NEW SERIES:
Complete guide to player missiles
2 GAMES TO GIVE YOUR ATARI

ZZIP!

THE TAIL OF BETA LYRae will amuse and amaze you for many months to come. Why? Because it CHANGES as time goes by. So you'll never get bored. There's even original toe-tapping, finger-snapping music to entertain you while you play.

Commander:

A nomadic race of ALIENS has taken over the mining settlements on the tail of the double star Beta Lyrae. Your mission, as Wing Commander, is to destroy the Alien surface installations and force their retreat from the planetoids within The Tail of Beta Lyrae.

Cassette £9.95 Disc £14.95

Mr. Robot and The Tail of Beta Lyrae are trademarks of Datamat Inc. ©1983 Datamat Inc. Distributed by DataByte under licence from Datamat Inc. Distribution arranged by International Computer Group.

Mr. Robot: The incredible game you can "PLAY" with!

Get ready for a new experience in computer gaming. As Mr. Robot, you'll thrill to the excitement of jumping over alien fire, running over breadmills and bombs, climbing ladders and escalators, sliding down poles, bouncing off trampolines, and transporting yourself through thin air. Then — when you've mastered all 22 screens and can play MR. ROBOT blindfolded — you can use the ROBOT FACTORY and design your own screens! Any way you like! Up to 26 of them! You'll be having so much fun you may forget you're human!

Cassette £9.95 Disc £14.95

Available from all good computer software stores, or post free from:

Atari ST Road Show is coming

There are currently more than 1,000 software developers writing programs for Atari ST machines, 400 of them UK-based.

And to keep dealers up to date with this software explosion an Atari ST Road Show is touring the country during the spring.

Presentations at venues in Birmingham, Bristol, Manchester, Leeds and Edinburgh will demonstrate what the 520ST and 1040ST can do for the small to medium sized business.

Leading software houses have been invited to talk about their products, from simple book-keeping programs to CAD/CAM packages, the VT100 terminal emulator and Prestel software.

Dealers will hear a presentation about Atari itself, the marketplace in general, and how best to boost sales of the ST machines.

A 15,000 CROWD BOOST FOR ATARI

The first Atari Computer Show proved a spectacular success, attracting 5,000 more people than had been expected. In all close to 15,000 people converged on the three day event held at the Novotel, Hammersmith.

Now observers are claiming that this mass demonstration of popular support for the Atari range has effectively re-established the computer company as a market leader in the UK.

So impressed were the party of Atari VIPs who had flown over from California to attend the show that they immediately announced their intention to hold similar events in both Germany and the United States.

This was not only the first Atari Computer Show in the UK, it was the first in the world. Atari's president Sam Tramiel summed up the reaction in one word: Fantastic.

He told Atari User: "We couldn't be more pleased. You people over here have really shown us a thing or two. The organisation has been superb, the standard of exhibitors first class and as for the visitors, if those are Atari users here in the UK then we are certainly on the right track."

"I can only thank everyone on behalf of Atari. Naturally when you take over a sick company as we did you are bound to be a bit concerned over what the future has in store, but after this show we realise our efforts have all been worthwhile."

The 70 exhibitors were equally enthusiastic about the success of the show. And no wonder considering that sales over the three days amounted to more than £1 million.

Standholder after standholder found themselves running short of stock by noon on the
THE resurgence of Atari as a force in the computer industry has led to unexpected benefits for 8 bit enthusiasts.

In a major about face the company is revitalising its approach to the "low end" of its product line which has had to take a back seat to the ST machines since the great Atari revival began a year ago.

A new word processing package has been built around the 130XE to take on the Amstrad PCW8256 in the small business and serious hobbyist arena.

And there are plans to double the memory capacity of the sole surviving Atari 8 bit micro and launch a 256k version.

All this has come about in response to demand from a section of the market that Atari bosses were convinced was declining.

The survival, and growing strength, of the 8 bit user base has surprised and delighted company executives.

They had relegated the low end micros to a secondary role in the remodelled marketing strategy designed around the ST generation of Atari computers.

Production of the 800XL was discontinued and remaining stocks offloaded at bargain prices through Dixons and Curry outlets over Christmas.

At the time Atari promised continued support for the 130XE as its sole ongoing machine in the 8 bit market.

Now the company has gone even further, encouraged by demand from consumers and support from third party suppliers.

The 130XE Super Word Processing Pack comprises a micro, 1050 disc drive, 1027 letter quality printer, AtariWriter Plus and three more pieces of software.

At £349 it undercuts the Amstrad PCW8256 by an impressive £100 and is sure to cause a stir among Alan Sugar's high flyers in Brentwood.

Atari vice-president Sig Hartmann explained the reason behind his firm's new emphasis on the 8 bit market during an interview with Atari User.

"We intend to revitalise this section of the market", he said.

"We have come to realise that there is definitely a need for machines to serve consumers at the so called low end of the market.

"I have to admit that we have been surprised by the continuing strength of the 8 bit market. It is healthier than ever, and we intend to get our share of the action.

"As well as bringing out the 130XE word processing pack we will be producing a 256k version of the XE and it should be on sale within the next few months".

\[ What the Exhibitors said... \]

"It was a very good show. We felt the strength of it was the contacts made both in the UK and with overseas people. Our business software brought in orders and promises of more than £100,000 and most of it has already been shipped."

- Haba Systems managing director Mike Dale

"We really had a super three days. We launched Blue Ribbon and sold out the games by the second day. We just could not get enough to meet demand. It was one of the best shows we have been to and we are certainly going to the next one."

- CDS Software sales manager Martyn Wilson

"A super show, really like the old days. Our sales covered the cost of the stand in two days and we were pleased with the profit."

- Llamasoft director Hazel Minter

"The show was excellent. Congratulations to Database. We can't wait for them to organise another. It was 100 per cent above what we expected, the sales were just thousands of pounds when we were only expecting hundreds."

- Software Express managing director Jerry Howells

"We made excellent contacts with foreign and European visitors. Sales were very good. It was an impressive show, nicely put together."

- Microdeal press officer Jenny Pope

"I was pleased there was a split for the games and business sectors. This kept away the noise of the games and the general melee there rather than distracting the business side, which produced good sales."

- Exceen director Vernon Hovsepian

"It was above expectations. Our software games sales were excellent. We sold out certain games and had to send out for more stock. We were happy with the whole show and with the interest shown by Atari owners which has encouraged us to produce more software for them."

- Tynesoft sales manager Trevor Scott

May 1986 Atari User
The five year pitch

JACK Tramiel has given himself and Atari five years in which to grab 20 per cent of the world's micro market or suffer dire consequences.

The colourful Atari chairman told influential US financial paper Investors Daily that sales of ST machines in North America and Europe prove his target is attainable.

But he warned: "If you don't reach 20 per cent of this computer market in five years you're out. You won't get the support from software houses and you won't get the right prices from your suppliers because you won't be able to buy in sufficient volume".

However Tramiel was confident the 20 per cent figure was within his reach "although I don't have the exact timing - it's all a matter of market conditions".

Billy Ocean

Atari is a star's star turn

THE Atari 1040ST has proved a star attraction for chart-topping Billy Ocean. His manager, Laurie Jay, bought the computer to organise plans for a six month world tour which starts in June.

Said Laurie: "The Atari has done everything for us. It has worked out our flight arrangements, listed our hotels and all our venue details.

"But the most useful is that we have been able to draw the stage plans and print them out in colour so they can be forwarded in advance to the venues for preparation".

"It is the first time we have used this computer to arrange things and we are still learning what it can do. We are now two months ahead of schedule, and I cannot believe the amount of work it has saved us".

Crime in the past

A CRIME adventure, out for Atari ST users, has a small-time private detective as the hunter - and the hunted.

Activision's Borrowed Time, set in the 1930s, entails tracing 20 suspects who want the hero dead and avoiding being shot, beaten up or imprisoned demands fast reflexes.

Hugh Rees-Penall, managing director of Activision, said: "Only the movements of the private eye are controlled, the other bad guys' actions are sudden and unexpected, making the pace frantic".

Price, on disc, is £14.99.

Lunar sequel

A SEQUEL to last year's chart-topping adventure Red Moon has been released by Level 9 Computing to run on Atari 800XL and 130XE machines.

Price of Magik has more spells and independent creatures to control than Red Moon.

The compact disc ROM has not been shelved

DESpite rumours to the contrary, compact disc ROM players still feature prominently in Atari's plans for the future. Reports that the company has shelved the project indefinitely have been strongly denied by sales and marketing manager Rob Harding.

He told Atari User: "Nothing could be further from the truth - Atari will definitely launch a CD ROM player, although the event won't take place for several months. "There are two reasons for the delay, and both involve factors beyond Atari's control. "Firstly the ROM player is an extremely software-dependant piece of equipment, and there is a worldwide shortage of CD software capacity. "Secondly the price of CD mechanism prices are currently too high for us to turn out a product for the mass market that would meet Jack Tramiel's criterion of power without the price. "And you have to remember we aim to bring out a machine with audio as well as data-reactive capabilities along with other sophisticated features, all of which add considerably to Atari's costs. "While the CD ROM player is not a viable mass market product for us at the moment, the situation is improving. "Our partner, Warner Communications, is setting up a plant to manufacture compact discs and this should be operational later this year. "Also we expect the high cost of CD mechanisms to come down sharply in the next six to nine months and create the conditions we need to go ahead with the project".

COMPILER SPEECH PROGRAMS

STAND by for a host of new high quality programs for the Atari ST range.

A flurry of activity in software houses has been sparked by the launch by specialist programming language compiler Pro Fortran-77 for the ST.

The new compiler opens the door to 68000 architecture for professional programmers and developers and is likely to prompt a new generation of Atari ST software.

Pro Fortran-77 will also enable developers to recompile existing mini and mainframe software to run on ST machines.

Atari has enthusiastically welcomed the Prosecco initiative. Sales and marketing boss Robert Harding told Atari User: "This is an important milestone in the development of the market for ST. "We believe it will generate a wave of high quality software allowing users to fully exploit the machines' potential".

Fortran-77 is one of the most widely used high level programming languages among engineers, scientists and academics - and the most popular medium for micro professionals writing their own programs.

Prospero marketing manager Andrew Lucas said: "We recognised the possibilities offered by the Atari ST and other 68000 machines at a very early stage. "Our compilers will allow micro professionals to unlock the vast library of existing technical software, such as state-of-the-art CAD/CAM for instance, and make it available to Atari users. "With the power and sophistication of such a machine costing less than £1,000 there are now tremendous opportunities for developers".

Pro Fortran-77 for the Atari ST costs £129.
Upgrade the 520 ST to one megabyte and add the professional look from under £100!

MEMORY CARDS
The AST-520 MEMORY CARD upgrades the standard 520 ST to ONE MEGABYTE of RAM, and costs under £100 inclusive of VAT!
The AST-2080, goes even further, brings the RAM to TWO AND A HALF MEGABYTES for less than £90 inclusive!
Now, really big RAM DISK — as big as a double-sided disc drive, compilers that can crunch thousands of lines a minute, megabyte long documents, huge spreadsheets and useful databases with thousands of records in memory become practicable.
Either card fits inside the ST keyboard case.

DISC DRIVES
AST Disc Drives are all 80-track double-sided, offering 720K (one megabyte unformatted) — TWICE the storage capacity of the standard ST drive. They are available in 3.5 and 5.25 inch formats. The drives are daisy chained to the standard ST drive, using the power and data cables supplied.

SYSTEM CASE
You can give your ST a really professional look with the AST SYSTEM CASE. It can hold two 3.5 inch, and one 5.25 inch floppy drives, or a Winchester drive together with the ST power supply units. The Monitor can stand on top.
The System case will improve your viewing angle and leave your desk uncluttered.

COMPLETE ATARI 520 ST SYSTEMS
We can advise, install and support complete ST systems. Please call for a quote. Below are some examples:
1) 520 ST, SM124 — HiRes Monitor, SF354 — 360K disc drive, TOS in ROM, standard software on disc

   £685.00

2) 520 ST, one Megabyte RAM installed, 160 cpm matrix printer with NLQ module, SM124 — HiRes
Monitor, twin AST drives (2 x 720K), AST System Case, TOS in ROM and bundled software on disc

   £1105.00

AS the president of Atari, Sam Tramiel – the eldest of Jack's three sons – is in charge of the day-to-day running of the world-wide organisation. It is he, second only to his charismatic father, whose decisions will eventually make or break Atari. Here he talks to MIKE COWLEY about his life and the events which have influenced his current thinking.

TO all outward appearances, Sam Tramiel comes across as supercapitalist. Rich, relatively young – he's still only 36 – he wears the mantle of wealth easily as befits the heir to a dynasty which one day may well be compared to the Rothschilds.

Yet it hasn't always been like that. An Italian friend brought vivid memories flooding back when he recently recalled the saying: "If you aren't a communist by the time you are 18 you haven't got a heart. But if you aren't a capitalist by the time you are 25, you have no brains".

For that's almost exactly what happened to the eldest son of the man who built Commodore into a billion dollar empire, then turned his back on it to give Atari the kiss of life.

It was 1968 and Sam Tramiel had just finished his first year at university. Like so many of his contemporaries, he was disenchanted with what was happening in the United States in general and in Vietnam in particular.

Soon he began associating with other radical thinkers on the fringe of an extreme left wing front organisation known as the Students for a Democratic Society. Quite naturally his father, who even then was viewed as the epitomy of the capitalist, objected.

"My father was very straight with me", recalls Sam. "He called me in and said 'You cannot have a Jaguar E type, credit cards and be a communist'.

"I said yes I can. He replied: 'No you can't. The Jaguar is out. The credit cards are going'.

"'Fine', I said. 'Thank you very much. I don't need any of that'... and I took no more money'.

So Sam Tramiel turned his back on his wealthy father and went to work to put himself through university. He headed for Canada where schooling was cheaper and took to wearing a hard hat during his vacations while acting as a surveyor on construction sites.

"My father and I still loved each other", he remembers, "but there was a very basic philosophical difference between us. And he could not imagine supporting that philosophy financially – as was his right."

Yet Sam was to undergo a dramatic change in the next couple of years. "Having to support myself and survived the horrors of Auschwitz to emigrate to the States."

By the time he was three young Sam had moved with his family to the New York district of Queens where his father, now a typewriter repair man, had acquired a house. "The truth of the matter was the house wasn't really much bigger than the apartment we had", says Sam.

And once again, they were living in a predominantly immigrant area where the Jews kept to themselves, as did the Poles, the Irish and the blacks.

So Sam could speak only Yiddish until he was five years old and left the shelter of what was little more than a ghetto to venture to kindergarten.

"Pledging allegiance to the flag of the United States was my first English lesson", he recalls. It wasn't to be too long before he found himself doubting the wisdom of it all.

At the age of five Sam was transported to Toronto, which his father judged would be an easier place to compete in than the United States.

By this time Jack Tramiel had set himself up as a dealer in typewriter and adding machines, importing stock from Europe. Little did he realise then but he was laying the foundations of an empire.

The stay in Toronto lasted five years, during which time Sam developed a passion for outdoor sports. Then it was back to New York, but by this time the Tramiel family
business had flourished sufficiently to warrant an up-market address in Long Island.

"The Commodore company had been started by then", says Sam. "We were fully fledged importers of adding machines from Berlin and typewriters from Czechoslovakia. And it wasn’t long before my father was able to buy the factory making the adding machines in Germany".

'Inevitably with both his father and mother actively involved in the family firm, Sam can only recall one topic ever being discussed around the dining table – business.

"It was always the same", he says, Hong Kong.

He had been out there for a year when he remarried his second wife being a schoolteacher from Toronto.

By this time Commodore was booming with sales of close to $600 million and growing in leaps and bounds.

However like many other sons of successful fathers, Sam Tramiel began to be torn with self doubt. "Could I do it on my own I began to ask myself", he says. "Would it have all been possible if I’d not been Jack’s son in the Commodore framework?"

"So my father and I had a long talk and it resulted in my leaving Commodore and setting up on my own in Hong Kong".

Within two years Sam Tramiel had proved his point. He controlled four companies with the help of Chinese partners, making watches, telephones, computer peripherals and games. "We were typical Hong Kong OEM suppliers", he says.

It was the illness of a friend which led him back to Commodore. The man in question had been running the Hong Kong operation for the company when failing health forced him to take early retirement.

Who then could Commodore turn to fill the gap in Hong Kong, the corporation’s key manufacturing centre? Sam Tramiel was persuaded to help out for 12 months.

"It was a crazy time", he recollects. "Every week I received phone calls saying ‘Make more C64’s. Make more C64s. The market simply couldn’t get enough’.

"And in the meantime his wife gave birth to their “Chinese, Jewish, Canadian” son. At the end of the year’s contract, Sam Tramiel was convinced that his future lay with his father in Commodore.

"He kept control of the Far East situation but moved to Japan to get a better understanding of the key component market there. He remained in Tokyo for nine months until the news broke that his father had left Commodore following a bitter dispute with the chairman.

That was in January 1984. Sam flew back to California the following month and told Commodore he would be happy to stay on if required.

Five months later he too resigned after becoming frustrated through a seeming inability of the Commodore management to make decisions following his father’s departure.

While working his month’s notice Sam Tramiel had lengthy discussions with his father over what they would do in the future. "By this time my father had accumulated a vast amount of wealth", he revealed. "So we were faced with a number of alternatives.

"Should we become merchant bankers?"

"Should we just take it easy?"

"Should we go back into the computer business? What should we do?"

By the time he left Commodore the opportunity to buy Atari had arisen. With a number of outstanding design experts – including his own brother Leonard who had just gained a degree in astrophysics from the university of Columbia, the Tramiel clan began to think seriously about computers again.

"Our people went to talk to Warner Communications, and to cut a long story short, ended up buying Atari", says Sam Tramiel. "We had expected to find a sick company, but what we really found was a complete shambles".

It is Sam Tramiel’s conviction to this day that Atari will only become a world force if it remains internationally minded. "We see this as the key", he says.

"When we designed the ST we emphasised the international aspect, so we had a German keyboard, a French keyboard, an Italian keyboard, a UK keyboard right from the word go – not coming along later. TOS was designed in four languages".

The man coordinating this global approach by Atari is Sam Tramiel himself. "I see myself as an international citizen", he insists. In fact, the Atari president holds a Canadian rather than an American passport.

"The reason for this is I feel much more like a Canadian who are more open in their views than the Americans who tend to be inward looking and chauvinistic.

"And perhaps there’s just that little bit of radical left in me after all..."

HOTLINE
IN-I-GO JOE, the world famous archaeologist and explorer, triumphs again, finding the long lost treasure of King Muneebags in the labyrinths below the king’s recently discovered tombs.

It only remains now for Joe to escape. But it’s easier said than done. For the caverns in which he is now lost are full of perils.

The king’s ghost wanders there seeking revenge, assisted by a mindless zombie. The slightest touch by these will mean instant disintegration.

Treacherous sulphur pits wait to catch the unwary. The caves themselves are old and crumbly and it is easy to find yourself cut off in a dead end where the ghost will soon find you.

If this was not enough, the designers of the local underground have enroached on the caverns and you are in constant danger of being run over by the 8.15 to the city centre.

Your escape is also blocked by five doors and you must find the keys hidden somewhere in the caves before you can pass them. Joe himself has lost his knife and trusty whip and ran clean out of bullets some time ago. His only weapons now are his wits and agility.

So you’ll need plenty of luck as you guide Joe to freedom.

Playing the game is straightforward. When run for the first time the screen will go black for 90 seconds, but after this will start immediately. You may also see a vertical coloured stripe, but Don’t Panic.

Joe is controlled by joystick 1 and he will move instantly in the direction commanded. The caves consist of a maze of 100 rooms and must be completed in the correct sequence.

I advise you to draw a map as you go along. If you hit a wall it will knock you into the centre of the room — and possible danger — and may daze you.

Picking up a key is performed by touching it. If you then touch the corresponding door it will open and stay open. The wrong key and you will be knocked back.

Occasionally the king’s curse will result in your developing a shadow. Watch for this and if it occurs you must run over it to make it disappear.

If you are killed you will be reincarnated, but you only get three lives.

The program itself fits tightly into 48K. It uses a complicated vertical blank interrupt to move the players, a redefined character set and Antic Mode 4 (Graphics 12 on XL/XEs). It will however, work on all Ataris with sufficient memory.

The lengthy initialisation is because of the large amount of data for the machine code routines, VBI, character set and players.

The maze is held in the data statements from line 2000 to 2099. The first four letters hold the exits, the next number is the type of cave, the next the information line and the last number is the degree of difficulty for that room. This is only relevant in type 3 and 4 rooms.

The difficulty of the game can be altered by changing these – the higher the number the more difficult, up to a maximum of 255.

By altering these lines you create a different maze without needing to rewrite the whole program.

I’ll be providing an editing program in a future issue. This will enable you to redesign Cavern Escape at will.

May 1986 ATARI USER 21
Prizes galore at the Atari User birthday party!

Your FREE entry form

I consider that the nine cuttings from Atari User advertisements were taken from the following pages:

I would like to see an article on:

The Atari machine I use is the:

Name
Address

POST TO: Birthday Contest, Atari User, 68 Chester Road, Hazel Grove, Stockport SK7 5NY.

This month sees the first birthday of Atari User—and to celebrate we're giving away a bumper collection of prizes worth more than £3,000 in our biggest, easiest-ever competition.

The prizes are amazing, covering the whole range of Atari products.

First prize is a complete 130XE system comprising an Atari 130XE, XC11 data recorder and joystick, courtesy of Atari, worth more than £170. And the second prize, also courtesy of Atari, is a disc drive.

It seems as if all the leading lights of the Atari world are helping us celebrate. Software Express is contributing more than £1,000 worth of assorted software and SECS a further £500 worth.

Not wishing to be outdone, US Gold has more goodies for Atari users in the form of 30 copies of its best-selling game Asylum.

And joining in the spirit, CDS has donated 10 Steve Davis Snooker games, Ariolasoft is giving away its fabulous T-shirts and badges and Silica Shop is providing software worth more than £100.

Yes, there’s lots to win. And if all that weren’t enough, Database Software is giving away 100 5½in discs—that’s 10 boxes—and 25 dust covers.

ST owners have not been left out either. Half the prizes from Software Express are for ST owners, and these include copies of Pascal and Ultima 2. Microdeal
has donated five copies of Lands of Havoc and five copies of Flipside.

Psygnosis has provided five copies of Brateaucus together with two limited edition Roger Dean prints for each of the winners.

Kuma is giving away two copies of each of its K software: K-Spread, K-Seka, K-RAM, and the just released K-Comm.

The contest itself couldn’t be easier to enter. We’ve taken pieces out of nine advertisements in this issue and put them in a numbered grid. All you have to do is find the page number of the original advertisement.

Now comes the bit where you use your brain. We’d like you to tell us, in not more than 25 words, what you’d like to read about in a future issue of Atari User.

Provided the page numbers are correct the most original, entertaining or useful suggestions will go into the hat for the great First Birthday Prize Draw. That’s not too hard, is it?

We’d also like to know what type of Atari machine you use, so there’s a space on the coupon for you to enter that information too.

So get to work and let us have your entry not later than May 31, 1986.

Remember there are lots of prizes. So everyone has a good chance of getting an Atari User first birthday present.
YOU should now know how to compile any programs you write, so let's discuss Compiler Basic and what it is capable of. Rather than giving you a list of its keywords, along with explanations, I'll use Atari Basic as a starting point and explain how to translate it into Compiler Basic.

- LET

A convenient starting point is the LET statement. Like Atari Basic, this keyword is optional in Compiler Basic. There are, however, the following major differences between the two statements — variable names may be A to Z only, expressions may be Integer only (0..65535) and expressions are evaluated left to right, without operator precedence.

Expressions are also different in the two Basics. The allowable operations are:

- for integer addition (no overflow check).
- for integer subtraction (no underflow check).
- for integer multiply (no overflow check).
- for integer division (no divide by zero check).
- for integer remainder on division (no divide by zero check).
- for bitwise logical OR.
- for bitwise logical AND.
- for bitwise logical Exclusive OR.

If you don't understand the last three you can think of "bitwise and", and "bitwise or" as being just Atari Basic AND and OR respectively, and "bitwise exclusive or" you can probably live without. As well as these operations all the relational operators — greater than, less than, equal to and so on — are available as you would expect.

One thing to be wary of is the lack of operator precedence. Take the following statement for example:

LET X=3+2*4

This means two completely different things in Atari Basic and Compiler Basic. In Atari Basic X would get the value 11 since the multiplication would be done before the addition. In Compiler Basic X would get the value 20.

This occurs since the compiler does the operations strictly in the order they appear from left to right, in much the same way as a cheap calculator would. You can't use brackets to compensate for this, since the compiler does not accept bracketing of expressions.

Don't worry though, there is always another way to write the assignment, perhaps using an intermediate variable, so that the operators are done in the order you want. The above example may be written:

LET X=2*4+3

This expression will come out the same in both Atari Basic and Compiler Basic.

In Atari Basic you can use functions such as ASC, PEEK and so on, in expressions. Although you can't use these functions in the same form in Compiler Basic, they are available to you.

Figure 1 shows a list of Atari Basic functions and their Compiler equivalents.

The compiler also has a facility to pass expressions to the assembler cartridge — but they must be constants not variables. The advantage of this facility is that the expression is evaluated by the assembler before the program is ever run, so that the expression is evaluated only once and does not slow down your program when it is running. Here is an example:

X=A+ [12*3+20]

This has the assembler work out what 12*3+20 actually equals (56) and substitutes it into the expression — so it is as if you had originally written:

X=A+56

This obviously will be quicker to work out than if you had omitted the square brackets, thus leaving the program to unnecessarily compute 12*3+20 each time this assignment...
In all the above, A may be an expression — so you can have the following assignments:

<table>
<thead>
<tr>
<th>Atari Basic</th>
<th>Compiler Basic</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>PEEK(A)</td>
<td>A</td>
<td>Returns byte pointed to by A.</td>
</tr>
<tr>
<td>ASC(&quot;A&quot;)</td>
<td>'A'</td>
<td>Returns ASCII code of A, where A is a</td>
</tr>
<tr>
<td>PEEK(A)+256*PEEK(A+1)</td>
<td>A@</td>
<td>character.</td>
</tr>
<tr>
<td>ADR(&quot;string&quot;)</td>
<td>&quot;string&quot;</td>
<td>Returns 16 bit word pointed to by A.</td>
</tr>
<tr>
<td>PRINT CHR$(A);</td>
<td>PRINT A</td>
<td>Returns address of literal string.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Prints character whose code is A.</td>
</tr>
</tbody>
</table>

**Example**  

<table>
<thead>
<tr>
<th>Effect</th>
<th>X=88@</th>
<th>Assigns PEEK(88)+256*PEEK(89) to X</th>
</tr>
</thead>
<tbody>
<tr>
<td>X=88</td>
<td>Assigns PEEK(88) to X</td>
<td></td>
</tr>
<tr>
<td>X=1+'A'</td>
<td>Assigns ASC(&quot;A&quot;)+1 to X</td>
<td></td>
</tr>
<tr>
<td>X=&quot;hello&quot;</td>
<td>Assigns ADR(&quot;hello&quot;) to X — this is a number not a string.</td>
<td></td>
</tr>
<tr>
<td>PRINT 1+2+43</td>
<td>Prints the character whose code is 46. Same as PRINT CHR$(1+2+43); in Atari Basic.</td>
<td></td>
</tr>
</tbody>
</table>

is encountered.

Well, that's just about it for expressions, and the LET statement.

Here are some other statements supported by the compiler:

**PRINT**

PRINT is a simplified version of Atari Basic's PRINT command. As you have already seen, PRINTing an expression causes a character to be output, and not the value of the expression as you would expect. In fact there is no way to PRINT a number in Compiler Basic, except by writing a special subroutine which will give you in a later article.

You can, however, PRINT a string. PRINT "hello" causes the expected output on the screen — except that the cursor does not move to a new line unless you issue a PRINT command on its own. In other words, PRINT "hello" in Compiler Basic is the same as Atari basic's PRINT "hello".:

**GOTO, GOSUB,**

**RETURN**

These work the same way in the compiler as in Atari Basic. You cannot GOTO an expression however, nor can you GOSUB an expression. You can however use labels, as in:

```
1000 LABEL LOOP ONE
1010          . . . .
1030 GOTO LOOP ONE
```

You can POP a return address in Compiler Basic — I don't recommend it though, since if you do it wrongly you can crash the computer, and will probably have to switch off and on, losing your program and data.

If you miss the facility to GOTO an expression, you can use the GOVIA keyword. This accepts an expression, but consider the command GOVIA 1000+10. It does not GOTO line 1010, but causes the machine language to jump to decimal address 1010. You can use this to implement a sort of USR call, or an ON...GOTO command. More about that in a later article.

**IF...THEN**

IF ... THEN is also available in Compiler Basic. Unlike Atari Basic you must finish with the ENDIF keyword. This allows the statements after the THEN to span several lines. For example:

```
1000 IF X=5 THEN GOTO 2000
1000 IF X=5 THEN IF G=2 THEN GOTO 3000 ENDIF
```

In this example the four statements after the THEN keyword will be executed if X is equal to 5, otherwise the program skips to the statement after the ENDIF. Note that you must always finish IF statements with ENDIF, even if only one statement is to follow the THEN keyword.

I guarantee that most of your errors will be to do with omissions of ENDIFs. The compiler warns you if this occurs, so you should pick up the habit of using ENDIF quite quickly.

Figure II shows some examples of ENDIFs being left out and the correct way to write these statements is shown in Figure III.

**POSITION, SOUND**

SETCOLOUR

These are all available in the compiler. However, there is no check to see if the arguments are in range — so for example SOUND 100,50,10,8 would pass unnoticed by the compiler but might cause your program to crash — but you can use IF statements to check that the arguments are in range before executing the statements.

Don't worry about your program...
running slowly if you do this—remember it is going to be compiled. Here is an example of using IF statements to trap out bad arguments:

1000 IF C>3 THEN GOTO ERROR ENDIF
1010 SOUND C,50,10,8

Here ERROR is some point in your program which you have labelled using the LABEL keyword (see the GOTO and GOSUB statements).

● DATA, READ, RESTORE

A crude DATA mechanism is provided in Compiler Basic. Each element in a data statement must be a number between 0 and 255, or an assembler expression. Here are some examples:

DATA 1,2,3,4,5,12+3
DATA "hello",155,0
DATA 'a','z',23,45,67

In the case of a string ("hello" above) a data element is produced for each character in the string, so READing will first produce the ASCII code for h, then for e, l, l, o in the case of our example.

Preceding a character with a single quote, as in 'a', 'z' causes the ASCII code of that character to be READ from the data stream. Numbers and expressions (12+3, and so on) simply cause the appropriate value to be placed in the data stream.

RESTORE may be used to address a label or a line number. This line number or label must point directly to a DATA statement—the compiler will not scan for the first DATA statement in sequence as Atari Basic would.

DATA statements must be consecutive if READing is to work correctly, and DATA statements should be placed out of the path of the executing program, for example at the end of the program, or between subroutines or procedures or else the program will crash.

You can use REM statements in Compiler Basic programs. For example:

1000 REM Initialise:X=1;Y=1

● FOR . . . NEXT

These statements are available, albeit in a slightly corrupted form. In the FOR statement there is no initialization part, so you write FOR X TO 200 rather than FOR X=1 TO 200. This means—for X counting in increments of one from its current value TO 200. In Atari Basic you would write FOR X to 200.

If you want a loop which counts from 3 up to 1000, in Atari Basic you might write:

FOR N=3 TO 1000:NEXT N

To do this in Compiler Basic you would have to write:

N=3:FOR N TO 1000:NEXT N

It's a little strange, I'll grant you—but it simplifies the writing of the compiler.

There are no checks to see if your FOR . . . NEXT loops are properly nested, so be careful of statements like:

1000 FOR X TO 100
1010 Y=1 FOR Y TO 80
1020 NEXT X
1030 NEXT Y

which will not give an error message despite being incorrect. If you use proper indentation you should have no problem avoiding this situation.

● OPEN, CLOSE, GET, PUT, XIO

These are the same in both Basics except XIO. Take XIO 17,#6,0,0,"S"; for example, which is the XIO command to draw a line in Atari Basic. In Compiler Basic you would have to change the two zeros to be the same numbers that you used when OPENing channel 6. Suppose you used OPEN #6,12,3,"S"; for example, then you should XIO 17,#6,12,3,"S" as well.

The commands, as well as allowing the use of cassette, disc and keyboard devices from Compiler Basic also allow you to use colour graphics in your programs. You can replace Atari Basic's GRAPHICS, PLOT and DRAWTO commands using OPEN, CLOSE and PUT.

LOCATE can be simulated using GET. All you have to do is OPEN channel 6 to the "S:" device. For example, OPEN #6,12,3,"S:" gives you Graphics 3 without a text window. Unfortunately space does not permit a full discussion of the possibilities of OPEN and XIO, but I may return to this subject later.

In Atari Basic you can TRAP errors. Similarly, in compiler Basic you can TRAP errors which arise when using OPEN, CLOSE, GET, PUT and XIO. For example, TRAP 2000 will cause control to transfer to line 2000 in your compiler program in the event of any error, say while GETting characters from cassette. To turn off the TRAP use TRAP OFF. To turn it back on use TRAP ON.

To examine the cause of an error you can use variable S. This is updated after every OPEN, CLOSE, GET, PUT and XIO command. In the event of an error this will contain the error code.

So if S equals 141, ERROR 141 has occurred (error 141 being cursor out of range—see the Basic manual for a full list of error codes) by the way, S is short for status variable.

As in Atari Basic you can POKE a byte to any address in memory. Compiler Basic also provides DOKE, short for double POKE. This POKE's a 16 bit number (0-65535) to an address in memory in low byte/high byte format.

To load the screen memory address register at location 88, for example, you might use DOKE 88,w—where W is the number to be DOKEd.

To do the same thing in Atari Basic you have to resort to something like POKE 89,INT(W/256):POKE 88,W-256*PEEK(88).

If you examine the games listings in magazines and books you will see that constructs similar to this occur frequently. For this reason, DOKE is an extremely neat and useful command.

● That's the end of the statements

Compiler Basic and Atari Basic have in common. Next month I will discuss the keywords that are peculiar to Compiler Basic—these include keywords to handle timed interrupts and local variables, so stay tuned.
MicroLink slashes the cost of Telemessages

OLD-fashioned telegrams have been projected into the Electronics Age – in the form of Telemessages. The difference is that today you can compose the message on your micro, transmit it over a phone line via MicroLink, and it is delivered by the postman the following morning, neatly presented in a distinctive, eye-catching yellow envelope that just demands attention!

The Telemessage service was originally introduced so that people could phone their message to the operator. You can still do this, but it costs £1.45 for up to 50 words.

Now, using your computer and MicroLink, it only costs £1.45 for up to 350 words! Which is sufficient for an average business letter – and a small price to pay if it means you beat the opposition to clinch that all-important contract.

What’s more, for an extra 65p your message can be delivered inside an attractive greetings card.

So if you’ve almost forgotten your loved one’s birthday, or it’s too late to buy a card – or you’ve already missed the last post – Telemessages can be a real godsend.

To ensure delivery by first post the following morning you have to send your message before 8pm. It is instantly transmitted, exactly in the form you keyed it in, via the MicroLink mainframe in London direct to the postal delivery office nearest the recipient’s address.

There it is printed out, put into the special envelope, and passed on to the local postman for delivery.

It’s as simple as that!

Until now you could only send electronic mail if your recipient also had a computer. Now you can send a Telemessage to any address in the UK – all 22 million of them. (And there is also a next-day service for any of the 90 million homes in the USA.)

What it costs to send a Telemessage:

<table>

Takeover boosts e-mail service

BRITISH Telecom’s takeover of Dialcom, the world’s largest electronic mail service, has been welcomed by Derek Meakin, head of MicroLink.

“The service has a head start over all the other companies engaged in electronic mail on a global scale and is in the best position to take advantage of the dramatic increase in international messaging that is now under way”, he says.

“MicroLink will be able to benefit in many ways from the revitalised Dialcom that will result from BT’s involvement.

“We can expect many technical developments that will considerably enhance the service we offer our subscribers”.

Dialcom has been sold to BT by ITT, the US conglomerate, which has recently been divesting itself of a number of its subsidiaries.

Last year it had an income of £19 million from its 100,000 mailboxes in the USA and from the fees it charges its licencees, the largest of which is the UK’s Telecom Gold, of which MicroLink forms part.

But its growing revenue still wasn’t sufficient to stop Dialcom running up heavy losses. BT is putting in its own management and expects Dialcom to be back in profit by 1988.

In addition to the USA and UK, other countries on the Dialcom network are Australia, Canada, Denmark, West Germany, Hong Kong, Ireland, Israel, Korea, Netherlands, New Zealand, Puerto Rico and Singapore.

Subscribers in all these countries can have instant communication with each other by electronic mail, in addition to other messaging services such as telex and telegrams.

Dutch delight

DUTCH subscriber J.W. Bangert says MicroLink is the most painless way to communicate with friends and colleagues all over the world – and he should know because he’s a dentist.

When he isn’t filling or pulling teeth at his surgery in Spanbroek he can often be found at the keyboard of his micro.

“I use the fabulous MicroLink to communicate – that’s what computers are made for”, he says.

“As a dentist who is interested in computers I find the system is a good way to send letters to the USA and England very quickly.

“It also makes it easier to get answers to my questions about computing – it is sometimes very difficult to get computer information in Holland, as we are not so much into these things as you are in Britain.

“I have a lot of friends in England who I often surprise with a nice card on the Telemessage service and I’m also able to send fast messages to professional magazines and organisations like the Dental Association in America”.

YOUR chance to join MicroLink – Page 35
Sterile approach to maths studies

THE Software Factory has produced a series of five discs called CSE and GCE O Level Maths to match the five years the children would study mathematics in a senior school. Although referred to as a course, they are at best a simple aid to learning, and at worst just a series of mathematics tests. The authors say the programs are designed to assist those studying CSE and O-level mathematics and that using them will increase the pupil's abilities in mathematics.

Yet the first four discs merely offer tests where they are marked and timed and the help pages offer little more than a traditional textbook would.

The questions are difficult, there appears to be no common thread and the pupil can get the correct answer by entering incorrect inputs. Failure results in an explanation, but even this is inadequate if understanding is to arise.

The language used is difficult to understand, for example: "A number in standard form is a number expressed as a number between 1 and 10 multiplied by a power of 10".

Disc 5 amounts to a test of tests. It is the revision section and a reflection of the efficiency of the course you are given three attempts to get the correct answer instead of two.

Success at this level would guarantee a pass at O level as the pupil would have to be well above O level standard and understand the questions - and some of the explanations.

There is a market both in school and at home for revision software, but for it to be of real value it needs to be sound in its subject content and to take into account how the child learns. The traditional approach of this software might be acceptable for the grammar school where it would be backed up with teaching and an in-depth explanation.

But the course is no use for pupils who wish to teach themselves. Even if the computer is used to the full it still requires a skilled teacher to enable the average and above average child to learn from this package, and a skilled teacher would find little in this software to excite them.

The computer has no screen graphics to speak of and little interaction and the documentation is limited.

Children using the programs felt demoralised by them and showed little motivation, considering they were using the computer.

With exciting software available to help the pupil develop an investigatory approach to mathematics there is little room in school for such sterile software.

Although it could provide a revision aid for a bright child who had already attained the required standard, it does not provide the careful explanation that most children need.

I suspect that the children who would benefit from this set of programs will already enjoy using textbooks anyway.

Alan Coode

Spying isn't easy, but

IF you're a fan of Mad magazine you will undoubtedly know about the Spy vs Spy comic strip. For those of you who don't, the stories follow a deadly duel between two opposing spies, one dressed in black and the other in white.

After the success of the first Spy vs Spy computer game the spies have now returned to continue battle in Spy vs Spy II: The Island Caper.

The game boots up with an attractive title page. After a short pause a plane flies past shooting holes in the titles, then another follows in to destroy more of the picture. The pilots are the spies and, after wrecking the screen they fly off and the display changes to the main screen.

A big selling point with the Spy vs Spy games is the way in which they display the action. Star Software has designed a screen with two monitors connected to a main computer via ribbon cables.

The two monitors show the position of the spies - this is called simulview. They also update in real time, and this is called simulplay. A monitor will display a 3D view of the landscape and you can move your spy away to the distance, towards you and left and right.

Moving to the edge of the screen forces more landscape to scroll on, and little gaps at the top and bottom of some screens allow access to the north and south of the island.

The object is to recover all three parts of a top secret missile. In the Mad fashion this missile is not an Exocet or a Polaris, but an XJ4 1/4.

It has crashlanded on Spy Island and broken up into the three parts that you must retrieve and assemble. The island has only one resident, an active volcano which is about to erupt, so quick completion of your mission is essential.

The spies have been equipped with the latest spy technology, the Trapulator Model FSS 85. This technological gadget aids you in your fight for the missile. It shows what you have in your inventory and also allows you to access the equipment that you have acquired.

You have a good selection of devious weapons with which to trap or attack your foe - from napalm to a coconut gasoline bomb. You can also dig holes and put sharp sticks down them. This has a nasty effect on any spy unlucky enough to fall into a pit.

My favourite is the rope snare. You select the rope from the trapulator and climb up a tree tying one end to the tree top, then you stretch the other end to the ground.

Once the snare is set it becomes invisible, so you must remember where you set it.

If a spy triggers off the snare he will be lifted in to the air and left dangling from the tree. All of the traps degrade your strength and delay you for a few seconds, giving the other spy time to do more dirty work.

If you want spy to spy combat then you must confront your enemy. When a spy enters the same area as his opponent the simulview ends and all attention is switched to just one monitor.

You are also unable to
Hit a trifle below the belt

IN Gremlin Graphics’ King of the Ring you are the manager of a boxer. It’s your task to guide your fighter through four fights before taking on the world champion. You must use skill to select the correct training strategy and tactics to guide your boxer to victory.

That’s what the cassette inlay said, but all I found in this game were two jerky page flipped boxers and lots of laborious typing.

The game starts off with a list of 20 opponents from which you pick a contest — if the opponent you choose is considered too high grade you try again.

After that you are given a screen of information on your opponent ranging from his age to his fight record. You should be able to get an idea of what sort of fighter he is from this.

Next you train for the fight by choosing four out of the following six routines — sparring, punch bag, weights, gym work, footwork and road work. Each is supposed to develop you in a different way, for example road work improves stamina and weights will improve punching power.

After assessing your training you choose a strategy from another list. You have four set fight strategies. Once one is picked then it’s on to another list, this time awarding priority points for the way you fight each round. Options available are footwork, infighting, attack and defence. The more points awarded for an option, the more effort is put into that choice.

By now my fingers were developing cramped and I was wondering if I was ever going to fight. But the bell sounded and I got a chance to watch my boxer’s progress. At this point you have the excitement of watching the other boxer belt the living daylight out of you while amassing a huge punch count.

This goes on until you either win or lose and then it’s back to the start for a new opponent. Four wins and you fight the World Champion who generally pulverises you.

After playing the game for more than three hours I lost interest. It seems to lack action and strategy, as you only have limited set choices.

There is sparse use of sound and graphics. The fighters themselves are outlines which are well drawn but badly animated.

This is one of Gremlin Graphics’ first releases for the Atari but it is well known for its quality games on other machines. So let’s call this a start and hope they work their way up.

Not the best of games but it will please some people — but look before you buy, otherwise you may feel you have been hit below the belt.

Paul Irvine

it certainly can be fun

access your trapulator while in combat range. You have two methods of attacking an enemy spy. You can either jab your opponent with a sword that appears when you enter combat mode, or smash him over the head with the sword.

There are also natural hazards you need to look out for. The island has small areas of quicksand, which when stepped on can be hard to escape from.

The sea looks nice for a quick dip but if you wade into deep waters you find that spies are poor swimmers and you will soon drown.

In these parts the sea is infested with hungry green-gilled mud sharks with an appetite for spies. The only need for venturing out to sea is for a player who has assembled the missile to find his off-shore submarine which will take him home.

The spy who achieves his goal first gets onto the submarine and a girl pops out of the hatch to give her hero a small kiss on the cheek. Finally, they both jump into the sub and dive deep James Bond style. Altogether I found Island Caper a great game especially in the two player mode, but the computer is very hard to beat.

To overcome this problem I just changed the computer’s IQ level.

One pleasing feature was that the program could be played via the keyboard as well as joystick. You also have control over which level you wish to play. On two of the levels there are two islands, making the game longer and much more fun.

The only disappointment was one small bug which I found. Somehow managed to get a screen where a tree had been split in half and all the perspective went wrong — this only happened once in many hours of game playing, so it wasn’t too bad.

Spy vs Spy II, is a well presented and complete game. It is slightly difficult for younger players to get to grips with but great value for money.

Disc price is £14.95, cassette £9.95 and you need a minimum of 48k RAM.

Richard Vanner
Player missile graphics offer more than lasers

By STEPHEN WILLIAMSON

MY Atari 800XL came with an inadequate nine page reference guide that told me little of the computer's capabilities and nothing at all about the player missile graphics system.

And that's a pity, for player missile graphics—henceforth PMG—deserve a prominent place in anything that claims to be a guide to the Atari computer.

The name is derived from the days when most computer games featured force battles with alien invaders. The alien shape and the spaceship used to zap them are known as players, with the laser beams or missiles tearing around the screen appropriately known as missiles.

PMG were invented to make the life of the shoot 'em up games programmer easier. The system processes such things as animation, collision detection and shape priority.

The name is misleading, for PMG can be used for all sorts of things. In some Atari graphic art programs the system is used to draw and move a crosshair pointer across the screen that does not erase any shape that it passes over.

It can also be used to display graphs or charts in more business orientated programs.

Other computers, such as the Commodore 64, have similar graphic systems, but generally these are known by the updated and I think better name of Sprites.

Inside Atari 8 bit computers—these include the 400, 800, XL and XE series—are two microchips called Antic and GTIA which are separate microprocessors dedicated to handling screen displays.

If you followed Mike Rowe's series in last year's Atari User you will have seen how, by using display list interrupt techniques, Antic and GTIA can be accessed to produce spectacular multicoloured effects. These chips also process the player missile system.

The Antic chip receives data from a program which is processed using Antic's own built-in programs and then the relevant information is passed on to the GTIA chip which takes care of putting the display on to the TV screen.

Unfortunately Atari has not seen fit to support player missile graphics with any Basic commands. There are some extended Basic programs that add extra commands which can be used to control the system, for example Basic XL reviewed in the December 1985 issue of Atari User.

Without the advantage of extended Basic you must resign
yourself to lots of POKE statements if you wish to use player missiles in Basic programs.

This can be complex, but the effort required to understand the system is well worth it. Incorporating PMG can add a touch of class to a Basic program.

This month's program demonstrates some aspects of the system and illustrates how some of the jargon associated with PMG is employed.

The first part shows the screen area on which text and graphics can be displayed. This screen display area is called Playfield 0. The border around the display area is known as the background.

Anything appearing on the top of Playfield 0 that is not a player or a missile is Playfield 1, Playfield 2 or Playfield 3. These playfields are created by plotting points using the PLOT or DRAW commands or by directly POKEing into the screen memory area.

When you use COLOR 1 and DRAW or PLOT on to a graphics screen you are plotting Playfield 1, with Playfields 2 and 3 plotted by using COLOR 2 and COLOR 3. PMG supports up to four playfields (0 to 3). Computers insist on counting from 0, unlike humans who prefer to start at 1, so Playfield 1 is actually the second playfield — confusing isn’t it?

In the demonstration we are using Graphics Mode 5, a four colour mode which consists of a 40 row by 80 column graphics display area on which pixels may be plotted, and a four line text window at the bottom of the screen on which the text appears.

For the purposes of PMG the text window is also part of Playfield 0. It follows from this that the text that appears on this window is also a Playfield — Playfield 2 in this program.

Lines 180 and 190 draw a line around the edge of Playfield 0 to outline the dimensions of the Playfield 0. This line is drawn in COLOR 3 and is therefore Playfield 3.

In lines 220 and 230 a rectangle is drawn on Playfield 0 in COLOR 2 to become Playfield 2, with Playfield 1 drawn inside the rectangle in COLOR 1.

The next part of the program shows what is meant by a player stripe. If you look closely at any of the standard Atari characters that appear in the text window when you run this program, you will see that they are made up of a series of small dots known as pixels (short for picture elements). This is more noticeable on large screen televisions than small portables.

Each character is designed on an 8 x 8 grid which means that a character can be a maximum of 8 pixels wide and 8 pixels high.

A player is a shape made up of pixels in a similar manner — but instead of using an 8 x 8 grid, the player missile system uses either an 8 x 256 grid or an 8 x 128 grid.

The 8 x 256 grid is used for single resolution players, the other for double resolution players which take up less memory space but are much chunkier looking and made up of larger pixels than the single resolution players.

The demonstration program lights up all the pixels within a player stripe area to form a ribbon of colour that stretches from the top of the screen to the bottom.

While all playfields must be plotted with the Playfield 0 area, shapes plotted within the player stripe can leave the playfield area and travel over the border at the top and bottom.

By altering the horizontal position of the player stripe, players can also reach the border area at the left and right hand edges of the screen.

In most applications only a few pixels within the player stripe are switched on, and the next part of the program shows the shape of a big when selected pixels are plotted. This shape is known as a player which is plotted within the area of the player.
stripe. The player shown by the program is a single resolution player.

A missile is similar to a player but uses a much narrower stripe of 2 x 256 single resolution pixels or 2 x 128 double resolution pixels.

PMG can control up to four missiles and four players numbered like the playfields from 0 to 3. It is also possible to place all four missile stripes together to form a fifth player.

To make it appear as if the player is moving horizontally is fairly simple - you just adjust a register that stores the horizontal coordinate of the stripe. To move vertically is more difficult and is not illustrated by this program, but it will be looked at in a later article.

The program moves the player from left to right. The animation is so smooth because the player is moving a very short distance at a time - equal to the width of one pixel.

When the player touches Playfield 2 - the rectangle - a sound effect is switched on. This is done through a process called collision detection.

We can find out from Antic when a player or missile has touched another player, missile or playfield. This program checks to see if the player has collided with a playfield then jumps to a sound effect routine. As the player leaves Playfield 2 the sound effect is switched off.

When moving from left to right the player appears to travel over the playfields, but when travelling from right to left it passes under the playfields.

The portion of the player beneath the bars cannot be seen, but the section of the player between them is visible - this is an example of shape priority, and enables us to decide which players or playfields are on top and which underneath.

At this point I will not go into how the program works, but it is there to show you something of the player missile system's capabilities. If you examine the program you will get a flavour of what is required to operate PMG.

In future articles I will analyse how to initialize the system, the designing of players, animation, collision detection, changing the size of players and shape priority, as well as other matters involved in player missile graphics.

All these elements will eventually be combined in a game starting the bug that has made its first appearance in this month's program.
The adventurer's world is really looking up now

I SPENT some time at the Atari Show in the Champagne Suite at the Novotel, Hammersmith. Apart from the fact that the show was an absolute smash hit from everybody's point of view, there were some exciting developments in the world of adventure.

The show was the first opportunity for everyone to see what sort of support the ST was going to get. So far Talent was the only software house fresh to the scene, although the Infocom range was there almost as soon as the ST.

Now comes The Pawn from Rainbird Software. Quite honestly this adventure features the best graphics I have even seen in an adventure on any machine. They are absolutely brilliant - and this from a confirmed graphics-hater. If you have an ST I urge you to rush out and see for yourself. I only wish I had one.

As it is, I shall have to wait for the 8 bit version, which should retain the graphics but in a somewhat different form.

Also at the show our old friends Level 9 (even if the friendship seems to be a little strained at late) showed the preview of The Prince of Magyck which I am sure I have spelt wrong. This is the first of the games they will be releasing for the ST although the rest of their range are to follow.

The version they were showing was far from complete, as you could do little more than move around. The notice above the game did say that the authors knew there were bugs in it, so hold on all you glitch hunters.

Obviously it is too soon to try to review either product but in comparison with The Pawn the Level 9 graphics came a poor second. I feel that their ST graphics are the same as will appear in the 8 bit version, and hence could only be disappointing on a machine like the ST.

When you consider the power of packages such as Degas for the creation of artwork on the ST, 8 bit graphics are really not good enough.

Glitches of the Month:

IT is hats off to Gavin Jones, winner of this month's T shirt for, wait for it, TWO Infocom bugs.

In fact they are similar bugs in the parser routine but I am determined to have an Infocom Glitch, so with apologies to the typeraters here goes.

In Zork II, type in TASTE MGCKJK (don't ask me why he typed it) to receive the helpful prompt of 'I don't think the gdxr syilc xwuhiyorkpek- krgghas smj would agree with you'.

Not so much a bug as a complete Vogan dictionary, speaking of which, if you type EXAMINE ZZMGCK in HHGTG the computer says 'How can you read a jujctw?'

How indeed?

Gavin reveals he is the possessor of Zorktools for his IBM which also allowed him to list out the complete vocabulary of HHGTG - all 900 words plus.

Now can anyone tell me the use of the words 'wimbug' and 'woonbe in the game? A bonus T-shirt to be won for the best answer.
The rest of the Level 9 range do not all have graphics and should convert admirably to the ST. As yet there is no indication of prices.

The last of the Atari Show adventurers were Bignose Software, who exhibited at the SECS stand their new adventure Qa!

In the game you play the stranded member of an expedition to find the fabled mask of the Sungod Qa. You have to rescue the only other survivor from the local tribesmen before they manage to sacrifice her to their god, as she is the only person who can radio the supply ship for help.

The game has more than a touch of the Indiana Jones about it, and the clock which ticks off the minutes as you try to penetrate the jungle to rescue Kate Mellender makes the action all the more tense.

A good deal of care is required at the start to survive to reach the first major obstacle, a crocodile-infested river. If tough logical problems with a real sense of escapism are what you seek then this is for you.

Jon Dean of SECS also explained that the licensing deal his company has with Bignose allows the games to come out at budget prices. The Pay-Off and Opera House are combined on cassette at £4.99, Qa! is alone at £2.99 on cassette, but is combined with Opera House on disc (Atari has the disc rights to The Pay-Off) at £6.99. Amazing value.

In a sense the show captured the new directions adventure software is taking with regard to price. Certainly the budget games that SECS had on display were selling well, and yet there is still a huge market for the Infocom and Parn style of game. These are the Rolls Royces of the adventure market and deserve their premium price.

To round off, Andrew Dalglish wants to know how to get past the guard dog in The Pay-Off. As the dog is hungry why not give it a feed, Andrew, but do something to the meat first to make sure he wants a post prandial nap.

Once the dog has stopped foaming at the mouth that should give you some ideas about how to stop the alarm.

Happy adventuring.
What it offers the Atari user...

Electronic mail is much cheaper than the post

Sending mailbox messages to other subscribers, whose numbers are rapidly growing, is the cheapest form of communication possible. You can send a message of any length to another mailbox for less than the cost of a first-class stamp. And it doesn't cost a penny more to send the same message to 500 different mailboxes! Even a message sent to a mailbox on the other side of the world only costs 50p.

The biggest bulletin board of them all

The number of bulletin boards is growing rapidly. The only snag is that the vast majority are single-user boards - which means lots of other people are also trying to make contact and all too often all you get is the engaged tone. But with the MicroLink bulletin board there is no limit to the number of people using it at the same time. And no limit to the number of categories that can be displayed on the board.

Give your micro mainframe power

With MicroLink your micro becomes a terminal linked directly to the Telecom Gold mainframe computer, and able to tap its tremendous power and versatility. Right away you'll be able to use giant number-crunching programs that can only run on a mainframe.

The mailbox that is always open

MicroLink is in operation 24 hours a day, every day. That means you can access your mailbox whenever you want, and from wherever you are - home, office, airport - even a hotel bedroom or golf club! No-one needs to know where you are when you send your message.

We're only a local phone call away

The majority of MicroLink subscribers can connect to our mainframe computer in London by making a local phone call. This is possible because they use British Telecom's PSS system, which has access points all over Britain. A local phone call is all you need, too, for direct access via MicroLink to all the other countries belonging to the international Discom system.

Telemessages - at a third off

The modern equivalent of the telegram is the telemessage. Send it before 10pm and delivery is guaranteed by first post the following day (except Sunday). The service was intended for people phoning their message to the operator, which costs £3.50 for 50 words. But you can now use it via MicroLink, for only £1.25 for up to 350 words! For an extra 65p your message can be delivered in an attractive greetings card.

Go teleshopping on your micro

With MicroLink you can study the British Rail timetable - and then buy your ticket in advance. You can book theatre tickets. And even order a bouquet of flowers. It's all part of the tele-shopping revolution!

Send and receive telex messages

With MicroLink you can turn your micro into a telex machine, and can send and receive telex messages of any length. You will be able to communicate directly to 96,000 telex subscribers in the UK, 1 million worldwide - and even with ships at sea via the telex satellite network. Business people can now send and receive telexes after office hours, from home or when travelling.

What does it all cost?

Considering all the services you have on tap, MicroLink is remarkably inexpensive. You pay a once-only registration fee of £5, and then a standing charge of just £3 a month. On-line costs are 3.5p a minute (between 7pm and 8am) or 11p a minute during office hours. There is an additional 2.5p a minute PSS charge if you are calling from outside the 01- London call area. Charges for telex, telemessages and storage of files are given on the next page.
# How much it costs to use MicroLink

**Initial registration fee:** £5.

**Standing charge:** £3 per calendar month or part.

**Connect charge:** 3.5p per minute or part – charge rate: 11p per minute or part – standard rate.
Applicable for duration of connection to the Service. Minimum charge: 1 minute.

**Change rate from 7am to 8am, Monday to Friday, all day Saturday and Sunday, and public holidays; Standard rate is from 8am to 7pm, Monday to Friday, excluding public holidays.**

**Filing charge:** 20p per unit of 2,048 characters per month.
Applicable for storage of information. Such as text, short codes and mail files. The number of units used is an average calculated by reference to a daily sample.

**Information Databases:** Various charges.
Any changes that may be applicable are shown to you before you obtain access to the database.

**MicroLink PSS service:** 2.5p per minute or part (300 baud); 3p per minute or part (1200/75 baud).
Only applies to users outside the O1-London call area.

**Telex registration:** £10.

**Outgoing telex:** 5.5p per 100 characters (UK); 11p per 100 (Europe); 19p per 100 (N. America); £1.25 per 400 (Rest of world); £2.75 per 400 (Ships at sea).
Deferred messages sent on the night service are subject to a 10% per cent discount.

**Incoming telex:** 50p for each correctly addressed telex delivered to your mailbox.
Obtaining a mailbox reference from the sender incurs a further charge of 50p.
It is not possible to deliver a telex without a mailbox reference. If a telex is received without a mailbox reference the sender will be advised of non-delivery and asked to provide a mailbox address.
Each user validated for telex and using the facility will incur a charge of 6 storage units a month. Further storage charges could be incurred depending on the amount of telex storage and the use made of short code and message file facilities.

**Telemessages:** £1.25 for up to 350 words.
Telemessages can be sent with an illustrated greetings card for 55p extra.

**Radiopaging:** No charge.
If you have a BT Radiopager you can be paged automatically whenever a message is waiting in your mailbox.

**International Mail:** For the first 2,048 characters: 20p to Germany and Denmark; 30p to USA, Australia, Canada, Singapore, Hong Kong and Israel. For additional 1,024 characters: 10p; 15p.
These charges relate to the transmission of information by the Database service to other Dialcom services outside the UK and the Isle of Man. Multiple copies to addresses on the same system host incur only one transmission charge.

**Billing and Payment:** All charges quoted are exclusive of VAT. Currently all bills are rendered monthly.

---

## Software over the telephone

MicroLink is setting up a central store of software programs which you'll be able to download directly into your micro. The range will include games, utilities, educational and business programs, and will cover all the most popular makes of micros.

## Talk to the world by satellite

MicroLink is part of the international Dialcom network. In the USA, Australia and a growing number of other countries there are many thousands of users with electronic mailboxes just like yours. You can contact them just as easily as you do users in Britain — the only difference is that the messages from your keyboard go speeding around the world via satellite.

## What you need to access MicroLink

You must have three things in order to use MicroLink: a computer (it can be any make of micro, hand-held device or even an electronic typewriter provided it has communications facilities), a modem (it can be a simple Prestel type using 1200/75 baud, or a more sophisticated one operating at 300/300 or 1200/1200 baud), and appropriate communications software.
A NEW feature can be added to the excellent Horse Play from the March issue by entering the lines on the right.

They enable moves to be replayed instantly - just like Match of the Day.

An array keeps track of the X, Y values. These are then used to reprint the black squares - see line 3020.

After the replay there's a short pause before the program returns to the end screen - P.R. Dean, Walsington, Surrey.

Cost of expansion

In reply to G.T. of York about expanding his 600XL, the RAM pack he is after cost £39.99. The cost of a new 800XL is only £40 more.

How does Atari account for this? If they can cut 50 per cent off the 800XL then please do this with the RAM pack.

Friendly Jack has cut the cost only on the computers that did not sell. The reason that they did not sell was that the add-ons were over priced.

If Atari can price their goods more reasonably they might sell a few more computers.

Atari has left all 600XL owners with a computer that costs too much to expand. — T.J. Keane, Beaconsfield.

Attack that fails

HAVING recently bought an Atari 800XL, I started buying the Atari User.

I thought I would have a go at typing in the Alien Attack game by S. Williamson from the January Atari User.

I listed it out and double checked. When I run the game I keep getting Error at line 30, which is a data loading error.

Could you please let me know if there has been a printer's error on this game or can you tell me why I keep getting this error? — M.

New bug

Well bugged ST basic

I BOUGHT my Atari 520ST in October 1985 and it may well be a wonderful machine. But how can I tell?

I was promised that a Pascal compiler was ready and send off my money in October. The latest word is that I will get it this month, but I've given up hoping. It is all too disappointing.

I was promised that a Basic would be sent within four days of my purchase. Atari took four weeks and it is full of appalling bugs.

There is no accurate cursor control command and Gem keeps interrupting programs at run time unless I remember to run them in Edit mode. The manual is incomplete - vital tables and portions of example program listings are missing.

Atari Helpline are very charming - they accurately indicate that a lousy Basic is better than no programming language at all, but they are only just right.

By the way, don't ring Helpline unless you are prepared to pay Telecom at least £15 to pop music through the phone - not a pleasant experience.

Don't buy a book called the ST Companion by Jeremy Vine, too much of it is about things that Atari won't give us, like Gem Draw and Paint and Write.

Congratulations to Andrew Bennett, who tells us how to use the Gem INSTALL option. I've never seen a 520ST where this worked.

I long to use my machine - my business needs it and here is stuff, nothing to do but look at it and play with the word processor which is vastly inferior to the Wordstar I ran on my 48k North Star, Horizons eight years ago. Heck, it doesn't even tell me when I reach the end of a page.

The line counter counts the lines from the top of the screen, as useless a piece of information as one could hope to be given.

Yours, still hoping that he hasn't been bad for a total really, but hope is waning. — Martin Frey, Appledore, Kent.

Happy victim

DO I detect a note of resentment in Allan J. Palmer's letter from the February edition of Atari User, concerning the bargain priced 800XL units. Could it be that he has paid twice the price for his?

As a happy victim of the Atari master plan to grab a larger slice of the market I can confirm that I and at least three other new owners have units which are fitted with the Revision C ROMs, so Mr Palmer you have badly misjudged Atari and all that it stands for.

With regard to the comments about the staff of outlets such as Dixons, Boots or Laskys - more power to them. They provide just as good a service if not better than the so called specialist. — Lappage, Dagenham, Essex.

Lappage, Dagenham, Essex.

- You've made a typing error - not in line 30, but probably somewhere in the DATA in lines 190-220.

Seeking an arrow

I RECENTLY bought an 800XL computer and was typing your Bridge game when I came across a character of which I couldn't figure out how to print.

It was in line 5000 and on 5010. "", ",", ",", ","; the problem was I couldn't print the arrow. — Nigel Strutt, Boreham Wood, Herts.

- The left-facing arrow is achieved with ESC CTRL +. See page 51 of our December 1985 issue for a complete list of those elusive special characters.

I OWN an Atari 130XE Data Recorder and 105D Disc Drive which I have just bought, and would like to correspond with Atari users anywhere in the world. – Sergio Trigo, Rua General Silva Freire 151, 4D 1800 Lisbon, Portugal.

American source

IN the February Atari User there was a letter asking for information about software for bridge.

While researching some of my older computer magazines I found an advertisement in the October 1984 edition of Antic which offers a Bridge Pro for the Atari which should work OK on the 130XE.

The Californian company concerned was Computer Management Corporation, 2424 Exbourne Court, Walnut Creek, CA 94596 (415) 930-8075. – A.J. Daniel, Worthington, Suffolk.

Bridge in sight

A.G. FERMOY of Orpington wrote to you regarding Bridge for the 130XE.

I own an 800XL and decided in October to buy Computer Bridge for my husband for Christmas. I eventually tracked down a supplier who imports it from the States. Unfortunately due to problems with the manufacturer it took over three months to arrive but it was well worth the wait to see the pleasure on my husband’s face when he opened his belated surprise present.

The staff of the company concerned, Software Express, were very patient and sympathetic when I kept chasing them as Christmas drew nearer, and did all in their power to get the package on time. – Mrs S.D. Morgan-Griffiths, Ashford, Kent.

Flight simulator

I AM interested in flight simulation programs and have all the programs that I know of. I’m sure there are more. I am looking for an interested party to assist in designing a definitive flight simulation program.

Through my knowledge of actual flying, general interest in aviation and seeing the good and bad parts of the many flight programs, I feel I can offer the basis for a realistic program.

Although I have no knowledge of programming the Atari 800XL or BBC B that I own, I do have basic knowledge of the machine operation.

I would be pleased to hear from anybody who has a flight simulation program that is not generally available, or from anyone interested in helping me get this project off the ground. – Alex J.M. Ford, 27 Colne Avenue, West Drayton, Middlesex.

Loading routine

IN the January Mailbag you advised a reader who wanted his Basic programs to run automatically when loaded, to use SAVE “C:”.

However this uses a lot more tape than with CSAVE, so your reader might be interested in the small routine below, which loads and runs CSAVEd programs.

First, SAVE “C:” the routine on to tape and then CSAVE your Basic program after it. To load, Rewind the tape, type RUN “C:” and sit back. – P.J. Rixon, Sheffield.

Contact

WHY don’t all you modern users give England’s biggest Atari bulletin board a call? It has eleven special interest groups, catering for most home micros and it also has a flag for Sysops only, which is for sysops of any BBS to use for exchanging information.

Some of us Atari sysops are trying to organise an Atari sysops club to help each other. For more details yell for me on the board.

The board is on 0903 503711 ring back 24 hours a day. It is a 300 baud system. – SYNOP ROY Wabba, Worthing, Sussex.

Interface advice

I HAVE just bought a printer to go with my 800XL. Having tried an Atari 1027, I decided it was too noisy and slow for me so I purchased an 850 interface and a Smith-Corona fasted 80 dot matrix printer.

I acquired them both from a shop in Warrington called All-computers. I must recommend them as being extremely helpful and keeping a good selection of software for the Atari.

When I hooked up the printer and interface and tried out my Home File Manager I discovered it would only print out the letter X in piece of a character.

So borrowing an Epson MX80 from work, I linked this to the interface and tried again. This time it printed out, only it was all in italics.

Searching the Epson and Smith-Corona manuals I discovered that the Home File Manager was sending out Ascil character codes in the range of 128 to 255. This was too high for my printer, and provided italics on the Epson.

So I ground the MS8 on the data lines by putting the wire on pin 15 on to pin 11 on the plug going into the 850 interface.

I hope this information comes in handy for other Atari users who are in the same position. Could we have a disc of the best of Atari User programs, in the near future? – Gary G. Bates, Bootle.

Ribbons available

FOR all those frustrated owners of the Atari 1029 printer who are experiencing difficulty in obtaining replace-
ment ribbons. Commodore MPS 801 ribbons are a direct replacement.

They are available from larger branches of Boots with computer departments, at £2.95. — A.R. Hussey, Reading.

Out of data error

I’ve just bought my Atari 800XL and finding the operators manual as useful as second hand toilet paper I went on the hunt for some books on how to use it. I found “Basic Basic”, by Donald M. Monroe which gave me a foundation at least.

My local software shop had a few games programs as did Boots. I found the assistant in Boots helpful — he pointed out your magazine so I bought the February edition.

As a newcomer to home computing I must admit I found bits of it hard to understand, namely the checksum list. How do I use them?

Also I typed in the program for Make time for a time clock by Paul Lay. Ran the program and all that comes up is the first two print lines followed by Error 6 at 110.

I’ve checked all the program and found a few data errors which I corrected, but still no joy. Just Error 6 at line 110. What do I do?

Please could you also give me the address of my local Atari club as this may help me get more use out of what could be a very useful computer.

David C. Chapman, Milton Keynes.

Boots is an out of data error, so presumably you’ve missed something out somewhere between lines 530 and 890.

The Milton Keynes Atari Users Group contact is T. Jordan, 18 Buckman Close, Greenleys, Milton Keynes. Tel: 0908 314439.

Lost illusions

AFTER more than a few months’ reading around I decided that the Atari 520ST would be a very good machine for small business applications. Just a little more research would, I thought, finally convince me.

The local computer shops, listed by Atari in their recent advertising promotion in most of the magazines either did not have an ST and/or software.

Well I thought, I’ll go to the horse’s mouth, so I wrote to...
Atari UK — and from them I received absolutely nothing.

When in Peterborough recently while standing next to a 520ST a salesman said: “Forget it (the ST) wait ‘til the Commodore Amiga gets underway”.

By now my enthusiasm was getting battered. But I had the good luck to find a copy of Atari User and bought it. Now, I thought, I’ll really get to know something, and I did.

The Whittaker correspondence (February, Atari User, page 55) convinced me of what I should do after all my searching, reading and writing — skip the Atari and its “Big event of 1986 Show” — M. Smelt, Gainsborough, Linex.

We think you’re missing out on a great machine, but that’s your choice.

Helpful Mailbag

I WOULD like to say thank you for the excellent magazine. The Mailbag section helps with minor everyday problems, for example, what revision your Atari has.

The article concerning VAL in February’s issue also contained a useful PEEK location to determine which revision A, B, C, you have. — A.B. O’Neill, Portsmouth.

Really full of heart

DISHEARTENED. Well I am, but my new Atari 800XL certainly is not, it’s full of heart.

So much so that when in Modes 1 and 2 I POKE 766,226, which I suspect should give me a clear screen on which to print characters from the alternative graphics set, instead I get a whole screen of heart shapes (character 032).

The POKE command has worked because I can overprint these with any character from the alternative set using COLOR and PLOT in the usual way.

What’s up? Have I got it wrong or is there a bug in the system somewhere? Either way, please tell me what I should do. Whatever happens, I want my computer disheartened — just a little. — John J. Quinn, GT. Yarmouth.

● Nothing’s wrong — you just need to read Dave Russell’s graphics article from our July 1985 issue. He dealt with exactly this problem.

Slower scrolling

ONE thing that annoys me about the Atari is that the list scrolls so fast it is virtually impossible to find, for example, the value of a certain variable.

Therefore I have created this program in order to avoid wear on the Break key or repeated typing in of LIST X, Y.

30080 REM LIST SLOWER 30090 REM BY PEREGRINE HILL 30100 FREE FNC,3,FNC 168255,4,1,NEW YORK WRIS CON80 30110 1 "STARTING LINE",INPUT ST 30120 1 "FINISHING LINE",INPUT FI 30130 1 "ENGAGEMENT",INPUT EN 30140 1 "STAND”,INPUT ST 30150 IF ST<>0 THEN 30180 30160 IF EN<>0 THEN 30170 30170 PRINT "PLEASE EDIT THE PROGRAM" 30180 REM END OF LIST 30190 REM LIST 30195 REM FOR EXAMPLE 30196 30200 REM PUB 2,1,NEW CURSOR BACK 20 30205 REM PUB 2,1,NEW CURSOR BACK 60

A recommended speed for this is about 250 but it depends how fast you can read. — Peregrine Hill, London.

American disc drives

A LETTER in the January 1986 Atari User of particular interest to me concerned using American disc drives in Europe and the question of the power supply.

I too am interested in buying an American disc drive, but am unsure of finding a transformer to handle the power difference and also 50 Hertz/60 Hertz cycle.

It was heartening to read that a normal Atari transformer would do the job. But in Mr Bloodworth’s letter and your reply it was never mentioned if he was buying an American 1050 or an alternative, such as an Indus, Astra and so on.

Personally I’m interested in an Indus GT. Would the Atari disc transformer work with this drive or would I have to find another transformer.

I await your reply with great interest and hope you can give a positive answer as I’m itching to order one. — P Malin, Holland.

● The Indus GT does not use the same power supply as the 1050, unfortunately.

Considering the relative prices, your best alternative would be to purchase a normal 1050 and US Doubler chip, which will provide you with just about everything that the Indus does, plus a much better chance of getting service cover should anything go wrong.

Composite adapter

I OWN an Atari 130XE and would like to use the RGB computer display which is fitted to my Hitachi monitor/TV.

Some time ago I bought a lead which fitted into the monitor socket in the computer and RGB socket in the TV.

When I used this, however, all I get is a blue and yellow screen accompanied by an annoying crackling. A friend once told me that an RGB interface was available and that this would do the trick.

Could you please tell me if such a device is available, and if so give me a price. If not, then could you tell me of any other way? — Philip Benson, Rayleigh, Essex.

● Composite to RGB adapters are very expensive — far more than your computer, for example. You would be better trying to connect the composite monitor output into a composite monitor, as there is absolutely no advantage in using RGB with an 8 bit Atari.

If the connection on your TV is a Scart type, or any other type which may be used by a video recorder, you can connect the Atari directly to it just by using the correct cable. Consult your TV dealer for more information.

Assembler advice

I HAVE an 800XL and would like to learn machine code. I therefore want to buy an assembler. Could you recommend a good one?

Also, is there a good Pascal available for the Atari? — M. Malik, Ilford, Essex.

● The best assembler on the market for the 8 bit Atari is probably OSS’s MAC/65 cartridge.

This is a full featured macro assembler, with resident full screen editor and de-bugger. It can be used for anything from simple routines to writing a full machine code game.

However for starting off the Atari Assembler/Editor is a cheap, but very slow alternative.

Draper Pascal is available in the States, but we don’t know of any Pascal available in the UK for the Atari.

Knocked black and blue

I AM having a little colour trouble on my 800XL. On the set up screen black and blue the blue area goes a slight greenish colour until I give the computer a little knock, when it goes back to blue for a short while.

It is also annoyingly noticeable on some games software. Could you tell me if this would just require a minor adjustment?

I would also like to suggest that you could do some hardware reviews as I’m sure your readers would find them beneficial. — N. Tait, Little Sutton, South Wirral.

● It would probably be best to take your equipment back to the dealer for a check-up.
THIS program was written in response to my youngest daughter’s request for something to administer her weekly spelling test.

It illustrates string storage in a loop by string joining, as opposed to a string array which the Atari lacks.

The user is invited to enter spellings that are to be tested. The words are then displayed singly on the screen and the user is invited to enter the spelling.

If the spelling is incorrect the word is redisplayed until a correct response is given. The number of wrong responses is counted and suitable reinforcements are displayed at the end of the program. These can be altered to suit the individual child.

Although the program works as it is, readers could use it as the basis for a more ambitious program. For example, you might want to allow no more than three wrong responses or you might want to give different feedback depending on the nature of the error.

Adults could make use of the program as part of a foreign language learning exercise, or even to improve their own spelling.

Make sure you enter the words correctly in the first instance.

Mike Rooke

**MAIN VARIABLES**

- **A$$**: Main string that substrings are joined onto.
- **NM$$**: The substring name.
- **X**: Number array to record number of letters in substring.
- **$$S**: Spelling attempt.
- **T**: Error counter.

**PROGRAM STRUCTURE**

- **30**: Dimensions strings and arrays.
- **50**: Initialises variables.
- **80**: String joining and counting sequence.
- **110**: Printing substrings from main string.
- **140**: Error counter.

NEWS FOR ATARI 8-BIT

Silica Shop, the UK's leading Atari specialists, based in Sidcup Kent, have announced a massive drop in the price of the Atari 1050 Disk Drive. The 1050 is compatible for use with the Atari 400/800 and 520/1040c computers and allows access to a range of over 450 disk-based software titles. The 1050 comes complete with DOS 2.5 and can also be used with other Atari Disk Operating Systems, making it compatible with the complete range of Atari Corp and Third Party software for Atari 8-bit computers. The addition of a disk drive is a great enhancement to any computer system, increasing storage facilities and cutting information access time to seconds instead of the minutes taken by the 400 or 1010 data recorders. Many professional/business programs are only available on disk and not cassette. Until now, only a limited proportion of Atari Computer Owners have been able to benefit from the power and speed of the 1050. Now Silica are pleased to speed up the 1050 to a new low price of £99.95. We also offer credit facilities allowing Atari owners to purchase it over 12 months for only £12.96 per month. The total purchase price over 12 months, with interest at a flat rate of only 16%, is only £174.66 (£144.95 + APR 3.9%).

FREE SOFTWARE

The 1050 comes with three free software titles: Atoll, and two of the DOS 2.5 Disk & Manuals. The Atari of these is The Payroll on disk, a new adventure game in which you play the leading role. On the reverse side of the disk is a demonstration program showing the Atari's amazing sound and graphics. Also included is Home File Manager which will help you organise your files. It allows you to see a list of all files in the directory and perform file operations such as opening, deleting, renaming, copying and printing. The software which comes free with the Disk Drive costs £12.96. The total price of £174.66 is £144.95 + APR 3.9%.

FREE POST & PACKING

Main Orders to the UK and EEC are sent from Silica with post and packing free. We provide a 24-hour service and aim to dispatch orders on the same day that we receive them. Any orders received after 12 noon will be posted the following day.

12 MONTH GUARANTEE

The 1050 Disk Drive comes with a full 12 month guarantee. Silica will replace any faulty 1050 Disk Drive with a new unit within this period.

**SMART ART (16k)**

- **Title**: SMART ART (16k)
- **Description**: Over 80 different colours can be displayed at once
- **Features**: 4 brush sizes, 3 brush speeds, airbrush mode, plotter
- **Drawings & Complete Sets**: Drawings & complete sets are available
- **Order**: Order includes either a single program or complete set
- **Price**: £4.50 each

---

**THE YOUNGER SET**

This series is aimed at 9 years and upwards.

**Unit 1: FIRST STEPS IN BASIC**
Starting with the first things every programmer needs to know, you will learn to issue commands to the computer, as well as writing and running programs. By the end of the unit you will be able to make your computer perform useful and interesting tasks.

**Unit 2: EXPLORING BASIC**
This unit teaches you the most important concepts of BASIC: numeric variables, string variables, FOR...NEXT and IF...THEN statements, and much more. You will create a digital computer clock, interesting graphics programs and a Zap the Bagels video game.

**Unit 3: MAKING BASIC WORK**
This unit teaches you how to use the POKE command for graphics and games. You will find out about creating interesting sounds. You will also learn much more BASIC, including READ - DATA, GOSUB - RETURN and Arrays. By the end of the unit you will have considerable programming skills.

£2.95 each

FOR many years the availability of new software and peripherals for Atari machines has depended heavily on America as the main source of supply. Recently this has begun to change, with more and more UK software houses turning to the development of software for the Atari.

Even so the majority of software released in the UK is of US origin, imported by companies such as US Gold, Ariolasoft and more recently Databyte. They are all engaged in licensing programs from American software houses and releasing them on to the British market and usually at lower prices than in their country of origin.

However even when a UK company licenses a newly released US title for manufacture in Britain it can take some considerable time to see it finally arrive in local computer stores.

Since Atari first started making an impact in Britain, back in the days of Cherry Leisure – the first company to import Atari products – UK users have found difficulty in obtaining American software as soon as it was released. More recently we have seen increased activity from two major Atari distributors, Software Express and Silica Shop, who both specialise in getting new software into the UK from the States.

Looking at developments in the two markets, it becomes apparent that the British are beginning to show much more independence, illustrated by the arrival of new software houses on the Atari scene, but British users still have to rely heavily on their cousins across the ocean to lead the way.

Many software houses have taken advantage of the 512k of RAM in the ST and developed sophisticated adventure games with both text and graphics. Penguin Software has released Transylvania and a follow up called The Crimson Crown (Return to Transylvania), the first in a series of illustrated novels with a 1000 word vocabulary and 100 detailed graphic pictures. However these are not up to the quality of those pictures to be found in The Pawn from Magnetic Scrolls.

Sundog: Frozen Legacy will turn a few heads. Available for the colour monitor version only, this is a massive science fiction adventure covering 80 cities on 18 worlds in 12 star systems. The real-time 3D action with scrolling display has its roots in Elite but you can also walk into buildings and barter with the animated characters you meet there. A very impressive piece of software.

For younger people there is Walt Disney’s Winnie the Pooh in The Hundred Acre Wood, produced by Sierra On-Line. This sophisticated adventure, for 7 year olds and upwards, features all the favourites – Tigger, Eyore, Piglet, Kanga, Roo and of course, Christopher Robin.

The package comes complete with a large map and a colourful booklet. Future releases include Mickey’s Space Adventure, Goofy’s Word Factory, and Donald Duck’s Playground.

Activision’s latest acquisition, Infocom, has released its latest adventure, called Ballyhoo. In this you join a travelling circus and find yourself engaged in the search for the owner’s daughter.

It’s an adventure that really lives up to the Infocom name. It has just started arriving in Britain and is currently retailing for £34.95 and is available for both 8 and 16 bit Atari machines.

One exciting new company in the ST field, based in Los Gatos, just outside Sunnyvale, California, is quaintly called Hippopotamus Software. Hippo, as I affectionately call them, have been engaged in producing software for the ST range for the last few months, but I was thrilled to find out what was in two new packages they are developing. Both are aimed at the music market, one for the home user and the other for the professional musician.

They are both sound sampling devices. Basically they are programs that allow you to record a sound, either from a microphone or a synthesiser and play it back through your computer. But there’s much more to it than this because you can edit its characteristics in many different ways.

For instance you can speed up or slow down the playback, or reverse the sound wave so that it is played back in the opposite direction to the way it was recorded. Or you can take the middle of the sound wave and place it at the end or at the beginning. Put like this, it might not sound that fantastic, but the resultant effect is quite outstanding.

Quincy Jones, one of the world’s most talented musicians and producers, has already placed his order for the package.

If you would like a better idea of what some of the effects sound like, just listen to groups like Go West, Sigue Sigue Sputnik and Paul Hardcastle.

In these articles I hope to bring you first news of new products appearing in the States, although I will not be attempting to give you detailed reviews. This I will leave to Atari User’s team of specialist reviewers.

Next month I will be bringing you a lot more gossip about new products and some still in development, plus some exciting news from Atari in the USA.
These back issues are still available

May 1985 issue: Profile of Jack Tramiel, preview of the new machines, Atari! Scaash!, Adventuring, Alphabet Train, Hexer utility, Software reviews, Sounds, the 6502 Microscope, Atari Insights - Bit Wise, Beginners and Graphics.

March issue: Machine code games Pt. 3, Knight's tour program, Compiler Pt. 1, Superscript review, Check-sums for early games, Book reviews, Adventuring, Software reviews, PLUS Atari ST User: Review of TOF's Multics 2, music via the Multi port, Making the most of the ST, and all the latest news.

£1.25 EACH
Zone X is an exciting action game for your 48k Atari featuring:

- 12 zones to clear of plutonium canisters
- 3 difficulty levels
- Four-directional scrolling
- Automaton robot guards to hinder you
- Self-operating laser doors to trap you

This challenging game “should keep the best of gamers occupied for many weeks” (Atari User March, 1986).

Keying in long programs too much of a chore?

Then give your fingers a rest by sending for our monthly disc or cassette containing all the programs from each issue of Atari User. See order form opposite.

JULY: Bomb Run: Plant the desert bomb and land safely. Disassembler: Find out what's going on deep inside your Atari. Treasure Hunt: Use logical thinking to find the treasure. Password Generator: Keep generating passwords till you find one you like. Keyboard: Convert your micro into an organ. Quasimodo: Can you sort out the mess of ropes in the belfry?
MAY: Cavern Escape: Can you help In-U-Go Joe escape from the labyrinth with King Munchin's gold? Player Missile: Program to accompany the start of the series. Spelling: Automate those weekly school spelling tests.
Your Atari needs protecting

Protect your ST, 130XE or 800XL with our luxury dust cover made of soft, pliable, clear and water-resistant vinyl, bound with strong cotton and decorated with the magazine's logo. Only £3.95

Keep your collection complete
