ATARI USER

Vol. 1 No. 5 September 1985 £1

8-PAGE SPECIAL
Launch of the 520ST

The great software race is on!

ALSO IN THIS ISSUE
Features on conditional loops, binary logic, display lists, graphics, screen dumps, Logo insights – plus an action-packed maze game
Welcome to Atari Magazine

(IF YOU'RE NOT YET AN ATARI USER)

The only way to make full use of Atari User is to become one. And the easiest way to do that is with Atari Personal Computer Packs.

There isn't a better way to get into computers. There isn't a more comprehensive starter pack.

Only Atari could give you a 64 Ram memory, cassette 'soundthrough' capabilities, a maximum of 256 colours on the screen at one time and 4 'sound' voices.

Atari 800XL Personal
COME
ATARI USER, STOP HERE.

A choice of a 1050 Disk Drive or a 1010 Cassette Programmer Recorder and additional software.

No one else could offer you all this power at these prices. And, as everything comes together, you can make the most of the unbeatable ATARI 800XL straight away.

Without doubt, ATARI Personal Computer Packs are the easiest way to get into computers.

The only difficulty is deciding which one. Now read on.

PERSONAL COMPUTER PACKS
News
All the latest developments in the expanding world of Atari computing.

MicroLink
This month's update on news from Britain's electronic mail service.

Beginners
Mike Bibby's regular series continues to take the pain out of programming. This month he explains why some things are more equal than others.

Adventuring
Brillig looks at the games which combine Scott Adams adventures with Marvel comic characters and there's the solution to last month's brick-dropping problem.

Software
Fast arcade action with Boulderdash and Hijack, Archon for the strategists and Wishbringer for aspiring Post Office workers everywhere.

Graphics
Dave Russell's still working his way through the Atari graphics modes. This month Modes 4 and 6 receive his attention.
Utility
There's some clever tricks in Roland Waddilove's Data Making routine.

Display List
Mike Rowe explains that it's not at all rude to use a Display List Interrupt.

We take a first look at the wealth of software now being developed for the 520ST — in our 8-page introduction to Atari's wonder machine.

Game
Help Horace the Blob avoid the Maze Monsters in this fast-action version of the arcade classic.

Output
Dump those Mode 8 pictures to your Atari 1029 printer with the aid of Michael King's program.

Addressing modes of the 68000 microprocessor

Hardware
Mike Cook describes the extensive addressing modes of the powerful 68000 chip.

Logo
Derek Radburn stresses the list processing properties of Logo.

Mailbag
Four pages of your letters — the moans, the praise, the questions, they're all here.

Bit Wise
If you thought EOR was something to do with Winnie the Pooh, you'd better read Mike Bibby's series on binary operations.

Order Form
Binders for your back issues, disc doublers, dust covers for your micro and a free T-shirt for all new subscribers.

ATARI IS THE REG. TRADEMARK OF ATARI CORP. LTD.
ALL INFORMATION CORRECT AT TIME OF GOING TO PRESS.
Tramiel pledges support for the whole range

ON the eve of the consumer launch in the UK of the 520ST, Atari chief Jack Tramiel has pledged continuing support for all the company’s current machine range.

In an exclusive interview with Atari User, the controversial former boss of Commodore insisted that the arrival of the 16 bit micro will not mark the beginning of the end for Atari’s less powerful models.

“We intend to support all lines which Atari has manufactured and are selling”, said Jack Tramiel.

“This includes the VS2800 games machine, the 130XE and 800XL computers, the ST line and all future machines”. Questioned about the number of 520STs Atari hopes to sell in the first 12 months, the outspoken head of the Atari clan replied: “Sales projections are high.

“We believe that any company which has smaller than 20 per cent share of the personal computer market will be out of business in the long run”.

Battling Jack – as he is known in the States – went on to deny claims that the ST was aimed primarily at the business market.

“Since I started in this business, I’ve always sold personal computers”, he said. “People have the imagination to do what they like with my products”.

A suggestion made by a leading UK retailer that the 520ST was too cheap with not enough profit in it for dealers to provide the necessary back up also met with a similar rebuke.

“The profit margins we provide for retailers are comparable to any in the computer industry”, he said.

Asked about stories emanating from the US that STs are already being sold before any software is available, he said: “Why people are buying it without software is because for every machine there are stages.

“In the first stage the program developers buy machines. In the second stage the computer enthusiasts and hobbyists buy the machines.

“Then, as software is developed, comes the third stage – the consumer buys”.

What will follow the ST? “If you are in Las Vegas in November please visit our booth at Comdex. You will see quite a line of new products…”

Hard discs on the way

ATARI hard discs for the 520ST are to have a 10MB capacity and will be available in the United States in October.

This was the message from Jack Tramiel when he spoke to Atari User. However he did point out that UK purchasers of the 520ST will have to wait until November for the British versions to be made available.

DUTCH PICK THE 800XL

ATARI has achieved a dramatic breakthrough in Europe with the news that the Dutch government has selected the 800XL as its recommended micro for the country’s schools.

The company now predicts that this will result in sales of 100,000 machines to educational outlets in Holland over the next two to three years.

Atari was given the blessing of the Dutch after months of negotiations and in the face of intense competition from major rivals.

This is now being seen as the key to unlock the door to similar deals all over Europe. However France remains the one country where Atari is unlikely to make much headway, thanks to the chauvinistic attitude of the French themselves.

As part of the Dutch deal the 800XL – named as Home Computer of the Year in the British Micro Computing Awards 1985 – is now to be featured in a television series there.

Breakthrough

This, according to the company, is being designed to introduce school children in Holland to the intricacies of computing, similar to the pioneering BBC series. "This award is a major breakthrough for Atari computers in Holland", says Rob Harding, Atari UK sales manager. "It was won in the face of formidable competition from Philips, the indigenous manufacturer.

“We believe that this will lead to the 800XL becoming the leading 8-bit micro in education."
Games link with toys company

SOFTWARE house Martech has joined forces with a toy manufacturer and comics publisher for the latest release for the Atari 8-bit machines.

In mid-October it will be launching Zoids - The Battle Begins, the first in a series of computer games based on a range of Zoid robot toys made by Tomy.

Both manufacturers are keeping in close touch with Marvel, which is bringing out a comic based on the Zoids' adventures.

Martech says Tomy has orders from all over the world for its dinosaur-like robots - sales of the toys have already reached the two-million mark in the UK.

Tomy is also planning to spend in excess of £1.5m on television advertising alone in the run-up to Christmas. Martech is hoping its partner's promotions will help sales of its own game.

"Zoids have clearly captured the imagination of the same kids who buy computer games", said a spokesman for the company.

The Battle Begins is an arcade game which centres on the battle for supremacy between two warring factions of Zoids. Martech says it involves a lot of strategy.

LASER DISC SYSTEM FOR ATARI

ATARI is set to become the first micro manufacturer to introduce a laser-read compact disc system in this country.

Spokesmen at Atari's headquarters in Sunnyvale, California, and at Slough have confirmed the product is under development and will be released before Christmas with a price tag of about $500 - under £400 at current exchange rates.

The CD ROM player is based on a Philips drive unit and is designed to run with the Atari ST range.

It will be capable of storing 500 megabytes of memory on one 12 cm optical laser disc.

"We are also thinking of making it an audio product so it will double as an audio player."

A prototype previewed in America recently, running with the ST, stored 20 volumes of an encyclopaedia on one third of its capacity.

There was the full index of the encyclopaedia on another third and high quality graphics related to the material on the other third.

It took approximately three seconds to locate any particular reference using laser scanning.

Drive units developed by Philips and disc and tape manufacturer 3M have been available to North American original equipment manufacturers for several months.

Nigel Murphy, 3M's disc products manager in the UK, has said that CD data storage is "the technology that will substitute for all forms of recording media in 10 to 15 years time."

His company believes optical memory systems will take off within the next few years, with annual disc sales expected to reach half a billion by 1990.

The discs will be able to store a variety of information - standard computer data, graphics, digitised TV pictures and audio.

SOFTWARE IMPORTS FROM USA

DISTRIBUTOR Software Express is importing four utilities and five games for the Atari 8-bit range from the United States.

Homepack is a three-in-one package which includes word processor, information manager and telecommunications program. Price is £49.95.

A word processor called Paper Clip will cost around £50. It enables the user to merge Touch Tablet and other pictures with text and also to print out.

Broderbund's Print Shop, price £40, enables users to create letterheads, greetings, messages, signs and displays.

Extra data files cost £20.

Last in the utilities section is B-Graph, a graphics construction program which allows bar or pie charts to be made.

The games are Epyx's Rescue on Fractals and Ballblazer, Broderbund's book-based Mind Wheel game for an Atari with twin drive, and Micropose's strategic war game, Crusade in Europe, and its Great American Road Race. Cost per program ranges from £30 to £40.
Micro Live returns to the screen

TELEVISION'S Micro Live series is returning to BBC 2 as a result of pressure from computer buffs.

Starting on October 13 the new weekly series will cover subjects ranging from electronic music, micros in schools, the Data Protection Act and the use of computers in timing races.

The battle for the personal computer market is to be featured in a serious film with a lightweight title, Big Blue and the 700 Dwarves.

Micro Live will also take an in-depth look at work being done by the Carnegie-Mellon University in the States on molecular memories and robots, communications and networking.

These, together with other items still to be filmed, will take the series up to December 13 when it will take a break for Christmas. It will return for another 10 weeks starting on January 17.

The program's producers have also taken heed of the viewer's mailbag by introducing more items on personal computers. But air time will also be given to the growing business and communications sectors.

Presenters of the program will be Lesley Judd, Ian McNaught-Davies and Fred Harris. Micro Live will go out on BBC 2 at 7.30pm each Friday.

Top team for 520ST launch

ATARI boss Jack Tramiel is to spearhead the consumer launch of the 520ST on the first day of the Personal Computer World Show on September 4.

The fact that he is to appear with his American entourage is being seen as a demonstration of the importance attached to the new machine's showing on the UK market.

It was because of this that the first ST machines were shipped to Britain some weeks ago, much to the irritation of would-be developers Stateside.

When questioned about this Tramiel said the decision had been made based on the overwhelming interest shown in the ST when it was unveiled at the Hanover Show earlier this year.

"As an international marketing company we put emphasis on all our markets, but especially Europe," Jack Tramiel told Atari User.

In recent weeks UK software houses, like their US counterparts, have been involved in a mad scramble to provide ST products ready for the consumer launch here.

Much has been the interest generated by the machine that most major British companies got caught up in the rush to actually buy ST development systems.

"We even had to wait in line to pay for one", bemoaned a spokesman for one company a little slow off the mark.

Programmers have been working round the clock in an attempt to beat the September deadline. Although many will only be showing "unfinished" products, more than 80 software houses will be featuring their wares on the Atari stand at the PCW Show at London's Olympia.

"There has been nothing quite like it since the gold rush", said one industry observer. "It's as though Jack Tramiel had invited them all to the opening of the Klondike".

TOP VALUE

A REVIEWER in Popular Computing Weekly has described the as-yet-to-be-released Commodore Amiga as the main challenger to the Atari ST range.

However the writer, Andrew Pennell, concludes that the ST is likely to score heavily on price - some £400 cheaper for the basic model, which includes a monitor when the Amiga does not - and the fact that it has more RAM.

Atari bridges the gap

ATARI owners have been invited to help fill a gap in our national heritage caused by the likes of Henry VIII and Oliver Cromwell.

Because of these and other iconoclasts there is no British history of Nativity art as there is in other European countries.

But that is something archivists and historians Count and Countess Andrej von Stauffer intend to correct.

They have organised the First British National Nativity Competition to put Britain alongside the other countries of the world who already have a longstanding tradition of Nativity-making.

It coincides with the Twelfth World Congress of Nativists, which is hosted by a different country every three years and this year is at Innsbruck, Austria, in December.

The competition, in two parts, will be held at Westminster Cathedral on December 8 and at the Christian Resources Exhibition at the Horticultural Halls in London on February 8.

Count and Countess von Stauffer have been working closely with their international counterparts for eight years, as well as with British craftspeople, artists, photographers and - during the past two years - computer graphics artists.

They have been helped by Epson UK, which was involved in the Christmas Archives Exhibition, Folk Nativities of the World, at the Barbican Centre last winter.

The Epson connection with the National Nativity Competition is in the special category for the best computer-generated image of the Nativity.

Any part of the Christmas story may be represented, and entries will be judged on originality, content and approach.

Epson will judge this section of the competition and award a prize to the winning computer artists.

"The winner in the computer category will also compete for the overall Best in Show trophy", Count von Stauffer told Atari User.

"And it is likely to be given a place in the British Nativity archives which will be going on tour to the United States and leading Commonwealth countries shortly".

Atari owners who want to enter the competition should write to National Nativist Competition, Christmas Archives, 64 Severn Road, Cardif CF1 9EA enclosing a 24p stamp.

10 ATARI USER September 1985
£1m computer to the rescue

THE phenomenal growth of MicroLink has hastened the purchase of additional computer power by Telecom Gold.

Demand for the new electronic mail service has been such that despite the tremendous processing power of a Prime computer, at certain times of the day users have been inconvenienced by motorway-like congestion caused by the large volume of traffic.

Since it started, MicroLink has had to share its computer with the somewhat verbose members of the European Parliament. The traffic jam worsened as subscribers from all over Britain and Europe and as far away as Australia and Japan began logging on in increasing numbers.

With MicroLink growing at more than four times the predicted rate, the result left it no option but to request a separate computer for its exclusive use.

Telecom Gold has come to the rescue and on September 7 MicroLink will be moving to its own £500,000 dedicated system — much to the relief of its own users and the Euro MPs.

The move will enable MicroLink to provide an increasing number of exciting facilities, together with a response time described by its systems manager, Colin Rogerson, as "super quick".

Telecom Gold officials have been staggered by what they describe as "the phenomenon of a specialist service growing so big in such a short time".

Rogerson believes he knows exactly why MicroLink has taken off so dramatically.

"It's more friendly than other electronic mail services, it's informative, and it's fun to use", he says.

Popular abroad

NOT only is MicroLink the great new national electronic mail service — it's also making a name for itself on the international scene.

On the Continent there are already subscribers in Belgium, France, Luxembourg, Spain, Switzerland and West Germany.

Further afield are its members in Saudi Arabia, Australia, New Zealand and Japan.

There are even a couple of subscribers stationed at British Forces bases in Germany, in addition to those in the UK and the Republic of Ireland whose numbers increase daily.

Why is MicroLink so popular abroad?

Says one happy customer: "It's a very good way of sending information by the international PSS system, it's faster and more economical than telex, and it's portable. I can take my lap-top computer just about anywhere and it's in touch with MicroLink at any time of the day or night."

Showing 'em how

MICROLINK will be notching up another first when it goes on line from the Electromation & BBC Micro User Show in Manchester.

A continuous demonstration of the new service will be held at UMIST from September 27 to 29, with experts on hand to answer all questions from users.

Stories about the show will be transmitted live over MicroLink's own electronic news pages during the three-day event.

MicroLink forges commercial ties

NEW commercial ties between Britain and Japan are being forged by MicroLink's speed and efficiency.

For several years Bristol electronics engineer Jeff Gearing has been UK correspondent of a Japanese motoring magazine, regularly sending his news reports by mail on floppy discs to its editor, Yuichi Ishikawa.

Other than expensive long-distance phone calls, the two men had to rely on the five-day minimum air mail service to keep in touch.

Until MicroLink, that is.

Now both Gearing and Ishikawa are subscribers of the fast-growing international mail service, and news about Britain's motor industry gets to Japan in seconds rather than days.

MicroLink has paid off for them in another way — high-speed two-way exchange of up-to-the-minute business information that can be sold as a service to commercial concerns.

And this has led to a further profitable spin-off.

For some time Gearing and Ishikawa had been aware that there was a demand in Japan for luxury European goods, and in Britain for Japanese-made models.

MicroLink is now providing the fast, low-cost medium for import/export orders, resulting in an increasing flow of Wedgwood pottery from Bristol and radio-controlled models from Tokio.

It's all systems go...

THE ever-ready Help Line came to the assistance of a distinguished early MicroLink subscriber, Conservative MP for Aston Sir George Young.

He telephoned to say: "The screen does not scroll when it is in the Telecolm Gold mode. The new lines simply super-impose on the old, making it very difficult to read messages."

"I have a BBC Micro with a Telecolm 2 modem and a Micronet 800 ROM. To access Telecolm Gold I have to generate a new Return signal. What am I doing wrong?"

What Sir George was doing was trying to access the service using Micronet 800 software.

Help Line was able to give him two options — either get a Commstar ROM, which has both Telecolm and terminal emulation, or get the Micronet 800 ROM and use it with a terminal emulation program such as Termi.

Shortly afterwards Sir George was able to report: "All systems go at his end of the system."

Your chance to join MicroLink — turn to Page 45.
STRAIGHT to work this month. Have a look at Program I. I don’t think it should cause you too many problems.

We’re just assigning the values 1, 2, 3 to three numeric variables, NUMBERONE, NUMBERTWO, NUMBERTHREE, and printing out the value of the variable immediately after each assignment.

```
10 REM PROGRAM I
20 PRINT CHR$(125)
30 NUMBERONE=1
40 PRINT NUMBERONE
50 NUMBERTWO=2
60 PRINT NUMBERTWO
70 NUMBERTHREE=3
80 PRINT NUMBERTHREE
```

Program I

The end result is that:

```
1
2
3
```

appears on our screen. A long-winded way of doing things, I admit, but easy enough to follow.

Program II is a different kettle of fish, but believe it or not, its output is exactly the same as in Program I.

It’s sensible enough down to line 40. We clear the screen in line 20, assign the value 1 to numeric variable NUMBER in line 30, then PRINT NUMBER in line 40.

Line 50 looks decidedly odd, though:

```
50 NUMBER = NUMBER + 1
```

How can a number be equal to itself plus one? That’s what line 50 seems to be saying, after all.

The fact is that equals sign doesn’t mean equals here – it just tells the computer to do something. The equals sign instructs the computer to do whatever task is given on its right and then label the result of that task with the label on its left.

In this case the micro interprets line 50 as starting on the right of the equals sign, take the value labelled by NUMBER and add one to it. Then label the answer with the variable NUMBER. The micro doesn’t bother assign the result to the label on the left.

Let’s take this idea a little further. Have a look at Program III. The first five lines should be fairly familiar.

When we run it the screen clears, line 20, we set NUMBER equal to zero, line 30, increase it by one, line 40, and then print it, line 50. Since NUMBER was zero, and we’ve increased it by one, the result will be that 1 appears on the screen.

Once the program’s done this, we come to line 60 which reads:

```
60 GOTO 40
```

As you’ll recall, the GOTO 40 tells the micro to make line 40 the next line it does. This increases NUMBER by one, as we’ve seen, so NUMBER takes the value two. Line 50 then prints out the 2 and we encounter line 60 again.

This sends us back to line 40, which increases NUMBER. Line 50 prints out the new figure, 3, then we’re back at line 60, which takes us to line 40, which increases NUMBER, and so on.

I think you can see that the program will produce the steadily

```
10 REM PROGRAM II
20 PRINT CHR$(125)
30 NUMBER=1
40 PRINT NUMBER
50 NUMBER=NUMBER+1
60 PRINT NUMBER
70 NUMBER=NUMBER+1
80 PRINT NUMBER
```

Program II

```
10 REM PROGRAM III
20 PRINT CHR$(125)
30 NUMBER=0
40 NUMBER=NUMBER+1
50 PRINT NUMBER
60 GOTO 40
```

Program III
increasing sequence of numbers 1, 2, 3, 4, 5, 6, 7 and so on. Try running it and see. You’ll probably be glad to know that the way to break out of the program is by the aptly named Break key.

If you simply want to freeze things for a moment while you examine the output, press the Control and the 1 (one) key at the same time – we write this as “press Control+1”. To restart things simply press Control+1 again.

As we’ve mentioned, when a program is looping round in circles like this, we call it a loop. We can then make statements such as NUMBER increases by one each time round the loop.

If you press Break, or freeze it quickly enough after the start of the program, you’ll see that the first value of NUMBER printed out is one, and not zero as you might think. All right, we assigned zero to NUMBER in line 30, but we increased it by one immediately, before ever printing it out.

But what if we wanted the zero printing out? Well, a sneaky method would be to make line 30 of Program III:

30 NUMBER = 1

What happens here is that line 40 immediately increases NUMBER by one, to make it zero (1 + 1 = 0). Line 50 then prints it out.

10 REM PROGRAM IV
20 PRINT CHR$(125)
30 NUMBER = 0
40 PRINT NUMBER
50 NUMBER = NUMBER + 1
60 GOTO 40

Program IV

Another way round is just to swap lines 40 and 50, so we PRINT before we increase NUMBER. This is what I’ve done in Program IV. Try running it and you’ll see – if you’re quick enough – that 0 does appear on your screen.

Actually we don’t need to go up in steps of one. Have a look at line 50 of Program V:

NUMBER = NUMBER + 3

Remembering that micros start on the right of the equals sign, the Atari takes the value labelled by NUMBER, adds these to it, and gives the result the label NUMBER. The effect is that line 50 increases the value of NUMBER by three each time round the loop, so numbers are printed out on our screen going up in steps of three.

Nor do the numbers always have to be getting larger. Program VI, as actual INPUT, labelling it as START.

Lines 50 and 60 then prompt for, and INPUT the increment, or step, by which we want the numbers to go up, labelling it INCREMENT.

We then get down to business. Line 70 assigns the value of START to NUMBER. We then print this value of NUMBER in line 80, so we’re off to a good start, if you’ll pardon the pun.

We then have to increase NUMBER by the value of INCREMENT to get the next value. Line 100 then jumps back to 80, which then prints the updated value. Line 90 then increases it again by INCREMENT and so on.

If you have difficulty visualising this try substituting sets of real numbers for START and INCREMENT and see what happens as you go round the loop.

For instance, if you mentally input 25 for START and 5 for INCREMENT, line 70 would give NUMBER the value 25, which line 80 would then print out. Line 90 would then add 5 to this, giving NUMBER the value 30 then we’d loop back to 80 via 100. The figure 30 would then be printed out, line 90 would increase it by 5 again, and so on.

All well and good, but having to escape from these loops by pressing Break isn’t very elegant is it? Ideally the program should stop of its own accord. In other words, we should give it a condition to finish on. The loops we’ve met so far haven’t had any finishing condition so they’re known as unconditional loops.

We need to create a conditional loop, and Program VIII shows us how we go about it.

10 REM PROGRAM VIII
20 PRINT CHR$(125)
30 ? "I'll keep on going until you enter 999"
40 INPUT NUMBER
50 IF NUMBER=999 THEN STOP
60 GOTO 30

Program VIII

The idea is that we keep on looping round, printing out the same inane message, until we enter 999. That is, the condition for ending the loop is that we INPUT 999 – any other
number will cause the loop to be repeated.

Let's see how we achieve this: Line 20 clears the screen, then line 30 prompts for the INPUT, saying the program will keep on going until 999 is entered.

(In case you're wondering what the question mark is in line 30, it's the Atari's abbreviation for PRINT. If you want to substitute a question mark for PRINT, then go ahead. I prefer the clarity spelling it out gives you.)

Line 40 then INPUTs into the variable NUMBER. Line 50 is the heart of the matter -- this is where we test for our condition. It reads:

50 IF NUMBER=999 THEN STOP

This uses the IF...THEN statement, one we haven't met before. It reads:

IF some condition is TRUE, do what follows the THEN.
IF that condition isn't TRUE, ignore what's after the THEN and carry on with the next line.

In the case of line 50, this boils down to:

IF NUMBER does indeed equal 999 THEN STOP.
IF NUMBER isn't 999, THEN drop through to the next line -- line 60 in this case.

So if when prompted by line 30, we'd INPUT a value of 999 for NUMBER, we would do what's after THEN and STOP.

We haven't met STOP before, but I don't think you'll be too surprised to learn that it stops the micro dead in its tracks. It also prints out a message indicating the line it was stopped at. In this case it would be STOPPED AT LINE 50.

If, however, we entered a value for NUMBER other than 999, our condition hasn't been met, so we carry on with the next line of the program, line 60, which then sends us back to our prompt for INPUT again.

In other words, the IF...THEN statement ensures that we keep on looping until we enter the number 999. We've got ourselves a conditional loop!

Actually there are other ways of stopping it, such as pressing Break or entering a word when it's expecting a number. For the moment we'll assume that you're good-mannered enough to avoid this. Later on we'll see how to "idiot proof" our input, as it's known.

Try running Program VIII, and enter 999 to stop it. Then enter:

CONT

The program will restart -- CONT stands for continue. The same trick works after you've pressed Break. The IF...THEN statement isn't too hard to use; just remember:

- The condition you're testing for comes directly after the IF.
- You can put any valid Basic instruction after the THEN.
- The instruction after the THEN is only carried out if the condition has been met -- that is, if it's true.

If the condition is not true, the micro ignores what's after the THEN and continues with the next line of the program.

Take a look at Program IX now. This does exactly the same job as Program VIII but in a different way. This time we test to see if the number is NOT equal to 999, and, if it is so, we loop back to our prompt for INPUT. Lines 20 to 40 are identical. The vital bits are lines 50 and 60.

Line 50 reads:

50 IF NUMBER<>999 THEN GOTO 30

Here our condition is that

10 REM PROGRAM IX
20 PRINT CHR$(125)
30 "I'll keep on going until you enter 999"
40 INPUT NUMBER
50 IF NUMBER<>999 THEN GOTO 30
60 END

Program IX

NUMBER isn't equal to 999. That's what <> means -- not equal to. And if our condition's true -- that is, NUMBER isn't equal to 999 -- we THEN loop back to line 30.

On the other hand, if the condition in line 30 isn't met -- that is NUMBER is 999 -- we simply drop through to line 60, which reads:

60 END

We met this before. As its name suggests, it simply ends proceedings, this time without any message, unlike STOP.

. The not equal to symbol, <>, may be new to you. It's just one of a set of inequalities, as they're known, that come in very useful in combination with IF...THEN statements. Table I summarises them.

If you're anything like me, you'll get confused between > and <. The trick is to remember that, for both symbols, the larger number goes opposite the bigger end of the symbol, whereas the smaller number goes opposite the sharp, smaller, end. It may not be the way Einstein remembered it, but it's good enough for me!

Program X uses what we've learned about IF...THEN statements, as they're known, to add a finishing point to Program VII. Lines 10 to 40 are identical. We clear the

<table>
<thead>
<tr>

<td>6&gt;=5 is true, 6&gt;=9 is false</td>
</tr>
<tr>
<td>&lt;=</td>
<td>less than or equal to</td>
<td>7&lt;=7 is true, 7&lt;=6 is false</td>
</tr>
</tbody>
</table>

Table I: Inequalities
screen and INPUT a value for START, the number we start from.

Lines 50 and 60 then prompt for and INPUT the number we wish to end at, FINISH. 70 and 80 then INPUT INCREMENT, the value of our step. As in program VII, the value of START is assigned to NUMBER, line 90, and then printed, line 100. Next, we increase the value of NUMBER by INCREMENT and store it in NUMBER again at line 110.

Line 120 is the crux:

```
120 IF NUMBER>FINISH THEN END
```

What this says is, if we've incremented NUMBER past FINISH end the program here and now. If not, then continue with the next line, which will loop back to 100 and print the newly-incremented number.

Notice that if we have exceeded the limit we don't actually print that value of NUMBER since we don't loop back to the PRINT statement of the finish to 35 and prescribe a step of 5, you'll get:

```
25
30
35
```
on your screen.

However a start of 50 and a finish of 55 with an increment of 3 will result in:

```
50
53
```

You won’t see a 56, because it exceeds our limit.

What happens if the start and finish numbers are the same, or the increment is negative? In fact, will the program work with negative numbers? And what would happen if we choose an increment of zero? Find out!

- Well that’s all for this month. Next month we’ll be continuing with loops, but in an entirely different way.

Setting the standard for adventure graphics

AS promised last month, let's take a look at the Scott Adams Quest Probe series. Unfortunately, The Fantastic Four — next in the series of Marvel Super Heroes to be put into adventure form — has not yet arrived from Adventure International so I shall only be able to look at the first two games of the series, The Incredible Hulk and Spiderman.

The Quest Probe series is Scott Adams' first major venture into graphics from the off, although his earlier games have had graphics added in some cases. Hence the games are available either as text only cassettes or on disc with graphics, with a commensurate price difference.

The graphic versions also contain a "graphics off" command for any text fans who prefer the faster loading of discs.

Now I have in earlier columns expressed my views on what graphics add to and subtract from a game. In the case of Quest Probe I have to say that the graphics do add to the game for two main reasons.

Firstly the characters portrayed are cartoon characters in their own right. Hence the impression given in the games is an entirely accurate one, and nothing jars with the players' perception of the central figure. This is reinforced by the inclusion of an actual Marvel comic in the package, designed to introduce the characters to newcomers.

Secondly the text in the games tends to be fairly sparse and a little repetitive, presumably a reflection on the amount of memory taken up by the graphics. For instance, in The Hulk most of the action takes place in or around a series of large domes, while in Spiderman the action takes place in a large office building.

The graphics themselves, particularly in The Hulk, are the best I have seen in any Atari adventure, giving an excellent representation of the original cartoon characters. If graphic adventures are to be the way forward then this is the standard to beat for any new contenders.

The games have a slightly disappointing quality, in that the actual story line behind each is similar, as you send your Super Hero on a gem-collecting mission. I feel that with a little more imagination and variety the characters could have been set some slightly more challeng-
ing tasks to tax their amazing powers.

The Quest Probe series to date provides some good challenging hunt-and-find problems and as this is an interconnected series it will presumably follow the same pattern in the Fantastic Four. Worth buying for the graphics for sure, and any Scott Adams adventure is worth a look, but the text only versions are a little on the dry side.

Now on to some of the nitty gritty adventuring problems. Picture the scene. There you are strolling contentedly through your adventure, a nice full inventory, when suddenly everything looks the same. No matter which exit you take your surroundings never vary. In short you have hit what every adventurer dreads – a maze.

This is the sort of problem that is going to confront you in probably seven games out of ten, so we had better make sure that there is a way of dealing with it.

Richard Burke, of Gwent, has come up against just such a problem in *Escape from Pulsar 7*, written by Brian Howarth as one of the Mysterious Adventures now marketed by Adventure International.

Richard’s problem is that he cannot open the locker in the storeroom, or indeed always find the storeroom. The storeroom in Pulsar 7 forms part of a double maze in the game.

The first part of the maze is that several rooms are exits from a series of air ducts. The second part, in common with several of the other Mysterious Adventures, is the total lack of geographical logic in the game.

In adventures today there is absolutely no excuse for an exit leading north to a location and yet the south exit from that new location leading somewhere completely different. This is the case in Pulsar 7, and probably explains why Richard cannot always find the storeroom.

The Brilliant patent maze mapping method can, however, solve the problems caused by encountering games writers with no sense of direction. The first sign of a maze is when, despite the plethora of exits in many directions, the player cannot appear to move. The location description remains the same. But has the location?

The problem is that you cannot tell. Everything looks the same. What you need is a point of reference, so start with where you are and call that No 1.

All you have to do is drop an item from the inventory, such as a pencil, to identify location No 1. Now go through the available exits, and every time you can still see the pencil you have dropped, mark a dot against that exit. It obviously leads nowhere.

If you cannot see the pencil, then you have moved, so drop another item and repeat the process. Continue this until you have mapped the whole maze, and from then on it will be a piece of cake to pick your way through it.

In the case of Pulsar 7 I suggest you name each location after the inventory item you drop, as the geography of the maze is purely nonsense. But by persistence with my method I can promise Richard will find something that will be a smash hit with that locker.

Mind you, some adventure writers have got smart to this system, so don’t be too surprised if your mapping items start disappearing while you are away.

Jym Pearson’s *Curse of Crowley Manor* is the Other Venture causing James Chapman problems, being stuck in the numerical lock room with a monstrous creature. Well, James, follow Rule Number One and examine everything in an adventure, including your transportation to the manor, and you may find some useful liquid refreshment.

Finally a letter from M. Woodgate asks me to commit an act of heresy and recommend a good disc adventure that is not from Infocom.

I see from his letter that he already has Atari’s *The Pay-Off* and that he is considering *Mask of the Sun* by Broderbund – which is no bad choice.

Can I also suggest the Ultima series (I to IV) if a graphic adventure is what he is after. They should keep him busy for a few months.

Since Adventure International has featured as the bulk of this article Steve Calkin, of Pitsea, wins an Atari User T shirt for his “Glitch of the
Adventuring

Month" recounted to him by none other than Scott Adams at last year's PCW show.

Adventureland has an obstinate bear to pass. Shout(t) or Scree(am) Bear will work. Now try replacing "ami" with "w" as one frustrated American did.

No wonder the bear was surprised.

TAKE ONE LARGE HUD...

THOSE of you who solved last month's Bricks puzzle will know that you needed rather a large hud.

The program we present here provides a means of arriving at answers to the questions: (a) How many bricks did you drop? and (b) How many EW moves did you make?

The rooms are in the array R, with P as the pointer to the current room. There are a generous 700 rooms and P starts in room 20.

The data correspond to the cards described last month. Each set of three numbers provides the instructions to:

- Drop a brick or clear the room – drop 5 or 0 in R(P).
- Move East or West – add 1 or -1 to P
- Get the next three data items and count moves.

Reaching the equivalent of the STOP causes the array C to exceed its bounds and so the TRAP command causes the value of I – the number of moves – to be printed out. The array R is then searched for 5s, the number of these corresponding to the number of bricks dropped.

If you run the program you should get answers of 134,468 moves and 501 bricks. Be warned though, Atari Basic is so slow that the program takes about an hour to run.

---

Computer Support PRESENTS——

A whole new range of affordable software and hardware products for every Atari user

<table>
<thead>
<tr>
<th>80 COLUMN PACK</th>
<th>£69.95</th>
</tr>
</thead>
<tbody>
<tr>
<td>At last 80 columns built in to your Atari, selectable on powerup, works with currently available software.</td>
<td></td>
</tr>
</tbody>
</table>

ULTIMON

£49.95

A built-in machine code monitor capable of stepping any program on the fly, examine/alter registers/memory, read from disk, write to disk, return to program and many other commands available. A must for all assembly language programmers.

THE GAP

£29.95

Fit the 4k gap in your 400/800 with this hardware modification. Once fitted to a 8k machine there will be 52k of user RAM.

ROM EMULATOR

£29.95

Develop and debug cartridge software quickly and effectively, just flick a switch and cartridge RAM becomes ROM, can also be used in conjunction with CARTRIDGE DUPLICATOR to backup those internally protected cartridges then produce a custom copy.

OVER-WRITE

£14.95

Use the other side of all your diskettes, simple to operate just flick a switch.

BADSECTOR

£19.95

A hardware modification. Write bad sectors to any diskette, can be used for custom creation of bad sectors or to backup some protected disks.

PORTPRINT

£29.95

Run a standard centronics compatible parallel printer from the joystick ports of any Atari computer, includes a relocatable handler, runs with any boot program, comes complete with connection lead.

SUPER DISASSEMBLER

£24.95

Disassemble any disk, cassette or cartridge, uses system labels, separate input to pre-determine data bytes, the end result file can be customised then re-assembled using an assembler.

FILE LOADER

£14.95

An excellent DOS menu which does not require DOS on the disk, ideal for games.

BOOT LOADER

£14.95

A self booting menu, compacts boot disks/cassettes to a file format, utilities include: tape to disk, disk to tape, disk to disk, format, write master.

We are continually adding new products to our range so please send SAE for full details.

Coming soon:

128k BANK SELECT...

An extra 64k of user memory for the 800XL.

EPROM SELECTOR...

Select from any one of up to eight eproms from a menu on powerup, includes board and ROM.

CARTRIDGE SELECTOR...

Select from any one of up to four ready plugged in cartridges.

ULTIMACI...

Simply the best macro assembler yet.

DOUBLE CHIP...

Update your 1050 disk drive to true double density (180k) with switchable default to single or double density.

EPPROMMER...

A very advanced eprom programmer.

Send cheque or postal order to:

18 ATARI USER September 1985
Sparkling arcade game is fast – and fun...

ONE of the classic arcade games, often emulated but never in my opinion surpassed, is **Boulderdash**.

The concept is simplicity itself. You control Rockford, a handy little mole who whizzes through the boulder-riddled sub soil collecting diamonds as fast as his little paws will carry him.

Collect enough diamonds and a door opens up. Reach the door to the transported to the next level up, and start again in a different cave.

In practice it isn’t that simple – is it ever? – as there is a stringent time limit with a realty cutting, panic-inducing 10 second countdown.

Rockford is well aware of this, as any pause in the action leaves him frowning and tapping his foot impatiently.

This is quite apart from the fact that the more subsoil you remove the more Rockford is likely to receive a boulder on his head as he strives for the next gem.

The caves themselves are of varying degrees of difficulty, from not too easy to downright impossible.

**Cave A** lets you zoom around and acclimatise to the perils of the plummeting boulders you inadvertently induce. Cave B does more of the same, while Cave C wiped me out about a fortnight as I struggled to clear all 24 diamonds and find the exit in time.

**Expert boulderdashers** have shown me that there is a technique to every screen, although to assist the unworthy there is a facility to flip forward four caves at a time, or a pause button to allow you to plan your route through the earth.

Trapping Butterflies which turn into diamonds when you casually drop a rock on their heads is a theme in several caves, together with flooding them and avoiding nasty little “warps” set to chase you around the screen.

**HIJACK’S ALL RIGHT, JACK!**

IT’S a good job English Software released **Hijack** before the Shi’ite Muslims decided to play the game for real. Otherwise they might have laid themselves open to charges of opportunism.

As it is, the worst one could level against them is a charge of premeditated plagiarism.

If you ever saw Broderbund’s Choplifter, then Hijack will give you a remarkable feeling of **déjà vu**.

The innovative aspect of the scenario is that it is a train that has been hijacked.

“Fly this train to Waterloo” doesn’t sound quite right, does it?

There are 10 VIPs aboard the train and your job as a crewman is to pick them up and deposit them in the safety of the rear carriage. Meanwhile, of course, there are hazards to be avoided.

Guns fire at you and trees suddenly offer themselves as targets for you to crash into. It’s like learning to drive all over again!

**The title page** is accompanied by a jolly rendition of **The Runaway Train**, but the game sounds consist largely of the tacka-tacka-tacka helicopter rotor and whizz-boom gunshots.

One nice feature is that following a wipe-out you can start from the level you were on when killed. You can also restart from the beginning if you really want to.

It’s not one of the most compulsive games I’ve ever played. In fact in my opinion the cleverest part is the way the title is written in an appropriate shape on the cassette inlay.

It’s a lot more colourful than Choplifter, and if you never saw Broderbund’s classic you may well love Hijack. For my money, though, I prefer the original.

Talking of money, the 48k cassette costs £7.95 and the disc version is £10.95.

Dave Russell

September 1985 ATARI USER 19
Magick moments in Festeron

ONCE upon a time there was a nasty Queen who, as the law governing fairy stories dictates, had a beautiful and virtuous stepdaughter.

Now the Queen, being the crabby, cantankerous and malicious monarch that she was, decreed that no one should marry the fair Princess Morning Star until they first proved themselves worthy.

Naturally Queenie devised tests that would ensure that none of the macho knights that sought the Princess’s hand would live to tell the tale. One besotted wretch was even sent deep into the Mines of Mendon, there to slay a Ghre and drag the carcass up where all might see it.

Now any Infocom adventurer worth his or her salt could have told the poor sucker that he’d have been better off staying at home reading a good magazine like Atari User but no – off he went. Darkness soon overcame the hapless knight who, lost without a lamp, was soon devoured by a lurking Ghre.

Since nobody ever survived the ordeal, the Princess was condemned to a life of loneliness and died without ever seeing a single knight make it to the finals.

Many kingdoms later, a scholar happened to be rummaging through the ruined tombs of monarchs and chanced across a glowing object amid the dust and decrepitude. It was the Princess’ heart, now long since turned to stone but shining brightly with the unfulfilled wishes of a lifetime. And that, dear reader, was how the Magick Stone of Dreams was discovered.

In Wishbringer, from Infocom, you begin not as a knight in shining armour but as a humble Post Office worker. The game begins atop a hillside in the coastal town of Festeron.

You may wish to explore the town before or after going to the post office – the cinema, cemetery, police station, lighthouse, pleasure wharf, park, library and church are all worth a visit.

Your boss, Mr Crisp, is not looking and pale “as a faded signature in an antique book” when she sees the writing on the envelope: “It has been a long, long time since I last saw this handwriting. Hoped I never would again”.

The letter turns out to be a ransom note. Somebody signing themself as the Evil One has kidnapped the old lady’s cat and wants the Magick Stone in return.

The lady is evidently distressed. In a voice breaking with emotion, she whispers “Many seek to gain the Stone of Dreams yet few can imagine the price. For years I have fought to conceal it from the Evil One and others like her. “My youth, my home and family all were forfeited for its protection. And now, now it...”
Some of the best
at a fraction of
the price

I've got some good news and
some bad news.

First the bad news. If, like
me, you were one of the first to
spend your hard-earned cash
on an old 800, then you might
be forgiven for thinking that
you had some terrible personal
problem when it came to
buying cheap quality software.

But this is where the good
news comes in. Now, thanks
to a few enterprising software
dealers and the growing
potential of our own software
writers, we can at last enjoy
some of the best Atari
software at a portion of the
price.

Archon by Electronic Arts,
is one of these classics to filter
through. It's distributed in the
UK by Anlaisal and costs
£1.95 tape or £14.95 disc. It
is at first glance similar to
chess, not only in its board
layout but in the movements
of some of its players.

But that is where the
similarity ends.

Archon is a two-screen
game. The main screen is a
dotted board, of light and
dark squares.

There are also squares
which vary between light and
dark, but most important there
are the power points — five
squares which, if totally con-
trolled by one side, will end the
game.

The second screen is the
scene of fierce battles to
decide the right to own a
square.

So much for the layout.
Now on with the game itself.
Archon can either be a one
or two player game.

You are given the choice of
being either the light force or
the dark force — and this is
where the squares matter.

If you are the light side, the
light squares will give you
more strength than the dark
squares and vice versa for the
dark side.

The revolving squares will
give a different amount of
strength depending on your
colour and its colour.

Each side has an army of
equal strength but different
in their fighting styles. Thus
tactics play a major part in
Archon.

The most important ele-
ment is the Wizard who can
cast spells ranging from heal-
ing your player to reviving a
dead piece.

This usually encourages an
onslaught on the Wizard from
the word go, but it can prove a
very costly attack and is
generally not preferred by the
more experienced player.

My only complaint about
this excellent game is that you
do not have any skill-level
selection in the one-player
mode so I found myself
beating the computer time
after time.

The manual is well laid out
giving hints on playing the
game and a thorough expla-
nation of your spell-casting
ability.

The one I received was a
Commodore 64 version which
was accompanied by a photo-
copy of the Atari key functions.

I find this a touch strange as
Archon was released first on
the Atari, then on the 64. Perhaps this was a pre-release
version of the manual.

All in all an original game,
well written and a pleasure to
play.

Paul Irvine

Bob Chappell

The review of M.U.L.E. in
the July issue was also by Paul
Irvine and we're sorry we only
managed to get 60 per cent of
his name right!
WE looked last month at Modes 3, 5 and 7 and saw how they were four-colour modes. This month we'll take a look at the modes we missed out, 4 and 6.

These are still "map" modes, but they only allow two colours to be used. If you're wondering why anyone should want to limit themselves to two colours, the answer is memory. By way of a slight digression, let's see why this should be so.

We talk about a bit of information and because the word bit is used in everyday language it's easy to forget that it has a precise meaning in this context.

When someone offers you some more food and you say "Well, maybe just a bit more, please", you're using the word in a very imprecise way.

In information processing terms, bit is a contraction of the two words binary digit. We say that one bit of information has been transmitted if the number of possible outcomes has been halved.

Suppose I toss a coin and tell you that the outcome is heads. I've given you one bit of information because I've reduced the possibilities from two to one. Before I transmitted any information, the outcome could have been heads or tails.

Suppose your task is to guess which square on an otherwise empty chess board contains a pawn. If I tell you that it isn't in the left-hand half of the board, once again I've given you one bit of information.

In the case of the chess board I've reduced the possibilities from 64 to 32. With the coin I reduced the possibilities from two to one. In both cases I have provided the same amount of information - one bit.

If you've been following Mike Bibo's Bit Wise series, you'll be quite familiar with binary notation, so let's work our way back towards the graphics screen.

If you think about a simple black-and-white screen, each pixel can either be white - lit - or black - unlit. That is, we can describe the pixel's state using only one binary digit. Let's say 1 represents lit and 0 represents unlit.

We could now describe a complete screen as a string of 1s and 0s and we could store this information in memory.

Suppose now we have the option of each pixel not only being lit but being coloured red. That is, each pixel can be lit or unlit, and if lit can be white or red.

Our single binary digit can't convey all this information, so we need to introduce another one. We could then describe each pixel's state as 00 - unlit, 01 - white lit - or 11 - red lit. There is another possible combination, 10 - red unlit - but in this case it doesn't make much sense.

It's easy to see that if we wanted to describe a screen containing this much information we'd need a bigger string of 1s and 0s. If even more colours were possible, we'd need an even bigger string.

This information is held in the micro's RAM memory and so we can see that if we want more colours available we have to allocate more memory to hold the possible colour information.

The other variable in the equation is the size of the pixel or the resolution. A high resolution screen has many pixels per row of screen and therefore needs more information-holding space than a low resolution screen.

Mode 4 has the same resolution as Mode 5 - 40 rows x 80 columns plus a text window. However because only two colours are available in Mode 4, it takes up less memory than Mode 5.

Similarly Mode 6 has the same resolution as Mode 7 - 80 rows x 160 columns plus text window - but again with only two available colours.

We can do much the same as we did in Modes 3, 5 and 7. For example, type GR.4 and the screen should clear to black with the blue text window at the bottom.

If you now enter:

**COLOR 1: PLOT 5,5**

you'll see our old friend the orange
The colour of the plotted point defaults to orange but we can alter it by setting register 0. If you enter:

**DRAWTO 30,9.**

The colour of the plotted point changes to orange but we can alter it by setting register 0. If you enter:

**SC 0,7,4**

you alter register 0 to colour 7, luminance 4 and the orange blocks change to a nice deep blue.

The colour information for the background is held in register 4, so if you type:

**SC 4,5,6**

the black should change into a purple — colour 5 — with luminance 6.

The colours for the plotted points and the background are the two colours. We could also change the colour of the text window via register 2. Try:

**SC 2,12,4**

for example. You should now have blue blocks, purple background and green text window — revolving, isn’t it?

Blue, purple, green . . . that’s three colours. However, we haven’t discovered an undocumented aspect of these colours. We’ve cheated by counting the colour of the text window which is really a bit of Mode 0. If we use a full-screen Mode 4, the text window would disappear and we’d be back to two colours.

If we specify **COLOR 2** for the plotted points, we plot them in the background colour. If there’s nothing already on the screen we wouldn’t see any effect of this. However, one way to erase part of a display is to re-plot it in the background colour.

For example, try entering:

**COLOR 2; PLOT 5,5; DRAWTO 30,9**

and the line should disappear.

In addition to PLOTTing, we can still PRINT #6 as we did in Mode 5. For example, enter:

**POS 20,20; PRINT #6;"111110000011111"**

and you should see lines appear where the 1s are printed and a space in between them where the 0s are.

If you’re looking for ways of saving memory, it’s worth noting that using PRINT #6 is generally more economical than PLOTTing pairs of data points. This means that a combination of Mode 4 and PRINT #6 can be a very economical way of producing a display.

Although we can see the display simply by looking, there are times when your program needs to “see” the display. That is, it needs to know whether a particular screen location contains anything.

For example, you may be bouncing a ball around the screen and need to know if it has hit a wall.

Atari Basic provides a graphics command which will look at a screen location and say what is there. The command is LOCATE and the form it takes is:

**LOCATE X,Y,Z**

where X and Y are the coordinates of the screen location and the contents of the location are stored in Z.

If you press Reset and enter GR.4 to get back to a clear Mode 4 screen, then enter:

**COLOR 1; PLOT 40,20; LOCATE 40,20,Z; PRINT Z**

you’ll once again be confronted by an orange square. If you now type:

**LOCATE 40,20,Z; PRINT Z**

the number 1 should appear in the text window. If you type:

**LOCATE 40,19,Z; PRINT Z**

the number 0 should appear in the text window. In the first case, the 1 signified that location 40,20 contained a coloured pixel whereas the 0 in the second case signified an unlit pixel.

You can use the information gained from looking at the screen to determine what happens next in your program. For example, if your ball has hit a wall, you must change its direction to simulate a bounce.

For example, enter:

**LOCATE 40,20,Z; IF Z=1 THEN SETCOLOR 4,5,6**

and see the effect. Because we plotted a point at 40,20 the LOCATE command assigned a value of 1 to the variable Z. The IF Z=1 test returns a value of “true” so the THEN part of the command is carried out. In this case the colour in register 4 is altered and the background once again becomes purple.

The LOCATE command is very useful but behaves slightly differently depending on which mode you’ve selected. If you’re in Modes 0.1 or 2 the LOCATE returns a value between 0 and 255.

If you’ve selected Modes 3, 5 or 7 then LOCATE will return a value of 0, 1, 2 or 3. As we’ve just seen, in Modes 4 and 6 the LOCATE command returns either 0 or 1.

If you recall the earlier articles in this series, you’ve probably worked out the correspondence between the characteristics of the mode and the values that LOCATE returns.

Even so, I suggest you try out the LOCATE command in all the graphics modes that we’ve covered so far and get familiar with its results.

*That’s your homework for this month – next month we’ll look at Mode 8.*
ROLAND WADDILOVE goes down the road that leads to artificial intelligence with this program that modifies itself

THE assembler published in the August issue of Atari User is a very useful tool for developing short machine code routines. If you've been using it, you might well be asking: How can these routines be incorporated in a Basic program?

The best way would be to store the machine code in data statements in the program. Then a simple routine could be used to read each item and store it in memory.

The problem with this method is how to get the code into the data statements. It would be very tedious to do it yourself... surely there must be an easier way?

Well, there is. Just ask your Atari to do it for you.

Data Maker was designed to take any section of memory and to convert it into data statements. All you have to do is tell it where to start and how many bytes to convert.

The program constructs all the data statements and types them in for you. It then deletes itself, leaving just the lines of data.

Quite a clever technique is used by the program and it's worth studying.

What the program does is to clear the screen and print a line number followed by "DATA". This is carried out in line 70.

It then Peeks the memory and gets 20 bytes of data. These are printed with commas between by lines 80 to 110. Finally, it prints:

```
GOTO 138
```

The next line, 120 is the most important line. It Pokes memory location 842 with 13 and ends the program.

What this does is to put the Atari editor into input mode when the program ends. It's as if you had just pressed Return when entering a line. Anything printed on that line is entered.

The clever part is positioning the cursor just before the program ends so that it lands on the line of data that it just printed. It then enters it as if you had typed it in. The cursor is then moved on to the next line.

It's still in input mode remember, so it enters:

```
GOTO 138
```

which it does. This line sends it back to line 70 to print another data statement if it hasn't finished. When it's done this, it stops, enters it and goes round again.

When it's entered all the data, it goes on to line 140 which puts it back into normal keyboard mode. All the line numbers used by the data maker itself are printed on the screen followed by:

```
POKE 842,12
```

in line 150.

Again the cursor is positioned and the editor put into input mode.

The program ends, at which point the editor takes over and enters all the line numbers, deleting the program itself.

Finally it enters the poke which sets the editor back to normal keyboard mode. All that remains are the data statements.

As you can see, it's a powerful technique that's worth mastering.

I find programs that modify themselves quite interesting and there must be many other applications of this clever trick.

How about an artificial intelligence program? It could grow like a living creature, building up its data as it learned...
Guarantee
Our exclusive Direct Exchange Guarantee is available free of charge to all our customers. If a product purchased from Silicon Chip becomes faulty due to a manufacturing or component defect, within one year of purchase, we will subject to availability, exchange for new.

Silicon Chip
No. 1 for Atari*

Atari 520 ST

Prices
ST pack includes:
520 ST
½ meg. floppy drive
Hi-Res B/W monitor
Plus software listed below
£749.99
Basic, logo, GEM WRITE, GEM PAINT and GEM BOS Operating Systems.
Final prices and specs may be subject to change.

Power Without the Price
Chipsoft Integrated Accounts Package - Including Stock Control, Nominal, Sales and Purchase Ledgers £250
ST to Centronics Printer Lead £29.99
ST Midi Lead £14.99

Specs
512K RAM
Expandable ROM
MIDI Interface, RS232
Serial/Centronics Parallel Interfaces, Floppy Disk and Hard Disks Interfaces, RGB Video and TV outputs, Sound Generator with 3 channels.
2 Joystick Ports, 3 Graphics and Text Modes - 320 x 200 = 512 colours, 640 x 200 = 4 colours, 640 x 400 B/W.
16-bit Motorola 68000 Microprocessor running at 8 MHz.

Silicon Chip Ltd, Showroom address:
302 High Street, Slough, Berkshire. Tel: 0753 70639

*1st Atari Business Centre
*1st Dealer for 130 XE
*1st Dealer for 1029 Printers
*1st Dealer with our own Software House for Software Support
*1st Dealer for 520 ST

Please phone or write for full details.
(Dealer Enquiries Welcome)
AN interrupt, in computer terms, is when the computer temporarily stops executing the main program – Basic, machine code or any other language – and executes another program in memory before returning to the original program.

There are several types of interrupt which are useful for different functions, and they can be divided into two types.

NMI – non-maskable interrupts – cannot be disabled by the 6502 processor and include vertical blank interrupts – VBI – display list interrupts – DLI – and Reset.

The VBI occurs during the screen blank after drawing one screen and before starting the next. These occur every 50th of a second.

A DLI can occur after each line is drawn on the screen and takes place in the small delay between drawing each line on the screen.

The other type of interrupts are called IRQ – interrupt request. These are maskable, which means they can be disabled by the 6502 processor.

These are several timer interrupts, peripheral and serial bus input/output interrupts, the Break key and 6502 Break instructions.

NMI is handled by the Antic chip while IRQs are handled by the Pokey and PIA chips.

But we are only interested in DLIs for now. A DLI can occur every time a line is drawn on the screen. Therefore, because it enables you to have a small program running each time a DLI occurs, it means you can change various parameters as the screen is drawn.

The result of this is that you can change, for example, the colour of any of the registers part way down the screen once or many times.

This allows many more colours to be displayed at once. Other possible uses are to change the character set in use part way down, change sound or music, move players or split players several times, fine scrolling in different directions – such as in Frogger – and differing screen widths. Any of these without interfering with your main program at all.

All this sounds too good to be true and there has to be a drawback. Well, if you are purely a Basic programmer there is. The interrupts must be in machine code.

However, don’t panic. There is no reason why you cannot use DLI routines from other sources in your own program because using them is very easy.

Let’s begin by looking at the routine itself, should you decide to try writing your own. The first point is that timing is critical. Only a relatively short amount of time is available in a DLI, so the routine must be short.

It must start by storing any registers it uses – A, X and Y – on the stack, as the main program will require these back after the interrupt, and it must restore them at the end of the routine.

Also note that many locations for colour or other functions have two locations, the hardware register and the shadow register. In these cases you would normally POKE to the shadow register and the OS transfers the number to the hardware register during the vertical blank.

Any registers changed by the routine should be the hardware registers, not the shadow registers used from Basic.

For example, to change the background colour in Basic you would POKE 712 with a number. This is the shadow of the hardware colour register for the background – 53274.

However if you POKE directly to this the operating system would reset it to the value in 712 during the VBI.

This can be used to your advantage in that any colour change in a DLI will be reset to normal each time the screen is redrawn, thus keeping the change just below the DLI.

Any colour change on a line will not occur in a constant position on that line. This can be overcome by storing the value in WSYNC – 54282
Don't panic, but the interrupts must be in machine code

---

before the colour register. This
delays the interrupt until the end
of the line making a neat boundary.
The best way to write your own
DLI is to examine the ones in the
examples in this article first.

Having got your DLI routine
-written or borrowed - it is used as
follows. First modify the display list.
This involves changing each display
list line where the DLI is required by
setting bit 7. In other words add 128
- $80 - to the line. This can be a
single line or several lines.

Next POKE 512 and 513
- $200,$201 - with the low and high
byte values of the location of the DLI
machine code routine.

For example, Page 6 is 1536. Here
machine code is safe from Basic and
most other operations. POKE in the
code from 1536 and POKE 512 and
513 with 0 and 6 respectively -
$6256+0=1536. Finally POKE
54286 with 192 to enable the DLI to
call.

Note there is only one address for
DLI routines and if more than one is to
be used then the interrupts must
change the address as each is
executed.

If this seems complicated, it isn’t
really, as the following examples
show.

First you can change colours part
way down the screen. Program 1
changes the background colour half

Independent User Group

---

September 1985 ATARI USER 27
way down a Graphics 2 screen. Note that more than one colour register could have been changed.

The machine code for the DLI in this program disassemblies as shown in Figure I. This shows a single change of colour. The colour can be changed several times down the screen.

In Program II we increase the colour of the foreground by 4 on each line to produce a multicoloured design.

The next step from this is to make the colours rotate. Program III produces a gradual change in colour rotating up the screen as seen in numerous Atari demos.

Spectacular isn’t it? And so easy. Graphics 0 is rather plain and boring normally. By using a DLI on each line a spectacular multicolour – 48-colour – Graphics 0 screen can be made as in Program IV. You can alter the colours by changing the Data statements in lines 210 and 230.

**Figure I: Disassembly of DLI**

**Program II**

**Program III**

**Program IV**

All these examples involve altering colours on screen, but other uses are just as easy. As mentioned before, you can change character set part way down screen.

You can run sound effects or music in DLLs. You can split players part way down the screen to make it appear as though there are more than eight player-missiles. Finally you can use DLLs to get horizontal scrolling in different directions on different lines.

Remember, as far as the Atari is concerned, It’s not at all rude to interrupt.
THE 520ST is about to take its first public bow amid scenes never before witnessed in the micro industry anywhere in the world.

In the UK alone some 80 software houses have been working around the clock to launch programs on the ST bandwagon.

A similar number of companies have already committed themselves to the new machine States-side – making this the biggest pre-launch build up ever seen.

Billed as revolutionary both in power and price, the 520ST has already lived up to its name in the opinion of all leading British computer magazine reviewers. According to them it is no longer just a new machine, but THE machine for 1985 and the foreseeable future.

The 520ST has caught the imagination of both the industry and the critics alike. And after its formal launch at this month’s PCW Show it is expected to take the buying public by storm...
The race is on to provide a wide range of ST goodies

A MUSIC system and a flight simulator for the ST have been promised by Island Logic, though no prices or release dates have been set.

The music system will be similar to Island Logic's BBC and Commodore version "but by utilising the capabilities of GEM will be a lot more elegant on a window-based system".

The flight simulator will make users feel they are flying over real landscapes, thanks to the ST's graphics capabilities, says the company.

SOFTWARE publisher Talent is converting Lost Kingdom of Zkull for the ST.

The text adventure is set in real time, has hundreds of locations and a large vocabulary, and many traps, tasks, puzzles and mazes.

The company also plans to bring out Flexfile, a data management system with new techniques of user interfacing to offer a wide range of facilities without the need for programming.

It will run under the GEM operating system for single file applications - lists, medical records, personnel histories, credit and stock records, on single card index.

Flexfile is menu-driven, integrated with the GEM environment of icons, drop-down menus, and mouse, and uses variable sized overlapping windows.

Data entry is at the keyboard, with most other operations mouse-driven. Optional on-screen help windows prompt the user at every stage with no programming languages required.

The record card is user-defined, can be of any size up to the limit of a single screen, and can hold a number of fields such as numbers, dates, class variables and strings.

Talent intends to demonstrate both programs at the PCW Show.

LANGUAGES are in the pipeline at Metacomco and should be ready for demonstration at the PCW Show.

The company will bring out a full C compiler, ISO standard Pascal, macro assembler and full Lisp compiler for the ST.

An Atari development kit, consisting of one language plus editor, manual and example programs, will retail for about £80, says Metacomco's Peter Mackeons.

EXPECTED to be available to the public in late October is Computer One's version of C with source debugger, assembler and full screen Lisp-type editor making full use of GEM.

The company is also considering porting its QL monitor across to the ST. "It should be quite impressive with windowing facilities", says Computer One's Chris Bentley.

The C language package will be demonstrated at the PCW Show.

OASIS Software will almost certainly be bringing out a comprehensive assembler and a monitor to operate with the assembler to simulate a logic analyser.

The company may also do Atari ST versions of its chemistry utilities like White Lightning, and will be aiming to get at least one ST product on the market for Christmas.

FIREBIRD won't talk about a 65000 version of the best selling cult game Elite - Acornsoft's hold over the name complicates any plans the BT-owned software house may have for an Atari version.

But Firebird has commissioned an independent author to write an ST game it hopes will be just as good.

This substantial project, which has the working title Star Glider, should be released early next year, says Firebird's Herbert Wright.

"It has a lot more in it than the usual arcade or adventure game, including some pretty flashy graphics".

Some of the work that has already been done on it will be demonstrated at the PCW Show.
THE race between UK software houses to announce the first program for the 520ST has been won by Microdeal of Cornwall. It has pipped some 80 other companies to the post with the news that its arcade adventure game, Lands of Havoc, is to be released this September.

This came only a matter of weeks after Atari made development systems for the new machine available. Atari User asked Microdeal's John Symes how his company was able to be so quick off the mark.

"Lands of Havoc was already available for the Commodore and the QL," he explained, "and although we took a year to develop the game the program was written on a Vax mini computer so we could easily adapt it for the Atari."

It was the success of the original versions which resulted in it moving over to the 520ST. "Atari asked us to bring the game to them," he revealed. John Symes. "They must have been impressed because once they saw what it was like they agreed to provide us with a development system."

Lands of Havoc boasts 2,000 screens. The object is to bring about the downfall of the Dark Lords who have turned the once bountiful land into a place of desolation.

The disc costs £19.95.

QUEST International is working on two major business software packages, both conversions of proven programs.

Cash Trader, an accounting package designed for smaller businesses, should be ready for demonstrating at the PCW show. The ST version is likely to cost less than the £195 price tag on previous versions.

The Padrmede business control system, a fully integrated five module accounts package, is two thirds ready for the ST, says Quest's Deniel McNulty. It will cost less than the £1,245 charged for other versions.

McNulty says Quest is committed to producing business software for smaller micros and has a vested interest in designing programs for the ST.

AN ST version of its 8-bit Atari light synthesiser Colourspace is being developed by Llamasoft.

The multi-coloured special-effects generator is operated by a combination of keyboard and joystick to produce the kind of light shows seen at rock concerts.

The planned synthesiser for the ST should provide even more spectacular displays, says Llamasoft.

SCHEDULED to be on sale early next year is an "extremely large and complex game" for the ST from Maretch.

The program is "very heavily into graphics capabilities of the 520ST, and involves several simulations in a war type scenario," a spokesman said.

A NEW page make-up system for the ST, to be called the Fleet Street Editor, is being developed by Mirrsoft. The company says it will drive a full phototypesetting system and will include full graphics and the ability for users to develop their own illustrations.

Due for release in March 1986, and costing in the region of £60, it has been developed by Jill Zaum, who was primarily responsible for the software being used to generate page make-up for the Mirror Group of newspapers.

Mirrsoft state they are definitely planning further developments for the ST, believing it to be a major machine in 1986. A flight simulator is already planned.

PROGRAM development aids for professionals and the serious hobbyist are on the way from GST Computer Systems.

The company is porting its successful C compiler, macro assembler and linker from the QL.

The first ST product will encompass all three components and the company is also likely to issue the macro assembler and linker together at a later date, says GST's Chris Sheyebeller. Prices should be announced at the PCW Show.

The firm is almost certainly going to produce a low cost GEM toolkit, which should be out before Christmas, and has plans for cross-compilation tools to help the smaller software houses.

A powerful communications package available from late September is promised by Kuma Computers.

The "all encompassing" software will handle all types of electronic communications including MicroLink, Telecom Gold, bulletin boards, Prestel and file transfer.

Also available at the same time will be word processing, spreadsheet and database software with some very nice features, says the company.

Kuma has been working in 6800 machine code for a couple of years and is really impressed with the 520ST.

Languages and other tools are well along the pipeline, too, the spokesman said.

The first Kuma products for the ST will be demonstrated at the PCW Show.

Watch Atari User every month for all the latest ST news
A FORMER miner who first became interested in computers through playing arcade games in pubs is the author of Microdeal’s Lands of Havoc.

Steve Bak of Mansfield graduated from zapping aliens to writing complex programs in six machine languages.

Now his former credits include the Cuthbert series – well known to Dragon and Commodore 64 users – and Scramble for the Tandy colour computer.

But how did he go about creating a program such as Lands of Havoc? Bak told Atari User:

“The first stage involves a lot of sitting down and thinking while an idea comes to you. Once the idea is there you have to think about structuring the game so it is both interesting and progressive to play.

“Presentation is the next thing to worry about, how the game should appear on screen. The story line also needs filling in.”

This stage took Bak four months, working 50 hours a week “plus stealing a few hours of other people’s time”. It was at this point he realised the game would not be able to compete with many other bigger games on the market for it then only had 80 screens.

He enlarged it by developing the storyline further and eventually added another 1,920 screens. This part was not a solo effort, however.

“I try to involve people who are not programmers as a scientific mind usually sees things in black and white, whereas non-programmers seem more creative and are able to add to a story”, he said.

Only then did Bak start the actual programming. The original game for the Commodore took three months, the Spectrum version two, and the latest, for the ST, another two.

Bak had to write routines for every step of the game.

“I do not write more than 100 lines a night so I am fresh enough to go through it all at the end to ensure there are no bugs”, he says.

“The last stage is fitting each small routine into a whole, fully integrated program, then passing it on for others to pick to pieces.

“If they believe there are any problems I sort them out and, when everyone is satisfied, turn out the final program and put it in Microdeal’s hands while I sit back.

“And that’s how the 520ST version of Lands of Havoc was born...”

THOSE who have followed Digital Research’s fortunes from the launch of CP/M in 1975 through to Concurrent PC-DOS in 1984 will appreciate that as a systems house, we have so far specialised in languages and operating-system products for the industry.

However, we are taking a different approach with GEM because it is a user interface which is compatible with a wide range of applications, operating systems, languages and hardware.

GEM will have more impact on the end-user market than any other product which we, or any other

*Frank Iveson is Director, Northern European Operations, Digital Research (UK).*
software house, have so far produced.

A working definition of the term
"user interface" is "the repertory of
commands a user needs to know to
make his or her machine work to
satisfaction".

Command repertories which
require the memorisation of obscure
sequences of keystrokes are difficult
to retain and the full power of the
system may never be fully appreci-
ated by the non-technical user.

This is true of the command
structures of CP/M, MS-DOS,
PC-DOS and especially of some
variants of Unix, which contain
certain innocent-looking commands
which can destroy the integrity of the
system if used at the wrong time.

There is also confusion among
users who regularly work at different
machines. Often a user has to
interrupt work to decide if the
command he or she is about to enter
does in fact belong to the system in
use.

More resistance to personal
computer use stems from the
obscurity factor than any other
non-cost consideration — especially
among women.

Menu-driven applications are also
affected by obscurity. Menus provide
more clues than commands, but a
major difficulty for the novice is the
disappearance of the subject matter
from the screen while choosing a
menu option. Even for experienced
users, this causes continuing frustra-
tion with the software. Users are
ready for something better.

The GEM user interface remedies
these frustrations and eliminates
obscurity. More than 50 software
houses have stated their intention to
publish GEM-based packages by the
end of the current year.

Among these are Chang Labs,
Compsoft, Pegasus, Thorn EMI
Computer Software, Lifetree,
Infocom and ABC Software.

The available GEM applications
include GEM Desktop, which
replaces operating system com-
mands, an advanced word processor,
GEM Write, graphics programs such
as GEM Graph and GEM Draw and
several business packages including
SPI's well-known Open Access suite.

The 520ST is now shipping with
Desktop, GEM Paint and DR Logo
under GEM. GEM Paint is a drawing
and design package and DR Logo is
the Digital Research version of Logo.
which won a European computer press award presented last year by
West Germany's Chip magazine.

The fundamental research behind
the GEM concept was done in the
early '70s by Xerox PARC in the US
and was first implemented on Xerox's
Star network, and later by Apple on
Lisa and Macintosh. GEM is therefore
based on a long history of user
experience.

Xerox's recent commitment to
GEM is a further indication of the
maturity of the product, and rein-
forces the approach of this special
interface as an industry standard.

GEM Desktop, the operating
system metaphor, is the first GEM
application that most users will come
across. Visually, its screen resembles
a bird's-eye view of a desk, with
documents, folders, disc drives and a
rubbish bin. These objects are called
icons.

Analogue of real world
accessories such as calculators and
clocks are also available. At the top of
the screen is a menu bar.

In GEM Desktop and all other GEM
applications the user selects a
resource by using a mouse or the
cursor keys to move a pointer on the
screen over an icon or desk
accessory.

Clicking the mouse - or keyboard
equivalent - selects the resource
represented. Moving the pointer to
a command on the menu bar causes a
sub-menu to drop down into the top
quarter of the screen.

Thus, in GEM Desktop, selecting a
disk drive icon and moving the pointer
to the File command on the menu bar
reveals the File dropdown menu.
Clicking on the command Open in this
dropdown menu displays the contents
of the drive in a directory window, and the dropdown menu disappears.

The directory window contains
more icons - named folders and
documents, representing files and
applications.

By moving the pointer over a folder
and clicking, the folder is selected.
Repeating the menu bar procedure as
above, or double clicking, opens up
the folder into a second icon-filled
window which overlaps the first and
contains a catalogue of the folder contents.

Pointer movements can delete or
save files and groups of files in the
window by dragging them to the
rubbish bin or to a disc drive, can
change the sizes of the desktop area
and the windows and can scroll their
contents.

They select the whole range of
commands available in Desktop via
the menu bar and dropdown menus.

No command has to be typed in, or
memorised. Errors are explained in
full in dialogue boxes which contain
options for recovery.

For drawing and painting applica-
tions, use of a bitpad or tablet and
pen are even more intuitive to users.

Having mastered the simple skills
of hand and eye co-ordination in
moving the pointer with the mouse or
other pointer device, the user has only
to become familiar with the simple
logic of GEM's visual command
structure in Desktop to know how to
get started with all other applications,
because GEM is a highly consistent
user interface.

Non-GEM applications coexist
with GEM applications written to the
same operating system. Running a
non-GEM application is simply a
matter of opening the appropriate
application folder icon, when control
is handed back to DOS and the
application runs normally.

Co-existence is possible because
the functionality of GEM software is
based on a system extension which
does not interfere with the workings
of the underlying operating system.

The GEM system extension and
GEM software can be implemented on
any 16 and 32 bit CPU
configuration, for CP/M, MS-DOS,
PC-DOS and Concurrent DOS
operating systems.

GEM's applicability to a wide
range of hardware configurations and
operating systems will help good
GEM applications to spread fast from
one machine to another and/or
between operating systems.

Moving GEM itself to another
machine only requires minor modifi-
cations to peripheral parts of the GEM
software.

For example, a software developer
wishing to move an application
written for the Macintosh's 68000
environment to a more popular
computer, need only implement
minor modifications of subroutine
calls to convert it to GEM, followed by
recompilation for another operating
system.

Because IBM dictates in the
personal computer market, other
manufacturers, software houses,
dealers and users all need a standard
IBM compatible user interface. GEM
is such a standard and it will migrate
to all conceivable 16 and 32 bit
configurations of the future.

In the US, amid claims made for
Microsoft's Windows and IBM's
Topview, GEM Desktop is the only
machine independent icon based user
interface on the market and selling in
volume.

### Speeding applications

To speed the development of
versions of GEM applications by
manufacturers and software dev-

developers, Digital Research has intro-
duced the GEM Programmers Toolkit.
The Toolkit itself uses a GEM
interface, and programmers are
pleased with it. They expect the
graphics to be slow, but in fact GEM's
fast code doesn't sacrifice perfor-

mance.

The Toolkit allows programmers to
interactively design GEM icons and
other objects without resorting to
back-of-envelope calculations or
special coding. With Toolkit's icon
editor, for example, the programmers
paint and edit an object at the pixel
level until satisfied, and the Toolkit
generates the code automatically.

Similarly, text for custom dialogue
boxes is installed simply by typing it
in, using any of the major West
European languages whose character
set is supported by the operating
system in question.

GEM applications are also possible
in a number of high-level languages
for which the Toolkit can be equipped.

Demonstration programs may be
produced in a matter of days, and
full-scale implementations within a
few months.

The Toolkit also comes with good
licensing agreements allowing
software houses and manufacturers
to bundle GEM Desktop with their
own applications or machines.
THE ST has many remarkable features, not least of all its operating system. To most users, the ST is controlled by the GEM – Graphics Environment Manager – and that is the means by which users will communicate with the machine.

However, buried away from sight is the TOS – Tramiel Operating System – or what most people understand to be a DOS – disc operating system. When the ST is booted up, which at the moment is done from the TOS system disc, the machine not only loads the TOS into RAM but also loads the GEM Desktop, which is the screen that appears when loading is complete.

The name 'TOS system disc' is slightly misleading, as you can see, because it contains far more than merely the TOS.

Despite the name TOS and the state of the art hardware, the DOS is in fact a virtual clone of CP/M 68k. I say virtual as there are differences which are not strictly part of CP/M and it would appear to mix in some of the better features of MS-DOS. But more of that later.

Designed by Digital Research, CP/M 68k, as its name suggests, is a version of CP/M which runs on a 68000 processor, the chip at the heart of the ST.

Now all this may seem to be confusing. Which is the operating system – GEM or TOS?

To understand the function of these systems it's important to realise the purpose of a DOS. Stated simply, it is a program, or more accurately a number of programs, that process commands inside the micro.

As these operations are related to accessing the disc drive, though not exclusively, the term is DOS rather than OS – operating system.

The function of the DOS is to see that commands and files of data are processed and in general take away from the user the headaches of what is happening inside the machine.

From the user's point of view, the DOS is a convenient method of helping him to manage his files on disc.

The means of control are by typing a command line, say, DIR, for a directory of files. But as useful as that is, systems like CP/M have not been renowned for theirfriendliness.

Command lines like:

PIPB:=A:.*

are not quick to type, nor are they immediately obvious. The above command line merely tells the system to copy all files from disc drive A to drive B. And this is what salesmen have called user-friendly systems...

To make life easier, these functions of a DOS – copying, formatting, and so on – are presented by a GEM system in pictures, or to be more accurate, icon graphics.

Just point the mouse, drag the icons, click and the files are copied. OK, so far, but if the GEM system does all this why bother with the TOS? Well it’s not quite as simple as I’ve made out so far.

The TOS is far more complicated, and those developing professional software will need the command facilities of TOS to probe the inner depths of the machine.

Unfortunately for the enthusiastic user, Atari has not made this easy and there is no straightforward method of entering TOS.

But more importantly, the TOS is THE operating system of the ST. GEM is merely a second level operating system which is under the control of TOS and the ST.

GEM DOS, also developed by Digital Research, needs certain sub-directories in order to work.

At least 128k of RAM is needed and of course the 520ST meets this more than adequately. This requirement explains why the 130ST – 128k RAM – has not and might not be released.

Atari has the intention of placing the TOS and GEM system in ROM, within the machine. This would of course release valuable space within the memory and increase speed.

Although the requirement is for a minimum 128k, the TOS and GEM Desktop together on the system disc account for around 200k of code. This also explains why the machine takes about 30 seconds to boot.

The TOS is an interesting beast as it is not quite one thing or the other.

A first glance at it suggests that it is merely a copy of CP/M 68k and considering DR's involvement in the entire package – GEM and LOGO – this would hardly be surprising.

But unlike CP/M 68k the filing system can be hierarchical, which is a definite improvement. This feature is reminiscent of MS-DOS and is more than just a nice touch.

The GEM Desktop allows the user to open different folders for storage of files. These folders are in effect sub-directories under the main directory.

This can be seen if opening a folder from within a present directory. The window display shows the contents 'within that folder' – sub-directory – and closing the window returns the...
user to the directory above. In this way a hierarchical directory structure can be created.

As GEM has this structure the parent DOS -- as I will refer to TOS -- also has a hierarchical nature. So it is more than just cosmetic. Creating directories within directories is a convenient method of splitting up and finding files.

But what else happens when you boot up the machine with the system disc?

The purpose of booting the ST is not only to load TOS and GEM but to initialise the entire system and carry out certain status checks.

These determine what kind of monitor is being used -- mono, colour and so on -- whether there are applications in cartridge memory that can be run, that is, a cartridge is inserted, setting various registers to default values, and a host of other vital functions.

Of course this is transparent to the user and all you will see is the pretty desktop display once booted or the particular application if using a cartridge.

The status of the desktop can be saved at any point and this is stored in a file called DESKTOP.INF. This contains all the startup conditions of the desktop, these being the number of windows open -- if any -- their positions on the screen, which drive(s) to access and the labels assigned to the disc identifiers.

It also provides information to the system about the way in which an application should be run. This information is set up by the user with the INSTALL APPLICATION option on the desktop screen.

And that just about concludes this brief look at the TOS and GEM.

Fortunately for the user, these two systems work in unison and together provide a powerful and easy means of control over the main operations of the micro.

The overall manager is the TOS, with the GEM system as a second level operating system.

GEM is the friendly face of the ST and the one part of the ST all users will come to know and understand well, but behind the icons and windows is another system which maintains order within the machine.

A case of two systems in perfect harmony -- well, that's the theory anyway...

---

**American software on the move**

NEWS of exciting software being developed for the Atari ST is beginning to filter through from the United States.

Noted producer of the best-selling DB Master database, Stoneware, has reached an agreement with Atari Corp to develop a new filing program for the ST. The company promises it will be "extremely easy for the entry level home or business user".

Users will be able to select colours and change fonts, as well as lay out files to suit individual needs.

Microbits is developing the Omega telecommunications package for the ST and existing 8-bit Atari computers. It will have icons, windows and pull-down menus and will use either a mouse or joystick.

The 16-bit program is expected to cost about $50. Microbits is also developing a 3D battle-zone game for the ST.

Spinnaker Software expects to have eight products for the ST shortly. These are believed to be adventure games. Infocom is planning to convert its entire line of text adventures.

And Sierra On-Line intends to bring out top-selling favourites King's Quest and Ultima II for the new machine.

**Getting in first**

AN enterprising UK distributor went Transatlantic to ensure it would be the first company to be able to deliver software for the 520ST. Faced with the prospect of shortages here for some time to come, Software Express arranged to import programs from Haba Systems of Van Nuys, California, itself breaking new ground as the initial company to produce software for the new machine States-side.

The distributors' first consignment, which was due to arrive in August, included Haba Check Minder, HabaCom and Haba Hippo "C".

Check Minder is a money manager program which enables the user to monitor income and expenses and prepare tax returns.

The second, HabaCom, is a telecommunications program which supports terminal emulation, direct link to the computer, and VT100, TTY/CRT and full/half duplex baud rates.

Haba Hippo "C", the third program, is a complete language system consisting of compiler, assembler and linker. It supports GEM DOS calls and functions.

Depending on the rate of exchange between the two countries, prices for Check Minder and HabaCom are expected to be around £50, while Hippo "C" will cost in the region of £60.

This month Software Express is expecting delivery of two more programs -- HabaWord, a word processor with large document capabilities, and HabaCalc, a versatile spreadsheet. Prices have yet to be fixed.

The company is currently negotiating for more American software for the ST but the deals have yet to be finalised.
**ATARI 520ST SPECIFICATION**

- **VIDEO PORTS:**
  - Game Port
  - Supports 256 colors
  - TV Out
- **GRAPHICS:**
  - 256 x 256 pixels
  - Maximum resolution: 640 x 400 pixels
- **COMMUNICATIONS:**
  - Modem interface: 28800 baud
  - Fax interface: 14400 baud
  - Ethernet interface: 10Base-T
- **COMMUNITY:**
  - Supports up to 100 users
  - Bulletin board system
- **USER FRIENDLY OPERATING SYSTEM:**

**PRESS COMMENT**

"Atari has announced the first of its new range of ST product, the Atari 520ST. With a starting price of $2,984, it is a significant step up from the Atari 1040 ST. However, it is also a welcome addition to the range of computers available. The 520ST is a powerful machine that can handle a wide range of applications. It is also user-friendly and easy to use. The inclusion of MS-DOS compatibility makes it a valuable addition to the range of computers available. We are looking forward to seeing more products from the new range of ST products."
FEELING a bit peckish one afternoon, Horace, a friendly Blob creature, wanders off in search of food. There's not a bite to eat to be found anywhere, so after a short while he decides to risk entering the maze monsters' den.

He's in luck, the ground is covered with crumbs left over after one of their great feasts. The sight of all those tasty morsels makes Horace completely forget about the monsters until they start to chase him.

Can you help Horace collect the crumbs and avoid the monsters? Be careful, though – the monsters are out to make a meal of Horace if they can catch him...

Maze Munch is a fast arcade game to sharpen up your reflexes and get the adrenalin flowing. You start with three lives on screen one and the difficulty increases with each screen cleared. Your best score is recorded in a high-score table.

If you find it too easy or too
Maze Munch

If you've got an appetite for a fast moving maze game then help Horace munch the morsels in this action-packed game by ROLAND WADDILOVE.

hard, the difficulty can be changed by altering L in line 4210. The higher the number the harder it is.

There are several features to interest programmers, so it's not just for games players. A short machine code routine is used for all printing. This prints the multicoloured characters used by directly writing to screen RAM.

If you want to see how it works you can use Kevin Edwards' disassembler which was in the July issue of Atari User. The code is stored in page 6 in the memory starting at 1536.

A fast tune accompanies the high-score table, instructions and title page.

The high-score routine shows how to sort numbers and strings in Atari Basic.

The program has been broken down into short subroutines as usual and is as structured as possible. A title at the start of each subroutine describes its function so it should be fairly easy to follow.

EOR—A way to find out who’s telling the Exclusive truth

MIKE BIBBY continues his series on binary numbers

In the last article we looked at the AND and OR operations on binary numbers—logical operations, as they are known. These were simply rules for combining numbers bit by bit. We shall continue our exploration this month with a look at the EOR operation.

EOR stands for Exclusive OR—sometimes people call it XOR. Either way it’s the same thing. EOR is a variant on the way we normally use the term OR.

For example, if I say:

Mike OR Pete wears glasses

this is true if Mike wears glasses, OR Pete wears glasses, OR both Mike and Pete wear glasses.

Now it’s this last case of OR we’re interested in, where they both wear glasses. EOR works just like OR up to this point. However, EOR does not “allow” both of them to wear glasses. Either one does, or the other, but not both.

To put it another way, the one who wears the glasses does so exclusively. If both are wearing glasses then while:

Mike OR Pete wears glasses

would be true,

Mike EOR Pete wears glasses

would be a downright lie!

We could signify that a statement is true with the letter T, and use F for false. At school our teachers used ticks for truth and crosses for false. Since we’re using computers, though, we’ll use numbers: 1 will denote true and 0 will denote false. We’ve chosen 1 and 0 because they fit in so well with the binary system.

So, in the above example, if Mike has glasses we can give Mike the value 1. If Pete hasn’t glasses we can give Pete the value 0. Table I shows the idea, applied to each combination of spectacle user. The ones and zeros are known as truth values, states or conditions.

As you can see, there are four possible cases as far as Mike and Pete wearing glasses are concerned: neither can wear them as in case 1, where both Mike and Pete has 0 value.

Then again, Pete may wear them (1) whereas Mike does not (0), case 2, and so on.

If you look carefully at the numbers involved in all four cases, you see that we’ve got four pairs of bits we can combine. Each pair of bits is made up of the “truth bit” for Mike and the “truth bit” for Pete.

What I’ve done in Table II is to combine these pairs for all four cases in accordance with our OR rules. We’ve stored the result in a third

<table>
<thead>
<tr>
<th>Wears glasses</th>
<th>Mike</th>
<th>Pete</th>
<th>neither wears glasses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case 1</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Case 2</td>
<td>0</td>
<td>1</td>
<td>Pete wears glasses</td>
</tr>
<tr>
<td>Case 3</td>
<td>1</td>
<td>0</td>
<td>Mike wears glasses</td>
</tr>
<tr>
<td>Case 4</td>
<td>1</td>
<td>1</td>
<td>Both wear glasses</td>
</tr>

</tbody>
</table>

Table II
column.

We call such a table a Truth Table. In this case, it’s the truth table for OR. We can use it to work out the result for any OR combination of two bits. All we have to do is find the row that starts with the two bit values we’re combining and then look in the third column for the result.

Table III shows a similar table for:

Mike AND Pete wear glasses

Again the first two columns are identical, covering all four possible cases. The third column combines them according to the AND rules.

Look again at Table II. This corresponds in a sense to our binary rule for OR: you get a 1 if either or both bits you combine contain a 1.

However if when talking about Mike and Pete you mean OR in the exclusive sense, EOR, then the combination of Mike wearing glasses and Pete also wearing glasses would have to be false. This is because EOR means either one or the other wears glasses, but not both — it’s exclusively one or the other.

If we do mean EOR in this exclusive sense we’d write our statement about them as:

Mike EOR Pete wears glasses

Its Truth table is given in Table IV:

<table>
<thead>
<tr>
<th>Mike wears</th>
<th>Pete wears</th>
<th>Mike EOR Pete wears</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Table IV

To put it another way, if the bits are identical the result is 0, otherwise the result is 1.

Let’s have a look at how we EOR binary pairs of numbers. It’s the same as for OR and AND — just apply the rules for EORing to each pair of bits in succession. For example:

\[
\begin{align*}
\text{EOR} & : 1010 \oplus 1101 \\
& = 0111
\end{align*}
\]

Take a look at what happens when you EOR a number with zero:

\[
\begin{align*}
\text{EOR} & : 1010 \oplus 0000 \\
& = 1010
\end{align*}
\]

that is, when you EOR a number with zero it leaves that number unchanged. Also something interesting happens when you EOR a number with itself:

\[
\begin{align*}
\text{EOR} & : 1010 \oplus 1010 \\
& = 0000
\end{align*}
\]

Whenever you EOR a number with itself, the result is zero. This is as it should be: remember, when you EOR two identical bits the result is zero.

Now EOR has a property which makes it quite useful — let’s look what happens when we take a number, EOR it with a second number and then go on to EOR the result once more with that second number.

First number : 1010101
Second number : 0101010
Result : 1111111
Second number : 1111111
Final result : 0000000

As you can see, the first number has magically re-appeared! This always happens when you EOR twice with the same number as, in a sense, the two EORings cancel each other out.

Table V summarises the process for all four possible pairs of one-bit numbers. As you can see, for all the cases the final resulting bit (when the first bit has been EORed twice with the second) is identical to the first bit.

Another way to think of it is that we are doing:

first number EOR second number EOR second number

which, as we’ve also seen, must leave just the first number, since EORing with zero leaves a number unchanged.

All this may seem rather abstruse, but actually it’s quite useful. In fact we tend to use AND, OR and EOR quite often in graphics, particularly in animation.

To simulate movement we frequently print something on the screen, then after leaving it there for a while to register on the eye, we blank it out and print it in a new position and so on.

Sometimes we blank the character out by printing it again in the same place but in the background colour.

We can, however, use EOR. If we use EOR to place our character on the screen — never mind exactly how for the moment — when it comes to wanting rid of it, we can just repeat ourselves.

That is, we just EOR the character on again. As we’ve seen, the effect of two EORs is to cancel each other out. In this case, they cancel out to the original background — and the character disappears.

The point is, logical operators, as AND, OR and EOR are known, can be invaluable to both the Basic and machine code programmer.

Next month we’ll take a brief look at the idea of masks.

Table V
THIS is your passport into the exciting world of telecomputing!

IT'S by far the fastest growing field in micro-computing. All over the world micros are talking to each other over the telephone line. As well as to the ever-increasing number of public and private databases, bulletin boards – and even giant mainframe computers.

We want all Atari User readers to share in the new technology that makes all this possible. So we're offering a unique starter pack at an unbeatable price. It gives you everything you need to get in touch with the big wide world outside:

- Modem
- Software
- Serial Interface

The modem is the amazing Miracle Technology WS2000. One of the most powerful on the market, it provides all the facilities you require. Yet it's simplicity itself to use. Just plug it into a standard British Telecom jack and you're away!

The package also features the superb Datari serial interface, which links the modem directly to the Atari's peripheral port without the need for the 850 serial interface.

The best hardware deserves the best software to drive it, and with the specially written Multi-Viewterm program the package is complete. It supports all the standard baud rates – 1200/75, 75/1200, 1200/1200 and 300/300 full duplex.

Your Atari User package will allow you to talk directly to other computers, to send your own telex messages, to go tele-shopping – even to download free software programs directly into your Atari.

You will be able to join Micronet/Prestel, which will immediately open up to you a vast menu of 750,000 pages of information – instant world news, sports, holidays, hotels, train and airline timetables, all regularly updated.

And you can become one of a growing number of enthusiasts who are joining MicroLink, the giant database set up in conjunction with Telecom Gold, which is described more fully in this issue.

But first, send for the Miracle package – and enter the fascinating, limitless world of communications!

Use the order form on Page 61
What it offers the Atari user...

Give your micro mainframe power

With MicroLink your micro becomes a terminal linked directly to the Telecom Gold mainframe computer, and able to tap its tremendous power and versatility. Right away you'll be able to use giant number-crunching programs that can only run on a mainframe. You can set up your own computerised filing systems, store and update statistics and other information, cross-reference material between files, selectively extract the information you want, perform massive calculations and design reports to display information from any of the files and in any format you choose.

We're only a local phone call away

More than 96 per cent of MicroLink subscribers can connect to our mainframe computer in London by making a local phone call. It is possible because they use British Telecom's PSS system, which has access points all over Britain. A local phone call is all you need, too, for access to the international Distelcom system through MicroLink.

The biggest bulletin board of them all

The number of bulletin boards is growing rapidly. New ones are springing up in all parts of Britain and all over the world, with people of like minds chatting to each other on all manner of subjects. The only snag is that the vast majority are single user boards - which means lots of other people are also trying to make contact and all too often all you get is the engaged tone. But with the MicroLink bulletin board there is no limit to the number of people using it at the same time. And no limit to the number of categories that can be displayed on the board.

Telemessages - at a third of the cost

The modern equivalent of the telegram is the telemessage. Send it before 10pm and delivery is guaranteed by first post the following day (except Sundays). The service was intended for people phoning their message to the operator, and it costs £3.50 for 50 words. But you can now use it via MicroLink for only £1.25 for up to 350 words!

Send and receive telex messages

With MicroLink you can turn your micro into a telex machine, and can send and receive telex messages of any length. You will be able to communicate directly to 96,000 telex subscribers in the UK, 11 million worldwide - and even with ships at sea via the telex satellite network. Business people can now send and receive telexes after office hours, from home or when travelling. You can key in a telex during the day and instruct MicroLink not to transmit it until after 8pm - and save 10 per cent off the cost!

The mailbox that is always open

MicroLink is in operation 24 hours a day, every day. That means you can access your mailbox whenever you want, and from wherever you are - home, office, airport - even a hotel bedroom or golf club! No one needs to know where you are when you send your message.

What does it all cost?

Considering all the services you have on tap, MicroLink is remarkably inexpensive. You pay a once-only registration fee of £5, and then a standing charge of just £3 a month. On-line costs are 3.5p a minute (between 7pm and 8am) or 10.5p a minute during office hours. There is an additional 5p a minute charge if you are calling from outside the 01-London call area. Charges for telex, tele-messages and storage of files are given on the next page.
How much it costs to use MicroLink

Initial registration fee: £5.
Standing charge: £3 per calendar month or part.
Connect charge: 3.5p per minute or part - cheap rate, 10.5p per minute or part - standard rate. Applicable for duration of connection to the Service. Minimum charge 1 minute.
Cheap rate is from 7pm to 7am, Monday to Friday, all day Saturday and Sunday, and public holidays. Standard rate is from 7am to 7pm, Monday to Friday, excluding public holidays.
Filing charge: 20p per unit of 2,048 characters per month. Applicable for storage of information, such as telex, short codes and mail files. The number of units used is an average calculated by reference to the daily sample.
Information Databases: Various charges. Any charges that may be applicable are shown to you before you obtain access to the database.
MicroLink PS service: 2p per minute or part (300 baud); 2.5p per minute or part (1200/75 baud).
Only applies to users outside the 01-London area.
Telex registration: £10.
Outgoing telex: 5.5p per 100 characters (UK); 11p per 100 (Europe); 16.5p per 100 (N. America); £1.15 per 600 (Rest of world); £2.75 per 400 (Ships at sea).
Deferred messages sent on the night service are subject to a 10 per cent discount.
Incoming telex: 50p for each correctly addressed telex delivered to your mailbox. Obtaining a mailbox reference from the sender incurs a further charge of 50p.
It is not possible to deliver a telex without a mailbox reference. If a telex is received without a mailbox reference the sender will be advised of non-delivery and asked to provide a mailbox address. Each user validated for telex and using the facility will incur a charge of £6 storage units a month. Further storage charges could be incurred depending on the amount of telex storage and the use made of short code and message file facilities.
Telemessages: £1.25 for up to 350 words.
Radiopaging: No charge. If you have a BT Radiopager you can be paged automatically whenever a message is waiting in your mailbox.
International Mail: For the first 2,048 characters - 20p to Germany and Denmark; 30p to USA, Australia, Canada, Singapore, Hong Kong and Israel. For additional 1,024 characters - 10p, 15p.
These charges relate to the transmission of information by the Dialcom service to other Dialcom services outside the UK and the Isle of Man. Multiple copies to addresses on the same system host incur only one transmission charge.
Billing and Payment: All charges quoted are exclusive of VAT. Currently, all bills are rendered monthly.

Software over the telephone

MicroLink is setting up a central store of software programs which you'll be able to download directly into your micro. The range will include games, utilities, educational and business programs, and will cover all the most popular makes of micros.

Talk to the world - by satellite

MicroLink is part of the International Dialcom network. In the USA, Australia and a growing number of other countries there are many thousands of users with electronic mailboxes just like yours. You can contact them just as easily as you do users in Britain - the only difference is that the messages from your keyboard go speeding around the world via satellite.

What you need to access MicroLink

You must have three things in order to use MicroLink: a computer (it can be any make of micro, hand-held device or even an electronic typewriter provided it has communications facilities), a modem (it can be a simple Prestel type using 1200/75 baud, or a more sophisticated one operating at 300/300 or 1200/1200 baud), and appropriate communications software.

September 1985 ATARI USER 47
WHAT a wonderful company Atari is turning out to be since J.T. took over a while ago. Just look at the range of disc drives, modems, monitors, computers, printers and so forth that are on offer today.

After swapping my good and trusty 800 for a 130XE recently, which was a bit of a wrench, I decided to go the whole hog and increase my collection of Atari paraphernalia by one printer. The problem was, which one?

There were a number of choices, of course, from the Atari range of printers to Epson, Alphacom and Star, to name but a few.

In the end I decided to stick to the company known and loved so long. Why? Well, how about because they plug straight into the back of your computer without the need for an extra interface?

But which one should I go for? Should it be the letter quality 1027? No, lacking graphic ability. What about the 1020 or the 1025, 1029?

In the end I decided upon the new 1029. It’s inexpensive at under £200. It is capable of printing five or 10 characters per inch and graphics among other things as well as looking very nice.

Anyway, off I went, cash in hand, and arrived home with the beast a while later. After reading through the instruction book a few times I must confess that I was a little disappointed that I could not dump a screen to the printer straight away.

Why, do I hear you ask? Well, the 1029 is a dot matrix printer with a single printed line of seven dots high by 480 dots across. Only seven dots high? Then how do you print characters?

When in graphics mode, imagine seven lines high by one line wide.

That’s what you have to print to. The bottom line has the value of 1, the next line up 2, then 4, 8, 16, 32 and finally 64 for the top line.

That’s right – no 128.

So if you want a single dot on the bottom line and a single dot on the top line you print CHR$(65). See 1 for the bottom plus 64 for the top.

Now take this one step further. Try to convert the top seven lines of

```

20080 PRINT:FOR I=1 TO 7
20090 PRINT:FOR I=1 TO 7
20100 PRINT:FOR I=1 TO 7
20110 PRINT:FOR I=1 TO 7
20120 PRINT:FOR I=1 TO 7

Program 2

10 GRAPHICS 24
20 FOR I=0 TO 255 STEP 5
30 COLOR 1:PLT 0:ORANTO 255-1,191:EXT
40 FOR I=1 TO 255 STEP -4
50 POPT 0:ORANTO 255-1,191:EXT
60 GOSUB 20000
70 END
```
screen information, standard 8 bit horizontal bytes, to the 7 bit vertical bytes understood by the 1029. That’s a lot of bit manipulation if you want to print out a whole screen.

Well, for all of you who have been out and parted with your well-earned cash for the 1029, look no further. Type in Program I and save it to disc before putting it to use.

This is only a subroutine, and must be used together with your own program to set up your own picture screen.

If you would like an example, type in Program II, which will set up a graphics 8 screen with a basic design scribbled all over it – see Figure I.

Just set the variable OFFSET to a value between 0 and 160. This is the offset of the picture on the paper left to right.

If you wish your masterpiece to occupy the left edge of the paper, then set OFFSET to 0, or to occupy the right side of the paper set it to 160. But for a centered picture, rather nice, OFFSET should be 80.

Ensure your 1029 is on and type RUN. The whole screen will be dumped to the printer.

**Figure I:** Printout made by using Programs I and II together

**PROGRAM STRUCTURE**

20000 Finds the screen address, sets the variable IOCBO to use the IOCBO number 1 and checks to see if OFFSET is within the range 0 to 160.

20010 Uses a little trick that gives Atari Basic an IF... THEN ... ELSE command. If PEEK(1570)=8 (converter loaded) THEN control will be passed to line 20020 ELSE the rest of line 20010 will be acted upon and the converter will be read into page 6.

20020 Start of the loop that opens the printer and prints the line headers to the printer.

20025 There’s that ON GOTO trick again. Prints the OFFSET number of blank pixels to the paper.

20030 The USR call. Also adds 280 (7 * 40) to the variable SCREEN to give us the next printable line.

The rest of the program is the data for the converter.
LAST month we looked at the instruction set of the 68000 microprocessor. And, just as man cannot live by bread alone, neither can a microprocessor live by instruction alone.

What gives an instruction set its power is the addressing modes associated with it.

This is because an instruction identifies the operation to be performed - such as add and subtract - but the addressing mode explains where the operation is to be performed.

The best instruction set in the world is no good without a variety of addressing modes.

Basically the action of an instruction can be based in one of two places - either an on-chip register or an off-chip memory location.

There are two different types on on-chip registers in the 68000. These are the address registers and the data registers. Off-chip memory can be specified with a 32 bit address although only 24 bits are used in the 68000.

Registers can be thought of as temporary storage to be used while bit patterns are being manipulated, whereas off-chip memory is used for more permanent data as well as storing the program and accessing the hardware.

So why do we need different types of addressing mode? The answer is to cope with different programming problems.

The best way to understand the different modes is to look at each in turn and see how they can help us.

First, the form most assemblers use when handling address information for this processor. This consists of three basic parts -

- The instruction mnemonic and length of operation - byte, word, long word.
- The source - where the data is to be taken from.
- The destination - where the result is to be placed.

The art of programming is to tie these three things together to perform as you want without tying yourself in knots.

The manner in which the source and destination are specified is known as the addressing mode. This calculates an address which is known as the effective address. It is this effective address that is used.

Let's take the simplest addressing mode, that of Register Direct.

This simply uses the registers to hold the data. For example, if you wanted to move the data from data register D3 to address register A5, you would use the register direct addressing mode for both source and destination.

Assemblers might differ in syntax, but typically the form would be:

MOVE.W D3,A5

which means move the word - 16 bits - FROM data register 3 TO address register 5.

In fact there are two variants of the same mode being used here. They are Data Register Direct for the data register and Address Register Direct for the address register.

The Address Register Direct addressing mode is used mainly in the housekeeping parts of a program or to operate on temporary storage areas. Now in order to write any type of program you need to be able to cope with constants, even if only to set up the initial value of a variable.

A constant is a value that is known at the time you write the program - we say that it is "known at compile time".

So when the assembler turns all the mnemonics into the binary bit patterns of machine code instructions, the number we want to use is known.

What happens is that the assembler places these numbers alongside the instructions in the body of the program. The values to use follows immediately after the instruction.

Hence the name of Immediate Data Addressing. Its main use is to initialise counters or variables. For example, suppose we want to set up...
data register D1 with the value 9 we would write:

MOVE.B #9,D1

that is, move the byte – 8 bits – into data register D1. The # before the number tells the assembler to treat what follows as an immediate decimal value.

In fact there are two types of immediate addressing mode – Immediate and Quick-Immediate. The quick mode incorporates the value into the instruction, whereas the normal mode adds the value at the end of the instruction bytes.

Only limited number values can be used with the quick mode, but any assembler worth its salt will choose the quick mode if the numbers are within the restricted range.

Therefore you do not have to worry too much about the difference between them.

To handle a variable you must be able to access off-chip memory. Most of the time you know what address you want to use, just as in a high level language you know what name the variable is. We say the address is known at compile time.

To do this you can use the Direct Memory Addressing mode. This takes a value and compiles it next to the instruction just like the immediate mode. The difference is that when the number is used it is taken not as a value but as the address where a value is to be found.

For example, to move the value in memory location B into data register D4 you would use:

MOVE.B &B,D4

where & indicates that what follows is the hexadecimal value of the memory address from which to take the data.

Again there are two types of this addressing mode – Absolute Short and Absolute Long. The difference lies in how many extra bytes are used to specify the address.

Basically, the short mode is used when you want to address the first or last 32k or memory – where you can get away with specifying the address in two bytes – otherwise you need the long mode which specifies the address in four bytes. Again, any semi-decent assembler should choose the correct one for you.

In many cases the address of a variable is not known at compile time.

This may be where you want to apply the same operation to many different variables. In high level languages you would use an array with a fixed name and a variable subscript. In machine code you would use a form of indirect memory addressing of which there are five different variants.

Indirect Memory Addressing is therefore the most complicated of the addressing modes.

The simplest of this complex bunch is the Register Indirect mode.

In this mode a register holds not the value but the address of a value. We say that the register points to a memory location, of course before this mode is used the register must be set up to point to the area you want.

For example, suppose we wanted to clear a section of memory. Then we could set up the address of the start of our section in memory in address register A0 and then perform:

MOVE.B #0,(A1)

The brackets indicate not to use the register itself as the destination but what the register points to.

We can then increment the register, jump back and perform the same instruction. This time we clear the second byte of our memory.

We can add a constant on to the value in a register by using the Register Indirect with Displacement Addressing mode. This allows you to access memory locations up to 32k either side of that pointed to by the register.

This can be useful if we want to access a particular element of an array whose address is variable.

Note that the displacement can be zero, in which case the addressing mode would be in effect the same as the simple register indirect mode. To indicate this it is usual to place the displacement outside the brackets, so:

MOVE.B #0,#6(A1)

which clears the byte six locations away from that pointed at by the address register.

Perhaps the most complex addressing mode of all is Register Indirect with Displacement and Index.

This works like Register Indirect with Displacement but with the addition of another value. The effective address is the sum of the displacement, the contents of an address register and the contents of a data register – the index bit. When all three have been added the result defines the location to use.

As it is quite a complex mode, any example to illustrate it is going to be complex, but here is one case where I have used this mode in anger.

I had a digitised picture and I wanted to count how many pixels I had of each brightness level. So I set up an address register (A3) to point at the start of an array whose elements were the brightness levels and whose contents were the number of pixels at that level.

I then put the pixel brightness level into a data register (D3) and performed:

ADD.B #1,#0(A3,D2)

This added the value 1 to the memory pointed at by the sum of A3 and D2.

The displacement was not needed and so could be zero. As there were many such arrays in my system, once A3 was primed with the correct value the same code could be used for all arrays.

There are two more modes in this section – Post-increment Register Indirect and Pre-decrement Register Indirect. They are quite a mouthful but basically are variants of the simple form of indirect addressing.

One mode increments the actual register after performing the operation, and the other mode decrements the register before performing the operation.

These two modes are usually used together to form a push-down stack in memory. As any of the address registers can be used in this mode it gives us up to eight different stacks. This allows us to pass parameters to subroutines on stacks. This is just what is needed when implementing the high-level language Forth.

Basically, to push data from D0 on to a stack pointed at by A5 you
would use:

MOVE.L D0,-(A5)

To recover the data back into D2 then:

MOVE.L +(A5),D2

As you can specify byte, word or long word operations the increment sizes are one, two and four respectively. This also allows you to process an array or string a single element at a time.

Relative addressing does not mean “Dear Auntie Flo” but is a way of specifying an address relative to the instruction in the program.

I am sure you have played Monopoly and received the card “Go back three places”. Well, that is relative addressing, your destination depends upon where you are.

In most processors this is reserved for program branching, but in the 68000 it can be used with many different instructions.

The purpose of this is to enable you to write code that is position independent. That means that the code can run when placed anywhere in memory. This is necessary in overlay systems where memory to run programs is dynamically allocated by a memory allocation program.

Code can be moved in from disc to an area of memory when needed. It can then stay in the memory after use unless some other program needs more space in which case it is purged (removed).

As the free memory – known as a heap – is always changing it is essential that programs must be position independent.

There are two types of relative addressing – one that specifies a displacement and one which uses an index value as well as a displacement.

Normally you will access these through labels in your assembler program and the assembler will look after calculating the displacements at compile time.

The final addressing mode is the simplest one – Implied Register Addressing. The register to use is specified in the instruction. This is a catch-all mode for those instructions that alter the status register, program counter or stack pointer.

The register to use is part of the instruction itself, so will not trouble you further.

Mastering the addressing modes is 90 per cent of being a good machine code programmer and sound knowledge of what each one does is essential. As you can see, the 68000 provides a comprehensive collection of addressing modes which can be used as both source and destination in many instructions.

Next time we will look at the overall environment the 68000 presents to the programmer.

LOGO IS AN EXTENSIBLE LANGUAGE says DEREK RADBURN

WORDS and lists are what makes Logo tick. They may not be as well known as turtle graphics, but it is worth remembering that turtle graphics was developed in a word and list environment.

In Atari Logo almost all aspects of list processing are present, the exceptions being TEXT and DEFINE. The purpose of this article is to show something of what is possible in Logo, using words and lists.

To begin with, Logo is an extensible language. You can make the system larger and more powerful. I will illustrate what I mean by looking at its conditional test.

Logo's test is one found in many programming languages, the IF condition true THEN do this and, optionally, ELSE do this. Let's illustrate this:

```
TO ENTER
  TYPE [What shape do you want? (S or T)] MAKE *KEY RC
  IF NOT OR :KEY = S :KEY = T [PRINT
    [You must respond with S or T]
  WAIT SB ENTER]
END
```

All that this very trivial procedure does is to ask for some input, create a variable called KEY to hold the response, and then test the value of that variable to ensure that it's what is asked for.

There are several things to note about this. First, in this example the THEN branch is a list and the optional ELSE list is not present.

Second, input is handled by RC, ReadCharacter, which always outputs a single character word. Notice also the use of TYPE instead of PRINT - can you work out why?

Third, by using OR it is possible for IF to check two conditions and output true if either is found.

It is possible for OR to take more than two inputs. To do this, OR has to be preceded by a parenthesis, (, and the list of conditions terminated by a closing parenthesis, ).

When a Logo primitive, which normally takes two inputs, is used in this way with more than two inputs, it's known as a 'greedy procedure'. These might make writing procedures easier, but they have their price when things go wrong - error messages tend to be misleading.

Now one thing which is useful to have is a conditional test which allows an action to be carried out once before a test is invoked. The structure for this is DO action UNTIL condition. It is quite easy to write such a test in Logo.

```
TO DO :ACTION :CONDITION
  RUN :ACTION
  IF RUN :CONDITION [STOP]
  DO :ACTION :CONDITION
END
```

DO takes two lists as its inputs. Let's put it to use:

```
TO SPINSQ
  DO [S Q RT 27]
END

TO SQ
  REPEAT 4 [FD 50 RT 90]
END

TO MOREP
  TYPE [Again?] MAKE *KEY RC
  IF NOT :KEY = "Y" [OP *TRUE] [OP *FALSE]
END
```

Notice here the use of the backslash. This stops the Logo interpreter from processing the character following it.

Another point to note is the use of NOT in the IF test.

Finally, OP is short for OutPut which causes the procedure to terminate, sending the item following OutPut to the calling procedure or command level - toplevel.

The DO procedure is an example of tail recursion. Recursion is a process which often gives problems in getting to grips with understanding it. Essentially, recursion exists in ordinary everyday life.

Think about walking:

```
TO WALK
  MOVE OPPOSITE FOOT IN FRONT OF OTHER
  WALK
END
```

I do not suggest you type this into your Atari, but if it does, I suggest, put a Logo type of form to an everyday recursive activity.

As you have probably noticed, the particular quality of a recursive procedure is that it has, as part of its definition, a call to itself.

This is not the same as a REPEAT loop. Recursion produces many images and uses a lot of memory. The REPEAT loop does not.

Often, in explanations of Logo, recursion is used to do trivial things in turtle graphics where the use of the REPEAT loop would be far more appropriate and economical.

Here is an example of recursion being used to manipulate a word or...
The Logo system sees words and lists as being very different

If you're not clear what this procedure does try typing PR REV [I LOVE ATARI LOGO].

Let's try to analyse and explain what's happening. First, notice REV needs to be given two things. The first is something which can use any output which arises from REV, the second is an input for REV to operate upon.

The first line of REV, as distinct from its title line, checks to see whether the input :OBJECT is empty.

If it is, it causes either an empty word or list to be output, which terminates that call to the procedure.

The second line tests to see if the input to REV is a word. If it is, it builds a new word by taking the last letter of the input and joins it to the results which come from using REV with the ButLast everything but the last letter of the input.

The third line tests to see if the input is a list. In this event the first item of the list is subjected to another call to REV and then a new list is built up by placing the results at the end using LPUT – LastPut – and then using REV on the BF – ButFirst – of the original input. This application of recursion is known as total recursion.

If this example seems rather complex it is because it is a very generalised procedure capable of handling both words and lists, without the user needing to distinguish them.

It is important here to note that the Logo system sees words and lists as being very different. Try this example:

```
PR "ATARI

and this:
PR [ATARI]
```

What you should see is no apparent difference.

But now, try this:

```
IF [ATARI = [ATARI] [PR "SAME"] [PR "DIFFERENT"]
```

Now you know!
It is important to know where each data type may be used. WORD joins only words together to form one word. SE, or SENTENCE, joins either words or lists. If it's word to word, or word and list, or list to list, the result output is one list.

With either FPUT, FirstPut, or LPUT there are also two inputs. The first can be a word or a list, but the second must be a list.

The resultant output is either, in the case of word to list, a list with an embedded list and a word, or in the case of list to list, a list with two lists embedded in it.

I want to finish by showing how Logo and lists can be used for numeric manipulation. The three procedures which follow will generate all of the prime numbers up to a chosen level. Try using PR PRIME 50. You should get your results very quickly.

```
TO PRIME :N
  OP SIEVE (QUOT :N - 6) * 6 + 6 (SIEVE (QUOT :SORT :N) 6) * 6 [2 3 ]
END
```

The function of this procedure is to present SIEVE with suitably prepared inputs – notice one of those is actually a call to SIEVE itself.

The first input is a complex expression which, when evaluated, gives SIEVE the next multiple of 6 above the initial input of PRIME.

The second input is the output which results from a call to SIEVE, which produces the list of prime factors, this early call has 2 and 3 as its initial prime factors.

Atari Logo does not have a QUOT operator, so you will have to write it:

```
TO QUOT :N :D
  OP INT :N / :D
END
```

Try this out, and see what the largest number is that it can handle before the system runs out of memory.

Try out some procedures of your own. I would be interested in hearing about what you produce.
The golden road to successful listings

I feel I must write to explain to beginners who are having difficulty getting programs to run which they have typed in from magazines.

When I started typing in programs from magazines three years ago I encountered exactly the same problems. I would check the listing and my typing dozens of times and not find any errors, so I would write off to the magazine concerned.

I would receive a reply saying that I had made a mistake. So I would check my listing again and again and sometimes after hours I would spot a silly typing error, say a letter O, which should have been a zero.

All I can say is check your typing very very carefully and I can guarantee you will find the error eventually. I still make typing errors even now.

I can’t understand why Mr N. Buckle from Kent does not like Antic’s checksum methods. I and thousands of other Atari owners find Typos II a godsend in pin pointing typing errors. — Paul Carfoot, Burton-on-Trent.

* We are thinking of reprinting this letter every month! If you are one of the many people who have written with problems in getting the listed programs to run, believe us Paul is right.

When we find genuine bugs in the programs we’ll print corrections.

Wanted — a full list

I would like to say thank you for a fine first issue of Atari User and to say that you have not filled a void on the shelves of my local newsagents.

In spite of owning a number of books on the Atari micros, I have not been able to find a full list of error messages, and even with some of the ones that I do have I have been unable to decipher the shorthand in which they are written.

I would suggest that if you could rectify this shortcoming in future issues of Atari User you would earn the gratitude of many of your readers. — T.J. Hurley, Liverpool.

* Some of the error messages are pretty inscrutable, aren’t they? Our favourite is DEVICE NAK. We’ll bear your suggestion in mind.

Clean out of REMs

When I bought the July issue of Atari User I typed Bomb Run in on my 800XL and at the end I typed RUN.

Every time I pressed the Return button the computer kept putting up “Error 12 at line 50”. I know that the 12 means that it cannot find line 50. It did it on the Submarine game and this time it said “Error 12 at line 90”. I have checked these two games over and over again.

Could you tell me please tell me how I can make these games run. — Paul Lynch, Birmingham.

* Both line 50 of Bomb Run and line 90 of Submarine GOSUB to a REM statement. We suspect you’ve entered these games without bothering to type in the REM statements.

With many listings this would be fine, but in both these cases the program authors have chosen to jump to a REM.

Typing in the missing line numbers with just the word REM on them should cure your problems without too much extra typing.

Odd dice

While I was reading the June edition of Atari User I noticed that in Random Thoughts on Page 54 the two dice are wrongly printed.

On all dice opposite sides add up to 7. From the numbers visible on both dice this rule does not apply. — Philip Smith, Walsall.

* At least it shows that gambling isn’t one of our vices.

Poor service

How pleased I am to see that we have now got a great magazine, Atari User.

I was feeling sorry that I had changed my computer to the Atari until I got your first edition.

What had got me fed up was the ignorance of Atari UK in Slough.

In January of this year I sent a tape of a program that I was having trouble with and no-one had the decency to reply or send my tape back.

After trying loads of times to contact Helpline by telephone — it was always engaged — I did manage to speak to someone who promised I would be written to in two weeks.

I don’t know which century they meant the two weeks to be in, because I still have heard nothing.

Ten weeks ago I got in touch with customer relations at Slough, who told me I should send another copy of the program they would give it urgent attention.

But then again — silence.

In my opinion, if Jack Tramiel wants to sell his computer in the UK he should come and sort things out at

I have owned an Atari 800XL for two months and have just seen your series on graphic modes (issue 1).

Being a beginner I typed in Listing 2 and found it only showed one luminance, so I sat down and worked out a listing for each colour and luminance. I think it will come in handy for other Atari beginners.

To pause use Control+1. — C.M. Hempsall, Nottingham.

September 1985 ATARI USER 55
**Room for improvement**

I WOULD like to congratulate you on producing such a good magazine and wish you good luck for the future.

But I feel that the magazine could be improved in several ways. Although it is well presented I feel the subjects are aimed too much at novice and beginning computerists rather than the veteran Atari programmers.

So please could you try to broaden your horizons and show us what the Atari really is capable of.

Topics you could cover are scrolling, display list interrupts, vertical blank interrupts, assembly language routines and complex graphic techniques.

Also, how about some photographs in your software reviews section.

Other than that I feel that your magazine is excellent value and is just what we Atari owners need.

I mean, who wants to pay three quid for an American Atari magazine?

Steven Hurst, Horwich, Lancs.

**Why am I locked out?**

WHEN I use my Atari 800XL, it sometimes locks up. If it just stops - you can't type anything at all. Even if you press Reset it will not clear the screen.

The only thing you can do is to switch off the computer - and this can make me quite mad, because I have to load the program on the computer.

Could you please explain why this happens?

Secondly, could you tell me what the Help button is? It does not seem to do anything.

P. Cartlidge, Church Lawton, Stoke-on-Trent.

If your machine "looks up", you should take it back to your dealer and explain the problem.

For information on the Help key, see our July issue, Page 57.

**Not for homework**

COULD you tell me if it is possible to record sounds produced by my computer in the audio channel on my 1010 cassette recorder, and then to use these sounds while loading programs?

This was intimated by Elisabeth Dennis in her review of "Snowball!" by Level 9 in issue No. 1. - David E. Barker, Derby.

No, it's not possible to record sounds from your programs onto your recorder.

Elisabeth was referring to programs like Atari's conversational language series which have an audio track alongside the program track on the tape.

This audio track is put on using specialised recording equipment - not the sort of thing you could do at home.

**Check-sum a good idea**

I HAVE now received both my May and June issues of Atari User and found them very interesting. I particularly liked the 12 page feature on computer communications, and wish I could afford a modem, because it looks great fun.

I think a check-sum program is a good idea. I was going to write and suggest the idea myself but I got beaten to it.

They save a lot of time and frustration and newcomers are often put off as I was if a program doesn't work after hours of typing.

Please get one soon.

I have a couple of suggestions. My first is that your programs be made available on cassette as well as disc.

I think this is a great idea having all the programs on a disc, but as not many of us can afford disc drives I think a cassette would please many people.

In future issues I would like to see a private ads page for readers to advertise their unwanted equipment and games.

I have seen this sort of thing in other magazines and I think it is a good idea. Apart from these two suggestions I think your magazine is great.

**Making it childproof**

AFTER typing in the Alphabet Train I found a problem. If the user has not got a joystick, the Break key can easily be pressed by a very enthusiastic child, thus ending the program.

If you insert the following lines they will stop this from happening:

Lines 150 & 915, POKE 16,64: POKE 53774,64

As the program takes up nearly all of the 16k, it will be necessary to delete some of the REM statements if the user has not got a machine over 16k. - Kelvin E. Cutty, Rayleigh, Essex.

**Monitor questions**

CAN you plug in a monochrome monitor and use it at the same time as a TV display - the monitor for text and the TV for graphics?

Which monochrome monitors can be used with the Atari 800XL, and which have standard connecting cables - if any?

Do 80-column monitors show 40 character lines?

Is there any way of making the 800XL show an 80 character line on a suitable monitor by using Peek and Poke, or a machine-code routine? - J. Smart, Hitchin, Herts.

Yes, you can connect a monitor and a TV at the same time, but you will get the same picture on both - one in colour, one in black-and-white.

Any monitor with a composite input connection - that is, almost any monochrome monitor - will work. Cables will probably be wired up as extras, or contact an Atari dealer for a ready-made cable - stating the make of monitor you have decided on.

The picture is generated by the computer, and the monitor just displays it. Hence, any monitor, whatever the number of characters it can display,
The answer to inverse video

THANK you for Britain's most readable "Atari only" magazine.
I bought the first issue out of curiosity, and shortly afterwards found myself buying the second - it must be good.
I'm glad to see you are trying to catch the interest of the younger Atari users - something which hasn't been the custom in the past.
The varied editorials are most interesting, but how about some short demo programs in assembly to allow dabbles like myself to get to grips with the Assembler Editor cartridge?
I have a tip for all Home Filing Manager owners. It concerns the annoying inverse video (italics) printout on Epson type printers.
Having spoken to Atari's Helpline, who verified that it was not curable with an easy software fix, I decided to have a go on the hardware front.
The solution lies in the fact that the characters are sent to the printer in inverse ASCII codes. That is, decimal 129 to 255. These generate a 1 in the eighth bit of the parallel interface.
So by grounding the data 8 wire in the printer cable the eight bit now becomes 0 and the printer receives decimal codes from 0 to 128.
A miniature single pole double throw switch now resides in my printer plug resulting in 7 or 8 bit operation to suit any program.
I hope this modification is of some use to other readers with this problem. - R.B. Moss, Hadfield, Cheshire.

Software suits

I AM very pleased with your magazine, especially Mailbag and the lengthy software reports. Keep it up.
In the July edition you gave a report on the new DOS 2.5. You said that it would be free, and to ring the Atari Helpline during office hours to find my nearest group or retailer who would be able to put DOS 2.5 onto one of my own blank discs.
I rang the Helpline to find out where my nearest user group or retailer was. They told me that I might have to pay £5 or more but no more than a pound to have it transferred on to one of my own discs.
I was satisfied with this and they told me that my nearest retailer was in Leicester.
I went there with my blank disc, but they told me that no way could they put a copy of DOS 2.5 onto my disc for me.
They told me it would be around £3 and that they didn't have it in stock. They said that they were expecting it in at any moment.
I have been in again and they are selling it at £3.25 on Memorex discs with a label stuck on saying DOS 2.5.
I am very disappointed at this because I think there is a lot of difference between three pounds and one pound. Atari software isn't cheap and at last I thought I might get something at the right price for a change. - R. Grace, Leicester.
- We are offering DOS 2.5 on a disc free with our Disc Doubler. See Page 60.

Lusting after Elite

ALTHOUGH there are thousands of computer games available it's rare for one to really like.
Recently however I discovered an excellent game on my friend's BBC Micro - Acornsoft's Elite.
Now I've heard they've started to produce versions for other micros. Obviously what I'd like to know is whether there's any chance of an Atari version? - D. Barrows, Redcar.
- We've heard a rumour that an Atari version is being negotiated. For a similar game while you're waiting try Star Raiders.
Incidentally, the rumour suggests a 68000 version called Star Rider.

Upgrading the 520ST

I AM glad that someone has started a British magazine which is Atari orientated and is easily available at most newsagents.
I have several points that need to be clarified and one that you should be made aware of. I have owned an Atari 800 for three years and I am very interested in the new ST series.
However after contemplating placing an order I have decided that I need to have available the answers to the following questions.
First of all, if I purchased a version of the 520ST with a disc orientated BIOS could I upgrade it to a ROM version when the ROMs become available?
Secondly, does the ST manual contain a thorough memory map or will I have to purchase one when I becomes available?
Finally, in my collection of 300 magazines there is not one review of DR's Personal Basic. Do you know where I might be able to find out about the standard, if not the ST's, version of Personal Basic?
Having already written to Atari (UK) and only receiving their standard sales leaflet, I would be very grateful if you can help me. - Jason Hopkins, Leicester.
- ROM upgrades will be available to purchasers of
disc-based Gem systems, probably in the autumn.

The answer to your second question is not known at present. The Basic manual might contain some form of memory map, but the Gem manual certainly doesn’t.

We don’t know of a Personal Basic review either. Try writing to Digital Research themselves.

Atari link-up

I HAVE an Atari 400 and am hopefully going to buy a 65XEM when it is released.

I would like to know if there is any way I can connect these two together for a computer link-up. Peter Dunlop, East Kilbride.

You can connect the two machines via the joystick port to send information from one to the other. However you will be able to use the same cassettes or discs that you have used on your 400.

Of course this assumes that the 65XEM ever sees the light of day.

User group needed

LAST Christmas I treated myself to the 800XL 1050 disc drive and the 1027 printer. It is all very confusing, but I am enjoying myself enormously trying to understand it all.

I would be very grateful if you could possibly help me with the following:

• How do I find out if there is an Atari user group in my area?
• Could you advise me the best software package to insert separate 12 month’s sales figures for 1984 with the annual total - then as each month’s 1985 figures are fed in drop the corresponding 1984 figure, calculate the moving annual total and project what the 1985 total figure will be. - F.J. Savage, Leeds.

• There doesn’t seem to be a user group in the Leeds area.

Looking for a book

IN the June edition of Atari User there was the listing of a game Submarine by Vince Apps, one of 40 educational games listed in a book published by Granada Collins. So far I have been unable to obtain a copy of this book, and I wonder if you can tell me where I may obtain one.

R.H. Cook, Leicester.

• Any decent bookshop should be able to order it for you.

... and some software

I WOULD like to congratulate you on a fine magazine for the Atari. I’ve got it on prescription (also subscription) as I feel sick about the lack of support the Atari seems to get.

On a recent visit to Boots I found they stocked the 800XL but little software, yet for the Commodore and Spectrum there was plenty.

What is the point of stocking the hardware if you don’t stock software? There are many products for the Atari available by mail order, the problem being that unless you have tried the product before you buy it you can be very disappointed.

So, dealers, please give the support the Atari and its owners deserve. P.D. Little, Carshalton.

Failure to save

I HAVE an Atari 800XL having upgraded from a 400. This step in the available RAM has increased my programming skills.

So I wonder if you could tell me if there is an additional RAM pack for the 800XL to hopefully boost it up past that point. Not only RAM – is there one for ROM? Also do you know if there are any programs available to increase the baud rate on the 1010 data recorder?

- Craig Brankin.

• ROM is expanded via the cartridge port on top of the machine. At the moment 64K is the maximum for an 800XL.

in this country.

Baud rate on the 1010 recorder can be changed up to about 900 baud from its current 600 baud.

Beyond this, reliability suffers severely. Programs have appeared in the computer press to achieve this but if any of our readers have written one we’d be glad to take a look at it.

Packing in the RAM

I HAVE an Atari 600XL and a 1010 tape recorder, but I cannot save programs that I have typed in. Can you please help me so that I can save great programs like your Comb Run on tape? - Eoin Maewere, Frintay, Aberdeenshire.

• Unless you have faulty equipment there should be no problem.

With a program in memory and the head prompt on the screen, press the Record and Play buttons together on your 1010 and then type CSAVE and press Return twice. The program will then be saved to tape.

To load it back in, re-wind the tape, press Play on the 1010 and then type CLOAD and press Return twice.

MORE HAPPENING ON DISC

I WRITE to correct what I feel to be a misinterpretation in your answer to Nigel Ward (Mailbag, July 1985).

You are wrong in saying that games on tape and the same game on disc are of the same size. Zaxxon was specifically mentioned, and in this case the disc version contains missles and movement in 3D in the dogfight screen which the tape version lacks.

Now without getting too technical, the disc format for such a game does not contain any form of DOS.

Instead the first 6 bytes of sector 1 contain firstly a dummy byte, then the number of 128 blocks of memory to load, then the memory address to start the load in loc/hi format, and lastly the initialisation address, again in loc/hi format.

The operating system extracts this information and proceeds to load the indicated number of blocks.

This is the same format as used for a boot tape, however it does not take any account of any protection scheme that may be present.

Now such a record is called sequential, as each block is loaded in one by one serially until it is fully loaded, so the disc requires no directory nor VTOS, so no DOS needs to be loaded to handle these entries.

A Basic load file on the other hand requires both. Such a file is called a linked file, the main difference being that each sector only contains 126 bytes of program with the last 3 bytes containing information about the number of bytes in that sector, the file number and where the next sector is to be found on the disc. No doubt this will be covered in these pages in the future.

Information from “De-Re Atari” and “Technical User’s Notes”, although both are heavy reading.

Many thanks for your support for the most superior home computer. - Derryck Croker, Wembley.

HOMEWORD
The personal WORD PROCESSOR 1984 outstanding software AWARD

Simple versatile effective.
HOMEWORD is a writing tool designed for the home. It offers the power of a sophisticated word processor without the complications. Use HOMEWORD to write school assignments, shopping lists, letters, business memos and reports. HOMEWORD makes putting your ideas on paper a snap.

An easy to follow audio cassette will introduce you to HOMEWORD and take you step by step through its operation. No complicated commands to memorise, so anyone in your family can learn to use HOMEWORD in a matter of minutes. The menu features ICONS (pictures).

These ICONS make HOMEWORD a joy to use.

Other features include MOVE TEXT/ COPY TEXT/ ERASE TEXT/ INSERT ERASED TEXT/ FIND/ FIND and REPLACE/ INSERT DOCUMENT/ INCLUDE DOCUMENT/ UNDERLINE TEXT and JUSTIFICATION. A full 80 characters per line enables you to view your documents as they will appear in printed format. Use with any printer. Many other fine features make HOMEWORD a great WORD PROCESSOR.

MAGNIPRINT II
THE ULTIMATE GRAPHICS PRINTING PACKAGE

Print your ATARI graphics like you've never seen before! MAGNIPRINT II is the most powerful print utility available for your computer. It is the only software that can accurately print GTIA modes with 16 shades.

Prints all graphic modes. Can blow up your pictures to wall sized posters. Special option lets you centre the picture on the page.

Accepts your own graphic creations or those created with MICROPAINTER, FUN with ART, PAINT, SUPER SKETCH, ATARI TOUCH TABLET, KOALA PAD, ATARI LIGHT PEN GRAPHICS, B/GRAF, GRAPHICS MAGICIAN, and many others. Includes many beautiful sample pictures. Add text to your pictures. Allows you to print the whole screen or any selected portion of the screen.

FREE with every MAGNIPRINT II PRINTALL. PRINTALL prints your programs and files just as they appear on your screen. It clearly prints all ATARI graphic characters including INVERSE characters. This alone is worth the price.

Keying in long programs too much of a chore?

Then give your fingers a rest by sending for our monthly disc, containing all the programs from each issue of Atari User. See order form opposite.

JULY: Bomb Run: Flatten the deserted city and land safely. Disassembler: Find out what's going on deep inside your Atari. Treasure Hunt: Use logical thinking to find the treasure. Password Generator: Keep generating passwords till you find one you like. Keyboard: Convert your micro into an organ. Quasimodo: Can you sort out the mess of ropes in the bellry?

JUNE: Frog Jump: Guide the frog across the road and river to his home in this version of the arcade classic. 130Xe Ram Power: Use the extra 64k of memory to good effect, or use the drawing routines to produce some pretty displays. Submarine: Scuttle the submarines.

Etch-a-Sketch: Draw pretty pictures with only a joystick. Random Numbers: Get random numbers from machine code. Filthy Fifteen: Can you keep the Filthy Fifteen happy in their cells?

MAY: Alphabet Train: The combination of colour, sound and animation makes this early learning game a winner with the children. Sounds Interesting: Drive your neighbours potty with these ready-made sounds. Hexer: Enter, display and run machine code programs with this hexadecimal loader. Attack Squash: A fast action game to keep you on your toes. Reaction Timer: See how fast your reactions really are. Binary: Use this program to convert denary numbers to binary notation.

£5.95

Double the capacity of your discs with this money-saving offer!

 Allows you to cut out a correctly positioned notch which will enable you to use BOTH sides of the disc - and HALVE your costs. Extremely well made to a compact design, it has a unique position guide to assure pin-point accuracy!

£9.95
Back issues

£1.25

June issue: In-depth analysis of the 130XE. Submarine, Adventuring, Random numbers, Software reviews, FrogJump, Microscope, Sounds, Atari Insights - regular series of tutorials: Bit Wise, Beginners and Graphics, special 12 page feature on Communications, PLUS Now and Mailbag.

August issue: In-depth analysis of the 520ST, program protection routines, Fruit Gambler, Assembler, Touch Tablet programs, first look at Logo, Raider 1997, Dos 2.5 upgrade offer: Display List tutorial, Microscope, Software reviews, Insights - regular series of tutorials: Bit Wise, Beginners and Graphics PLUS News and Mailbag.
