATN(65)
Returns the arctangent of the variable or expression in parentheses
cos
Format: COS(aexp)
Example: $100 \mathrm{C}=\operatorname{COS}(X+Y+Z)$
Note: Presumes X. Y. Z previously defined!
Returns the trigonometric cosine of the expression in parentheses

## SIN

Format: $\quad \operatorname{SIN}($ aexp $)$
Example: $100 \mathrm{X}=\operatorname{SIN}(\mathrm{Y})$
Note: Presumes Y previously defined
Returns the trigonometric sine of the expression in parentheses
DEG/RAD
Format: DEG
RAD
Example: 100 DEG
100 RAD
These two statements allow the programmer to specify degrees or radians for trigonometric function computations. The computer defaults 10 radians unless DEG is specified. Once the DEG statement has been executed. RAD must be used to return to radians.

See Appendix E for the additional trigonometric functions that can be derived.

## SPECIAL PURPOSE FUNCTIONS

ADR
Format: ADR(svar)
Example: ADR(A\$)
Returns the decimal memory address of the string specified by the expression in parentheses. Knowing the address enables the programmer to pass the information to USR routines, etc. (See USR and Appendix D)

## FRE

Format: FRE(aexp)
Examples: PRINT FRE (0)
100 IF FRE (0) < 1000 THEN PRINT "MEMORY CRITICAL"
This function returns the number of bytes of user RAM left. Its primary use is in Direct mode with a dummy variable (0) to inform the programmer how much memory space remains for completion of a program. Of course FRE can also be used within a BASIC program in Deferred mode.

## PEEK

## Format: PEEK (aexp)

Examples: 1000 IF PEEK $(4000)=255$ THEN PRINT " 255 ' 100 PRINT "LEFT MARGIN IS"; PEEK (82)
Returns the contents of a specified memory address location (aexp). The address specified must be an integer or an arithmetic expression that evaluates to an integer between 0 and 65535 and represents the memory address in decimal notation (not hexadecimal). The number returned will also be a decimal integer with a range from 0 to 255 . This function allows the user to examine either RAM or ROM locations. In the first example above, the PEEK is used to determine whether location 4000 (decimal) contains the number 255 . In the second example, the PEEK function is used to examine the left margin.

## POKE

Format: POKE aexp1, aexp2
Examples: POKE 82, 10
100 POKE 82, 20
Although this is not a function, it is included in this section because it is closely associated with the PEEK function. The POKE command inserts data into the memory location or modifies data already stored there. In the above format, aexp1 is the decimal address of the location to be poked and aexp2 is the data to be poked. Note that this number is a decimal number between 0 and 255. POKE cannot be used to alter ROM locations. In gaining familiarity with this command it is advisable to look at the memory location with a PEEK and write down the contents of the location. Then, if the POKE doesn't work as anticipated, the original contents can be poked into the location.

The above Direct mode example changes the left screen margin from its default position of 2 to a new position of 10 . In other words, the new margin will be 8 spaces to the right. To restore the margin to its normal default position, press SYSTEM RESET.

## USR

## Format: USR (aexp1 [, aexp2] [, aexp3...]) <br> Example: 100 RESULT $=$ USR (ADD 1,A*2)

This function returns the results of a machine-language subroutine. The first expression, aexp1, must be an integer or arithmetic expression that evaluates to an integer that represents the decimal memory address of the machine language routine to be performed. The input arguments aexp2, aexp3, etc., are optional. These should be arithmetic expressions within a decimal range of 0 through 65535 A non-integer value may be used; however, it will be rounded to the nearest integer.

These values will be converted from BASIC's Binary Coded Decimal (BCD) floating point number format to a two-byte binary number, then pushed onto the hardware stack, composed of a group of RAM memory locations under direct control of the 6502 microprocessor chip. Figure 6-1 illustrates the structure of the hardware stack.
$\mathbf{N}$ (Number of arguments on the stack-may be 0)
$X_{1} \quad$ (High byte of argument $X$ )
$X_{2} \quad$ (Low byte of argument $X$ )
$Y_{\text {, }} \quad$ (High byte of argument $Y$ )
$Y_{2} \quad$ (Low byte of argument $Y$ )
$Z_{1} \quad$ (High byte of argument $Z$ )
$Z_{2} \quad$ (Low byte of argument $Z$ )
-
$\cdot$
-
$\mathbf{R}_{\mathbf{1}} \quad$ (Low byte of return address)
$\mathbf{R}_{\mathbf{2}} \quad$ (High byte of return address)
Figure 6-1. Hardware Stack Definition
Note: $X$ is the argument following the address of the routine. $Y$ is the second. $Z$ is the third etc. There are $N$ pairs of bytes.
See Section 11 for a description of the USR function in machine language programming. Appendix $D$ defines the bytes in RAM available for machine language programming.

## STRINGS

This section describes strings and the functions associated with string handling． Each string must be dimensioned（see DIM statement，Section 8）and each string variable must end with a $\$$ ．A string itself is a group of characters＂strung＂ together．The individual characters may be letters，numbers，or symbols（including the ATARI special keyboard symbols．）A substring is a part of a longer string and any substring is accessible in ATARI BASIC if the string has been properly dimen－ sioned（see end of section）．The characters in a string are indexed from 1 to the current string length，which is less than or equal to the dimensioned length of the string．

The string functions described in this section are：

## ASC STR CHR\＄VAL LEN

## ASC

## Format：ASC（sexp）

## Examples： $100 \mathrm{~A}=\mathbf{A S C}(\mathrm{A} \$)$

This function returns the ATASCII code number for the first character of the string expression（sexp）．This function can be used in either Direct or Deferred mode． Figure 7.1 is a short program illustrating the ASC function．

```
10 DTM A婁(3)
20 A実:"E"'
30 A=ASC(A⿻⿱口口丨心)
40 FRTNT A
```

Figure 7－1．ASC Function Program
When executed，this program prints a 69 which is the ATASCII code for the letter ＂$E$＂．Note that when the string itself is used，it must be enclosed in quotation marks．

## CHRS

## Format：CHR\＄（aexp）

Examples： 100 PRINT CHR\＄（65）
100 A\＄＝CHR\＄（65）
This character string function returns the character，in string format，represented by the ATASCII code number in parentheses．Only one character is returned．In the above examples，the letter A is returned．Using the ASC and CHRS functions，the program in Figure 7.2 prints the upper case letters of the alphabet．

```
10 FO& T-0 T0 25
20 PRTNT CHR+(ASC("A")+T)
O0 NrXT Y
```

Figure 7-2. ASC and CHR\$ Program Example
Note: There can be only one STRS and only one CHRS in a logical comparison. For example, $\mathrm{A}=\mathrm{CHR} \mathrm{\$(1)}<\mathrm{CHR} \mathrm{\$(2)}$ is not a valid operation.

## LEN

## Format: LEN (sexp)

Example: 100 PRINT LEN(A\$)
This function returns the length in bytes of the designated string. This information may then be printed or used later in a program. The length of a string variable is simply the index for the character which is currently at the end of the string. Strings have a length of 0 until characters have been stored in them. It is possible to store into the middle of the string by using subscripting. However, the beginning of the string will contain garbage unless something was stored there previously. The routine in Figure $7-3$ illustrates one use of the LEN function:

```
:0 O\त A束(10)
C0 At=.."ATABT"
30 rajNT LEN(AW)
```

Figure 7-3. LEN Function Example
The result of running the above program would be 5 .

## STR\$

## Format: STR\$ (aexp) <br> Example: $\quad \mathrm{A} \$=\mathbf{S T R} \mathbf{\$}(65)$

This string form number function returns the string form of the number in parentheses. The above example would return the actual number 65 , but it would be recognized by the computer as a string.
Note: There can only be one STR\$ in a logical comparison. For example, A = STRS(1) > STR\$(2) is not valid and will not work correctly.

## VAL

## Format: VAL(sexp) <br> Example: $100 \mathrm{~A}=\mathrm{VAL}(\mathrm{A} \$)$

This function returns a number of the same value as the number stored as a string.
This is the opposite of a STR\$ function. Using this function, the computer can perform arithmetic operations on strings as shown in the example program in Figure $7-4$.

```
10 மTM Bक(5)
20 E里:"10000'
```

```
40 ? "THE SQUABE ROQT OF "夕E\$\%"エS"莫
```

Figure 7－4．VAL Function Program
Upon execution，the screen displays THE SQUARE ROOT OF 10000 IS 100
It is not possible to use the VAL function with a string that does not start with a number，or that cannot be interpreted by the computer as a number．It can， however，interpret floating point numbers；e．g．，VAL（＂1E9＇）would return the number 1000000000

Only the numeric field will be translated，while the text will be ignored．For example：
A\＄＝＇ 5 SUM＂＇
$\operatorname{VAL}(\mathrm{A} \$)=5$

## STRING MANIPULATIONS

Strings can be manipulated in a variety of ways．They can be split，concatenated， rearranged，and sorted．The following paragraphs describe the different manipula－ tions．

## STRING CONCATENATION

Concatenation means putting two or more strings together to form one large string Each string to be included in a larger string is called a substring．Each substring must be dimensioned（see DIM）．In ATARI BASIC，a substring can contain up to 99 characters（including spaces）．After concatenation，the substrings can be stored in another string variable，printed，or used in later sections of the program．Figure 7.5 is a sample program demonstrating string concatenation．In this program， $\mathrm{A} \$, \mathrm{~B} \$$ ， and $C \$$ are concatenated and placed in $A \$$ ．

```
10 DTM A & (100) E音(100), C+(100)
20 A⿻="STRTNGS/SUESTETNGS ARE DXSCUSSED"
30 E立"TN ATAET EASTC\cdotsA SELF TEACHTNG GUTDE"
40 Cक=.".........HAFTEE 夕'
#0 At(1EN(A⿻) +1)=EF
60 A⿻ (LEN(AW)+I)=C.
70 FFTNT A⿻三丨口
```

Figure 7．5．String Concatenation Example

## STRING SPLITTING

The format of a subscript string variable is as follows:
svar(aexp1[,aexp2])
The svar is used to indicate the unsubscripted string variable name (with \$). aexp1 indicates the starting location of the substring and aexp2 (if used) indicates the ending location of the substring. If no aexp2 is specified, then the end of the substring is the current end of the string. The starting location cannot be greater than the current length of the string. The two example programs in Figure $7-6$ illustrate a split string with no end location indicated and a split string with an ending location indicated.

| 10 | DTM S |
| :---: | :---: |
| 20 | S串:= '侖 |
| 30 | FRTNT |
| 40 | ENO |

Result is BCD\#.
(without ending location)
10 DTM St(20)
20 Sक:"ATART 800 EASTC"
30 FRTNT S\$(7,8)
40 END

Result is 80
(with ending location)

Figure 7-6. Split String Examples

## STRING COMPARISONS AND SORTS

In string comparisons, the logical operators are used exactly the way they are with numbers. The second program in Appendix H is a simple example of bubble sort.

In using logical operators, remember that each letter, number, and symbol is assigned an ATASCII code number. A few general rules apply to these codes:

1. ATASCII codes for numbers are sized in order of the numbers' real values and are always lower than the codes for letters (see Appendix C).
2. Upper case letters have lower numerical values than the lower case letters. To obtain the ATASCII code for a lower case letter if you know the upper case value, add 32 to the upper case code.
Note: ATARI BASIC's memory management system moves strings around in memory to make room for new statements. This causes the string address to vary if a program is modified or Direct mode is used.

## ARRAYS AND MATRICES

An array is a one-dimensional list of numbers assigned to subscripted variables e.g. $A(0) . A(1), A(2)$. Subscripts range from 0 to the dimensioned value. Figure 8 -1 illustrates a 7 -element array.

| $A(0)$ |
| :--- |
| $A(1)$ |
| $A(2)$ |
| $A(3)$ |
| $A(4)$ |
| $A(5)$ |
| $A(6)$ |

Figure 8.1. Example of an Array
A matrix. in this context, is a two dimensional table containing rows and columns Rows run horizontally and columns run vertically. Matrix elements are stored by BASIC in row-major order. This means that all the elements of the first row are stored first. followed by all the elements of the second row. etc. Figure 8.2 illustrates a $7 \times 4$ matrix.

Columns

Figure 8.2. Example of a Matrix
This section describes the two commands associated with arrays. matrices, and strings. and how to load both arrays and matrices. The commands in this section are:
DIM
CLR

## DIM (DI.)

Format: $\quad \operatorname{DIM}\left\{\begin{array}{l}\operatorname{svar}(\operatorname{aexp}) \\ \operatorname{mvar}(\operatorname{aexp}[, a e x p])\end{array}\right\}\left[\left\{\begin{array}{l}, \operatorname{svar}(\operatorname{aexp}) \\ , \operatorname{mvar}(\operatorname{aexp}[, a e x p])\end{array}\right\} \ldots\right]$
Examples: DIM A(100)
DIM M(6,3)
DIM B\$(20) used with STRINGS
A DIM statement is used to reserve a certain number of locations in memory for a string, array, or matrix. A character in a string takes one byte in memory and a number in an array takes six bytes. The first example reserves 101 locations for an array designated $A$. The second example reserves 7 rows by 4 columns for a twodimensional array (matrix) designated M. The third example reserves 20 bytes designated $B \$$. All strings, arrays, and matrices must be dimensioned. It is a good habit to put all DIM statements at the beginning of the program. Notice in Figure 8-1 that although the array is dimensioned as DIM A(6), there are actually 7 elements in the array because of the 0 element. Although Figure $8-2$ is dimensioned as DIM M(6,3), 28 locations are reserved.
Note: The ATARI Home Computer does not automatically initialize array or matrix variables to 0 at the start of program execution. To initialize array or matrix elements to 0 , use the following program steps:

```
~E0 DTM A(100)
300 FOR E=0 TO 100
310 A(E)=0
320 NEXT E
```

Arrays and matrices are "filled" with data by using FOR/NEXT statements, READIDATA statements and INPUT commands. Figure $8-3$ illustrates the "building" of part of an array using the FOR/NEXT loop and Figure $8-4$ builds an array using the READIDATA statements.

```
10 DTM A(100)
20 X=10
30 FOR E=1 TO 90
40 X=:-X+1
G0 A(E)=X
60 NEXT E:

```

Figure 8-5. Building A Matrix
Note that the words ROW and COLUMN are not BASIC commands, statements functions, or keywords. They are simply variable names used here 10 designate which loop function is first. The program could just as easily have been written with $X$ and $Y$ as the variable names
Note: The command COM is identical to DIM and may be used in its place.
Note: Due to a discrepancy in boundary checking, arrays of up to 32766 by 32766 in size can be dimensioned. The programmer should size the array ahead of time to ensure that there is enough RAM storage space.

## $\overline{C L R}$

## Format: CLR

Example: 200 CLR
This command clears the memory of all previously dimensioned strings, arrays. and matrices so the memory and variable names can be used for other purposes If a matrix. string. or array is needed after a CLR command. it must be redimen. sioned with a DIM command.

## GRAPHICS MODES AND COMMANDS

This section describes the ATARI BASIC commands and the different graphics modes of the ATARI Home Computer. Using these commands, it is possible to create graphics for graphic displays or games.

The commands to be described in this section are:

| GRAPHICS | LOCATE | PUT/GET |
| :--- | :--- | :--- |
| COLOR | PLOT | SETCOLOR |
| DRAWTO | POSITION | XIO |

The PUT/GET and XIO commands explained in this section are special applications of the same commands described in Section 5.

## GRAPHICS (GR.)

Format: GRAPHICS aexp
Examples: GRAPHICS 2
100 GRAPHICS $5+16$
170 GRAPHICS $1+32+16$
120 GRAPHICS 8
150 GRAPHICS 0
140 GRAPHICS 18
This command is used to select one of the graphics modes. The 1200XL provides 16 graphics modes; the $400 / 800$ provide 12 graphics modes if the GTIA chip is installed and 9 if the CTIA chip is installed. Table 9.1 summarizes the modes and the characteristics of each. The GRAPHICS command automatically opens the screen, S:(the graphics window), as device \#6. So when printing text in the text window, it is not necessary to specify the device code. The aexp must be positive, rounded to the nearest integer. Graphics mode 0 is a full-screen display while modes 1 through 8 are split screen displays. To override the split-screen, add the characters +16 to the mode number (aexp) in the GRAPHICS command. Adding 32 prevents the GRAPHICS command from clearing the screen.

To return to graphics mode 0 in Direct mode, press SYSTEM RESET or type GR. 0 and press RETURN.

## TABLE 9.1 TABLE OF MODES AND SCREEN FORMATS

| SCREEN FORMAT |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Graphics | Mode |  | RowsSplit | RowsFull | Number of | RAM | Required ytes) |

| 15*** | GRAPHICS | 160 | 160 | 192 | 4 | 8112 | 8138 |

*GTIA Mode Only

* Refer to Figure 9-1
**1200XL Only

## GRAPHICS MODE 0

This mode is the 1 -color, 2 -luminance (brightness) default mode for the ATARI Home Computer. It contains a 24 by 40 character screen matrix. The default margin settings at 2 and 39 allow 38 characters per line. Margins may be changed by poking LMARGN and RMARGN (82 and 83). See Appendix I. Some systems have different margin default settings. The color of the characters is determined by the background color. Only the luminance of the characters can be different. This full-screen display has a blue display area bordered in black (unless the border is specified to be another color). To display characters at a specified location, use one of the following two methods.
Method 1.
lineno POSITION aexp1, aexp2 lineno PRINT sexp
Method 2
lineno GR. 0 lineno POKE 752,1 lineno COLOR ASC(sexp) lineno PLOT aexp1,aexp2 lineno GOTO lineno

Puts cursor at location specified by aexp1 and aexp2.

Specifies graphics mode.
Suppresses cursor.
Specifies character to be printed.
Specifies where to print character.
Start loop to prevent READY from being printed. (GOTO same lineno.)
Press BREAK to terminate loop.

GRAPHICS $\mathbf{0}$ is also used as a clear screen command either in Direct mode or Deferred mode. It terminates any previously selected graphics mode and returns the screen to the default mode (GRAPHICS 0 ).

## GRAPHICS MODES 1 AND 2

As defined in Table 9-1, these two 5 -color modes are Text modes. However, they are both split-screen (see Figure 9-1) modes. Characters printed in Graphics mode 1 are twice the width of those printed in Graphics 0, but are the same height. Characters printed in Graphics mode 2 are twice the width and height of those in Graphics mode 0. In the split-screen mode, a PRINT command is used to display characters in either the text window or the graphics window. To print characters in the graphics window, specify device \#6 after the PRINT command.
Example: 100 GR. 1
110 PRINT\#6;"ATARI'"
The default colors depend on the type of character input. Table $9-2$ defines the default color and color register used for each type.

## TABLE 9.2 DEFAULT COLORS FOR SPECIFIC INPUT TYPES

| Character Type | Color Register | Default Color |
| :--- | :--- | :--- |
| Upper case alphabetical | 0 | Orange |
| Lower case alphabetical | 1 | Light Green |
| Inverse upper case alphabetical | 2 | Dark Blue |
| Inverse lower case alphabetical | 3 | Red |
| Numbers and delimiters | 0 | Orange |
| Inverse numbers and delimiters | 2 | Dark Blue |

Note: See SETCOLOR to change character colors.
Unless otherwise specified, all characters are displayed in upper case non-inverse form. To print lower case letters and graphics characters, use a POKE 756,226. To return to upper case, use POKE 756,224.

In Graphics modes 1 and 2, there is no inverse video, but it is possible to get all of the characters in four different colors (see end of section).

Figure 9.1. Split-Screen Display For Graphics Modes 1 and 2

As shown in Figure 9-1, the $X$ and $Y$ coordinates start at 0 (upper left of screen). The maximum values are the numbers of rows and columns minus 1 (see Table 9-1).

This split-screen configuration can be changed to a full screen display by adding the characters +16 to the mode number.

## Example: GRAPHICS $1+16$

## GRAPHICS MODES 3, 5, AND 7

These three 4 -color Graphics modes are also split-screen displays in their default state, but may be changed to full screen by adding +16 to the mode number. Modes 3,5, and 7 are alike except that modes 5 and 7 use more points (pixels) in plotting, drawing, and positioning the cursor; the points are smaller, thereby giving a much higher resolution.

## GRAPHICS MODES 4 AND 6

These two 2 -color Graphics modes are split-screen displays and can display in only two colors while the other modes can display 4 and 5 colors. The advantage of a two-color mode is that it requires less RAM space (see Table 9-1). Therefore, it is used when only two colors are needed and RAM is getting crowded. These two modes also have a higher resolution which means smaller points than Graphics mode 3.

## GRAPHICS MODE 8

This Graphics mode gives the highest resolution of all the modes. As it takes a lot of RAM to obtain this kind of resolution, it can only accommodate a maximum of one color and two different luminances.

## GRAPHICS MODES 9, 10, AND 11

Use GRAPHICS to select one of the Graphics modes (9 through 11). GRAPHICS 9 through 11 are only available if your system has a GTIA chip. GRAPHICS 9 allows you to have one playfield color with 16 luminances. GRAPHICS 10 can have nine playfield colors with eight luminances. GRAPHICS 11 can have 16 colors with one luminance.

## COLOR (C.)

## Format: COLOR aexp <br> Examples: 110 COLOR ASC("A") <br> 110 COLOR 3

The value of the expression in the COLOR statement determines the data to be stored in the display memory for all subsequent PLOT and DRAWTO commands until the next COLOR statement is executed. The value must be positive and is usually an integer from 0 through 4 . Modes 9 through 11 use 4 bits, so the color statement varies between 0 and 15. The actual color displayed depends on the value in the color register, which corresponds to the data of $0,1,2$, or 3 in the particular graphics mode being used. This may be determined by looking in Table 9.5, which gives the default colors and the corresponding register numbers. Colors may be changed by using SETCOLOR.

Note that when BASIC is first powered up, the color data is 0 , and when a GRAPHICS command (without +32 ) is executed, all of the pixels are set to 0 . Therefore, nothing seems to happen to PLOT and DRAWTO in GRAPHICS 3 through 7 when no COLOR statement has been executed. Correct by doing a COLOR 1 first.

## DRAWTO (DR.)

Format: DRAWTO aexp1, aexp2
Example: 100 DRAWTO 10,8
This statement causes a line to be drawn from the last point displayed by a PLOT (see PLOT) to the location specified by aexp1 and aexp2. The first expression represents the $X$ coordinate and the second represents the $Y$-coordinate (see Figure 9.1). The color of the line is determined by the color command in effect at the time.

## LOCATE (LOC.)

Format: LOCATE aexp1, aexp2, var
Example: 150 LOCATE 12, 15, X
This command positions the invisible graphics cursor at the specified location in the graphics window, retrieves the color data at that pixel, and stores it in the specified arithmetic variable. This gives a number from 0 to 255 for Graphics modes 0 through 2; 0 or 1 for the 2 -color graphics modes; and $0,1,2$, or 3 for the 4 -color modes. The two arithmetic expressions specify the $X$ and $Y$ coordinates of the point. LOCATE is equivalent to:
POSITION aexp1, aexp2:GET \#6,avar
Doing a PRINT after a LOCATE or GET from the screen may cause the data in the pixel which was examined to be modified. This problem is avoided by repositioning the cursor and putting the data that was read, back into the pixel before doing the PRINT. The program in Figure $9-2$ illustrates the use of the LOCATE command.

```
10 GRAFHTCS 3+16
20 COLOR 1
30 SETCOLOR 2.10.8
40 FLOT 10.15
50 DRAMTO 15,15
60 LOCATE 12,15,X
70 PETNT X
```

Figure 9.2. Example Program Using LOCATE
On execution, the program prints the data (1) determined by the COLOR statement which was stored in pixel 12, 15.

## PLOT (PL.)

## Format: PLOT aexp1, aexp2 Example: 100 PLOT 5,5

The PLOT command is used in Graphics modes 3 through 11 to display a point in the graphics window. The aexp1 specifies the $X$-coordinate and the aexp2 the Y-coordinate. The color of the plotted point is determined by the last COLOR statement executed. To change the color and luminance of the plotted point, use SETCOLOR. Points that can be plotted on the screen are dependent on the Graphics mode being used. The range of points begins at 0 and extends to one less than the total number of rows ( $X$-coordinate) or columns ( $Y$-coordinate) shown in Table 9-1.

## POSITION (POS.)

## Format: POSITION aexp1, aexp2 <br> Example: 100 POSITION 8, 12

The POSITION statement is used to place the cursor (invisible in graphics mode) at a specified location on the screen. This statement usually precedes a PRINT statement and can be used in all modes. Note that the cursor does not actually move until an I/O command which involves the screen is issued.

## PUT/GET (PU./GE.)

## Formats: PUT \#aexp, aexp GET \#aexp, avar <br> Examples: 100 PUT \#6, ASC(" $A$ ") 200 GET \# $1, X$

In graphics work, PUT is used to output data to the screen display. This statement works hand-in-hand with the POSITION statement. After a PUT (or GET), the cursor is moved to the next location on the screen. Doing a PUT to device \#6 causes the one-byte input (second aexp) to be displayed at the cursor position. The byte is either an ATASCII code byte for a particular character (modes $0-2$ ) or the color data (modes 3-11).

GET is used to input the code byte of the character displayed at the cursor position, into the specified arithmetic variable. (PRINT and INPUT may also be used.)
Note: Doing a PRINT after a LOCATE or GET from the screen may cause the data in the pixel which was examined to be modified. To avoid this problem, reposition the cursor and put the data that was read, back into the pixel before doing the PRINT.

## SETCOLOR (SE.)

Format: SETCOLOR $\exp 1$, $\operatorname{aexp2}$, aexp3
Example: 100 SETCOLOR 0, 1, 4
This statement is used to choose the particular hue and luminance to be stored in the specified color register. The parameters of the SETCOLOR statement are defined below:
aexp1 = Color register ( $0-4$ depending on graphics mode)
aexp2 $=$ Color hue number ( $0-15$. See Table 9-3)
aexp3 $=$ Color luminance (must be an even number between 0 and 14; the higher the number the brighter the display. 14 is almost pure white.)
TABLE 9.3 THE ATARI HUE (SETCOLOR COMMAND) NUMBERS AND COLORS

## COLORS SETCOLOR (aexp2) NUMBERS

GRAY 0

LIGHT ORANGE (GOLD) 1
ORANGE 2
RED-ORANGE 3
PINK 4
PURPLE 5
PURPLE-BLUE 6
BLUE 7
BLUE 8
LIGHT BLUE 9
TURQUOISE 10
GREEN-BLUE 11
GREEN 12
YELLOW-GREEN 13
ORANGE-GREEN 14
LIGHT ORANGE 15
Note: Colors vary with type and adjustment of TV or monitor used.
The ATARI display hardware contains five color registers, numbered from 0 through 4. The Operating System (OS) has five RAM locations (COLOR 0 through COLOR 4, see Appendix I-Memory Locations) where it keeps track of the current colors. The SETCOLOR statement is used to change the values in these RAM locations. (The OS transfers these values to the hardware registers every television frame.) The SETCOLOR statement requires a value from 0 to 4 to specify a color register. The COLOR statement uses different numbers because it specifies data which only indirectly corresponds to a color register. This can be confusing, so careful experimentation and study of the various tables in this section is advised.

No SETCOLOR commands are needed if the default set of colors is used. The purpose of the color registers and SETCOLOR statement is to specify the colors.

TABLE 9.4 TABLE OF SETCOLOR "DEFAULT" COLORS*

| Setcolor <br> (Color Register) | Defaults To <br> Color | Luminance | Actual Color |
| :--- | :--- | :--- | :--- |
| 0 | 2 | 8 |  |
| 1 | 12 | 10 | ORANGE |
| 2 | 9 | 4 | GREEN |
| 3 | 4 | 6 | DARK BLUE |
| 4 | 0 | 0 | PINK OR RED |
|  |  | BLACK |  |

*"DEFAULT"' occurs if no SETCOLOR statement is used.
Note: Colors may vary depending upon the television monitor type, condition, and adjustment.

A program illustrating Graphics mode 3 and the commands explained so far in this section is shown below:

```
A CRAPHTCS 3
20 SETCOLOR 0, 2. %%COLOR 1
30 FLOT 1%, %WRAWTO 1%, 10%DRAUTO %,10
40 F!OT 19,1%DRANTO 19,18
W0 FLOT 20, &ORANTO 20, 18
60 FLOT 22, 1 ODRANTO 22.10
70 D&ANTO 30,1E
ब0 FOKE 752, 1
90? %? " ATART HOME COMFUTERS"
100 GOTO 100
```

The SETCOLOR and COLOR statements set the color of the points to be plotted (see Table 9-5). The SETCOLOR command loads color register 0 with hue 2 (orange) and a luminance of 8 ("normal'"). The next 4 lines plot the points to be displayed. Line 80 prints the string expression ATARI HOME COMPUTERS in the text window.

Note that the background color was never set because the default is the desired color (black).

If the program is executed, it prints the ATARI logo in the graphics window and the string expression in the text window as in Figure 9-3.

Figure 9.3. Atari Logo Program Execution

## XIO (X.) SPECIAL FILL APPLICATION

## Format: XIO 18, \#aexp, aexp1, aexp2, filespec <br> Example: $100 \mathrm{XIO} 18, \# 6,12,0$, "S:"

This special application of the XIO statement uses XIO 18 fills an area on the screen between plotted points and lines with a non-zero color. A dummy variable
$(0)$ is used for $\operatorname{exp2}$. Refer to XIO statement for further information.
The following steps illustrate the fill process:

1. PLOT bottom right corner (point 1).
2. DRAWTO upper right corner (point 2). This outlines the right edge of the area to be filled.
3. DRAWTO upper left corner (point 3).
4. POSITION cursor at lower left corner (point 4)
5. POKE address 765 with the fill color data (1, 2, or 3 ).
6. This method is used to fill each horizontal line from top to bottom of the specified area. The fill starts at the left and proceeds across the line to the right until it reaches a pixel which contains non-zero data (will wraparound if necessary). This means that fill cannot be used to change an area which has been filled in with a non-zero value, as the fill will stop. The fill command will go into an infinite loop if a fill with zero ( 0 ) data is attempted on a line which has no non-zero pixels. BREAK or SYSTEM RESET can be used to stop the fill if this happens
The program in Figure 9.4 creates a shape and fills it with a data (color) of 3. Note that the XIO command draws in the lines at the left and bottom of the figure.
```
10 %-AFHTCS %+16
"0 COlOK 3
30 ए10T 70.45
40 एFAMTO W0, 10
W0 DFAWTO 30, 10

80 <70 10, #6,1%,0*" *"
90 GOTO 90
```

Figure 9.4. Example "FILL" Program

## XIO (X.) DRAW LINE APPLICATION

Format: XIO 17, \#aexp, aexp1, aexp2, filespec
Example: 130 XIO 17, \#6, 12, 0, "S:"
This application of the XIO statement uses XIO 17 and draws a line on the screen between the last point plotted and the current position of the (invisible) graphics cursor (moved by the POSITION command) in the current color.

```
100 GRAPHICS 5: COLOR 2
110 PLOT 5.5
120 POSITION 10.10
130 XIO 17. #6. 12, 0."S
```

The above program draws a line from 5.5 to 10.10 in COLOR 2. Lines 120 and 130 could be replaced by

120 DRAWTO 10.10

TABLE 9.6 INTERNAL CHARACTER SET

## Assigning Colors To Characters In Text Modes 1 and 2

This procedure describes the method of assigning colors to the ATARI character set. First, look up the character number in Table 9-6. Then, see Table 9-7 to get the conversion of that number required to assign a color register to it.
Example: Assign SETCOLOR 0 to lower case " $r$ " in mode 2 whose color is determined by register 0 .

1. In Table 9-6, find the column and number for " $r$ " ( 114 -column 4 ).

| Column 3 |  |  |  | Column 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \# | CHR | \# | CHR | \# | CHR | \# | CHR |
| 64 | -1 | 80 | $8$ | 96 |  | 112 | p |
| 65 | 4 | 81 |  | 97 | a | 113 | q |
| 66 |  | 82 |  | 98 | b | 114 | r |
| 67 |  | 83 |  | 99 | c | 115 | s |
| 68 |  | 84 |  | 100 | d | 116 | 1 |
| 69 |  | 85 |  | 101 | e | 117 | $u$ |
| 70 |  | 86 |  | 102 | ¢ | 118 | $\checkmark$ |
| 71 |  | 87 |  | 103 | 9 | 119 | w |
| 72 |  | 88 |  | 104 | h | 120 | $\times$ |

| :--- | :--- | :--- | :--- | :--- | :--- |
| MODE 0 | ${ }^{2}$ SETCOLOR 2 | $\#+32$ | $\#+32$ | $\#-64$ | NONE |
|  |  | POKE 756,224 |  | POKE 756,226 |  |
| MODE 1 | SETCOLOR 0 | $\#+32$ | $\#+32$ | $\#-32$ | $\#-32$ |
| OR | SETCOLOR 1 | NONE | $\#+64$ | $\#-64$ | NONE |
| MODE 2 | SETCOLOR 2 | $\#+160$ | $\#+160$ | $\#+96$ | $\#-96$ |
|  | SETCOLOR 3 | $\#+128$ | $\#+192$ | $\#+64$ | $\#+28$ |

2. Luminance controlled by SETCOLOR 1, 0, LUM
3. Using Table 9-7, locate column 4. Conversion is the character number minus 32 $(114-32=82)$.
4. POKE the Character Base Address (CHBAS) with 226 to specify lower case letters or special graphics characters, e.g.,
POKE 756,226
or
CHBAS $=756$
POKE CHBAS, 226
To return to upper case letters, numbers, and punctuation marks, POKE CHBAS with 224.
5. A PRINT statement using the converted number (82) assigns the lower case " $r$ " to SETCOLOR 0 in mode 2 (see Table 9.5).

## Graphic Control Characters

These characters are produced when the CTRL key is pressed with the appropriate alphabetic keys. These characters can be used to draw design, pictures, etc., in mode 0 and in modes 1 and 2 if CHBAS is changed.

## COLOR ASSIGNMENT IN THE GTIA MODES 9, 10, and 11:

The GTIA modes 9, 10 and 11 handle colors differently than modes 0 through 8. The following procedures describe how to use modes 9,10 , and 11.
Mode 9: In this mode, one color with 16 luminances is available. First, choose a hue from Table 9.3 and assign it with the SETCOLOR com. mand. Only SETCOLOR register 4 is used and the luminance must be set to zero; e.g.,

100 SETCOLOR 4, HUE, 0 (where HUE is the hue to be assigned) Then, use the COLOR statement to choose luminances from 0 through 15.0 is almost black and 15 is almost white.
Mode 10: Nine colors with nine different luminances are available. The nine colors are chosen by using COLOR 0 through 8 . These colors are assigned by use of POKE and SETCOLOR.

| COLOR | POKE <br> lOcation | SETCOLOR <br> register |
| :--- | :--- | :--- |
| 0 | 704 | --- |
| 1 | 705 | --- |
| 2 | 706 | --- |
| 3 | 707 | -- |
| 4 | 708 | 0 |
| 5 | 709 | 1 |
| 6 | 710 | 2 |

COLOR POKE SETCOLOR (continued)
location register
$\begin{array}{lll}7 & 711 & 3\end{array}$
$8 \quad 712 \quad 4$
COLORs 4 through 8 can be assigned by using SETCOLOR in the normal manner. All COLORs can be assigned by POKEing to the locations given above
Mode 11: 16 colors, all with the same luminance, are available. The luminance is assigned by SETCOLOR. Only SETCOLOR register 4 is used with the hue number of zero; e.g.

100 SETCOLOR 4,0,LUM (where lum is the luminance chosen)
The colors are chosen by COLORs 0 to 15. The COLOR numbers are the same as those given in Table 9-3.

This section describes the statement used to generate musical notes and sounds through the audio system of the television monitor. Up to four different sounds can be "played" simultaneously creating harmony. This SOUND statement can also be used to simulate explosions, whistles, and other interesting sound effects. The other commands described in this section deal with the functions used to manipulate the keyboard, joystick, and paddle controllers. These functions allow these controllers to be plugged in and used in BASIC programs for games, etc.

The command and functions covered in this section are:

## SOUND PADDLE STICK STRIG PTRIG

## SOUND (SO.)

Format: SOUND $\operatorname{aexp} 1, a \exp 2, a \exp 3, \operatorname{aexp} 4$
Example: 100 SOUND 2, 204, 10, 12
The SOUND statement causes the specified note to begin playing as soon as the statement is executed. The note will continue playing until the program encounters another SOUND statement with the same aexp1 or an END statement. This command can be used in either Direct or Deferred modes.

The SOUND parameters are described as follows:
aexp1 = Voice. Can be $0-3$, but each voice requires a separate SOUND statement.
aexp2 $=$ Pitch. Can be any number between 0-255. The larger the number, the lower the pitch. Table 10-1 defines the pitch numbers for the various musical notes ranging from two octaves above middle $C$ to one octave below middle C .
aexp3 $=$ Distortion. Can be even numbers between 0-14. Used in creating sound effects. A 10 is used to create a "pure" tone whereas a 12 gives an interesting buzzer sound. The following program combines the 10 and 12 sounds:
$10 X=1$
$20 x=X+2: ? X$
30 IF $\mathrm{X}<10$ THEN GOTO 20
35 SOUND 2, 100, 10, 8
$40 Y=0$
$50 Y=Y+2: ? Y$
60 SOUND 2, 100, 12, 8
70 IF Y < 10 THEN GOTO 50
80 GOTO 10
The rest of the numbers are used for other special effects, noise generation, and experimental use.
aexp4 $=$ Volume control. Can be between 0 and 15 . Using a 1 creates a sound barely audible whereas a 15 is loud. A value of 8 is considered normal. If more than 1 sound statement is being used. the total volume should not exceed 32. This creates an unpleasant "clipped" tone. A value of 0 turns off the sound of the specified voice.
Using the note values in Table 10.1, the program in Figure 10.1 demonstrates how to write a program that will "play" the C scale

Note that the DATA statement in line 90 ends with 256 , which is outside of the designated range. The 256 is used as an end-of-data marker.

## GAME CONTROLLER FUNCTIONS

Figure $10-2$ is an illustration of controllers used with the ATARI Home Computers. The controllers can be attached directly to the ATARI Home Computer or to external mechanical devices so that outside events can be fed directly to the computer for processing and control purposes.

Figure 10-2. Game Controllers

## PADDLE

## Format: PADDLE(aexp) <br> Example: PRINT PADDLE(3)

This function returns the status of a particular numbered controller. The paddle controllers (aexp) are numbered 0-7 from left to right for the ATARI 800 and 400, and $0-3$ for the ATARI 1200. This function can be used with other functions or commands to "cause" further actions like sound, graphics controls, etc. for example, the statement IF PADDLE (3) © 14 THEN PRINT "PADDLE ACTIVE." Note that the PADDLE function returns a number between 1 and 228, with the number increasing in size as the knob on the controller is rotated counterclockwise (turned to the left).

## PTRIG

Format: PTRIG(aexp)
Example: 100 IF PTRIG(4) $=0$ THEN PRINT "MISSILES FIRED!"
The PTRIG function returns a status of 0 if the trigger button of the designated controller is pressed. Otherwise, it returns a value of 1 . The aexp musi be a number between 0 and 7 for the ATARI 800 and 400. and $0-3$ for the ATARI 1200 as it designates the controller.

## STICK

## Format: STICK(aexp)

Example: 100 PRINT STICK(3)
This function works exactly the same way as the PADDLE command, but can be used with the joystick controller. The joystick controllers are numbered from (left to right) 0-3 for the ATARI 800 and 400, and 0-1 for the ATARI 1200 and 400
Controller $1=\operatorname{STICK}(0)$
Controller $2=\operatorname{STICK}(1)$
Controller $3=$ STICK(2)
Controller $4=$ STICK(3)
Figure 10.3 shows the numbers that are returned when the joystick controller is moved in any direction.

Figure 10.3. Joystick Controller Movement

## STRIG

$\begin{array}{ll}\text { Format: } & \text { STRIG(aexp) } \\ \text { Example: } & 100 \text { IF STRIG(3) }=0 \text { THEN PRINT "FIRE TORPEDO" }\end{array}$
Example:
The STRIG function works the same way as the PTRIG function. It is used with the joystick. The aexp for the ATARI 800 and 400 must be $0-3$. and the aexp for the ATARI 1200 must be 0-1.

This section includes hints on increasing programming efficiency, conserving memory, and combining machine language programs with ATARI BASIC programs. This section does not include an instruction set for the 6502 microprocessor chip nor does it give instructions on programming in machine language. An additional purchase of the ATARI Assembler Editor cartridge and a careful study of the ATARI Assembler Editor Manual are strongly recommended.

## MEMORY CONSERVATION

These hints give ways of conserving memory. Some of these methods make programs less readable and harder to modify, but there are cases where this is necessary due to memory limitations.

1. In many small computers, eliminating blank spaces between words and characters as they are typed into the keyboard will save memory. This is not true of the ATARI Home Computer System, which removes extra spaces. Statements are always displayed the same regardless of how many spaces were used on program entry. Spaces should be used (just as in typing on a conventional typewriter) between successive keywords and between keywords and variable names. Here is an example:

## 10 IF A $=5$ THEN PRINT A

Note the space between IF and A and between THEN and PRINT. In most cases, a statement will be interpreted correctly by the computer even if all spaces are left out, but this is not always true. Use conventional spacing.
2. Each new line number represents the beginning of what is called a new "logical line". Each logical line takes 6 bytes of "overhead", whether it is used to full capacity or not. Adding an additional BASIC statement by using a colon (:) to separate each pair of statements on the same line takes only 3 bytes. If you need to save memory, this program:

| 10 | $x \cdots x+x$ |
| :---: | :---: |
| 20 | $Y=Y+1$ |
| 30 | $\cdots$ |
| 40 | PRTNT |
| $\cdots 0$ | G070 0 |

can be entered on one line:

$$
10 \quad X=X+1: Y=Y+15 Z=X+Y: F W T N T \quad Z: G O T O \quad 10
$$

This consolidation saves 12 bytes.
3. Variables and constants should be "managed" for savings, too. Each time a constant ( $4,5,16,3.14159$, etc.) is used, it takes 7 bytes. Defining a new variable requires 8 bytes plus the length of the variable name (in characters). But each time it is used after being defined, it takes only 1 byte, regardless of its length. Thus, if a constant (such as 3.14159 ) is used more than once or twice in a program, it should be defined as a variable, and the variable name used throughout the program. For example:
$10 \mathrm{Fr}=3.14159$
20 FRTNT "AREA OF A CXFCLE XS THE RAD工
US SOUARED TMEE " 今FX
4. Literal strings require 2 bytes overhead and 1 byte for each character (including all spaces) in the string.
5. String variables take 9 bytes each plus the length of the variable name (including spaces) plus the space eaten up by the DIM statement plus the size of the string itself ( 1 byte per character, including spaces) when it is defined. Obviously, the use of string variables is very costly in terms of RAM.
6. Definition of a new matrix requires 15 bytes plus the length of the matrix variable name plus the space needed for the DIM statement plus 6 times the size of the matrix (product of the number of rows and the number of columns). Thus, a 25 row by 4 column matrix would require $15+$ approximately 3 (for variable name) + approximately 10 (for the DIM statement) + 6 times 100 (the matrix size), or about 630 bytes
7. Each character after REM takes one byte of memory. Remarks are helpful to people trying to understand a program, but sometimes it is necessary to remove remark statements to save memory.
8. Subroutines can save memory because one subroutine and several short calls take less memory than duplicating the code several times. On the other hand, a subroutine that is only called once takes extra bytes for the GOSUB and RETURN statements.
9. Parentheses take one byte each. Extra parentheses are a good idea in some cases if they make an expression more understandable to the programmer. However, removing unnecessary parentheses and relying on operator precedence will save a few bytes.

## PROGRAMMING IN MACHINE LANGUAGE

Machine language is written entirely in binary code. The ATARI Home Computer contains a 6502 microprocessor and it is possible to call 6502 machine code subroutines from BASIC using the USR function. Short routines may then be entered into a program by hand assembly (if necessary).

Before it returns to BASIC, the assembly language routine must do a pull accumulator (PLA) instruction to remove the number ( N ) of input arguments off the stack. If this number is not 0 , then all of the input arguments must be popped off the stack also using PLA. (See Figure 6-1).

The subroutine should end by placing the low byte of its result in location 212 (decimal), and then return to BASIC using an RTS (Return from Subroutine) instruction. The BASIC interpreter will convert the 2-byte binary number stored in locations 212 and 213 into an integer between 0 and 65535 in floating-point format to obtain the value returned by the USR function.

The ADR function may be used to pass data that is stored in arrays or strings to a subroutine in machine language．Use the ADR function to get the address of the array or string，and then use this address as one of the USR input arguments．

The program in Figure 11－1，Hexcode Loader，provides the means of entering hexadecimal codes，converting each hexadecimal number to decimal，and storing the decimal number into an array．The array is then executed as an assembly language subroutine．（An array is used to allocate space in memory for the routine．）
1．To use this program，first enter it．After entering it，save this program on disk or cassette for future use．

Figure 11-1. Hexcode Loader Input Program
2. Now add the BASIC language part of your program starting at line 340 including the USR function that calls the machine language subroutine. (See example below.)
3. Count the total number of hex codes to be entered and enter this number on line 270 when requested. If another number is already entered, simply replace it.
4. Run the program and enter the hexadecimal codes of the machine level subroutine pressing RETURN after each entry. After the last entry, type DONE and press RETURN.
5. Now the DATA line (1500) dispiays on the screen. It will not be entered into the program until the cursor is moved to the DATA line and RETURN is pressed.
6. Add a program line 5 GOTO 270 to bypass the hexcode loader (or delete the hexcode loader through line 260). Now save the completed program by using CSAVE or SAVE. It is important to do this before executing the part of the program containing the USR call. A mistake in a machine language routine may cause the system to crash. If the system does hang up, press SYSTEM RESET. If the system doesn't respond, turn power off and on again, reload the program, and correct it.
Note: This method only works with relocatable machine language routines.
The following two sample programs can each be entered into the Hexcode Loader program. The first program prints NOTHING IS MOVING while the machine program changes the colors. Use inverse video for lines 380 and 390 . The second sample program displays a BASIC graphics design, then changes colors.

After entering this program, check that line 270 reads:
270 CLR:BYTES $=21$
Type RUN and press RETURN.

Now enter the hexadecimal codes as shown column by column
$68 \quad 2$

## BRIEF SUMMARY

ABBREVIATION: OF BASIC STATEMENT
Function returns absolute value (unsigned) of the variable or expression.
Function returns memory address of a string.
Logical operator: Expression is true only if both subexpressions joined by AND are true.
String function returns the numeric value of a single string character.
Function returns the arctangent of a number or expression in radians or degrees.
Exit from BASIC and return to the resident operating system or console processor.
Loads data from Program Recorder into RAM.
String function returns a single string byte equivalent to a numeric value between 0 and 255 in ATASCII code.

Function returns the base 10 logarithm of an expression.
I/O statement used to close a file at the conclusion of I/O operations.

The opposite of DIM: Undimensions all strings and arrays.
Chooses color register to be used in color graphics work.
Continue. Causes a program to restart execution on the next line following use of the BREAK key or encountering a STOP.
Function returns the cosine of the variable or expression (degrees or radians).
Outputs data from RAM to the Program Recorder for tape storage.
Part of READIDATA combination. Used to identify the succeeding items (which must be separated by commas) as individual data items.

BRIEF SUMMARY OF BASIC STATEMENT
Statement DEG tells computer to perform trigonometric functions in degrees instead of radians. (Default in radians.)
Reserves the specified amount of memory for matrix, array, or string. All string variables, arrays, matrices must be dimensioned with a DIM statement.
Reserved word for disk operators. Causes the menu to be displayed. (See DOS Manual.)
Draws a straight line between a plotted point and specified point.
Stops program execution; closes files; turns off sounds. Program may be restarted using CONT. (Note: END may be used more than once in a program.)
I/O command used to store data or programs in untokenized (source) form.
Function returns e $(2.7182818)$ raised to the specified power.
Used with NEXT to establish FOR/NEXT loops. Introduces the range that the loop variable will operate in during the execution of loop.
Function returns the amount of remaining user memory (in bytes).
Used mostly with disk operations to input a single byte of data.
Branch to a subroutine beginning at the specified line number.
Unconditional branch to a specified line number.
Specifies which of the graphics modes is to be used. GR. 0 may be used to clear screen.
Used to cause conditional branching or to execute another statement on the same line (only if the first expression is true).
Causes computer to ask for input from keyboard. Execution continues only when RETURN key is pressed after inputting data.
Function returns the next lowest whole integer below the specified value. Rounding is always downward, even when number is negative.
String function returns the length of the specified string in bytes or characters (1 byte contains 1 character).

## BRIEF SUMMARY

OF BASIC STATEMENT
Assigns a value to a specific variable name. LET is optional in ATARI BASIC, and may be simply omitted.
Display or otherwise output the program list. Input from disk, etc. into the computer.
Graphics: Stores, in a specified variable, the value that controls a specified graphics point.
Function returns the natural logarithm of a number.
Command to line printer to print the specified message.
Erases all contents of user RAM.
Causes a FOR/NEXT loop to terminate or continue depending on the particular variables or expressions. All loops are executed at least once.
A " 1 " is returned only if the expression is NOT true. If it is true, a " 0 " is returned.
See DOS/FMS Manual... used only in disk operations.
Used with GOTO or GOSUB for branching purposes. Multiple branches to different line numbers are possible depending on the value of the ON variable or expression.
Opens the specified file for input or output operations.
Logical operator used between two expressions. If either one is true, a " 1 " is evaluated. A " 0 " results only if both are false.
Function returns position of the paddle game controller.
Function returns decimal form of contents of specified memory location (RAM or ROM).
Causes a single point to be plotted at the $X, Y$ location specified.
See DOS/FMS Manual...used only in disk operations. Insert the specified byte into the specified memory location. May be used only with RAM. Don't try to POKE ROM or you'll get an error.
Removes the loop variable from the GOSUB stack. Used when departure from the loop is made in other than normal manner.
Sets the cursor to the specified screen position.

| RESERVED WORD: | ABBREVIATION: | BRIEF SUMMARY <br> OF BASIC STATEMENT |
| :---: | :---: | :---: |
| PRINT | PR. or ? | I/O command causes output from the computer to the specified output device. |
| PTRIG |  | Function returns status of the trigger button on paddle game controllers. |
| PUT | PU. | Causes output of a single byte of data from the computer to the specified device. |
| RAD |  | Specifies that information is in radians rather than degrees when using the trigonometric functions. Default is to RAD. (See DEG.) |
| READ | REA. | Read the next items in the DATA list and assign to specified variables. |
| REM | R. or (SPACE). | Remarks. This statement does nothing, but comments may be printed within the program list for future reference by the programmer. Statements on a line that starts with REM are not executed. |
| RESTORE | RES. | Allows DATA to be read more than once. |
| RETURN | RET. | RETURN from subroutine to the statement immediately following the one in which GOSUB appeared. |
| RND |  | Function returns a random number between 0 and 1 , but never 1. |
| RUN | RU. | Execute the program. Sets normal variables to 0 , undims arrays and string. |
| SAVE | S. | I/O statement causes data or program to be recorded on disk under filespec provided with SAVE. |
| SETCOLOR | SE. | Store hue and luminance color data in a particular color register. |
| SGN |  | Function returns +1 if value is positive, 0 if zero, -1 if negative. |
| SIN |  | Function returns trigonometric sine of given value (DEG or RAD). |
| SOUND | So. | Controls register, sound pitch, distortion, and volume of a tone or note. |
| SQR |  | Function returns the square root of the specified value. |
| STATUS | ST. | Calls status routine for specified device. |
| STEP |  | Used with FOR/NEXT. Determines increment to be skipped between each pair of loop variable values. |
| STICK |  | Function returns position of stick game controller. |

| RESERVED WORD: | ABBREVIATION: | BRIEF SUMMARY OF BASIC STATEMENT |
| :---: | :---: | :---: |
| STRIG |  | Function returns 1 if stick trigger button not pressed, 0 if pressed. |
| STOP | STO. | Causes execution to stop. but does not close files or turn off sounds. |
| STR\$ |  | Function returns a character string equal to numeric value given. For example: STR\$(65) returns 65 as a string. |
| THEN |  | Used with IF statement. If expression is true. the THEN statements are executed. If the expression is false, control passes to next line |
| TO |  | Used with FOR as in "FOR $X=1$ TO 10 " Separates the loop range expressions. |
| TRAP | T. | Takes control of program in case of an INPUT error and directs execution to a specified line number |
| USR |  | Function returns results of a machine-language subroutine. |
| VAL |  | Function returns the equivalent numeric value of a string. |
| XIO | X. | General I/O statement used with disk opera tions (see DOS/FMS Manual) and in graphics work (Fill). |

## ERROR MESSAGES

## ERROR

CODE NO. ERROR CODE MESSAGE
Memory insufficient to store the statement or the new variable name or to DIM a new string variable.
Value Error: A value expected to be a positive integer is negative, a value expected to be within a specific range is not.
Too Many Variables: A maximum of 128 different variable names is allowed. (See Variable Name Limit.)
String Length Error: Attempted to store beyond the DIMensioned string length.
Out of Data Error: READ statement requires more data items than supplied by DATA statement(s).
Number greater than 32767: Value is not a positive integer or is greater than 32767.
Input Statement Error: Attempted to INPUT a non-numeric value into a numeric variable.
Array or String DIM Error: DIM size is greater than 32767 or an array/matrix reference is out of the range of the dimensioned size, or the array/matrix or string has been already DIMensioned, or a reference has been made to an undimensioned array or string.
Argument Stack Overflow: There are too many GOSUBs or too large an expression.
Floating Point Overflow/Underflow Error: Attempted to divide by zero or refer to a number larger than $1 \times 10^{98}$ or smaller than $1 \times 10-99$.
Line Not Found: A GOSUB, GOTO, or THEN referenced a nonexistent line number.
No Matching FOR Statement: A NEXT was encountered without a previous FOR or nested FOR/NEXT statements do not match properly. (Error is reported at the NEXT statement, not at FOR).
Line Too Long Error: The statement is too complex or too long for BASIC to handle.
GOSUB or FOR Line Deleted: A NEXT or RETURN statement was encountered and the corresponding FOR or GOSUB has been deleted since the last RUN.
RETURN Error: A RETURN was encountered without a matching
GOSUB GOSUB.

Garbage Error: Execution of "garbage" (bad RAM bits) was attempted. This error code may indicate a hardware problem, but may also be the result of faulty use of POKE. Try typing NEW or powering down, then re-enter the program without any POKE commands.
Invalid String Character: String does not start with a valid character, or string in VAL statement is not a numeric string.
Note: The following are INPUT/OUTPUT errors that result during the use of disk drives, printers, or other accessory devices. Further information is provided with the auxiliary hardware.
LOAD program Too Long: Insufficient memory remains to complete LOAD.
Device Number Larger than 7 or Equal to 0.
LOAD File Error: Attempted to LOAD a non-LOAD file.
BREAK Abort: User hit BREAK key during I/O operation.
IOCB ${ }^{1}$ already open.
Nonexistent Device specified.
IOCB Write Only. READ command to a write-only device (Printer).
Invalid Command: The command is invalid for this device.
Device or File not Open: No OPEN specified for the device.
Bad IOCB Number: Illegal device number.
IOCB Read Only Error: WRITE command to a read-only device.
EOF: End of File read has been reached. (NOTE: This message may occur when using cassette files.)

Truncated Record: Attempt to read a record longer than 256 characters.
Device Timeout. Device doesn't respond.
Device NAK: Garbage at serial port or bad disk drive.
Serial bus input framing error.
Cursor out of range for particular mode.
Serial bus data frame overrun.
Serial bus data frame checksum error.
Device done error (invalid "done" byte): Attempt to write on a writeprotected diskette or a bad sector.
BAD screen mode error.
Function not implemented in handler.
Insufficient RAM for operating selected graphics mode.
Drive number error.
Too many OPEN files (no sector buffer available).
${ }^{1}$ IOCB refers to Input/Output Control Block.

S CODE NO. ERROR CODE MESSAGE

Disk full (no free sectors).
Unrecoverable system data $1 / 0$ error.
File number mismatch: Links on disk are messed up.
File name error.
POINT data length error.
File locked.
Command invalid (special operation code).
Directory full ( 64 files).
File not found.
POINT invalid.

See Appendix H for a user program that performs decimal/hexadecimal conversion.

## Notes:

1. ATASCII stands for "ATARI ASCII". Letters and numbers have the same values as those in ASCII, but some of the special characters are different
2. Except as shown, characters from 128-255 are reverse colors of 1 to 127 .
3. Add 32 to upper case code to get lower case code for same letter
4. To get ATASCII code, tell computer (direct mode) to PRINT ASC (• $\qquad$ ") Fill blank with letter, character, or number of code Must use the quotes!
5. The normal display keycaps are shown as white symbols on a black background: the inverse keycap symbols are shown as black on a white background

## HOME COMPUTER MEMORY MAP

## Derived Functions in Terms of ATARI Functions

```
\(\operatorname{SEC}(X)=1 / \operatorname{COS}(X)\)
\(\operatorname{CSC}(X)=1 / \operatorname{SIN}(X)\)
\(\operatorname{ARCSIN}(X)=\operatorname{ATN}\left(X / \operatorname{SQR}\left(\cdot X^{*} X+1\right)\right)\)
\(\operatorname{ARCCOS}(X)=\cdot \operatorname{ATN}(X / S Q R(-X * X+1)+\operatorname{CONSTANT})\)
\(\operatorname{ARSEC}(X)=\operatorname{ATN}(\operatorname{SQR}(X * X-1))+(\operatorname{SGN}(X-1)\)
*CONSTANT)
\(\operatorname{ARCCSC}(X)=\operatorname{ATN}(1 / \operatorname{SQR}(X * X-1))+(\operatorname{SGN}(X-1)\)
*CONSTANT)
\(\operatorname{ARCCOT}(\mathrm{X})=\operatorname{ATN}(\mathrm{X})+\) CONSTANT
\(\operatorname{SINH}(\mathrm{X})=(\operatorname{EXP}(\mathrm{X}) \cdot \operatorname{EXP}(-X)) / 2\)
\(\operatorname{COSH}(\mathrm{X})=(\operatorname{EXP}(\mathrm{X})+\operatorname{EXP}(-X)) / 2\)
\(\operatorname{TANH}(\mathrm{X})=-\operatorname{EXP}(\cdot X) /(\operatorname{EXP}(X)+\operatorname{EXP}(\cdot X))^{*} 2+1\)
\(\operatorname{SECH}(X)=2 /(\operatorname{EXP}(X)+\operatorname{EXP}(\cdot X))\)
\(\operatorname{CSCH}(X)=2 /(\operatorname{EXP}(X) \cdot \operatorname{EXP}(\cdot X))\)
\(\operatorname{COTH}(X)=\operatorname{EXP}(\cdot X) /(\operatorname{EXP}(X) \cdot \operatorname{EXP}(\cdot X))^{\star} 2+1\)
\(\operatorname{ARCSINH}(X)=\operatorname{LOG}(X+\operatorname{SQR}(X * X+1))\)
\(\operatorname{ARCCOSH}(X)=\operatorname{LOG}(X+\operatorname{SQR}(X * X-1))\)
\(\operatorname{ARCTANH}(X)=\operatorname{LOG}((1+X) /(1-X)) / 2\)
\(\operatorname{ARCSECH}(X)=\operatorname{LOG}((\operatorname{SQR}(\cdot X * X+1)+1) / X)\)
\(\operatorname{ARCCSCH}(X)=\operatorname{LOG}((\operatorname{SGN}(X) * \operatorname{SQR}(X * X+1)+1) / X)\)
\(\operatorname{ARCCOTH}(X)=\operatorname{LOG}((X+1) /(X-1)) / 2\)
```

## Notes:

1. If in RAD (default) mode, CONSTANT $=1.57079633$

If in DEG mode, CONSTANT $=90$.
2. In this chart, the variable $X$ in parentheses represents the value or expression to be evaluated by the derived function. Obviously, any variable name is permissible, as long as it represents the number or expression to be evaluated.

## PRINTED VERSIONS OF CONTROL CHARACTERS

The cursor and screen control characters can be placed in a string in a program or used as a Direct mode statement by pressing the ESC key before entering the character from the keyboard. This causes the special symbols which are shown below to be displayed. (Refer to Section 1 -ESC Key.)

| Alphanumeric: | The alphabetic letters $\mathrm{A}-\mathrm{Z}$, and the numbers $0-9$. (No punctuation marks or graphics symbols). |
| :---: | :---: |
| Array: | A list of numerical values stored in a series of memory locations preceded by a DIM statement. May be referred to by use of an array variable, and its individual elements are referred to by subscripted variable names. |
| ATASCII: | Stands for ATARI American Standard Code for Information Interchange. |
| BASIC: | High level programming language. Acronym for Beginner's All-purpose Symbolic Instruction Code. BASIC is always written using all capital letters. Developed by Mssrs. Kemeny and Kurtz at Dartmouth College in 1963. |
| Binary: | A number system using the base two. Thus the only possible digits are 0 and 1 , which may be used in a computer to represent true and false, on and off, etc |
| Bit: | Short for Binary Digit. A bit can be thought of as representing true or false, whether a circuit is on or off, or any other type of two-possibility concept. A bit is the smallest unit of data with which a computer can work. |
| Branch: | ATARI BASIC executes a program in order of line numbers. This execution sequence can be altered by the programmer, and the program can be told to skip over a certain number of lines or return to a line earlier in the program. This contrived change in execution sequence is called "branching". |
| Bug: | A mistake or error usually in the program or "software". |
| Byte: | Usually eight bits (enough to represent the decimal number 255 or 11111111 in binary notation). A byte of data can be used to represent an ATASCII character or a number in the range of 0 to 255 . |
| Central Processing Unit (CPU): | In microcomputers such as the ATARI systems, these are also called microprocessors or MPU. At one time, the CPU was that portion of any computer that controlled the memory and peripherals. Now the CPU or MPU is usually found on a single integrated circuit or "chip" (ATARI uses a 6502 microprocessor chip). |
| Code: | Instructions written in a language understood by a computer. |
| Command: | An instruction to the computer that is executed immediately. A good example is the BASIC command RUN. (See Statement.) |

## Computer:

Any device that can receive and then follow instructions to manipulate information. Both the instructions and the information may be varied from moment to moment. The distinction between a computer and a programmable calculator lies in the computer's ability to manipulate text as well as numbers. Most calculators can only handle numbers.

## Concatenation:

## Control Characters:

## CRT:

## Cursor:

Data:
Debug:
Default:

Digital:

Diskette:

DOS:

Editing:
Execute:

## Expression:

## Format:

Hard Copy:
Hardware:

The process of joining two or more strings together to form one longer string.
Characters produced by holding down the key labeled CTRL while simultaneously pressing another key.
Abbreviation for "cathode ray tube" (the tube used in a TV set). In practice, this is often used to describe the television receiver used to display computer output. Also called a "monitor."
A square displayed on the TV monitor that shows where the next typed character will be displayed.
Information of any kind.
The process of locating and correcting mistakes and errors in a program.
A mode or condition "assumed" by the computer until it is told to do something else. For example, it will "default" to screen and keyboard unless told to use other I/O devices.
Information that can be represented by a collection of bits. Virtually all modern computers, especially microcomputers, use the digital approach.
A small disk. A record/playback medium like tape, but made in the shape of a flat disk that is placed inside a stiff envelope for protection. The advantage of the disk over cassette or other tape for memory storage is that access to any part of the disk is virtually immediate. The ATARI Home Computer System can control up to 4 diskette drive peripherals simultaneously. In this manual, disk and diskette are used interchangeably.
Abbreviation for "disk operating system". The software or programs which facilitate use of a disk-drive system. DOS is pronounced either "dee oh ess" or "doss."
Making corrections or changes in a program or data.
To do what a command or program specifies. To RUN a program or portion thereof.
A combination of variables, numbers, and operators (like ,+- , etc.) that can be evaluated to a single quantity. The quantity may be a string or a number.
To specify the form in which something is to appear.
Printed output as opposed to temporary TV monitor display.
The physical apparatus and electronics that make up a computer.

## Increment:

K:

## Keyword:

## Language:

Memory:
Menu:
Microcomputer:
Monitor:
Null String:
OS:

Output:
Parallel:

Peripheral:
Pixel:
Precedence:

Increase in value (usually) by adding one. Used for counting (as in counting the number of repetitions through a loop).
Set to an initial or starting value. In ATARI BASIC, all nonarray variables are initialized to zero when the command RUN is given. Array and string elements are not initialized. Information transfer to the computer. Output is information transfer away from the computer. In this manual, input and output are always in relation to the computer.
A system that responds quickly to the user, usually within a second or two. All home computer systems are interactive.
The electronics used to allow two devices to communicate. Input/Output Control Block. A block of data in RAM that tells the Operating System the information it needs to know for an I/O operation.
Short for input/output, I/O devices include the keyboard, TV monitor, program recorder, printer, and disk drives.
Stands for "kilo" meaning "times 1000". Thus 1 KByte is (approximately) 1000 bytes. (Actually 1024 bytes.) Also, the device type code for the Keyboard.
A word that has meaning as an instruction or command in a computer language, and thus must not be used as a variable name or at the beginning of a variable name.
A set of conventions specifying how to tell a computer what to do.
The part of a computer (usually RAM or ROM) that stores data or information.
A list of options from which the user may choose.
A computer based on a microprocessor chip; ATARI uses the 6502.
The television receiver used to display computer output.
A string consisting of no characters whatever.
Abbreviation for Operating System. This is actually a collection of programs to aid the user in controlling the computer. Pronounced "oh ess".
See input and I/O.
Two or more things happening simultaneously. A parallel interface, for example, controls a number of distinct electrical signals at the same time. Opposite of serial.
An I/O device. See I/O.
Picture Element. One point on the screen display. Size depends on graphics mode being used.
Rules that determine the priority in which operations are conducted, especially with regard to the arithmetical/logical operators.
Program:
Prompt:A sequence of instructions that describes a process. A pro-gram must be in the language that the particular computercan understand.
A symbol that appears on the monitor screen that indicates the computer is ready to accept keyboard input. In ATARI BASIC, this takes the form of the word "READY". A "?'" is also used to prompt a user to enter (input) information or take other appropriate action.
RAM:

## Random Number Generator:

Reserved Word: ROM:
Random Access Memory. The main memory in most computers. RAM is used to store both programs and data.
May be hardware (as is ATARI's) or a program that provides a number whose value is difficult to predict. Used primarily for decision-making in game programs, etc.
See Keyword.
Read Only Memory. In this type of solid-state electronic memory, information is stored by the manufacturer and it cannot be changed by the user. Programs such as the BASIC interpreter and other cartridges used with the ATARI systems use ROM.
To copy a program or data into some location other than RAM (for example, diskette or tape).
The TV screen. In ATARI BASIC, a particular I/O device code "S:"
The opposite of parallel. Things happening only one at a time in sequence. Example: A serial interface.
As opposed to Hardware. Refers to programs and data.
A character that can be displayed by a computer but is neither a letter nor a numeral. The ATARI graphics symbols are special characters. So are punctuation marks, etc.
An instruction to the computer. See also Command. While all commands may be considered statements, all statements are certainly not commands. A statement contains a line number (deferred mode), a keyword, the value to be operated on, and is terminated by pressing the RETURN key.
A sequence of letters, numerals, and other characters. May be stored in a string variable. The string variable's name must end with a \$.
A part of a program than can be executed by a special statement (GOSUB) in BASIC: This effectively gives a single statement the power of a whole program. The subroutine is a very powerful construct.
A variable may be thought of as a box in which a value may be stored. Such values are typically numbers and strings.
A portion of the TV display devoted to a specific purpose such as for graphics or text.

## USER PROGRAMS

This appendix contains programs and routines that demonstrate the diverse capabilities of the ATARI Home Computer System．Included in this appendix is a Decimal／Hexadecimal program for those users who write programs that require this type of conversion．

## CHECKBOOK BALANCER

This is one of the＂traditional＂programs that every beginning computerist writes．It allows entry of outstanding checks and uncredited deposits as well as cleared checks and credited deposits．

## BUBBLE SORT

This program uses the string comparison operator＂$<=$＇＂that orders strings ac－ cording to the ATASCII values of the various characters．Since ATARI BASIC does not have arrays of strings，all the strings used in this program are actually sub－ strings of one large string．A bubble sort，though relatively slow if there are a lot of items to be stored，is easy to write，fairly short，and simpler to understand than more complex sorts．

## LIGHT SHOW

This program demonstrates another aspect of ATARI graphics. It uses graphics mode 7 for high resolution and the PLOT and DRAWTO statements to draw the lines. In line 20, the title will be more effective if it is entered in inverse video (use the ATARI logo key).

## UNITED STATES FLAG

This program involves switching colors to set up the stripes. It uses graphics mode 7 plus 16 so that the display appears as a full-screen. Note the correspondence of the COLOR statements with the SETCOLOR statements. For fun and experimentation purposes, add a SOUND statement and use a READ/DATA combination to add "'The Star Spangled Banner" after line 400. (Refer to Section 10.)

## SEAGULL OVER OCEAN

This program combines graphics and sounds. The sounds are not "pure" sounds, but simulate the roar of the ocean and the gull's "tweet". The graphics symbols used to simulate the gull could not be printed on the line printer. Enter the following characters in line 20.

## 20 BIRD\$ = " v-- "

To get these symbols, use CTRL G, CTRL F, CTRL R, CTRL R.

## COMMENTS AND DESCRIPTION

Highest location used by BASIC (LSB, MSB)
TV frame counter ( $1 / 60 \mathrm{sec}$.) (LSB, NSB, MSB). Time in seconds $=($ PEEK (18) + PEEK (19)*256 + PEEK(20)*256*256)/60
Noisy I/O Flag ( $0=$ quiet)
Attract Mode Flag ( $128=$ Attract mode)
Left, Right Margin (Defaults 2, 39)
Current cursor row (graphics window). Current cursor column (graphics window). Previous cursor row (graphics window). Previous cursor column (graphics window). Data under cursor (graphics window unless mode 0).
Actual top of memory (number of pages).
BASIC low memory pointer.
BASIC top of memory pointer.
Line number at which STOP or TRAP occurred (2-byte binary number).
Error number.
Print tab width (defaults to 10)
Low and high bytes of value to be returned to BASIC from USR function.
RAD/DEG flag ( $0=$ radians, $6=$ degrees ).
Light Pen* Horizontal value.
Light Pen* Vertical value.
Cursor row (text window)
Cursor column (text window)

## COMMENTS AND DESCRIPTIONS

Color Register 3
Color Register 4
OS top of available user memory pointer (LSB, MSB)
OS low memory pointer
Cursor inhibit ( $0=$ cursor on, $1=$ cursor off)
Character mode register (4 = vertical reflect; 2 = normal; $1=$ blank)
Character base register (defaults to 224)
(224 = upper case, $226=$ lower case characters)

Last ATASCII character.
Last keyboard key pressed; internal code; (255 clears character).

Fill data for graphics Fill (XIO).
Display Flag ( $1=$ display control character).
Start/Stop flag for paging ( $0=$ normal listing) Set by CTRL 1 .

Handler address table ( 3 bytes/handler)
I/O control blocks (16 bytes/IOCB)
Spare RAM
Console switches (bit $2=$ Option; bit $1=$ Select; bit $0=$ Start. POKE 53279, 0 before reading. $0=$ switch pressed.)
PIA Port A Controller Jack I/O ports.
PIA Port B Initialized to hex 3C.
Port A Control Register (on Program Recorder $52=$ ON, $60=$ OFF).
Port B control register.
Serial Port control register. Bit $2=0$ (last key still pressed).
Points to screen data area.
Read/data pointer (line \#).
Read (displacement in line).
Display list pointer.
Coldstart flag.
Inverse video ( $128=0$ on, $0=$ off $)$
Random \# between 0 and 255 .
Poke both w/64 to disable BREAK key (reenabled when entering new graphics mode).

as Dummy Variable, 38. 42

[^0]:    * Generally, a subroutine can do anything that can be done in a program. It is used to save memory and program-entering time, and to make programs easier to read and debug.

[^1]:    1. In mode 0 these characters must be preceded with an escape, CHR\$(27), to be printed
[^2]:    -Future product.
