

□ Phil and his ideal Christmas present — an Atari laptop.

All way to UK to prove a point

PHIL Reeves is a man on a mission.

He wants us all to realise the great benefits of owning an Atari computer.

To prove his point, he flew all the way to the UK for this year's PCW '89 in London.

While there he bought one of five Atari laptops in the world.

The Stacy 4 has 4Mb of main memory (Ram), a single 720K floppy disk drive, high resolution 640 x 400 pixel screen and 40Mb hard disk.

"When the full range of Atari laptops are released on the market, there will be four models," said Phil.

"The Stacy 1, a 1Mb model with a 20Mb hard drive, will sell for \$2995, but the Stacy 4 will sell for \$4995."

In the middle is the Stacy 2 (40Mb hard drive) which will sell for \$3995.

Phil is a partner in Paragon Computers, and he says the computer marketplace in Australia has been persuaded into believing IBM compatibility was the way to go.

While warming to the conversation, Phil pointed out that his laptop had four times the power of the PC on which this story was written.

"Initially the product will cause great interest in the music industry," said Phil.

"It is ideally suited for musicians heavily involved with midi and other electronic music systems."
