Eunnyvale, CA 94086

## DUPLIGATION DF IAASTER DISKETTE PRDCEDURE SUMMARY

Yo：r first disk operation should be to write－protect and duplicate your Master Diskette．The following steps describe the necessary procedure for duplicating the di三kette．

1．Turn on disk drive．Wait for BUSY Iight to go out．
2．Remove Master Diskette from uhite，protective envelope．
3．Plare write－protert tab over notch on Master Diskette．
4．Insert Master Diskette into Disk Drive \＃i and close drive door．
5．Turn on computer console．DOS will＂boot＂into RAM．
b．Type DOS［RETURN］，if cartridge is inserted．
7．Remove Master Diskette and insert ablank diskette or one you uish七口 еrase．
B．After the DOS Menu and SELECT ITEM prompt appear，Type I［RETURN］ to format diskette．
9．Type 1 ［RETURN］in response to WHICH DRIVE TO FGRMAT？prompt message．
10．Type $Y$［RETURN］in response to TYPE＂Y＂TG FDRMAT DRIVE 1 prompt message．
11．When SELECT ITEM prompt message appears，type H［RETURN］．
12．Type Y［RETURN］in response to TYPE MYMTD WRITE NEW DOS FILE？ prompt message．
13．Prompt message WRITING NEN DOS．SYSFILE displays on the sereen．
14．When SELECT ITEM prompt message appears，the duplication of the diskette is complete．

INDEX

This ATARI（R）Eisk Dperating System（DDS）Reference Manual assumes that the user is familiar with ATARI BASIC．It explains the commands and statements used by the Disk Dperating System（initial releaseータí24／79）to move data to arid from the ATAFI O1O［TM］Disk Drive（s）．

The first section explains the procedure for powering－up the cansole and powering up and initializing the Disk Drive（s）．It also defines the notations and conventions used throughout the manual．

The second section describes the ATARI B1O［TM］Disk Drive and a little about its operation．From this，the manual procepds to describe the diskettes and how they are organized to arcept data．Section 3 also contains ق＂troutle－shooting＂section on eDOT ERRORS and possible reasons for their occurrence．

Section 4 describas the interaction that takes plare within the Disk Dferating Systam itself when it is in operation．That two main files within the DOS ヨre described in terms of their relationship to the DOS Menu．This section also explains the parameters and＂wild cards＂ recognized by pos．

Sections 5 and $\dot{S}$ contain descriptions of the DOS Menu selections and the BASIC commands used with disk operations．Each of these provides an example of its use．

The appendices give useful information including the memory map，a glossary，error codes，and hints or how to obtain more useable RAM．

## SECTIDN 1. GENERAL INFORMATIDN

This saction reyiaws the procedure for powering-up and initializing an ATARI Personal Computer System with at least one ATARI Disk Drive attarhed. It also defines the notation conventions and general information that is used throughout this manual. It does not contain information regarding the attachment of disk drive(s) to the computer sonsole. That information is contained in the ATARI Disk Drive Dperator's Manual.

DISK DRIVE PDWER-UP AND INITIALIZATIDN

After you have cherked the connections and placement of your disk drivelsj, use the following procedure to power-up your system and to initialize the disk drive (s). This initializationprocedure is also called a "bootstrap" operation or "autodoot."

1. Turn on television set.
2. Turn on Disk Drive unit(s). The BUSY Iight(s) will come on and uill stay on until each drive unit is initialized.
3. Turn on any other peripheral devicesi g.g., printer.
4. Insert DOS diskette in Disk Driveo\# and rlose disk drive door.

NQTE: The Master Diskette DOS fhould always be placed in Disk Drive \#1 (see Drive Code Settings, Section ב).
5. Turn on computer console.
6. If you get a BOUT ERROR, turn off computer console for approximatery 5 seconds, then turn it on again. If the BUOT ERROR message persists cherk all connections and make sure the the drive dogr is closed. If everything seems to be alright, check the section entitled BOUT ERRORS on page 21.

## DEVICE IDENTIFICATION

Each ATARI devire, including the disk drives, has an identification letter that allows you to access it. These identification codes are given belou with a ミhort description of each device:

C: ATARI 4 ioctmi frogram Recorder. This is both an input and output device. If you want to save a program on tape in its tokenized form. use either the CSAve or SAvE "C:" command.

D i ：ATARI BiO［TH］Disk Drives．The disk drives are both input ב ：and output devices．To save a program on diskette，select the 3：drive you bant to usei e．g．，Disk Drive fご，and use the command 4 ：SAvE＂DE：PROG1．BA今日．＂Device Identification D：is equivalent to Di：．

E：Screen Editor．This input／output device uses the keyboard and display（seek：and $\operatorname{si}$ ）to simulate a screen editing terminal． Writing（output）to this devise causes the data to appear on the display starting at the surrent cursor position．Reading （input）from this devire activates the screen editing process and allows gou to enter and edit data．

K：Keyboard．This input only device allows you to read the convertad \｛ATACCII〉 keyboard data as you press aach key．

P：Line Frinter．This output only device pririts ATASCII chararters，usually a line at a time．This device identification is used for the ATARI BeO［TM］Frinter，the ATARI Bec［TM］Thermal Printer，and the ATARI ESE［TM］BO－column Printer．

R 1 ：ATARI gSO［TM］interface Module．This deviee hamdes both input from and output to RSE32C－compatible peripharal devices（and output only to a printer requiring an e－bit parallel port accessed through $P: \%$ ．

S：TV Monitor．This input／output device aliows the user to read chararters from and write characters to the display using the cursor as the screen addressing mechanism．

Throughout this manual，you will see these devire identifications used in both the DOS Menu options and BASIC commands used with DOS．

## FILE SPECIFICATIONS

Information is stored on a diskette in files．Files are classified into two tupes：program files and data files．Data files usually contain data used by a program file．A program file contains the instructions to perform a sertain task．

When referring to a file an a diskette，use afile specification（or filespec）．A filesper consists of up to siy alements．Figure 1－1 illustrates the six possible elements of a filesper．In BASIC， quotation marks are required when arcessing a file．

Filenames
Filenames follow specifis rules. If a filename does not follow these rules, you will see an ERROR-165 (File Name Error) message on the screen. The ruleffor filenames are:

1. The maximum length of a filename is B characters.
2. The only characters that can be $u s e d$ are $A$ through $Z$ and $O$ through 9.
3. The first character is always an alphabetic chararter.

DOS. SYS is a filename reserved by DOS.

Extenders
A three-character extender can be added to a filename to indicate the type of data in a file.

Currentiy, you can use any legal combination of letters and numbers for an extender, e.g.: SYS for system files, BAS for BASIC fragram

| files，DAT f files，． $\mathrm{ERC} f$ ᄃan uミロ Uf to にharacters ar | data files，LET for list files，DEJ for binary source files，MuE for Music Composer files，etc．You legal characters for extenders．Chararters beyond 3 trunceted and ignored． |
| :---: | :---: |
| Examples of Filenames |  |
| RATATAT | Legal name． |
| ATARI．EAS | Legal name．First character is not an alphabetic |
| 3ATARI．DAT | Illegal name．First character is not an alphabetic letter． |
| ATARI22．XYZ | Legal name． |
| ATARI\＃ | Illegal name．\＃chararter cannot be used． |
| A 1234567.827 | Legal name． |
| E ATARI．BAS | Illegal name．No spares allousd． |
| ATARI．BASIC | Legal name． <br> （DOS will truncate the last 2 letters of the extender．； |
| DOS．S＇S | Illegal name．Reserved for DOS file． |
| dossys | Legal name． |

gus Options Used With Filenames
Certain letters can be added to a filename to perform a specific task．
／A means to append data to an existing file on diskette．In the course of using the SAVE BINARY FILE selection on the DOS Menu，entering D：BINFILE／A， 5000 ，SEFF would append the contents of locations 5000 through 5eFF to EINFILE，which has alteady been stored on disk drive \＃i．
／N means no verification of an operation．In using the DELETE FILE selection on the DOS Menu，entering D2：DELTA．EAS／N bypasses the normal verification prompt message．

|  | String Exfression．Can consist of a string variabla，string literal iconstanti，or a function that returns a string value． |
| :---: | :---: |
| filespec | File Specification．A string expression that refers to a device such as the keyboard or to a disk file． |
| iosb | Input／Output Control Block（IDCB）．An arithmetic expression that evaluates to a number fram 1 to 7 ．The IOCB is used to refer to a device or file．IDCE $D$ is reserved for BASIC and cannot $b$ a used． |
| 1ineno | Line Number．A constant that identifies a particular program line in a deferred mode BASIC program．A line number can be any integer from 0 through 32767 ．Line rumbering determines the order of program execution． |
| var | Variable．Any variable．In this manual，Variables are slassified as arithmetic variables（avar），matix variables （myar），or string variables（svar）． |
| aVヨr | Arithmetic Variadle．A location where a numeris value is stored．Variable names can be from 1 to leO，alphanumeric chararters，but must start with an unrevefsed，upper case alphabetic chararter． |
| mvar | Matrix Variable．An element of an arrey or a matrix．Matrix variables san be subseripted．A matrix variabla is a number， Variable，or expression plared in parentheses immediately follouing the name of the array or matrix．For example，$A(1)$ ， $A(R O W), A(X+1, Y-3)$ ． |
| ミVョr | String Variable．A location where a string of characters can be stored．The same rules given for the arithmetic variable （avar）apply to the string variable with the additional restriction that the string variable name must end in $⿻$（． String variables can be subscripted． |

## WERSIDNS ANE RELEASES

Currently，the DOS Master Diskette is Version r．Subsequent versions uill be designated ョs DOS II，DOS III．etr．This manual describes only DOS I．As ATARI releases new versions af DDE，new documentation describing those varsions uill also ba released．

An ATARI B10［TMJ Disk Drive provides fast，reliable data storage． When attached to your ATARI Personal Computer Eystem，you can：

1．Store programs on diskette．
2．Retrieye programs from diskette．
3．Create and add to data files needed but programs．
4．Make rofies of disk files．
5．Erase old files from a diskette．
i．Load and save binary files．
7．Move files to and from memory，the screen，diskette，printer， and to and from any new peripherals that ATARI，Inc．will introdure．

The ATARI［isk Drives are＂smart．＂Each contains a mictoprocessor山ith its oun software in addition to the lagic and hardware necessary for the magnetic head to move back and forth＂across＂ ق floppy（flexible）diskette．

Your ATARI Personal Computer System with ibk RAM Can accommodate up to four ATARI Slo Disk Drives．Earh drive oparates independently of the others．

ATARI B10 Disk Drive
／1／ル！ル！いい！．いいいいいいいいい－

Door Release Lever－Press to open door．
Door Handle－Push down here to close door after diskette is in drive．Latch will click when shut．
Power ON／OFF Switch－Always turn power on before inserting diskette into drive and remove the diskette BEFORE turning the power off．
Power Indicator Light－Lights to in－ dicate that power is ON．

Disk Drive Busy Indicator Light－Glows red when drive is reading from or writing to the diskette．FIGURE $\mathrm{Z}-1$.

ATARI EIO LISK DRIVE

The ATARI 8ic Dist Dive is a single drive uith single density rerording capabilities．It uses standard 5 1／4＂flexible diskettes， Each of which stores Ebk（Es thousand）bytes．The gio Disk Drive contains a built－in microprocessor whish gives it an automatic stand－by capability．This means that the Disk Drive motor is mot in constant operation，but 山aits to be＂told＂when it is neaded．The ATARI EIO Disk［Tive Dperator＇s Mandal describes many of the Disk Urive＇s features．

MULTIPLE DISK DRIVE NUMBERING
When you attach the Disk Lrive（s）to yout ATARI Personal Computer System，you should check the back of each drive to ensure that each one is specified to a different DRIVE CODE NUMBER（Figute $\mathfrak{c}-1$ ）．

## ロRIVE CODE ND．

PWVR．

FIGURE こ－2．DRIVE CIDE SETTIUGS

The disk drive in the above figure bolfld be designated as Drive \＃l berause the white tab is behind the blark tab on the left side．To change the drive to Disk Drive \＃n，move the blark tab to the right， but leave the uhite tab on the left．If you move both tabs，the disk drive uill be set to Disk Drive \＃3 position．

You can designate the ATARI B1O Disk Drives in any order；e．g．，if you have tuo 810 Disk Dorives，either can be Drive \＃1 and the other san be Drive \＃ᄅ，\＃З，\＃4．Remember that DOS will not be able to boot unless the drive in the \＃1 position contains a Master Diskette or its duplicate．

## DISK DRIVE DPERATION

When you have set the drive code positions and connected the drive（s） to your ATARI Personal Computer System，you are ready to insert a diskette and begin disk drive operations．

## SECTIDN 3. DISKETTES

This section describes diskettes, their organization, and care. It also covers the method for write-protecting a diskette so that valuable files are safe from being overyritten or erased.

## EISKETTE DESCRIPTION

ATARI Diskettes are thin mylar circular sheets covered with an gxide similar to that used on recording tape. Each ATARI Diskette is about $51 / 4^{\prime \prime}$ in diameter and each is sealed in a special, black Jacket designed to protert it from being bent, scratched, or sontaminated. Figure 3-1 illustrates a diskette.

FIGURE 3-1. DISKETTE IN PROTECTIVE COVERIHG

NDTE: DQ NGT ATTEMPT TO REMOVE THE THE DISKETTE FROM ITS ELACK FROTECTIUE COVERING.

The read/urite area on each diskette is exposed ani the diskette can be damaged if you scratch or fingerprint this area, expose it to bright sumiight, or drop ashes on it. To prevent this from happening,
it is recommended that all diskettes not in use be kept in the white protective envelopes provided with them．

When the diskette is inserted into the Disk Drive，the spindle hole is automatically placed on the drive hub and the diskette is seated． The circular diskette spins within its protective jacket．When you access the diskette，the magnetic head is placed over the read／write агセョ．

## DISKETTE WRITE－PRDTECT

A sheet of large file identification labels and a sheet of small， adhesive tabs are included in each Master Diskette box（CXB1O1）and in each box of 5 Blank Diskettes（CxB100）．To write－protect a diskette， remove one adhesive tab from the sheet and fold it over the notch on the edge of the diskette（Figure З－2）．It is recommended that you isita－pratert your Master Diskette immediately and any other diskettes containing valuable files．Write－proterting a diskette prevents it from being inadvertantly overwritten．If you attempt to write on a山гite－protectad diskEtte，an ERROR－144 displays on the screen．

FIGURE 3－Z．WRITE－PROTECTING A DISKETTE

DISKETTE DRGANIZATION
Before you can urite on a blank diskette, you must "organize" the surface so that the DOS will know where the information is located. This is done by formatting a diskette into tracks and sectors. (Refer to Sertion 5, I. DISK FORMAT. ) After a diskette has been formatted, it is logically dirided into 40 tracks with 18 sectors per track. Each of these single density diskettes thus has a total of 720 sectors on which you can write information (see Figure 3-3).

Eleven of the sertors are allocated by the DOS for "special duty" so that they are not available to you.

1 sector used for boot
E sectors used for Directory
i sector used for Volume Table of Contents
1 sertar (number 7e0) is not addressable, so is unused.
---
11 TOTAL
Esch of the remaining 709 sectors can store i28 bytes of information, z bytes of which are used for overhead. That gives a total byte
sapacity per single density diskette of 8日，be5 butes．
If a disketie has the DOS on it，its storage capacity is reduced since the D口E file itself uses approximately gk bytes．It is not necessary to have the dos file on every diskette，but you will have to ramember to load the 口os from your Master Diskette before inserting your program diskette．
When you store data on a diskette，the disk drive converts the data it receives from the console into coded electrical pulses．These pulses magnetize minute areas of the oxide coating of each diskette while the diskette is spinning．

When you retrieve data from a diskette，the disk drive positions the magnetic head so that the area of the diskette where the data is stored passes beneath iti．The disk drive＇s microprocessar controls the positioning and timing for the diskette．

## EIEKETTE INETALLATIDN

Inserting the diskette into the ATARI B10 Disk Drive is a simple，but very important procedure．If the diskette is improperly inserted，it гan rause boot errors．Improper diskette insertioncan also cause damage to the diskette itself．

To insert the diskette，remove it from the white，protective envelope and，holding it as shoun in Figure 3－4，gentiv slide it into the drive．Be sure that the roteh is on thelleFT side．

Figure $3-4$ DISKETTE INSERTION

DISKETTE STORAGE
Since your diskettes are flexible, they are subject to being damaged. Always keep four diskettes mot in use in their white, protertive envelopes and storethem vertically. It is recommended that you store
 other possible source of magnetic fields. It is also recommended that मou keep them atay from any source of heat.

If you handle gour diskettes with sare and store them properly, you will minimize the chance of losing valuable data.

## BOOT ERRDRS

If you have inserted the diskette and get a EDOT ERROR message displayed over and over agョin on the screen, turn off the computer console, re-read the proredure and try it again (refer to gection i). BODT ERRORE can occur if:

1. The inserted diskette does not have the DDS on it.

己. Tha disk drive was powered up after the computer console was turned on.
3. The disk drive is not properly connected to the computer console.
4. The transformer plug has loosened in its uall socket.
5. The pober plug has loosened in the FWR sorket in the disk drive.
6. The diskette was improperly inserted.
7. The diskette has been scratched, warped, or marred. In this cヨse, use another diskette.
8. The drive code setting is not correct.

If you are sure that it is none of these probems, you should use the Msster Diskette to boot up, re-insert the problem diskette, and sare any arcessible files on yet another diskette. Then, reformat the "problem" diskette and try to use it again.

## DISA OPERATING SYETEM

DOS (pronounced doss\} is an acronym for Disk Dperating System. It is an extension of the ATARI Dperating System (DS) that allots you to interface uith a disk sirive so that informatian can be passed between the diskette and the computer memory (fall).

The ATARI Disk Dperating System contains two main parts:
o a Disk Utility Parkage (DUP)

- a File Management Subsystem (FMS)

This saction describes the interaction that takes place between the os and DOS when the system is powered up and the disk drive is "booted." It also provides a description of the two main parts contained in DOS.

When you power up your disk drive(s) and the computer console, the Operating $\Xi_{y}$ Stem executes a bootstrap loader that brings a special file called DOS. SYS into RAM and begins executing the initial code in that file. LOS. SYS contains both the File Management Subsystem and the Disk Utility Parkage.

When DOS I is loaded intr the computer RAM it orcupies a special area in RAM that does not interfere with the memory lorations allocated for BASIC or Assembly Language programs. The Memory Map in Appendix D shows the RAM locations occupied oy the DDS. After the disk drive system has been booted and the DOS SYS file is loaded, the ATARI Dperating System turns control of the system to the cartridge. If no cartridge has been inserted, aS gives control of the system directly to the Disk Utility Package'

## DISK UTILITY PACKAGE

The Disk Utility package (DUP) programs allow you to display the DDS Menu buf calling and executing its DUP Executive program. The Executive program, besides displaying the DOS Mens, takes Mens input and prints the module entry message for each Menu option; e.g., DELETE FILESPEC for Menu selection $D$, and executes the selected utility. The DUP programs also allow easy access to the File Management Subsystem (FMS) without your having to understand the logical structure of FMS.

## File management gubsystem

The File Management Subsystem gives you a simpler way of storing data on a diskette bu putting a logical structure on top of the formatted diskette. Eetause of the File Hanager program, dou don't have to keep track of all the sectors a program occupies; which sectors they are, or how to find a particular file. FME reiieves the user of all that reponsibility.

The FME also "controls" the operations performed on file: OPEN, CLDSE, PUT, and GET (see Section 6.). In addition, it defines the subfunctions displayed on the [OS Menu that are accessed by DUP. The subfunctions that are not defined by fME are EIMARY LOAD, BINARY SAVE, RUN AT AT ADDREES, RUN GARTEIDEE, COPY FILE, DUPLICATE FILE and DUPLICATE DIEK.

## OPERATION WITH/WITHOUT INSERTED CARTRIDGE

When no cartridge has been inserted, the 0 g gives control directly to the DOE Menu and that is what appears on the screen. However, if you have inserted a cartridge, you must type DOS [RETURN] before the DOS Menu will appear on the screen.

## FARAMETERS

A parameter is additional information (sometimes optional) that specifies how the command is to operate. If more than one parameter is required, separate them with rommas. For example, the RINARY LOAD selection requires a START and END. A parameter can be afilename or a hexaderimal rumber. If you enter a parameter and decide against it, press [RREAK]. The selected subroutine will not begexeruted and a SELECT ITEM prompt message will appear on the sefeen.

WILD CARDS
ATARI DOS recognizes two "wild cards" whish can be substituted for chararters in a filename. Wild cards are represented by the special characters $?$ and *

The $\bar{?}$ is used in place of any single valid character. If there are 25 files on a diskette and youpant to list to the screen only those five-letter files beginning with PROE and ending with. BAS, you would type frob? Bas. (See A. EISK DIRECTORY.) This wild card can only be substituted for a singlecharacter. To substitute for a variable number of characters. there is another, more flexible wild zard.

The : stands for any valid combination of characters in a filename or an extender. The following examples illustrate the use of the $*$.

EXAMPLES:

| *. BAS | will list all the program files on a diskette in di drive \#1 that end in. BAS. |
| :---: | :---: |
| D2:** | will list all the program files on the disk drive 2 diskette. |
| PRD*. BAS | will list all the program files on diskette of disk drive ull that begin with FRO mad have. BAS as the きxtender. |

Letters or numbers (but not a period) to the right of the asterisk (*) are ignored. In other words, *T. BAS would appear to the computer as *. BAS and PROT. *S would be the same as PROT. *.

You can load a program from the diskette using a wild card in the file name if there is no more than one file to which it is applicable; a.g., if while the BO S is searching for a file PROM. EAS and it finds a PRO1. DAS and a PROB. BAS, an ERROR-21 (Load File Error) will appear on the sEreen.

## 'DDS MENU SELECTIDNS

This section describes each of the selections that appear on the Disk Operating System Menu. The DOS Menu is "self-prompting." When you type the letter of one of the selectionsi e.g., A, $K$, $D, \quad e t c$, in response to the SELECT ITEM prompt, the DUF program prints the message concerning that selection and turns control over to the selected ミubroutine.

Figure 5-1 illustrates the DOS Menu selections and prompt message. The rest of this section describes each of these selections and gives examples of their uses.

A. DIEK DIRECTORY

The disk directory contains a list of all the files on a diskette. On demand, it displays the filename, the extender (if any), and the number of sectors allocated to that file. It will either display a partial list or a complete list depending on the parameters entered. Wild cards can be used in the parameters.

Tipe A [RETURN] below the SELECT ITEM prompt.
The screen immediataly displays the entry module message:
DIRECTDRY--EEARCH SPEC,LIST FILE

Yロu can cho口se at this time to search for a single filespec, several filespers, or all filespecs on the diskette.

Type DIS. SYS [RETURN]

The screen displays:
DIS SYS OG4
645
TYPE RETURN FOR MENU
This teils you that DOS. SYS is present on the disketta and contains 64 sectors. The number b45 on the next line notifies you of the number of free sertors left on the diskette. Since there are 70 sectors availade to the user on a diskette, this display also lets the user know that DOS. Sys is the only file on the iisketite.

The second parameter, LIST FILE, allows you to print the directory information to any output device you choose. Since there was no specified device in the example above, the pis printed it on the sereen (E:), which is the default device.

Notice that TYPE RETURN FOR MENU is displayed on the screen. Press the [RETURN] key and the DOS Menu redisplays with SELECT ITEM prompt. To list the filesper names on a.printer, type A [RETURN]. After the dirertory prompt message, type [OS. SYS, R: [FETURN]. If you have a printer and it is on, DDS will print dos sys of with b45 directly below it. If you do not have a printer (or it is not turned on), you will see an ERRDR-1כS displayed on the screen. Each time tín selection completes a task, it displays a TYPE RETURN FOR MENU pTompt message. The following examples illustrate different uses of this selection.

EXAMPLE 1:
SELECT ITEM
A [RETURN]
DIRECTORY--SEARCH SPECILIST FILE?
[RETURN]
Lists all filenames on screen.

TYPE RETURN FOR MENU [RETURN]

## EXAMPLE $\Xi$ :

SELECT ITEM
A [RETURN]
DIRECTORY--SEARCH SPEC,LIST FILE?

* SYS [RETURN]

Lists all files on screen with Sys extender.

TYPE RETURN FOR MENU [RETURNI

EXAMPLE 3:

SELECT ITEM
A [RETURNI
EIRECTORY--EEARCH SPEC,LIET FILE?
DE: $P$ : [RETURN]
List all files on disk drive \#2 on the line printer.

TYPE RETURN FOR MENU [RETURN]

## EXAMPLE 4:

EELECT ITEM
A [RETURN]
DIRECTORY--SEARCH SPEG, LIST FILE?
DOT. $*$ [RETURN]

Lists all 3-letter filespers beginning with DO.

TYPE RETURN FOR MENU [RETURN]
SELECT ITEM
B. RUN CARTRIDGE

Whenever you select $B$, the dup file gives contral of your atari Personal Computer System to the inserted cartridge. If the BASIC cartridge is inserted, the screen displays a READY prompt. If the Assembler Editor cartridge is inserted, the screen displays an EDIT prompt. If you have not insertad a cartridge, the message ND CARTRIDGE appears on the scteen.

You san also press [SYBTEM RESET] to return control to the cartridge. Tinis selection has mo entry message or parameters.

EXAMPLE:

## SELECT ITEM

 B [RETURN]
## C. COPY FILE

Use this selaction if you have two disk drives and sant to copy a file from one diskette in disk drive \#t to a second diskette in disk drive \#2. You can also use this selection to create a backup copy on the same diskette with tha same filename but a different extension, or even a completely different filename. No widd cards are allowed.

EXAMPLE 1:

SELECT ITEM
C [RETURN]
CDPY--FRDM, TD?
D1: DOSEX. BAS, D2: DOSEX. EAS [RETURN] COpies DOSEX. BAS from D1 to D2 SELECT ITEM

EXAMPLE $2:$

SELECT ITEM
C [RETURN]
COPY--FRDM, TD?
D1: DOEEX. BAS, D1: DOSEX. BAK Creates barkup copy of file on same diskette.
SELECT ITEM

Also, use this selection to copy the file listing to the screen, the printer, or tha program recorder.

EXAMPLE 3:

C [RETURN]
COPYー-FRDM, TD?
DI: DOSEX.LST, E: [RETURN] Eisplays the program listing on screen.

SELECT ITEM
EXAMPLE 4:

SELECT ITEM
C [RETURN]
COPY--FROM, TD?
E:, DI: TEMP. DAT IRETURNI

```
Copies any sucreeding screen data into a file named TEMP. DAT.
Type data on sereen to be stored in TEMP. DAT file.
Terminates entry of data.
```

EXAIMPLE 5:

SELECT ITEM
C [RETURN]
COPY-FFROM, TD?
D1: DISEX. LST, P: [RETURN] Lists the pragram listing DISEX. LST on the printer.
SELECT ITEM
D. DELETE FILE(S)

This selertion allows youto delate one or more files from the disk directory file and from the diskette. Wild cards can be used in the filesper names.

EXAMPLE 1:
SELECT ITEM
D [RETURN]
DELETE FILESPEC
[2: REM*. BAS [RETURN]
TYPE "Y" TG DELETE...
REM1. BAS
All files that begin with REM and that have a. BAS extender.
Varification prompt.
Y [RETURN]
REMB. BAS Deletes REM1. BAS
$Y$ [RETURN]
SELECT ITEM
EXAMPLE $2:$

EELECT ITEM
D [RETURNJ
belete filesfec
D: TEMP. DAT [RETURNJ
TYPE "Y" TO DELETE...
TEMP. DAT
Y [RETURN]
$A$ single file.
Verification prompt.
If $N$ is typed, fila will not be deleted.
SELECT ITEM
The verifisation prompt message gives you a chance to change your mind ヨbout daleting a file. By appending the option fik to the filespec antry, DUS will eliminate this Verification step.

EXAMPLE 3:
SELECT ITEM
D [RETURN]
DELETE FILESPEC
DDXEX. BAS/N [RETURN]
SELECT ITEM
File is deleted without requesting verification.

You formatting. Example 4 illustrates the steps for deleting all the existing files on disk drive \#1. Note that the lN option is used in this example so that the verifiration message is not displayed.

EXAMPLE 4:
EELECT ITEM
D [RETURN]
DELETE FILESPEC
*. * / [ [FETUFN]
SELECT ITEH

Deletes ali files from the disk drive \#1 diskette.

## E. RENAME FILE(S)

This selection allows you to change the name of one or more files. You ran use wild cards in the filespec names.

EXAMPLE i:
SELECT ITEM
E [RETURN]
RENAFE, GIVE OLD NAFE, NEW
D2: TEMP. DAT, NAMES. DAT [RETURN]
SELECT ITEM
The file designated on $D 2$ as TEMF. DAT is changed to NAMES. DAT.

EXAMPLE $2:$
SELECT ITEM
E [RETURN]
RENAME, GIUE DLD MAME, NEW
*. DKE: * BAS [FETURN]
All files with extender gkB have SELECT ITEM their extenders rhanged to. BAS.

If you attempt to rename a file on a urite-proterted diskette, an ERROR-i44 (Device Done Error) will display on the screen. If you try to rename a file that is not on the diskette, an ERROR-170 (File Not Found serror displays. If the screan displays ERROR-167, it means that you tried to rename a locked file (see F. LDCK FILE).

## F. LDCK FILE

Use this selertion to "urite-protect" a single file. A locked file cannot be written th, appended, or deleted. An ERRDR-167 uill result from trying to write to a locked file. You can use wild cards to lock several files ab the same time.

EXAMPLE i:

```
SELECT ITEM
F [RETURN]
WHAT FILE TD LDCK?
DOS. SYS [RETURN]
SELECT ITEM
```

A locked file is designated by an asterisk (*) preseding its file-
Mame in the Disk Directory.

The follouing exampla illustrates the use of the wild card to lock all files uith an extender of . BAS.

EXAMPLE $2:$
SELECT ITEM
F [RETURNJ
WHAT FILE TO LOCK?
[1: *. BAS [RETURN]
SELECT ITEM
EXAMPLE 3:
SELECT ITEM
F [RETURN]
WHAT FILE TO LOCM?
T*. * [RETURN]
SELECT ITEM
Locks all files on Di which begin with $T$.

EXAMPLE 4:
SELECT ITEM
F [RETURN]
What file to lock?
*. * [RETURN]
SELECT ITEM

## Locks all Di files.

If you do not enter a filename or a wild card filename before pressing [RETURN], the screen will display an ERROR-165.
e. UNLDCK FILE

Use this selection to unlark a file gr files that you previously locked using selection F. Wild cards ran be used in the filespec names.

EXAMPLE 1:
SELECT ITEM
G [RETURN]
WHAT FILE TO U四DOK?
DOSEX. BAS [RETURN]
Unlocks DOSEX. BAS file on D1.
SELECT ITEM
EXAMPLE 2 :
SELECT ITEM
G [RETURN]
WHAT FILE TD UNLDCK?
T* * [RETURN]
Unlorks files beginning with
SELECT ITEM the letter $T$ on disk drive \#1 diskette.

EXAMPLE 3:

Unlocks all 5-letter files beginning with PROB and having a . DAT extender.
H. WRITE DOS FILE

To urite a DOS/FMS file on a diskette, the diskette must have been previously formatted (see I. FORMAT DISK). The diskette to be written is inserted in Disk Drive \#1. This selection does not allow a choice of drives.

EXAMPLE:
SELECT ITEM
H [RETURN]
TYPE "Y" TD hRITE NEW dOS FILE?
Y [RETURN]
WRITING NEW DOS. SYE FILE
SELECT ITEM
You can also use C. COPY file or 0 . DUPLICATE FILE to write a new DOS onto a diskette, but you must first rename the DOS. SYS file before trying to copy it. After copying the fille, rename it back to DOS. SYS and you will have a bootable version of Das. However, since this is the selection designed specifically for writing a DDS/FMS file onto a second diskette, it is recommended, that you use it rather than either of the two other selections, Cor 0.

## I. FDRMAT DISK

This selection is used to format a diskette. The diskette can be blank or it ean have files on it that you do not want anymore. Formatting山rites a digitaj pattern on the diskette tinat allous data to be stored and retrieved. Fermatting a diskette takes approximately 2 minutes.

WARNING: Formatting a diskette always destroys all files existing on the diskette.

EXAMPLE:
SELECT ITEM
I [RETURN]
WHICH ERIVE TO FDRHAT?
1 [RETURN]
TYPE "Y" TO FORMAT DISK 1
y [RETURN]
SELECT ITEM

Although the above example illustrates disk drive \＃las the drive to ce formatted，you can specify any drive．It is possible to format a diskette containing bad sectors．［口S will＂flag＂the bad sectors internally and uill not urite eny data on those sertors．

## J．DUPLICATE DISK

Use this menu selaction to copy the files on a diskatte（Source diskette）to another（Destination）diskette．The Disk Utility Package （Dup）program uses sector by sector copying，which means that programs alreadig on the destination diskette will be destroyed．

This selection can be used with a one drive system or a multiple drive ミウラtem．For a one drive sustem，save any RAM－resident BASIC program before attempting to duplirate a diskette．This selection uses the program area（where a RAM－resident BASIC program is stored）as a buffer for moving the files on the source diskette to the destination diskette when one drive is used．

EXAMPLE 1

```
SELECT ITEM
\ [RETURN]
DUP DISK--SDURCE,DEST DRIVES%
1,1 [RETURN]
TYPE "Y" IF OK TO USE PROGRAM AREA?'
Y [RETURN]
INEERT SDURCE DISK, TYPE REETURN
[RETURN]
INSERT DESTINATION DISK, TYPE RETURN
[RETURN]
SELECT ITEM
```

Aluays write protect gour source diskette as a safety measure．Then， if it is areidentally inserted when the destination diskette is supposed to be，the screen will dispiay an ERROR－144，but your source diskette willstill be intact．

If you type any eharaster other than $Y$［RETURN］in response to the TYPE＂Y＂：IF DK TO USE PRDGFAM AREA message，the frogram aborts and a EELECT ITEM prompt appears on the streen．

NDTE：The number of times the DUP progran requests you to insert the source and destination diskettes depends on the number and size of the filess？to be duplicated for a given system and the amount of fAM in the system．A 4 gK system might raquire only two insertions whereas a lok system might require five or six diskきtte insertions．

For a multipledisk drive ミystam，it is not nesessary to aava a RAM－resident EASIC program，as an internal DOS buffer is used and the リミer＇s program area will not be altered．Notice tinat in the follouing exampie，there is no prompt message regarding the program area．Insert
the sロutre diskette in disk drive \＃l ヨnd the destination diskette in disk drive \＃ᄅ and use the steps in ExAMPLE 2 ．

EXAMPLE 2.
SELECT ITEM
」［RETURN］
LUP DISK－－GDURCE，DEST DRIVES
1,2 ［RETURN］
INSERT BOTH DISKS，TYPE RETURN
［RETURN］

## SELECT ITEM

The cursor remains on the screan during the duplication process． This process can take several minutes if the source distette is almost full．

Although the above example uses Disk Drive \＃i as the soorce disk and ث丷 as the destination disk，you can duplicate a disk from any numbered drive to any other numbered driva；e．g．2， $1 ; 1,2,3$.

## K．BINARY SAVE

Use this Menu selection to save the contents of memory lorations in object file（binary）format．Programs urittan using the Assembler Editor Cartridge have this format．The parameters for this selection， ETART and END，are hexadecimal numbers．These numbers are determined by your cbjert file program．For instance，if you had an Assembly Language program BINFIL．DEJ stored on diskette，it would be preseeded bu a b－byte header in the form shown in the following：

In Examplei，you bould insert the hexaderimal addresses 3COO and SEFF from the neader as the START and EivD parameters in the BINARY EAVE selection．

EXAMPLE 1：

SELECT ITEM
$K$［RETURN］
GAVE－GIVE FILE，START，END
EINFIL．DBU，3COO，SEFF［RETURN］
SELECT ITEM
This BINARY EAvE selection used with a fíafter a filename can be used to insorporate an automatic run feature into an object file program． To mate an object file run automatically，insert the starting address into hexadacimal locations $2 E O$ and $2 E 1$ ．Since EASIC does not recognize hexaderimal numbers，use PDKE statements uith the decimal equivalents of the hexaderimal locations of the starting address．In the above example BINFIL．OBJ，the starting address is 3COO．The Least Eignificant Eyte（LSB）$i s O O$ and the Most Signifirant Byte is 3C．When these are canverted to derimal the LSB is still D，but the MSB is bO． The decimal equivalents of dorations 2EO and בE1 ara $73 \in$ and 737， respestively．See Appendix E．

EXAMPLE $2:$

Einar！File Automatir Run
TUPE［［RETURN］to get into EASIC

READY
PDKE 73E，OO［RETURN］
READY
PDKE 737，60［RETURN］
Enter MEE secand in decimal．
READY
DIDS［RETURN］
Return to DOS Finnus．

SELECT ITEM
K［RETURN］
SAVE－GIVE FILE，START，END
BINFIL．DBJ／A，こEO，こE1 RRETURNJ
Enter hexadecimal equivalents．

## EELECT ITEF

When BINFIL．QEJ is lasded into RAM，it will begin exeruting immediately．Be sure to enter decimal numbers in the POKE state－ ments．If you enter hexadecimal numbers by mistake，you could POKE into DOS and create all kinds of problems，making it necessary for you to reboot the systein．

1．BINARY LDAD
Use this selection to load into RAM an Assambly Language（Binary）file that 山ヨs previgusif saved with BINARY SAvE．If the starting address Uヨミ appended to the fila in locations eEO and eEl，the file will automatically run after being entered．

EXAMPLE i:

SELECT ITEM
L [FETURN]
LDAD FROM WHAT FILE?
BINFIL. GEJ [RETURN]
Since this file had the starting address in lorations ceo and 2E1 (seek. BINARY SAVE), this file will begin executing as soon as the laad is complete.

If $\exists$ file has not had the starting locations inserted in céo and aEl, the SELECT ITEM prompt message would display on the sereen as soon as the file romplated laading.

EXAHPLE $2:$
SELECT ITEM
L [RETURN]
LCAD FRDM WHAT FILE?
MACHL DEJ [RETURN]
SELEGT ITEM
To run a program without an appended starting address, sae the next selection, M. RUN AT ADDRESS.

## M. RUN AT ADDRESS

Use this selection to enter the hexaderimal starting address of an object file program after youhave loaded it into RAM with the BINARY LaAD selertion. This selection is used when the starting address has not been appender to the object file.

EXAMPLE:
SELECT ITEM
M [RETURN]
RUN FROM WHAT ADDRESS?
3000 [RETURN]
In the above example, the instructions at hexadecimal location 3000 will begin executing. Ee very careful in entering these hexadecimal address lorations. If you enter an address that does not contain executabie code, it will ereate problems. The least damaging of these problems eauses the system to lock up making it necessary for you to reboot the system.

## N. DEFINE DEVICE

This selection allows you to change the ratiting defined in the fMS Handler Table. For this use, it helps to think of E:, P:, and D: as single files rather than devices. In the following example, data tinat
would have normaliy been sent to the printer is rerouted to a TEMPZ. P file on adiskette.

## EXAMPLE:

## SELECT ITEM

氏 [RETURN]
LDGICAL DEUICE, PHYSIGAL DEVICE
P:, TEMiPZ. P [RETURNJ

## SELECT ITEM

Within the system, the $P:$ handler address is changed to reflect another handlep in the FNS that "sets up" the actual device. In a program that has data to be sent to the printer, the FMS would find the address of $P$ : in the Handler Table, and route the data to that losation. Howaver, this selection changes the p: "fila" address and reroutes the data to the TEMP己. P file on the diskette. The logical devicg, which in this case is P:, can be redefined any number of times.

The full implementation of this selection is not supported, so use it uith caution.

## D. DUPLICATE FILE

Use this selection for a one drive system to sopy a file from the diskette in drive \#1 to another diskette. No wild cards are possible with this selection. The operation and prompt messages for this selection are very similar to those of the DUPLICATE DISK selection. The following example is for a single disk drive system.

EXAMPLE:
SELECT ITEM

- [RETURN]

NAME OF FILE TO MDVE?
DDSEX. BAS [RETURIV]
TYPE "Y" IF OK TO USE PROGRAM AREA
Y [RETURN]
INSERT SDURCE DISK, TYPE RETURN

## [RETURN]

INSERT DESTINATIUN DISK, TYPE RETURN
[RETURN]
SELECT ITEM
This selection also contains the same restrictions regarding the program area that are explained in Example 1 of the DUPLICATE DISK selection. Therefore, you should not have a RAM-resident EASIC program that you do not wish destroyed when performing this task.

SECTION 6.

DISK DPERATIONG WITH EASIC
This section deseribes the BASIC commands that are used to move data between devices. Four of these commands allow storage and retrieval of files and the remainder are associated with infut and output data operations. Earh command is illustrated with its abbreviation, format, and an example of the command.

COMHANDS TO STORE AND RETRIEVE FILES

| LOAD | LIST |
| :--- | :--- |
| SAVE | ENTER |

LQAD (LD.)
Format: LOAD filespec
Example: LOAD "D1:DOSEX. BAS"
This command causes the computer system to loadhe filespec from the disk drive specified into RAM. It loads the tokenized version of the program. The tokenized is shorter than the $u n t o k e n i z e d$ version in that, when recorded, this version contains shorter inter-record gaps. However, when a tokenized version is loaded, it also loads the program's sumbol table. If the program is altered or deletions are made, the symbol table is NOT changed. This means that all variables which were defined in the original program still exist in the symbol table. Therefore, it is recommended that LOAD and SAVE be used only when saving a program is itsfinal form. When specifying disk drive \#1, it is not necessary tocell it outi e.g., D: is the same as D1:.

This command $i \equiv$ also used in "chaining" programs. If you have a program that is toobig to run in your available RAM, you can use the LOAD command as the last line of the first frogram so that when the program encounters the LDAD statement, it will automatically read in the next part of the program from the diskette. However, the second program must be able to stand alone without depending on any variables, etc. from the first program.

To cause the serond segment to load and run automatically, you would use a RUN "D:filespec" as the last line of the first segment. However, before running the first segment, make sure you have saved it on diskette as the fUN statement will wipe out your fam-resident program.

SAVE (S.)
Format: SAvE filespec
Example: SAVE "Di:EXAMPZ. BAS"
This command causes the computer sustem to save a program on disk with the filespec name designated in the command. SAve is the complement of

LOAD and stores programs in tokenized form.
LIST (L.)
Format: LIST filespec
Example: LIST "D: DATFIL. LST"
In BASIC, if no devige is sperified after the LIST command; e. g. , LIST or L. 10, loO, the default device is the screen. All program lines currently RAM-resident or sperified program lines are displayed on the sereen. However, if $\exists$ devire is specified; e.g., P:, C:, D:, De:, the RAM-resident program lines (or designated program lines) will be listed to the sperified device.

When a disk drive is specified, this command causes the computer system to move the current RAM- resident (source: program to a file on diskette under the name specified by the referenced filespec. This command unlike SAVE, seves the untokenized (textual) format.

The untokenized format, although longer, does not merely enlarga on the already existing symbol table. Each time the program is changed and LISTED to the diskette, an updated symboi table is saved with it. This leads to less ERROR-7 and ERROR-5 messages as the variables are all current. When you are working with a frogrami it is advisable to save it using the LIST command.

ENTER (E.)
Format: ENTER filesper
Example: ENTER "D:LISTE.LST"
This command causes the computer system to move a file on diskette with the referenced filespecinto RAM. The program is entered in untokenized form and is interpreted as the data is received. ENTER, unlike LOAD, will not destroy a RAM-resident. PASIC program, but will merge the RAm-resident program and the disk file being loaded. If there are duplicate dine numbers in the two programs, the line in the program being ENTERed will replace the same line in the RAlt-resident program.

## DIEK INPUT/DUTPUT CDMMANDS

An I/D operation is contralled by an ifo Contral Block (IOCB). An IOCB is a sfecitication of the I/D operation, consisting of the type of I/ $\quad$, the buffer length, the buffer address and tio more auxiliary contral variables, gf which the second is usualiy o. ATARI BASIC sets up the eight IOCBS and dedicates three to the following:
IDCE \#O is used by EASIC for I/O to E:
IDCB \#6 is Usad by EASIC for I/D to S:
IDCB \#7 is used by EASIC for LFRINT, CNDAD, and SAVE
Eommands.

IOCBs \#1 through \#5 can be used freely, but the dedicated IOCBs should be avoided unless a program does not make use of one of the dedicated uses mentioned above.

The I/D commands defined in this section are:

```
OPEN/CLISE
INPUT/PRINT
PUT/GET
ETATUS
XIO
```

The NQTE and POINT commands are not supported in this version of DOS.

DPEN (I.)
Format: OPEN \#iocb, aexpl, aexperfilesper
Example: 100 OPEN \#2, $8,0, " D 1: A T A R I 8 C 0$. BAS"
The OPEN statement links a sperific IOCB to the appropriate device handler, initializes any CID-related contral variables (see Glossary), and passes any device-sperific options to thed device handler. The parametars in this statement are defined as follous:

```
            # Mandatory character entered by user.
    iocb A number between O and 7 that refers to a device
                or file.
    aexp1 Code number that determines the type of operation
        to be performed
            Code 4 = input operation
                        b = ds=k directory input operation
                            output operation
                                    end-of-file append operation
                                    Code }9\mathrm{ allows program input from sereen
                                    editor without user pressing [RETURN].
            12 = input and output operation
        aexp2 Device-dependent auxiliary code. An 83 (ASCII S) in
        this position causes the ATARI 820 Printer to
        print sidewaysi otherwise it is always O.
filesper Spacific file designation (see Section 1 for filespec
    definition).
```

In the قxample: DPEN \#こ, Q, O, "DI: ATARIEOO. BAS", IDCB \#2 is opened for gutput to $\exists$ file on disk drive \#i designated as ATARIBOO. BAS. If there is no file by that name on disk drive \#i, tie dos creates one. If a file by that name already exists, the GPEN statement destroys that file and creates a new one. If the IOCB hes already been opened, the scteen displaus an ERROR-129 (File Already OFENed.)

```
CLDSE (CL.)
```

Format：CLOSE \＃iocb
Example： 300 CLDSE $\#$ \＃
The CLOSE cammand closes devires or files that had been previously opened for read／urita operations．The number following the mandatory \＃ must be the same as the iact referenee number used in the OPEN statement．（See Example 1．）If the iorb has already been opened to one device and an attempt is made to open the same IDCE to another device without first closing the IOCR，ERROR－129 displays on the screen．The same IDCE cannot be used for more than one device at a time．

EXAMPLE 1：
10 OPEN \＃1，8，0，＂D：FIL．BAS 20 CLOSE \＃1

INPUT（I．）
Format：INPUT［\＃iocb；svar avar $\quad$ svar．．．］

Examples： 100 INPUT \＃Z；$X, Y$ 100 INFUT \＃ご，Nま

This command is used to requast data（either numerical or string）from a sperified device．When used without a \＃iocb，the data is assumed to be from the default device（E：.

```
PRINT (PR. or %)
```

Format: PRINT \#iocb i[exp]..
[exp] ,

100 PRINT \#2;A末

This command writes an expression (whether string or arithmetic) to the opened device with the same IOCB reference number. See Figure b-1. If no IOCE number is sperified, the system urites the expression to the screen, whith is the default device. If the information is directed to a device that is not open, ERRDR-133 displays on the screen.

PUT (PU.)
Format: PUT \#iocb: aexp
Example: 100 PUT \#S, ASC ("A")
The PuT command writes a single bute (value from 0-e55) to the device sperified by the IDCE reference number. In the tollowing example progran, the fuT command is used to witite eafh number you type into an artay dimensioned as $A(50)$. You can enter, ypor 50 numbers, aach of which should be less than 25t. See GET command for second half of this program.

STATUS (ST. )
Format: STATUS \#igCb, avar
Example: 100 STATUS Hi, ERRDR
This command is used to store the statss of the referenced drive in a specified variable. If no errors are encountered, the status is i; otheruise it is one of the errar codes found in Appendix B. The following program example incorporates the STATUS command to tast whether or not the disk drive is readg; i.e., whether the drive door is closed. If the disk drive door is open, the disk drive pouer is not an, the diskette has not been inserted, or the diskette has been incorrectly inserted, the screen displays an ERRDR-139 or ERROR-139 and takes the user out of the program. Using the TRAF command the user ran remain in the program while the statug rommand allows tha נser to determine and carrect the situation sausing the error.

To test this program and the STATUS command，tupe in the program and SAVE it on diskette．Dpen the door of the disk drive before RUNning the program．The STATUS command will cause the error number to be printed and uili give y口u a prompt message to close the disk drive door．Aftar you close the door，the program uill try again to open the file．This time no error will occur and the program uill not trap but give you a ？prompt for your first input．
$X I D(X$.

```
Format: XID Emcing,#iocb,aexp1,aexpコ,filespec
Example: 100 XID 3,#b,4,0,"D:TEST. BAS"
```

The XID commend is a general input/output statement used for special operations. It is used when you want to perform the functions that would otherwise be performed using the DOS Menu selections. These XIO commands are used to open a file, read or write a record or character, close a file, store status, referense a location in a file for reading or uriting, or to rename, delete, lock, or unlork a file.

The cmdno is used to designate just which of the operations is to be performed.

The following program allows you to create a fila for ach month of the year into which you can enter the names and birthdays of yaur family and friends. The program uses XiO statements to create the file for each month, to lock and unlock earit file as reeded by the program, and to close the file when you are through with it.

Line 20 defines the disk file D: BIRTHDAY as FILE\#. Then in line 170. FILE末 is opened with an XIO statement for input. The XIO statement in line 390 unlocks the proper file. The XID statement in line 400 creates the file and allows you to write to the file. The next XIO statement, in line 430 , closes the file and the next line's xio statement lacks the file to prevent it from being accidentally overimitten or erased.

To run this program, enter a number from 1 to $1 \geq$. The program will check to see whether or not there are any entrias in the file.

If there are none：the sereen will display the message ND EIRTHDAYS IN followed by whatever month you selerted．If you have made entries， the screan dill display the names of the people and their birthdays for that month．In either event，the sereen will display the names and birthdays for the month you selected and the surceeding month （as a failsafe feature against your forgetting an important birthday that comes at the first part of the next montin．When you do not wish to see another file or make another birthuay entry，type NO to each prompt message and the program uill terminate．

Figure $6-5$. Sample Program Using

| EAVE | 5. | I/D statement used to record a tokenized version of a program in a specified file on a specified device. |
| :---: | :---: | :---: |
| STATUS | ST. | Calls status routine for specified devire. |
| TRAF | T. | Directs execution to a specified line number in case of an INPUT error, allowing user to maintain control of program. |
| $\times 10$ | $\chi$. | General I/D statement used in a program to perform DOS mens selections and specified $I / 0$ commands. |

2 Insufficient memory to store the statement or the new variable name or to DIM a new string variable.
Value Error: A value expected to be a positive integer is negative, a value expected to be within a specific range is not.

Q Input Statement Error: Attempted to INPUT a nonnumeris value into a numeric variable.

Array or String DIMErTOT: DIM size is greater than 327 of or an arraytmatrix reference is out of the range of the dimensioned size, or the array/matrix or string has been already DIMensioned, or a reference has been made to anondimensioned array or string.

Argument Stark Dverflow: There are too many gosubs or too large an expression.

Floating Point DverflowiUnderflow Error: Attempted to divide by zero or refer to a number larger than $1 E 96$ ot smaller than-1E99.

Line Not Found: A GOSUB, GOTD, or THEN referenced a non-existent line number.

No Miatching FOR Statement: A $N E X T$ was encountered uithout a previous FQR, or nested FOR/NEXT statements do rot match properly. (Error is reported at tine NEXT statement, not at FOR).

Line Too Long Error: The statement is too complex or too long for BASIC to handle.

Note: The following are INPUT/OUTPUT arrors that result during the use of disk drives, printers, or other atesessory devices. Further information is provided with the auxiliary harduare.

GOSUB or FOR Line [eleted: A NEXT or RETURN statement was encountered and the corresponding FOR or GQSUB has been deleted since the last RUN.

RETURN Error: A RETURN was encourtered without a matrhing gasub.

Garbage Error: Execution of "garbaģa" (bad RAM bits) was attempted. This error code may indicate a hardware problem, but may also be the result of faulty use of POKE. Try typing NEW or powering down, the re-enter the program wihout any POKE commands.

Invalid String Character: String does not start with a valid character, or string in $\forall A L$ statement is not a numeric string.

LOAD Program Too Long: Insufficient memory remains to complete LDAD.

Device Number Larger than 7 or Equal to 0.
LDAD File Error: Attampted to LDAD a ron-LDAD file.

BREAK Abort: User hit [PREAK] key during I/D operation.
IDCE* already open. OPEN statement within a program loop or IDCB already in use for another device or file.

Nonexistent Device Epecified. Deviee is not turned on or not attached.

IDCE Write Einly. Command to a write-only device (Printer)

Invalid Command: The command is invalid for this device.
Qevice or File not Dpen: No DPEN specified for the device.

Ead IOCE Number: Illegal device rumber.
IDCB Read Oniy Error: Command to a read-only device.

EDF: End of Fila read has been reached. (NOTE: This message ran orcur when using cassette files. )

Truncated Record: Attempt to read a resord longer than 256 charョeters.

Device Timeost. Device doesm't respond. Check connections between peripheral equipment and console.

Device NAK: Garbage on serial port or bad disk drive.
Sarial Bus imput framing error.
Cursor Dut of Range for particular mode.
Serial Bus Data Frame Dverrun.
Serial Bus Data Frame Checksum Error.
Device Done Error (invalid "done" byte): Attempt to write on a write-protected diskミtte.

Read After Write Compare Error (disk handler) or bad screen mode hander.

Function not Implemented in hander.
Insufticient RAM for operating selected graphics mude.
Drive Number Etrot.
Too Many OPEN Files ino sector buffer available).
Disk Full (no free sectors).
Unrecoverable System Data I/O Error.
File Number Mismatth: Links on disk are messed up.
File Name Etrat.
POINT DAta Length Error.
Filalocked.
Command Invalid (special operation code).
Directory Full ( 64 files).
File Not Found.
POINT Invaiid.
*IOCB refers to Input/Dutput Contral Elock. The device number is the same as the IOCB number.

## APPENDIX C

HOW TI DBTAIN MORE USEAELE RAM
i．RELEASE UNGEGESSARY DISK DRIVE BUFFERS
The DOS is able to control up to four disk drives．If you have fewer than four drives，you can use some of the RAM that the DOS sets aside for frogramming to control four drives．

By PDKEing certain RAM locations，you can simplify the DOS so that it is not carrying the excess capability for controlling more disk drives than are in your system．

Here＇s the RAM－saving terhnique，step by step：
－First＂bogt up＂using your Master Diskette with the BASIC cartridge in its slot．Now remove the diskette and insert a new unformatted diskette．
－Eelert DOS item $B$（RUN CARTRIDGE）to get into BASIC，then POKE memory logation 1802 with the value shown in the table below． （Use Direct Mode）．

REQUIRED POKES

| NUMBER DF DRIVES | poke this value INTO 1802 | PRINT FRE（O） | BYTES SAVED （DVER 4－DRIVE CONFIGURATION） |
| :---: | :---: | :---: | :---: |
| 1 | 1 | 21006＊ | 397 |
| 2 | 3 | 20867\％ | こ58 |
| 3 | 7 | 20739＊ | 130 |

＊Assumes 1 化 今勺ラtem．
－Now do a RRINT PEEK（18OZ）and rheck that the value returned is the same Mumber that you PDKEd into that location．If it isn＇t， repeat the POKE step and check again．
－Go to DOS and use Menu item I（FDRMAT DIEK）to put the formatiing onto your blank diskette．Nos use item H iWRITE NEW DOS）to place the DOS．SYS file（with the new value of location 1802），व प y our new diskette．
－With the DOS file now on the new diskette，power doun the computer to clear the RAM．Power up \｛boot upl again with the new diskette installed．
－Now go to BASIC again and do a PRINT PEEK（18O2），FFE（O）in dirert mode．Lorgtion 1802 should show the new number you PDKEd into it，and the free RAM should reflect a significant memory saving．
2. CHANGE THE MUMEER DF BUFFERS USED TD REFLECT THE MAXIMUM NUMBER DF FILES THAT REED TO BE DPEN.

This procedure is exactly the same as the previous example except that you no: POKE memory location iEOL with the number of files you wish to allou to be apen simultaneously. This could be as small as if you arerertain that you will not be executing a program that needs to open more than 1 file. The value of this parameter in the 0 OS as supplied by ATARI is 3 , whirh means that 3 files can be open simultaneously.
3. ELIMINATE DOS AND FMS WHEN THEY ARE NO LONGER NEEDED.

When you power up in the proper sequence (disk drive then console), the DOS and FMS are loaded from the diskette into RAM. Whan you later run a EASIC program, you do not need parts of the DOS that have to do with dsiplaying the menu and responding to your selections. You can release the RAM reserved for these functions with the following BASIC program. You can still use all the DOS functions that are controllable uith BASIC keywords. You release 5384 bytes of RAM.

```
    10 POKE 10,35
    2O FOKE 11, 242
    30 POKE 12, 136
    40 POKE 13,7
    50 POKE 1804, 48
    60 POKE 1805,18
    70 TRAP 90
    \(80 x=U S R(192 \Omega)\)
    \(00 x=U S R(40968)\)
100 PRINT FRE(O) : REM LINE 100 FDR TESTING
```

Future versions of DDS and FMS will accomplish this operation automatically.

## APPENDIX E

TABLE FDR HEXADECIMAL TD DECIMAL CDNVEREIDN
(up to $4 \mathrm{Hex} \mathrm{Digits)}$

| FOUR HEX DIGITE |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 |  | 3 |  | 2 |  | 1 |  |
| HEX | DEC | HEX | DEC | HEX | DEC | HEX | DEC |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 4096 | 1 | 256 | 1 | 16 | 1 | 1 |
| 2 | 8192 | 2 | 512 | 2 | 32 | 2 | 2 |
| 3 | 12288 | 3 | 768 | 3 | 48 | 3 | 3 |
| 4 | 15384 | 4 | 1024 | 4 | 64 | 4 | 4 |
| 5 | 20480 | 5 | 1280 | 5 | 80 | 5 | 5 |
| $\epsilon$ | 24576 | 6 | 1536 | 6 | 96 | 6 | 6 |
| 7 | 28672 | 7 | 1792 | 7 | 112 | 7 | 7 |
| $\varepsilon$ | 32768 | B | 2048 | $\square$ | 129 | E | E |
| 7 | 36864 | 9 | 2304 | 9 | 144 | 9 | 9 |
| A | 40960 | A | 2560 | A | 160 | © | 10 |
| B | 45056 | E | 2816 | B | 176 | E | 11 |
| C | 49152 | C | 3072 | C | 172 | C | 12 |
| [ | 53248 | D | 3328 | D | $\underline{0.5}$ | [ | 13 |
| $E$ | 57344 | $E$ | 3584 | E | 224 | $E$ | 14 |
| F | 61440 | F | 3840 | F | 240 | F | 15 |

For example, to convert the hex number 1234 to decimal, add the entries from each of the 4 columns in the table. For 1 , use the column number 4, and 50 on.

1234 hex =

> 4096 $+\quad 512$ $+\quad 48$ $+\quad 4$ ---4660 dec.

C-
Other examples:

|  | 57344 |
| ---: | :--- |
|  | +3584 |
| + | 208 |
| + | 13 |
| --1147 dec. |  |

AB hex. $=$

160
$+11$
171 dec.

## APPENEIX F

AUTO. EYS USAGE

You can uselauto. Sys in limited ways to perform a task that you always want done each time you power-up the system. The following example illustrates one use of the AUTD. SYS file to control the margins of your display area. Normally, the margins are set at 2 and 38 , respectively. If you want them to be 0 and 39 respertively, you must POKE the new values into darimal locations 82 and 83.

EXAMPLE:

```
    POKE E2,O [RETURN]
READY
PGKE 83,39 [RETURN]
READY
DOS
```

Note that this example uses the intermediate mode to enter data into memory. The next step is to create the AUTO. SYS file which will automaticalld reload the data each time the computer is turned on. To ereate a load format file, you now use the DOS Menu selection, Binary Save, to save the contents of memortlocations 82 and 83 in a file called AUTD. SYS. The BASIC command SAVE sannot be used to save any data which has been stored in this fashion. If you followed the above axample, the DOS Menu should bedisplayed on the screen. (Figure 5-1 shows an illustration of the DOS Menu., Under the SELECT ITEM prompt message, type $K$ [RETURN], The screen will display a prompt message SAVE-GIVE FILE, START, END. Type AUTO. SY'S, 52, 53 [RETURN]. The 52 and 53 are the hexaderimai equivalents of the derimal locations 82 and 83. When the SELECT ITEM prompt message appears again, it indicates the AUTO. SYS file has been saved in load file format on the diskette. Now, whenevar the DOS is loaded from this diskette, AUTO. SYS will be automatically read into RAM and the margins will be 0 and 39.

If quu press the ©SYSTEM RESETJ key, the margins will default to their original defoult values of 2 and 38 . [SYSTEM RESET] re-initializes the Operating System, but does nat re-boot the DOS.

Binary Save：

Bit：

The method（or order）in which information is read from，or written to diskette

A loration in memory，usually sperified by a two－byte number in hexadecimal or derimal format．

The capital letters A－Z and the numbers 0－9， and／or combinations of letters and numbers． Sperifically excludes graphics symbols，punc－ tuation marks，and other special characters．

A one dimensional set of elements that can be referenced one at a time or as a complete list by using the array variable name and one sub－ script．Thus the array B，element number 10 would be referred to as B（iD）．Note that string ヨrrays are not supported ty BASIC，and that all arrays must be DiMensionede A matrix is a tio dimensional array．

The method of coding used to store text data． In ATASCII（which is a modified version of ASCII，the American Standard Code for informa－ tion Interchange），each character and graphics symbol，as well as most of the control keys， has a number assigned to represent it．The number is a one－byte code（derimal 0－255）．

Filename reserved by Disk Dperating System．
An exact coply of original master DOS／FMS diskette．Aluays keep barkups of your DOS／FMS mقster diskette and of all important data diskettes．

Signalling speed or speed of information inter－ change in bits per second．

Loading a binary machine－languaga object file into the computer memory．

Saving a binary marhine－language object file onto a disk drive or program recorder．

Abbreviation of＂binary digit＂．The smallest unit of information，represented by the value 0 or 1.

DOS. SYE:

Drive Specification वr Drivespec:

Drive Numbet:

End of File:

Entry Paint:

File:

Filename:

Filename Extender or Extension:

Disk Dperating Susstem abbreviation. The software or programs whish farilitates use of a disk drive system.

Filename reserved by Disk Dperating System.
Part of the filespec that tells the computer which disk drive to access. If this is omitted the computer will assume Drive \#1.

An integer from 1 to 4 that specifies the drive to be used.

A marker that tells the computer that the end of $a$ certain file on disk has been reached.

The address where exerution of a machinelanguage program or routine is to begin. Also called the transfer address.

An organized collection of related data. A file is the largest grouping of information that can be addressed with a single name. For example, a BASIC program is stored on diskette as a particular file, and may be addressed by the statements SAVE or LDAD (among others).

The alphanumerifocharacters used to identify a file. A total of 8 numbers andior letters may be used, the first of which must be a letter.

From O to 3 additional characters used following a period (required if the extender is used) after the filename. For example, in the filename PHONLIST. BAS. the letters "BAS" comprises the extender.

Abbreviation for file specifiration. A sequenre of characters which specifies a particular device and filename. Do not create two files with exartly the same filesper. If you do, and they are both stored on the same diskette, you will not be able to acress the second file. And, as they both have the same filespec, the DOS functions of Delete File, Fename File, and Copit File山ill act on both files.

To organize a new or magnetically (bulk) erased diskette onto trarks and sectors. When formatted, each disketta contains 40 eircular tracks, with 18 sectors per track. Each sector can store up to 128 bytes of data.

Hexaderimal or Hex: Number base system using lb alphanumeric chararters: $0,1,2,3,4,5,6,7,8,9, A, E, C, D, E$, and $F$.

IDCE

INPUT:

Least
Significant Eyte:
kilobyte or k:

Machine Language:

Most Significant Eyte:

Null Etring:

Db.ject Code:

Qctal:

OPEN:

Parameter:
Peripheral:
Record:
Sertor:
Input/Output Control Block. An arithmetic expression that evaluates to a number between 1 and 7 . The IDCB is used to refer to a device or file.

To transfer data from outside the computer (say, from a diskette file) into RAM. DUTPUT is the opposite, and the two words are often used together to describe data transfer operations: Input/Gutput or just "I/Q". Note that the reference point is always the computer. OUTPUT always means away from the computer, while INPUT means into the computer.

The byte in the rightmost position in a number or a word.

1024 bytes of memory. Thus a $16 K$ RAM rapacity actually gives us $16 * 1024$ or 16,384 bytes.

The instruction set for the particular microprocessor chip used, which in ATARI'S case is the 6502 .

The byte in the leftmost position in a number or a word.

A string consisting of no character whatever. For example, Ab='"'stores the null string as $A \neq$.

Machine language derived from "source code", typically from Assembly Language.

The octal numbering system uses the digits 0 through 7. Address and byte values are sometimes given in octal form.

To prepare a file for access by sperifying whether an input or output operation will be conducted, and sperifying the filespec.

Variables in a command or function.
An I/D devire.
A blork of data.
The smallest block of data that ran ba uritten to $\exists$ disk file or read fram one. Sectors can

|  | store up to 128 bytes．Also called a＂physical record＂． |
| :---: | :---: |
| Soutce： | The device or address that rontains the data to be sent to a Destination．See Destination． |
| Source Code： | A series of instruttions，uritten in language other than machine language，which requires translation in order to be executed． |
| String： | A sequence of letters，characters，stored in a string variable．The string variables name must end with a $\$$ ． |
| Tokenizing： | The process of interpreting textual BASIC source code and converting it to the internal format used by the BASIC interpreter． |
| Track： | A circle on a diskette used for magnetic storage of data．Each trark has 18 sertors，each with 12日 byte storage capability There are a total of 40 tracks on each diskette |
| Variable： | A variable may be thought of as a box in which a value may be stored Such values are typically numbers and strings． |
| Write－Protect： | A method of preventing the disk drive from writing on a diskette．ATARI diskettes are write－protected by covering a notrh on the かiskettecover with ョ small sticker． |
