ATARI COMPUTER SHOW

10am-6pm Friday, April 24
10am-6pm Saturday, April 25
10am-4pm Sunday, April 26

Champagne Suite, Novotel, Hammersmith, London

On display for the first time in the UK will be new Atari products that are set to rock the micro world.

Star of the show will be Atari's IBM PC compatible, offering a radically new design at a price that will revolutionise the PC marketplace. There, too, will be the latest models in the ST range - the Mega ST workstations. Plus the remarkable Atari laser printer, the machine that has broken the price barrier in desktop publishing.

All of these - along with breakthroughs for the ever-popular 8-bit range and hundreds of new software packages - will be on display at the April Atari Computer Show.

Advance ticket order

POST TO: Atari Computer Show Tickets, Europa House, 86 Chester Road, Hazel Grove, Stockport SK7 8NY

Champagne Suite, Novotel, Hammersmith, London
April 24-26, 1987

Send for your advance tickets now - and SAVE £1 a head!
Atari Show launch for new PC model

IT has now been confirmed that the April Atari Computer Show has been selected as the UK launch pad for the company's IBM PC compatible machine.

At the same time it was made official that the event has been chosen for the official unveiling of the revolutionary priced laser printer and the latest in the ST range – the Mega ST workstations.

Company officials had previously considered releasing all these breakthroughs at the Which? Computer Show.

However it was subsequently decided to hold over until the April event, so providing Atari users with the opportunity to see the machines first.

"We felt we owed it to our faithful army of Atari fans out there", said a company spokesman.

"This will transform the event into a never to be forgotten occasion".

Such is the importance now being placed on the show that chairman Jack Tramiel and a party of VIPs will be jetting across the Atlantic to attend.

But even long before it was known that there would be major launches at the show, demand from exhibitors had been at an all-time high.

And a large number of these are reported to be preparing to release further new products.

While most companies involved would not divulge details before the show, Atari User managed to unearth several who would.

On the ST front, Precision Software is to introduce a multi-file relational database. Known as Superbase Personal, it is designed for use with Gem and is likely to carry a price tag of around £100.

Highsoft also has a new package for the ST in the form of a basic compiler. Compatible with Microsoft Basic, the price has yet to be decided.

Nor will 8 bit users be overlooked. In fact it would appear that on the software front new titles for this range will overshadow those for the ST.

Red Rat Software has three new games – Asteroid, Death Racers and Forbidden Island – all costing £7.95 on tape, £9.95 on disc.

And on the budget title scene, Tynesoft will be offering a range under its new Micro Value label all priced at less than a £1.

"This show is shaping up to be the most significant event ever in the Atari calendar", says Derek Meakin, head of organisers Database Exhibitions.

The Atari Computer Show takes place at the Novotel, Hammersmith, London from April 24 to 26.

Doors open at 10am each day and close at 6pm on Friday and Saturday, 4pm Sunday.

A money saving advance ticket order form can be found on Page 53 of this issue of Atari User.

In-depth manuals plan

FULL operations manuals – many in excess of 100 pages – are now to be offered with the Atari 8 bit range of packages from MicroProse.

The in-depth publications are already the hallmark of the giant American software house’s 16 bit simulations.

But in a move to strengthen its position as the market leader MicroProse will now issue the extensively researched booklets with its lower priced packages – including those costing just £9.95.

The glossy covered works contain not only detailed operational instructions, but also historical background information, notes from the designer and advice on further reading material on the subject.

"We pride ourselves on authentic and accurate simulations that provide not just a few hours of enjoyment but hundreds", says Stewart Bell, managing director of MicroProse in the UK.

"So that every player can get the most out of our simulations, we’ve decided to issue manuals with all our products”.

65XE makes its bow

WITHIN 48 hours of Atari UK’s new 8 bit level entry machine taking its bow, it attracted advance orders for 75,000 units.

Known as the 65XE, it was shipped from America to make its spectacular sales debut at the London Toy Fair.

In its basic form it is a games machine but can be upgraded to a 130XE compatible computer.

Offered in a grey case like the ST range, the 65XE is to be sold for £89.95, the price including a joystick and a games cartridge.

Interface

However it does not have a built-in cassette as previous reports from the States indicated, but simply a cassette interface.

The upgrade kit, which costs £40, adds a keyboard, lightgun and cassette recorder to convert it into a true 8 bit micro.

Atari had previously planned to replace the successful 2600VCS games machine over with the 7800VCS.

However officials at Atari UK persuaded their American cousins that the British market would benefit from a machine that could run cassettes – not just cartridges as in the case of the 7800.

"We feel that this offers the users over here the best of both worlds", said an Atari spokesman.

Atari keeps eye on Parliament

A NEW publication which monitors Parliament’s activities in relation to health is being produced with the aid of an Atari 1040STF.

Healthcare Parliamentary Monitor appears fortnightly while Parliament sits. It aims to provide a non-partisan account of all health care developments at Westminster and at the DHSS.

The newsletter is distributed to companies and individuals with a specific interest in healthcare - health authority managers, family planning clinics, community health councils, pharmaceutical companies, pharmacists, medical equipment manufacturers and suppliers, and medical academics.

It covers debates in both Houses, parliamentary questions and answers, government and Private Members’ Bills, and select committee meetings among other topics. Editor Rodney Deitch told Atari User: "The most important criteria for me when I was evaluating different micro systems was to get the right balance between price and performance. "The best value for money was definitely supplied by the Atari ST. It is important for me to upgrade the system shortly, and I am already looking into different desktop publishing packages as well as laser jet printers. "I’ve found the ST indispensable in the task of putting the newsletter together. At the moment I’m using HabaWriter, HabaView and HabaMerge and find them extremely easy to use."

Problem solving service

A HAMPSHIRE man has started running a correspondence course specially devised and priced for young Atari users who want to learn how to write programs.

Roy Goring bought an 800XL four years ago to teach himself Basic and machine code.

He is now an expert in Atari Basic and has devised his own style of structured programming which is simple to write and debug.

“My correspondence course is run on a very personal basis”, Goring told Atari User. “Each lesson is tailored to the needs of the individual because no two people learn at the same speed.

“I sell only one lesson at a time – priced £2 – because this allows schoolchildren who follow the course to save up and buy each stage when they can afford it. “I’ve also included a problem-solving service because when I was programming and got stuck I had no one to turn to for help.

“I deal with people’s problems on a personal basis for a minimum fee of £1, rising in accordance with the amount of work I have to do in order to help them.

“Although my correspondence course is relatively new it has already proved popular.

Adventure for all

AMERICAN publisher Strategic Simulations has converted Phantasie for the Atari 8-bit machines and Phantasie II for the ST.

Phantasie is a multiple role-playing game where a party of up to six characters is assembled to search the Isle of Gelnor for nine rings that will rid the land of the Dark Lord.

Players can create an elf who is a wizard, a dwarf who is a fighter, or combine in creative ways the eight races and six classes of characters which include humans, elves, dwarves, thieves, warriors and wizards.

More than 80 types of monsters oppose the player in a total of 10 dungeons.

Phantasie II takes players to the Isle of Feronor, a place of beauty and magic beset by evil power from an enchanted orb controlled by Nikademus, the Dark Lord.

Players gather a group of adventurers to sail to the island, use spells and weapons to invade it, escape dungeons and destroy the demons.

New option

ATARI 8 bit users have a new joystick option available to them - the Phasor One from Britannia Software.

Its design incorporates a pistol grip trigger action, with the joystick placed on top of the device to permit night vision by both left and right handed users. Price £12.95.

London
April 24-26

All-in-one package includes return rail fare from anywhere in Britain, accommodation at a leading hotel (including private bathroom and full English breakfast), plus a ticket for a top West End show and entrance to the Atari Computer Show. You can choose from: Les Liaisons Dangereuses at the Ambassadors, No Sex Please We’re British at the Duchess, Woman in Mind at the Vaudeville or Run For Your Wife at the Criterion. For an additional £4 you can see 42nd Street at the Theatre Royal, Cribet at the Strand, High Society at the Victoria Palace or Wonderful Town at The Queens.

The cost of the complete package is:

March 1987 ATARI USER 9
The parting of the ways...

FOLLOWING an overwhelming response from our readers after the recent survey in Atari User, it has been decided that the magazine will say goodbye to its younger cousin – Atari ST User – which from now on will be published as a magazine in its own right.

Starting with the April issues, Atari User will return to being wholly aimed at owners of 8 bit Atari computers. There will be lots of room for more utilities, games listings and tutorial series.

Atari ST User will at least double in size and this extra space will allow us to support ST users better than ever before. Forthcoming features include detailed reviews of all the latest software and hardware and a major new series on Gem programming which will include details of everything from dialogs to windows.

Publishing two Atari magazines every month will allow us to give much greater coverage to all that’s happening in the rapidly expanding world of Atari.

Whether you own an 8 bit, ST or both, we’re sure that you will welcome both magazines and we look forward to your comments and suggestions on ways you would like to see them develop in the future.

To take out an annual subscription to Atari User or Atari ST User please use the subscription form on Page 53. If you are already a subscriber to Atari User and wish to transfer your subscription to Atari ST User, please write (giving the name and address to which we send the magazine) to: Subscriptions Dept, Atari User, Europa House, 68 Chester Road, Hazel Grove, Stockport SK7 5NY.
CURE those trigger-finger blisters by adding a voice-operated fire button to your favourite joystick. Astonish your friends with a talking head, whose lips move when you speak into a microphone.

Or keep track of vibration from any source – fridges, washing machines, TV speakers or even major earthquakes. Or just train your computer to do tricks when you whistle. This gadget can do it all.

Since you can trigger it by touch or by blowing gently across the mike, it could find a less frivolous use in Possum-type systems to help severely disabled people open curtains, answer the door or switch the TV on and off.

It can also be easily adapted to accept inputs other than sound, but more about that later.

You can’t connect a microphone directly to the joystick port for two main reasons. Firstly, the output from most mikes is very small – a few thousandths of a volt at best – and the computer isn’t sensitive enough to detect it. Secondly the signal is AC, which the internal hardware can’t handle.

We need to amplify the mike’s output and convert it into a DC signal which switches cleanly between 5V and 0V. Then it can be connected to any of the five on/off input lines on your joystick port.

Figure 1 shows the circuit. It’s not the simplest possible design, but it is very versatile and costs only a few pence more than a rudimentary sound switch.

Stage 1 is a fairly conventional AC amplifier which converts the microphone output into a respectable voltage swing at C3.

Stage 2 is less conventional, built around an ordinary quad 2-input NOR gate chip. Two of the gates are wired as a monostable, which converts brief input pulses into output pulses long enough for the computer to detect.

The remaining two gates form a Schmidt trigger, which ensures a clean on/off transition at the output. Stage 2 is in fact a self-contained analogue-to-digital switch which behaves in the following way:

The input (point A) is normally held above 2.7V, by the action of VR1 and R5. In this state the output is held at +5V (logic 1). When a brief negative-going pulse is received from C3, point A falls below 2.3V and the output then switches very rapidly to 0V (logic 0). The Schmidt trigger action ensures that

Figure 1: Circuit diagram for the sound-activated switch
the gadget can't send out any intermediate voltage which might confuse the computer.

The monostable holds the output low for about one tenth of a second, no matter what happens at the input. If at the end of this period point A has gone back to 2.7V or more, the output returns to its high state.

Otherwise it remains low until the input voltage rises above the 2.7V threshold. This gap of 0.4V between rising and falling thresholds ensures that the output won't chatter on and off when the input is exactly at one or other of the trigger voltages.

Now let's look at practical construction. If you like to etch your own PCBs, the foil pattern is shown at Figure II.

Alternatively you can buy a ready-etched and drilled board from RH Design. Use the board as a template for drilling the case before you solder any components.

At the same time, it's a good idea to drill a small access hole so that VR1 can be adjusted when the case is assembled. Dimensions are given in Figure IV.

Figure III shows the component layout for the basic sound-operated switch. Notice that the 741 IC is inserted "upside down", with pin 1 in the top right position.

This IC needs no special handling precautions, but the 4001 chip is a CMOS device, so treat it with care. Avoid handling it unduly and get rid of any static charge on your hands by gripping an earthed metal appliance before touching the IC pins.

The amplifier (Stage 1) is matched to a microphone impedance of around 200 ohms, so a standard cassette mike will work very well.

Telephone inserts also give good results and these are cheaper and more robust, especially for applications which involve tapping or blowing. Crystal and other high-impedance microphones are not suitable.

Connect the microphone and joystick leads to their respective terminal blocks as shown in Figure III. If the mike has a screened lead, its outer braiding should go to the pin nearest VR1.

We've assumed you will connect the gadget's output to the fire button line at joystick pin 6, but any of the other four on/off input lines (pins 1, 2, 3 and 4) will work, provided you modify the software.

If you use joystick Port 1, these pins return a four-bit word at address 632, as we have explained in previous articles.

Plug the gadget into Port 1 and run Program I. Adjust the variable resistor until the number on screen is 0, then advance it until the number changes to 1 and holds there reliably. The text window will also change colour, so it's easy to spot the transition.

Now clap your hands near the mike. The number should change momentarily to 0, then return to 1. Fine adjustment of the variable resistor will set the sensitivity to suit your application.

At its best, the gadget will respond to a snap of the fingers at up to three
metres distance, or a pin dropping on a hard surface close to the microphone.

To give your joystick a voice operated fire button, use both ends of the extension cable. Cut the cable to remove a section from the middle leaving you with suitable lengths - about six inches in from each end of the cable is best.

Strip back the black outer sheath to expose the nine internal wires and join each wire back to its partner, matching the colours. Solder the joints and insulate all except the ones to pins 6, 7 and 8, then connect those three joints to the terminal block as shown in Figure III.

If you want to disable the joystick's own fire button, leave the socket end of wire 8 disconnected.

Plug your joystick into the extension socket, load up a game and set the gadget's sensitivity low enough to eliminate spurious triggering. Then shout, clap or whistle to blast away.

There's scope here for some simple fund-raising games if you can stand the racket. You may need to position the mike fairly carefully, so that it doesn't pick up sound from the TV speaker or other inappropriate sources.

If you would like the output pulse to last longer than one tenth of a second, there are two options. You can increase the value of R6 (10 megohms will give a delay of around three seconds) or you can build a delay loop into your software, as shown in Program II.

Program III is the "talking head" I mentioned earlier. Lines 10 to 50 put a simple face shape on screen, then lines 60 and 70 use the gadget's output to modify addresses 709 and 710, which control the mouth colours. This gives the effect (if you're imaginative enough) of lips opening and closing. OK it's a primitive program - but you could use the same principle for a much more impressive multi-coloured display, say in graphics mode 7.

Remember though that inexpensive mikes respond best to high frequencies. The gadget will pick up most consonants without difficulty, but it may not detect vowels unless you're very close.

The gadget can easily be modified to accept other types of input - for example, you can trigger it by touching the microphone input, even if there is no mike connected.

It's easy to make a touch-sensitive switch by attaching a wire, or metal pad (for example Maplin type HY01B), to the terminal pin nearest the mounting hole.

Many types of sensor - such as thermistors, pressure transducers and moisture detectors - change state slowly, so can't be connected directly to the on/off input lines.

Others (like photodiodes), can switch on and off so rapidly that the trigger pulse may be long gone by the time your computer gets around to looking for it. This gadget can be used as an interface for both types of signal.

To modify the board, leave out all the amplifier components and fit a two-way terminal block in place of R5,
PARTS REQUIRED FOR SOUND-ACTIVATED SWITCH

On your bike

Program: BMX Simulator
Price: £1.99 (cassette)
Supplier: Code Masters, 1 Beaumont Business Centre, Beaumont Close, Banbury, Oxon OX16 7AT.
Tel: 0295 69426.

THIS is another action-packed game involving healthy competition against the computer or a friend.

The title is a little misleading – it’s not a true simulator since the view is from above, but that shouldn’t detract from what is a fairly good game at the price.

Your task is to race your BMX bike round a track, avoiding various obstacles. There are seven different courses, each more difficult than the last, and with less time allowed to complete each race.

A steady hand and a level head are needed here. The courses can be learnt gradually over a period of time, so even the worst games player sees a marked improvement as he plays.

Richard Darling, author of the Commodore 64 original, has also incorporated an action replay feature, complete with slow motion, which is unique for a game of this type.

The graphics aren’t bad, but I’ve seen better. The courses are appropriately laid out, and the “Burmas”, as they’re called, slow you down on the way up and help you speed up and turn on the way down.

There are ramps and rough ground to traverse, and obstacles which stop you getting back on the course if you wander off line.

As the view is from above, the bikes appear quite small, but if you crash the rider flies over the handlebars and bike and rider are revealed quite realistically.

The music, written by David Whittaker, is catchy and pleasant, and includes a short fanfare at the end of each round. Sound effects include pedalling and thuds as you crash.

If you’re a BMX fanatic, or prefer racing to spaceing, then this game is right up your street – and it’s cheap enough to buy without leaving too great a dent in your pocket money.

Rob Anthony

Fine quartet

Program: Shoot ’Em Ups
Price: £9.99
Supplier: US Gold, Units 2/3, Holford Way, Holford, Birmingham B6 7AX.
Tel: 021-355 3388

COMPILATION packages abound these days, and that is generally good news for both software houses (who get extra mileage from ageing games), and Joe Public (who gets the benefit of buying games at very much reduced prices).

Cynics might say that they are an excuse for jobbing out otherwise unsaleable games on the back of one big seller.

While that may well be true in some instances, it is definitely not so with this latest offering from US Gold.

The four games in the package are Super Zaxxon, Blue Max 2001, Fort Apocalypse and Dropzone. Instructions in compilations are sometimes a little skimpy, but US Gold has provided a comprehensive and well-detailed set for all four:

Super Zaxxon is a fair representation of an old arcade favourite. You fly over enemy fortresses and through tunnels in glorious 3D, dodging firing dragons along the way. Graphics and sound are both satisfactory, and although the pace is a little slow it remains very playable.

Blue Max 2001 owes much to Zaxxon for its style, there being many similarities in the gameplay and appearance.

Again you must bomb or shoot anything that does or doesn’t move, progressing to the next level after a precision bomb run on a special target.

While Fort Apocalypse is let down to a certain extent by blocky graphics, the game itself is excellent and thoroughly addictive.

Your task is to rescue stranded prisoners in your helicopter, dodging and shooting floating mines, tanks and robocopters, ultimately blasting the very heart of the fortress.

Dropzone is to my mind the best of the collection, and perhaps the best all-out blaster I have seen for the Atari.

The graphics are superb, the sound excellent and the action smooth, fast and furious.

Your moon base is attacked by aliens and you must gather in your comrades to the relative safety of the base.

Apart from the aliens you’ll have to watch out for molecular acid clouds, proton lightning bolts and erupting volcanoes. This game is sheer chaos and destruction from start to finish.

All in all, Shoot ’Em Ups lives up to its name

**Rambo rampage**

Program: Gun Law
Price: £1.99 (cassette)
Supplier: Mastertronic, 8-10 Paul Street, London EC2A 4JH
Tel: 01-377 6880

THE sales hype on the Gun Law pack starts off: 'Four months of bloody alien attacks have taken their toll...'

However anyone buying this game and expecting to see aliens is going to be in for a surprise and possibly a disappointment.

There you are in your smart blue army uniform at the bottom of the screen, brandishing your machine gun, ready to sort out the invaders from outer space. But hold on, those are soldiers shooting at you. In fact they are identical to you in every respect, but for the fact they are wearing green instead of blue. Whatever happened to the aliens? I certainly never saw any.

Anyway, the aim is to run up the screen with the background scrolling vertically downwards, fending off your attackers.

Various objects can be used as cover from enemy fire, such as trees, fences, rocks and buildings.

Due to some programming laziness, grass, ponds and small pebbles will also stop speeding bullets.

Once you reach the end of the zone (no easy feat) you must negotiate a flashing electric fence and then go through the same exercise in the next zone. Naturally your enemies are better armed and there are more hazards to contend with. So it goes on until you reach the fifth and final level.

The graphics in Gun Law are adequate, though they do have some oddities.

For example, an alien walking in front of your Rambo character is masked out as if it had gone behind.

The animation of the figures is minimal and movement is limited to up, down, left and right. The game would have been improved by the inclusion of diagonal movement.

With the high standards attained by many of the budget games around these days, I had expected a little more from this game.

It has nothing to particularly recommend it, but neither does it have any serious faults.

Gun Law is a no-frills budget shoot-'em-up and as such still represents fair value at under £2.

Paul Mills

**Bandits ahead**

Program: Spitfire 40
Price: £3.99 (cassette) £12.96 (disc)
Supplier: Mirrorsoft, Maxwell House, 74 Worship Street, London EC2A 2EN.
Tel: 01-377 4600

"SCRAMBLE! Scramble! Bandit coming out of the sun at one o'clock."

"He's all yours, Ginger, and try not to prang it in the briny this time."

Now that's the sort of gung-ho atmosphere I was hoping would be generated by this Spitfire flight and combat simulation program. Alas, it was not to be.

While Spitfire 40 is quite a good little simulation it didn't quite have the zip and excitement I had anticipated. Perhaps it was because I felt that much better use could have been made of the sound potential of the Atari.

The main screen is, as you would expect, a view straight ahead from your seat in the cockpit.

Not much to see, really, except acres of green grass and miles of the wild blue yonder.

Pressing the spacebar toggles you to and from the instrument screen. This shows fuel gauge, airspeed indicator, artificial horizon, VSI, engine rev indicator, slip and turn indicator, compass, altimeter, rudder and pitch indicator.

A further screen provides a map of South-East England showing your position and three areas which can be examined in more detail by a zoom feature.

You control the Spitfire using either a combination of joystick and keyboard or keyboard only.

Spitfire 40 lets you choose a practice flying session or to go straight into combat.

Unlike many simulators, getting the plane off the ground and keeping it up there is pretty easy.

In combat mode a number of enemy craft will appear, sometimes ahead, sometimes in your rear view mirror.

You give chase and manoeuvre your Spitfire to line the enemy up in your sights.

When you fire you hear the rat-a-tat-tat of your eight Browning machine guns and see the bullets spraying out from below both sides of your cockpit.

If the enemy craft is hit it immediately but silently disintegrates and disappears.

Response to joystick and keyboard is a fraction slow but not so much that it spoils the gameplay.

Not quite the spiffing show I'd hoped for, old bean, but jolly fair nonetheless. Chocks away!

**Software**

**Fight to survive**

Program: Red Max  
Price: £1.99  
Supplier: Code Masters, 1 Beaumont Business Centre, Beaumont Close, Banbury, Oxon OX16 7RT. Tel: 0295 68426

THE screen shots on the inlay card looked promising and I had high hopes for Red Max. After 22 minutes loading my enthusiasm was beginning to wane slightly, but thankfully it loaded first time.

The storyline revolves around the survivors of Earth's Global War who have colonised the moon. Things start off well enough for the fugitives, but unfortunately a band of renegade Death Lords hitch a ride in order to sabotage the power plants.

It is your job to get on your lunar motorbike, find the mines they have planted and de-activate them.

Having disabled the mines you progress to the engineering level, turn on the back-up nuclear cooling systems and shut down the main power plants.

Lastly you must descend to the hibernation complex and wake up nine crew members. You have an aerial view of the whole operation.

Controlling the bike with the joystick is simple. The only controls, apart from left and right, are acceleration and deceleration, achieved by pressing and releasing the fire button.

You must avoid collisions with buildings and walls while negotiating flashing laser fences and gates.

To neutralise the mines, collect fuel, temporarily disable laser fences and switch off reactors, you'll have to ride over certain key objects.

I found the game very pleasing visually, with smooth movement and detailed graphics.

There are complaints, however. In particular the bottom two thirds of the screen is taken up by the motorcycle console which shows speed, revs, fuel level and the state of your shields.

There is also a small prompt screen that tells you what to do next and warns of low fuel levels.

The console looks very pretty, but actually contributes little to the game.

Despite this, Red Max is one of the best budget games I've seen.

Paul Mills

**Trickier Willie**

Program: Jet Set Willy  
Price: £7.95 (cassette) £12.95 (disc)  
Supplier: Tynesoft, Unit 3, Addison Industrial Estate, Slaidburn, Lancs. Tel: 091-414 4611

JET Set Willy was originally written for the Spectrum and remains one of the all-time greats of computer gaming.

Tynesoft have now produced it under licence for the Atari, nearly three years after it was originally published by Software Projects.

The story so far: Miner Willy has returned home from his adventures and throws a party to celebrate.

However Maria his housekeeper won't allow him into bed until he has gone around the mansion and collected all the glasses.

You move Willy through the house and grounds, down stairways, up trees, swinging over obstacles on ropes, making jumps that require great precision and avoiding the many and various creatures that are out to get him.

The game remains faithful to the layout of the original, but unfortunately loses in the translation.

The graphics on the Spectrum are bright, lively and have a good deal of humour and charm.

Tynesoft seems to have made the conversion too literally. With the Atari's far superior graphics capabilities I had expected a riot of colour and fast moving action.

I got neither, the graphics being lacklustre, controls sluggish and the movement too slow.

Tynesoft has very deftly improved one part of the game - the music is superb. It can be switched off if necessary, but I really enjoyed it and kept it on.

If the music is switched off you are left in total silence, with none of the trills, bleeps and burbling that denote jumping, falling or whatever.

No great loss perhaps, but I do feel they would have added to the atmosphere. In its own right, the game is playable and more tricky to get through than the original.

The coordination and accuracy required to clear the gremlins and obstacles is considerable and the game will still appeal to those who like this sort of pixel-scraping challenge.

Niels Reynolds
Now's the time to link your Atari to the big wide world!

Join the communications revolution and use your Atari (plus the telephone) to roam the world... logging on to Microlink, Telecom Gold, Prestel, Micronet and the ever-growing number of bulletin boards, both in the UK and USA. Help yourself to hundreds of free telesoftware programs - and much, much more!

You'll be able to read all about it in Britain's No. 1 communications magazine TeleLink. Each issue contains an up-to-the-minute guide to all the modems and comms software now available for the Atari range.

Here's a special offer for readers of...
For every subscription ordered using the form below, we will give you free registration to Microlink, worth £5.

If you would like to take advantage of this offer, don't forget to tick box!

The truth about TELEX

How much does it cost to go on Telex?

You could go the conventional way and buy a dedicated Telex machine. The cheapest will cost you £1,604 (the Whisper), the dearest £2,692 (the Cheetah). You will also need a separate telephone line, costing £101 to install, plus £404 a year rental. That's a total outlay over the first year of a minimum of £2,109. (All prices include VAT.)

Or you could do what more and more micro users are doing - use your Atari to double as a Telex machine. And just use your ordinary telephone!

How do I turn my Atari into a Telex machine?

All you need is a modem and appropriate communication software (see the advertisement in this issue), a telephone, and a subscription to Microlink.

Telex is just one of a growing number of services available to micro users on Microlink. With it you can also read the news as it happens, go teleshopping, create your own closed user group, send telemessages and electronic mail right round the world, download free telesoftware programs directly into your micro... and much more.

But why use Telex?

Because it's a standard means of instant communication between businesses. Today there are 150,000 Telex machines in use in Britain - and more than 2 million worldwide. They need it to dramatically speed up business communications - just as quickly as using the phone but far more efficient, because you have a hard copy of every "conversation" for your records.

But there's a big bonus you get when you use Microlink for Telex that the conventional way doesn't offer.

With Microlink you don't HAVE to be in your office to send or receive Telex messages. You can just as easily use your computer at home (or even a portable). So now you can check whether there are any Telex messages waiting for you - anywhere, anytime. How's that for your business efficiency?
By Brilig

JUDGING by the number of letters received on the subject, one of the most frequently played adventures seems to be The Payoff, so it's not surprising that I should get more requests for assistance with this than with most others.

Conrad Wilson of Llangollen knows that you have to change the bit in the drill but cannot find the exact combination of words to do it.

He is also having some difficulty getting the hoist and wonders who has the key to the car.

On the same adventure, Domhnall Dods from West Lothian almost finished but cannot help triggering the alarm when he drills through the door of the vault.

GLITCH OF THE MONTH

Stewart Parsons from the Isle of Wight has spotted a cracking glitch in all things, Infocom's Spellbreaker. To get the cube from the hermit's hut, you're supposed to collapse the hut by using the Caskly spell.

However, if instead you CAST FROZTZ AT CUBE then EXTINGUISH CUBE, the response begins "taking the cube first"... which leaves you nicely in possession of the cube. Well done, Stewart, that's a smasher.

The Payoff goes something like this

Perhaps you're trying to get in the wrong way, Domhnall — have a look at the hoist hints.

Staying with The Payoff, Stewart Parsons from Cowes would like to know the exact words for getting through the window.

Stewart would also like some advice on how to get the cube from the Roc's nest in Infocom's Spellbreaker and how to get the alloy wheel in Level 9's The Price of Magik.

Finally, F. Chessell of Brighton is anxious to know how to solve a couple of problems with Lords of Time from Level 9.

He wants to know how to overcome the troublesome Pirate Pete and what to do in the colossal Habidrome.

That's all the help for this month. Be sure my YTS gnomes stay busy by keeping those letters rolling in. After all, they are being paid two ounces of Troll's gold a week and must have something to do besides plagiarise all my best spells. Exciting adventuring!

March 1987 ATARI USER 21
CIO devices:

Easier file handling

In the first two parts of this series we looked at the theory behind data input and output on the 8-bit Atari, and at the operation of the Central Input/Output system. We've also tried out a simple program which used CIO from machine code. Now it's time to look at the other facilities that CIO has to offer.

We have so far seen three CIO commands in use — Open, Put Text and Close — but we didn't go into any real depth on how they worked, or look at the other options available.

There are actually seven general commands available to CIO, plus a whole host of other device-specific instructions. The main commands are: Open, Get Text Record, Get Binary Record, Put Text Record, Put Binary Record, Status and Close.

They all have different uses with different types of device, and not all are applicable for all devices. For example, it's nonsensical to try to get data from a printer or put data to the keyboard.

Some commands, most notably Open and Status, may need to operate very differently each time you call them.

With Open, for example, you may wish to create a new disc file, open a long-gap mode cassette file for reading or even set up a channel to a particular graphics screen.

If you remember from last time, we said that each channel has its own control block of data — known as an IOCB — which you must set up before calling the CIO system (see Figures I and II).

Thus each time you use the Open command you need to set the relevant ICOM byte to 3 and the buffer address (ICBA1 and ICBAH) to point to the string containing the device name (such as "D:FRED" or "C:").

Part 3 of André Willey's series on the Atari's input/output facilities

The buffer length pointer (ICBB1 and ICBBH) is rarely used with Open, but in order to handle such a wide variety of functions the command does make full use of the first two auxiliary data bytes.

ICAX1 is used to specify the mode you want the device to adopt: If you require input, for example, you would use 4 and output would be 8.

Some devices are capable of doing both at the same time, so the two are added together to give a value of 12 for use with an input/output file.

Sometimes a device is capable of much more — such as the screen handler, which must know what graphics mode you want, and the disc and RS232 handlers which both allow various special options. These facilities are selected by using both ICAX1 and ICAX2. A full list of the options is given in Figure III.

If you examine the screen handler entries very carefully you will spot the answer to last month's puzzle — remember, the two numbers after the channel number in an OPEN statement are stored as ICAX1 and ICAX2 — so all the line did was to simulate the GRAPHICS 7 command using CIO.

After Open, the next four CIO operations control the actual transfer of data to and from the channel, with two commands for input and two for output. Obviously, if you try to output to a channel you've only set up for reading you will get an error.

The two modes of input and output are Line (or Text) and Binary, both of which actually operate in a very similar manner.

A binary record is a block of characters or data of fixed length, while a text record is a set of characters terminated by a Carriage Return byte (Ascii code 156). Text is normally dealt with in line mode — as Basic does with its strings, for example — whereas raw data is often processed as a binary record.

Command 9 will output a text string that:

* Some of the RS232 functions are very complex and are beyond the scope of this series. However, once enabled, concurrent I/O mode will prevent the use of any other peripheral I/O.

Figure III: OPEN command parameters

starting at the address in ICBAL/H and will keep sending characters until it comes to a Carriage Return.

Don't forget that whole numbers which need to be stored in two bytes — such as the buffer address in ICBAL and ICBAH — are always stored in the low-high format we talked about last time.

Command 5 is the input option for use with text strings. This will continue reading characters from the I/O channel and storing them in your buffer area (again given by ICBAL/H) until it finds a Carriage Return.

If you are worried that this might overflow your buffer area you can also specify a maximum number of characters by storing the size in the ICBL/H length count.

Command 11 is the Binary Put command, which will send a specific number of bytes to the file. The start of the buffer is given as ICBL/H and the length is given by ICBL/H.

Command 7 is the input command for binary data, which will input a given number of bytes of data and place them into your buffer area. As with Binary Put, the buffer address is given as ICBL/H and the number of bytes to transfer by ICBL/H.

It is quite common practice to use Binary Get mode to read a whole file into memory and to this end CIO will return the actual number of bytes which were transferred before the end of the file was reached. This number can be found in the length counter (ICBL/H) upon completion.

In addition, there is a special form of the Binary Put and Get commands. If you select a length of zero — by placing a zero in both ICBL and ICBL/H — then a single byte of data will be transferred to or from the 6502's main A register.

No data is placed into or read from

Figure IV: CIO command options

The reason why you shouldn’t place it into a string just as easily. The return address is 1536 and the parameters are as follows:

1. Address of machine code (1536)
2. The channel number (which you should have already OPENned for input or output)
3. The command number (7 for input, 11 for output - used by ICCOM)
4. The buffer address in memory (ICCBH/H)
5. The number of bytes to transfer (ICCBH/L)

The program routine will also return the actual number of bytes transferred. This might be different to the number you actually asked for if the file ended early or the disc was full.

There are just two more major commands to cover now, the first of these being the Status routine. When called, this will return a value to ICSTA for the device in question.

Most devices do little with this facility, but it is especially useful for the printer. The RS232 driver.

The cassette, keyboard, screen handler and editor simply return a token value of 1 to the ICSTA register.

The disc system returns a simple set of codes - 1 for normal file, 167 for locked file and 170 for file not found.

Both the printer and the RS232 driver return a block of four bytes of status data and store it in a special location called DVSTAT (Device Status) which is located at $2EA ($746 decimal). For more information on its contents, consult your RS232 manual.

Finally, we have the Close command, the simplest of them all. All you need do is place the value 12 into the ICCOM register and call CIOV. No other parameters or data are needed.

Some devices - such as the disc, screen and RS232 handler - also have their own unique commands. These are not normal CIO commands but are designed to handle the extra functions supported by that particular piece of hardware or software.

For disc files, command 32 does a Rename, 33 is Delete file, 35 and 36 are Lock and Unlock files, 37 and 38 are Note and Point and 254 will format the disc.

Some of these do not need the channel to be previously Opened as they contain the full filespec themselves, pointed to by ICCBH and ICBSH. The DOS manual gives more information on these commands.

For the screen handler (‘S:) you can use command 17 to draw a line and 18 to fill part of the screen - again, more information is available in the manuals.

The RS232 driver supports command 32 for sending an incomplete block of data, 34 to control the handshake lines, 36 to alter the baud rates, word size and number of stop bits, 38 to change the ASCII translation mode and finally 40 to start the concurrent I/O mode.

Those of you who have used the XIO command from Basic will now have realized that XIO is in fact a simple way of calling the CIO system.

The normal format of the XIO command is:

```
 XIO cmd, #channel, aux1, aux2, filespec
```

The first parameter is the command number (stored in ICCOM). Next comes the channel number (which is converted to the IOCB number).

The two auxiliary data bytes are stored in ICAX1 and ICAX2 and the filespec is accessed by setting ICCBH and ICBSH to point to it.

All the CIO commands we have been discussing are listed in full in Figure IV, but if you want to read up some more on the subject take a look at the Operating System User's Manual, which is part of Atari Technical User Notes.

This month’s I/O question is: Why can’t we use the very useful XIO command to access the Binary Put and Get functions from Basic, rather than using a special machine code routine to do the job?

- I’ll let you know the answer to that one next time, when we’ll start looking at how to make up your own machine code device driver programs, how to patch them into the CIO system and what rules to follow to make them ruggedized.

For Atari 520/1040 ST
LDW BASIC COMPILER
The best selling, most professional BASIC
in the USA!

Some important LDW BASIC advantages:

- Compiler time
  - Compiler can be invoked as a menu driven GEM application.
  - Can be run from a batch file.
  - Can be invoked as TOS command, or from any UNIX-like shell.
  - Easy to tailor to your system configuration.
  - Compatible with all RAM and hard disks.
  - Produces binary or assembly source output.
  - Many very useful options.

Run-Time
  - Application can customize the RAM memory layout.
  - Both single and double precision floating point.
  - Very fast integer arithmetic.
  - LDW BASIC creates the fastest ST programs on the market! (In some cases the best "C" compilers produce marginally faster programs).
  - Fully dynamic arrays, i.e. application can reallocate RAM memory.
  - No other Basic or "C" compiler allows array indices to take any integer value, even a negative! Program may define base of an array.

The first professional Basic compiler for Atari ST has arrived!
The LDW BASIC Compiler is very easy to use, but as powerful as the best professional developer's packages for the "C" language.

Reviews
"LDW BASIC will compile ST BASIC programs into blazing fast, PRG files..."
Mike Rekin
Antic Magazine

"The LDW BASIC Compiler is clearly superior to its competitors in virtually all respects..."
Mark Eisman
Current Notes

"The DAC Easy accounting line for the Atari ST, was developed using LDW BASIC, the best ST BASIC compiler on the market!"
Irreal Aquil
Vice-President
DAC Software

"I'm very impressed with the performance, and easy of use of the LDW BASIC Compiler. It works beautifully, and there are no nasty surprises!"
Joe Hayden
Micro-Tech Consultants, Inc.

To get your copy of the LDW BASIC Compiler, just visit your local dealer, or order directly from the Geneva address below.

A compiler's the if you want fast

HAVE you ever sat at your keyboard, gazing at a blank screen, and cursed the snail-like pace with which Basic runs your programs? I doubt if you're alone in this activity — most of us go through it from time to time.

The obvious solution is to write your programs in machine code instead, as this runs hundreds of times faster than Basic and is very much more flexible. However, machine code is not as easily mastered as Basic and it requires considerable time and effort to create quite small sections of code — you only need to look at the 80 line machine code equivalent to the Basic LPRINT statement last issue to see the problem.

Let's take a look at the reason for the speed differences, and at one possible solution.

Firstly, you must understand that the computer always does its internal work in machine code, no matter what language you decide to write your programs in. So if you use machine code too the computer is given the job in an easily digestible form and can thus function much faster.

Basic is itself a very sophisticated machine code program which takes your input in simple English-like words and converts them into machine code that the computer can understand.

However, because you will often be adding and deleting parts of your program, Basic only does this conversion when you finally RUN your new masterpiece.

Each line the computer comes to is translated into a machine code form and then executed, then the process starts all over again for the next line.

While the machine code itself is very fast, the conversion process takes time — and this is where the speed problem lies.

The ideal situation would be to write your program in a straightforward English-like language and then have the computer convert the whole lot into machine code in one go.

The result would execute almost as quickly as it would if you had written it in machine code in the first place, because no more complex conversions need be carried out at run time.

Is there an answer to this pipedream? Luckily, there are quite a number of these type of languages — known as Compilers because they compile your program into its machine code equivalent.

These include C, which is also very popular on the ST range, Pascal, Forth, Lisp and many others.

These are all languages which were designed with much larger machines in mind and can thus be quite unwieldy to use on an 8 bit micro such as the Atari. They also tend to produce much larger files than a pure machine code author would generate.

A few years ago, a Californian firm called Optimised Systems Software decided to produce a compiler written especially for the 8 bit Atari.

Unlike Forth, Lisp and the others this would have the advantage of being similar in style to Atari Basic but should also be able to create very fast, compact machine code.

Thus Action! was born.

Written by Clinton Parker, Action! is the result of many months of hard work and is now widely regarded as one of the simplest but nonetheless most powerful alternatives to Basic.

The language comes on a special type of cartridge known as a Super Cartridge, which is a way of packing 16k of information into an 8k slot in memory using a technique called bank switching.

It consists of four main segments — the Editor, Monitor, Compiler and Library.

The Editor is rather like a word processor and is in itself very flexible. It is here that you create your Action! programs in the same way as you would type a letter into AtariWriter.

There are no line numbers, and no LIST command — you simply use the cursor keys to move about your whole program at will.

Full search and replace options are available, and any line may be up to 128 characters long — and each line (or the whole screen) can be scrolled across the normal 40 column screen.

Two windows containing completely separate programs are available and you may cut and paste between them with ease.

Once your program is complete you can return to the Monitor, which allows you to control the system. From here you can select the various options and compile and/or run programs.

The Compiler itself is extremely fast — often completing programs many hundreds of lines long in less than a second.

This is the business end of the language and it turns your program text into very compact machine code ready for the 6502 to execute. This code may then be run or saved to disc for later use.

The final module, the Library,
contains pre-written routines to take
the hard work out of programming.
It provides all the features you are
used to having at your disposal from
Basic, such as input/output opera-
tions, graphics and sound, string
handling and so on.

This is one way in which Action!
manages to create such tiny machine
code files (otherwise known as object
files) – all these space consuming
functions are contained within the car-
tridge instead of cluttering up your
final program.

This does have the drawback that
your programs may only be run with
the Action! cartridge present, al-
though it is possible to buy a Run-
time Library, which effectively adds
this set of routines on to your final
object file.

Once this has been done, your pro-
gram is completely free-standing and
may be run on any Atari with or
without the cartridge.

Since there are no line numbers,
structuring your work carefully is most
important. You write your programs
as a set of small modules – called
Procedures – which may call each
other at will.

Each time you call up a procedure
you may pass information and vari-
able to it in the form of parameters,
which are illustrated in Program I.

There are limits to the ways in which
you may use procedures, however –
the most important being that you can’t
forward reference them, meaning
that a given procedure must be
defined before you try to access it.

Variables must also be defined
before you use them, either at the start
of the whole program (global vari-
able) or at the start of a procedure
(local variables).

Globals may be used anywhere in
the program but a local variable may
only be called from within its own
procedure.

To speed up the computer's job,
variables are stored only as whole
numbers since fractions take a lot of

time to calculate – and besides, most programs simply don’t use them. If you do need to use real numbers then a floating point package is available as a set of procedures to include within your programs.

Variables may be defined as BYTE (a value between 0 and 255), CARD (two bytes, a value between 0 and 65535) and INT (two bytes again, but also allowing for negative numbers, –32768 to +32767).

It is also possible to set up arrays of any of these types, or indeed arrays of arrays. A string is defined as an array of characters – or an array of BYTES to be more accurate.

One of the most powerful features of the Action! language is that variables may be set to point to any location in memory.

You could, for example, define the variable BACKGROUND to be stored at memory location 710, the background colour register. This would be achieved very simply with:

```
BYTE BACKGROUND = 710
```

Programs are mainly made up of loops and conditional statements. These are the equivalent of Basic’s FOR...NEXT and IF...THEN commands, but you have a lot more flexibility in Action!

Loops may be controlled by the FOR...NEXT, WHILE and UNTIL statements. Conditional operations are likewise improved with the fundamental IF...THEN being supplemented by ELSE and ELSEIF. All of these control operations are demonstrated by Program II.

It is interesting to note that there is no direct equivalent to the GOTO statement since all flow control is handled by loops and procedures. This encourages you to write good, readable software.

If you compare the listing in Program II with a normal Basic program you will probably find the former much easier to read and understand, even though you have probably never seen the language before.

The real power of Action! comes in everyday usage. Things which were once complex and unwieldy in Basic can be accomplished with ease and speed in an environment which also encourages you to explore the system’s potential in ways that Basic’s PEEKs and POKEs prevent.

So powerful is the language that many commercial programs have been written in it – the obvious example being HomePak, the integrated word processor, database and comms package.

The Action! editor is so flexible and simple to use that it has been used as the core of a number of word processors.

In short, Action! is probably the nearest thing to a perfect programming environment that you are likely to find on the 8 bit Atari, though it is perhaps a little pricey for the pocket money programmer.

It is extremely fast, yet simple to learn and use for everyday applications – though complete mastery will obviously take a little time.

In fact, it is probably a better second language for the advanced Basic programmer than machine code.

KYAN Pascal from Kyan Software gives you a full Pascal compiler and programming environment which could easily replace Basic as the main language on the 8 bit Ataris.

This implementation of the famous language opens a wide new world to the Atari programmer. Complex data structures, recursion and a host of powerful commands provide you with capabilities Basic could never hope to match.

Pascal was written by Kathleen Jensen and Niklaus Wirth of the Institut für Informatik in Zurich and was named after the 17th century mathematician Blaise Pascal.

It was first published in 1971 and then ran only on the Control Data 6000 series of computers, the most powerful of their day. Jensen and Wirth had as their goal the creation of a new structured general purpose language that would be ideal to teach the concepts of programming as well as suitable for use in commercial software houses.

A structured language, Pascal allows the programmer to write his code in separate building blocks that can be linked together to accomplish a set task. Because of this approach, Pascal programs are also self-documenting.

Anyone knowledgeable in the language should be able to pick up a piece of code and understand what is going on relatively quickly. And the compartmentalisation of tasks reduces the likelihood of changes to one section of code adversely affecting another.

The two keys to Pascal's building block approach are procedures and functions. Both are roughly analogous to the subroutine in Atari Basic but are considerably more powerful in that they allow the use of local variables and recursion.

Local variables have meaning only within a procedure or function, unlike Basic where all variables are global and so can be used anywhere in the code.

Recursion is the ability for a subroutine to call itself repeatedly—a valuable ability in many mathematical problems. Pascal excels at this as its

```
program Hanoi (input, output);  (*Recursively solves the Towers of Hanoi problem. Moves disks from A to C.*)
  var Height: integer; {All variables must be defined}(*
  procedure Move (Height: integer; FromPeg, ToPeg: char); (*More variable declarations*)
    (*Recursive procedure for determining moves.*)
    begin
      if Height = 1 then writeln ('Move a disk from ', FromPeg, ', to ', ToPeg);
      else begin
        Move (Height-1, FromPeg, ToPeg, UsingPeg, ToPeg);
        writeln (Move a disk from ', FromPeg, ', to ', ToPeg);
        Move (Height-1, UsingPeg, ToPeg, FromPeg, ToPeg);
      end
    end; (*Move*)

begin (*Main Program*)
  writeln ('How many disks are you going to start with?');
  readln (Height);
  Move (Height, 'A', 'C', 'B')
end. (*Hanoi*)
```

Program I: Kyan Pascal Listing

use of local variables allows it to keep track of how deeply it is layered on itself. By defining your own procedures and functions, you can tailor the language to your specific applications and at the same time build a library of functions and procedures for use in other projects.

When you have Pascal's powerful program control statements such as IF-THEN-ELSE, WHILE, CASE, REPEAT and FOR TO and the option to define variables and records beyond the character string options of Atari Basic, poor old Basic seems hopelessly limited.

As an example of Kyan Pascal, Program 1 is a solution to the famous Towers of Hanoi puzzle:

- What exactly do you get when you buy a copy of Kyan Pascal? First of all, you get a standard Pascal, not some unique dialect.

This means that any programs you write, with the exception of those that make use of sound or graphics, should run on any other Pascal system from micro to mainframe.

Perhaps more importantly, the fact that Kyan has produced a package that conforms to the International Standards Organisation (ISO) standard for Pascal means that the vast amount of Pascal code already in existence can be used on your Atari with little or no modification.

You also get a complete Pascal environment, including compiler, editor and macro assembler.

The editor is a very capable part of the package. All the standard cursor controls used in Basic still apply, along with the addition of control codes to allow search and replace, cut and paste and full file manipulation.

If, however, you prefer AtariWriter or some other word processor, you may write your code on that system for compilation later.

At the heart of Kyan Pascal are the Pascal compiler and the 6502 assembler. The former takes the Pascal source code you write and produces assembly language source
code: The assembler then produces an executable machine code file.

As a bonus, Kyan has added extensions to the compiler for both sound and graphics, as well as random file access capabilities not normally supported in other Pascals.

Nothing is perfect, but my only complaint is that the compiler is painfully slow. Program takes 95 seconds to compile and makes the disc drive whir and grind like a 1961 Morris Minor running without oil. Even loading the compiler takes over 25 seconds.

There is some respite, however, if you own a 130XE. You may load the compiler, source code, standard library and so on into the RAM. Loading now takes less than three seconds and compile times are cut in half.

There is nothing wrong with the code the compiler produces though. Unlike some other versions of Pascal for micros (which produce an interpreted language known as p-code), the Kyan package produces native 6502 machine code which runs extremely quickly—some five to ten times faster than Atari Basic.

If this increase isn’t enough for you, Kyan has thoughtfully allowed the programmer to place assembly language routines right in the middle of his program. I found this feature a lot easier to use than thrashing about with the Assembler/Editor cartridge.

A little bit less than 27K of ram is available for your program and so far nothing I have written has come close to using up even half the available memory.

In the event that you need to write a program that would exceed the size of your computer’s memory, you can chain two or more programs together and allow them to share variables between them as they execute.

The documentation that comes with Kyan Pascal is extremely good. The 274 page manual contains sections on using the package, assembly language programming and an excellent tutorial that leads you by the hand as you explore the capabilities of Pascal. Additionally, there is a comprehensive index, something all too rare nowadays.

There is also an optional bi-monthly newsletter available from Kyan with articles on Pascal and assembler programming, handy procedures and functions to add to your own library, and a forum for users’ letters and questions.

Kyan Pascal comes on both sides of a single density, unprotected disc. Included with the compiler, editor and assembler are DOS 2.5, utility files and a few example Pascal programs (both source and object). It will run on all 8 bit Ataris with 48K or more ram.

Kyan Pascal is a real Pascal. It puts you on a par with every other Pascal user and broadens your scope beyond Atari Basic. I highly recommend it.

Product: Kyan Pascal
Price: £89.95 (E58)

Mixing it with text and graphics

RICHARD PARKES gets round that bit mapped text screen snag

maximum value of 255 but are limited by the number of pixels on the screen. NUMCHS is the number of characters to be displayed.

The text between the quotes is printed in the desired colour and size at the requested position.

Type in the program up to and including line 140 and then LIST it to disc or tape. You can then easily merge the Write routine into your own programs using the ENTER command.

Now type in the rest of the listing which is a demonstration program to show you what the Write routine can do.

If you have any difficulty typing Write in, you can check it using Get It Right!, our checksum program or you can download it from MicroLink.

AUTO BOOT CASSETTE from STEPHEN HILL

If you've ever wanted to create auto-run cassettes or discs, then this five-liner could be the answer. It will create a file from a machine code program which will load on power up. To create an auto-run program, you will have to change the OPEN command in line 40 to:

OPEN #1,8,128,"D:AUTHOR RUN SYS" and change the second PUT command to:

PUT #1,1255

If you are using a cassette, you must press the Start key as you turn the computer on so that the program will auto-run.

Line Breakdown
10 Sets up screen.
20 Inputs the start and end addresses and calculates the header bytes.
30 The start and end addresses are converted in their high and low components.
40 A save file is created and the header bytes are written to it.
50 The contents of the memory block are written to the cassette or disc.

CONTROL LINE from HASSAN MEHMET

THIS small routine adds a 25th line at the top of the screen using display list interrupts. Even if you don't know anything about DLI's, you can easily incorporate Control Line in your own programs.

Line Breakdown
10 Gets the DLI address and the low and high screen pointers.
20 Reads the data for the DLI and POKEs it in.
30 Puts the text into the control line.
40 Repositions cursor and screen pointer.
50 DLI data.

MAGIC NUMBERS from ROGER WILLIAMS

MAGIC squares have been of interest to mathematicians for centuries. The magical property of a magic square is that each column, row and diagonal adds up to the same number. This small program creates magic number squares quickly and simply.

Line Breakdown
1 Inputs the number of rows in the square and initialises the main array.
2 Sets up the main loop for row by row counting and calculates the elements on the diagonals of the square.
3 Calculates column elements adjacent to the top left/bottom right diagonal.
4 Calculates column elements adjacent to the top right/bottom left diagonal.
5 Increments the main loop until completion and then displays the square.

March 1987 ATARI USER 33
FRUITS!

By DAVID WHITE
FRUIT machine programs will never be the same again once you've seen Fruits. With graphics which would put many an arcade fruit machine to shame, this month's type-in game will let you gamble your time away, but still leave the contents of your wallet intact.

Using an impressively redesigned character set, Fruits turns your 8 bit Atari into a one armed bandit complete with sound effects, nudge controls, smooth scrolling windows and a separate score screen.

Type in Listing I. If you use a cassette for storage, then make the changes given in Listing II making sure to delete line 2500. Be sure to save the program to disc or tape before you run it.

Now place a newly formatted disc in the drive or blank cassette in cassette deck and RUN Fruits. An auto-run version will be placed on the disc or cassette. It will take about 10 minutes to complete, then the normal Ready message will appear on the screen.

If you get an error message, check the offending line. An error message in line 32768 means that you have to check the DATA statements carefully.

You can now run Fruits by placing the disc in the drive or tape in the cassette deck and booting your computer without Basic.

If you have any problems typing in Fruits, you can check it using our checksum program Get It Right! which was last published in the August 1986 issue of Atari User. Alternatively you can download Fruits from MicroLink.

Happy gambling!

---

ATTENTION ALL 1050 DISK DRIVE OWNERS!!

Announcing the all new ULTIMATE drive enhancement

This Drive enhancement consists of a plug-in PCB, which can easily be fitted with our simple to follow instructions.

The 1050 IS PLATE Disk Drive enhancement offers many features never before available in one UNIT:

- Improved Drive speeds – up to TWICE normal loading speeds (Depending on disk format used).
- Reduction of Drive WEAR and TEAR; now whole tracks can be stored in the Internal 16k RAM.
- The IS PLATE can READ/WRITE a whole track in the time it takes a standard 1050 drive to READ/WRITE a single sector (up to FIVE times standard speed).
- Supports double, Dual and Single Densities.
- Sector SKIW is now no longer required to obtain H1-speed as with US Doubler.
- Other Special features are: Slow down, Fast write, Fast Read, Drive with lock, Skew on/off, Fast formatting.
- Fast write with verify. This system is faster than other systems which write without verify.
- A double sided operating system disk is supplied which offers the following:
  - Track Tracer, Diagnostic tester, 48k and 128k Disk Backup utilities.
- The PLATE can be made invisible to software detection by either slow down or 1050 emulation.
- Supplied with detailed information regarding software drive control to allow you to access the full potential of the PLATE.
- Will run all available disk operating systems (DOS) including: Spartados, Happy Warp speed DOS, and other high speed systems.
- With this system, up to sixteen drives can be connected and used.
- A comprehensive 30 page bound manual is supplied. This includes fitting instructions.
- All registered owners will be supplied with any software updates etc for the price of Dish and return postage.
- All this is available for ONLY £99.95 inc post/packing and Twelve months guarantee.

Whilst every effort is made to ship the product by return, please allow 21 days for delivery.

Now available exclusively for the Ultimate Drive Enhancement:

THE ISP GREMLIN GRABBER

WHEN switching between two screens of the same graphics' mode, some commercial programs use an effect where the displays are mixed so that as the first display disappears, the other starts to appear. Using the Mix utility, you can achieve this in your own programs.

Mix adds the MIX$ command to your programs which is called using:

A-USR(ADR(MIX$),SCADDR,BANK)

where MIX$ is the string containing the machine code data.

SCADDR is the address of the start of the screen memory for the new display which is to be mixed in.

BANK is the bank of memory on the XE where the new screen is stored.

The correct values are:

0 Normal memory. Use this on 8 bit Atarils other than the XE.
1 Memory between 0 to 16384.
2 Memory between 16384 and 32767.
3 Memory between 32768 and 49151.
4 Memory between 49152 and 65535.

Type in Program I up to and including line 310 and then LIST it to disc or cassette. It can then be easily merged with any of your other programs using the ENTER command.

$ 

Mix it with RICHARD PARKES

FADE IN

Mix in Program I. The short example section of the program will not run in 16k, because two graphics 8 screens are set up.

If you have any problems typing in MIX$, you can check it using the checksum table and our Get It Right! program which was last published in the August 1986 issue of Atari User. Alternatively, you can download this and all other Atari User programs from MicroLink.

A WINNER ALL THE WAY...

I AM writing to let you and other Atari users know about my experiences recently when I bought a new Atari setup as a result of a little work on the pools (nothing dramatic but enough to go to an Atari supplier and say "one of them, two of them, box of them, and so on). A very nice feeling indeed.

I decided to stick with 8 bits for a variety of reasons, so the order was for a 130XE, two disc drives, 1027 printer, 1020 plotter, a touch tablet and various other bits and bobs.

According to the advertisements in your magazine, this amounted to around £600 worth.

Acting on advice from a colleague who got a decent discount for cash on a BBC printer, I rang round the four Atari suppliers within a reasonable range of Sheffield asking for a quote for the lot paid for with cash.

Two suppliers made feeble offers and one actually jacked up the price by £70 and offered me a discount which brought the price back to the original. I don't know who they were kidding.

However, there was a firm which made me an offer which I could not refuse.

So it came to pass that I got the setup. The day after I collected it I sat down and started to use it. After about two hours one of the disc drives and the 1027 broke down.

Naturally I got in touch with the suppliers at once, with the result that they swopped them straight away, no quibbles. They were friendly people to deal with and even apologised for my inconvenience - I was impressed.

I therefore nominate Computar of Loughborough for a Pat On The Head award. - J.E. Colley, Sheffield.

Technical queries

COULD you help me in trying to interface a non-Atari printer to an 800XL?

The printer has a serial interface, but during my investigations it appears that the computer is sending out some data and expects a reply from the printer. When it doesn't get one it aborts with a timeout error. What am I doing wrong?

Also, could you tell me the prices and a source of supply for the Atari technical manuals and plugs to fit the serial port. I have a fairly good knowledge of computer systems and electronics generally. - J. Connolly, Redcar.

- You need to use an RS232 interface to run your printer, the best being the Atari 850 module, though you might find others that work. The Atari serial port is an internal standard running at 19.200 baud with its own protocol and command frame system.

- You would need to be an expert machine code programmer to alter this and it would be far easier to use an 850 anyway.

- Don't forget that you would also need to check your software is capable of sending to RS232 rather than the printer port. Superscript does this, but not AtariWriter for example.

- Your own home grown software could be easily made to use either port, of course.

Manual dexterity

I HAVE recently purchased an 800XL but have found the manuals to be far from helpful. I was awaiting Albrecht, Finkel and Brown's Atari Basic book from my local library, when I discovered Atari User.

It is a very good magazine, but I am having problems with the Santa's Grotto game in the December 1986 issue. I keep getting an error 3 at line 20110, but line 20110 seems to be correctly typed in. Can you help? - T.E. Pottel, Gosport.

- Error 3 simply means that a number the computer has come across is outside the range it expects. In this case it is most likely that the variable CHBASE is the guilty party, being either too large or too small.

- After the error has occurred, try typing PRINT CHBASE, which should give you a positive number no greater than 65535. In actual fact, it will be within a much smaller range.

- Since CHBASE is calculated from another variable, RAMTOP, the problem might lie in line 20050 which sets up RAMTOP in the first place. Don't forget to use Get It Right! to check the lines before you run the program.

Loading errors

I HAVE been unsuccessful in loading Football Manager. I keep getting errors 140 and 143. I would be grateful if you could explain these errors and advise me on the correct way to solve them. - P.E. Malone, Preston.

- These are known as checksum errors and occur because data from the tape has been corrupted before it reaches the machine. This may be caused by a bad tape, or a fault in the recorder or the computer.

- When a tape is recorded, each block of 128 characters is followed by a special extra digit which is basically a total of all the character numbers preceding it.

- When loading the tape back in again, the computer does the same additions on the data bytes as they come in and checks the new value off against the one from the tape.

- In much the same way as our Get It Right! checksum, the computer can then tell if the data it has loaded was
the same as that originally saved. If any discrepancies occur, the computer will signal an error — normally a 140 or a 143 — and stop the load.

Exploring possibilities

FOR the past 12 months my son has had an Atari 800XL. He has not used the machine for games up until now, only occasionally trying other features.

I now think it is time he explored the possibilities of the computer, the graphics and writing simple programs and so on.

If you could pass on any advice on this we would be very grateful. And if you have the name of any book we could buy which defines all the computer jargon this too would be very helpful.

Do you advise us to get a disc drive or stay with cassette type? — David and Michael Burne, Moseley.

For now a tape will suffice, though a disc is much faster and more reliable. If he takes to programming, he will very quickly find that waiting for a tape to load or save is very frustrating indeed.

We often run articles in Atari User helping new users to find their way around the machine and you will certainly find many of the features and series in our first few issues of benefit. Why not order some from our back issues department?

80 column cartridges

I WOULD greatly appreciate it if you could tell me of a way I could have 80 column text with my AtariWriter cartridge word processor. I use my 800XL for translations for the Ministry of Foreign Affairs of Greece.

I own an LX-80 Epson printer, 1050 disc drive and a Hantarex Boxer monitor. Although I also have Letter Perfect I find the cartridge based word processor is extremely easy to use and a perfect partner for my work.

The only problem is that with 40 columns I have to preview my documents and make corrections at the cost of valuable time. — J.M.D. Mantheakis, Athens, Greece.

80 column cartridges

I WOULD greatly appreciate it if you could tell me of a way I could have 80 column text with my AtariWriter cartridge word processor. I use my 800XL for translations for the Ministry of Foreign Affairs of Greece.

I own an LX-80 Epson printer, 1050 disc drive and a Hantarex Boxer monitor. Although I also have Letter Perfect I find the cartridge based word processor is extremely easy to use and a perfect partner for my work.

The only problem is that with 40 columns I have to preview my documents and make corrections at the cost of valuable time. — J.M.D. Mantheakis, Athens, Greece.

Increasing word power

I RECENTLY visited the Christmas Atari User show and whilst there I purchased an Atari 1029 dot matrix printer and a copy of AtariWriter Plus for my 800XL.

I had not used a word processing program before, but I found it really quite easy to use. This letter is my first full length attempt at using the program and I have found it and the manual to be excellent. My only complaint is that there are only two print modes available — normal and double width.

Would it be possible to review some of the other word processing packages for the 8 bit range? — Mick Smith, Ashford, Kent.

We have covered some other word processor packages in previous issues — notably the SuperScript program in the March 1986 issue.

The answer is simple — you will soon be able to purchase an update of AtariWriter, called AtariWriter 80, which will work with the new XEP-80 80 column module. Until then you're stuck with 40 columns I'm afraid.

Getting It Right!

I HAVE just purchased my first copy of Atari User. I had been looking for such a magazine for over a year and find it very informative.

Please could you tell me how I can operate Get It Right! as it is an obvious boon when typing in programs. At the moment the list of numbers don't mean a thing to me. — D.E. Boulter, Salcombe, Devon.

The instructions for our checksum program Get It Right! can be found in the August 1986 issue of Atari User which can be ordered using the form on Page 53.

Software compatibility

FIRST I would like to compliment you on such a great magazine which I have been reading even though I got rid of my 800XL some time ago.

I am now considering a 130XE. Could you please tell me if there are any compatibility problems with games for the 800XL? — L.P. Arnold, Littlehampton, Sussex.

The 130XE is really just an 800XL with an extra 64k of memory available. This means that you should have no problems at all with software compatibility between the XL and the XE, although you will still have the same problems as you had with the XL in running some of the older software written for the 400 and 800 machines.

Keyboard inputting

I OWN an Atari 800XL and wondered if cartridges for the earlier 400 and 800 are compatible with it. Also could you tell me how to get input without the user having to press Return? — Neil Evans, Avon.

You can use most 400/800 cartridges with the XL and XE machines, but some badly written code will not work properly. This applies as much to tape and disc software as it does to cartridges, so it's always best to check first. That said, the vast majority of software works fine with the XL. You can get input from the keyboard without requiring the user to press Return by side-stepping the normal INPUT routines.

Use instead the GET command which gets a single character, and build up from there. Don't forget to OPEN a channel to the keyboard first, with:

```
OPEN #14,0,"K:"
```

For example, to get five characters from the keyboard and place them directly into a string, use:

```
10 OPEN #14,0,"K:";
20 DIM TEXTS$[5]:TEXTS$="";
30 REM $S$=CHR$(BYTE)
40 GET TEXTS$(CHRS$(BYTE))
50 FOR CHAR=1 TO 5
60 NEXT CHAR
```

Mailbag

WE welcome letters from readers — about your experiences using the Atari micros, about tips you would like to pass on to other users... and about what you would like to see in future issues.

The address to write to is:

Mailbag Editor
Atari User
Europa House
68 Cheater Road
Hazel Grove
Stockport SK7 5NY
Silicon Dream & 
Jewels of Darkness

I BOUGHT Rainbird’s Silicon Dreams and Jewels Of Darkness trilogy at the recent Atari User show, but can’t get them working.

I have a 48k Atari 400. PEEK(106) returns 160 and I have no trouble running other 48k software.

I can get to the menu and loading message on both discs but after the load is finished I get a blank screen full of colourful garbage. I have removed the Basic cartridge and all unnecessary peripherals.

In desperation I visited Rainbird and they were most helpful. They managed to run the discs on a 130XE and told me that they had been successfully tested on an expanded 400. Might my expansion board be at fault? — R.S.L. Gillman, Tiptree, Essex.

According to Rainbird’s technical department, your problem lies with the fact that the program needs at least 64k to run.

Recorder diagnostics

RECENTLY my 1010 data recorder has not been loading my original computer games. I was wondering if a XC12 recorder would be compatible with my 800XL?

— Andrew Bolton, Bristol.

The XC12 will run with your 800XL, certainly, but is this your problem? The tapes may not load for a number of reasons, the most likely being simple misalignment of the record/play head.

You may also find that cleaning the tape heads will improve the load reliability. If you take your recorder into your local dealer they will almost certainly be able to arrange for it to be serviced for you.

On the other hand, if you have played the cassettes an awful lot you might have actually worn out the tape itself. This can happen, as the magnetic coating can gradually wear off the backing material after hundreds of passes though the recorder.

Check them out on a known good tape recorder before parting with your hard earned cash for a new unit.

Keeping in touch

IN READING Atari User I am surprised in that a large number of advertisers do not have Email, MicroLink, Telecom Gold or telex numbers.

To me, a fairly new user, I feel a software and hardware supplier who does not use or is not linked to this new exciting way to communicate is doing a disservice to the micro computer business.

After all, the more users of the system, the more they will sell. But if they do not use the technology themselves how can they convince people like me to use it?

I would often like to send for literature via Email rather than by phone. The micro shops are also badly set up to market this product.

In Edinburgh I went round all the shops to see a demonstration of MicroLink, Prestel or Telecom Gold, but it was on my third visit to...
one shop before they had
the system up and running. I
would be interested to know
if others feel as I do. – Tom
Stark, Edinburgh.
– Tom sent this message
via MicroLink. Don't forget
that as well as the usual
Atari User postal address,
we can be contacted on
MicroLink and Telecom
Gold at 72: MAG001 and on
Prestel at 814568383.

And don't forget to mark
your Email "For the attention
of Atari User".

You can even send us
your articles by Email, as do
most of our regular con-
tributors. The whole edi-
torial team of Atari User use
MicroLink to send complete
features straight from our
work processes at home
into the office computers
– which are linked direct to
the typesetting machines.

We write everything
on the ST and can thus send
our material straight in for
typesetting without a single
mistake occurring – well,
that's the theory, anyway.

Ribbon recycling

OUR apologies to anyone
who wishes to contact
Aldaddink about their printer
ribbon relinking service. The
address which we gave for
them in the January 1987
issue of Atari User was
incorrect: It is in fact 4
Hurkur Crescent, Eyemouth,
Berkshire TD14 5AP.

Trak-ball
or joystick?

I HAVE been a joystick
addict for about four years
but as a Christmas present
I was given a trak-ball which I
prefer for most games.

The only problem is I
do not know which games
will run in trak-ball mode. Could
you give me a list of games
which will?

Also, could you give me a
short routine which would
allow me to read the trak-
ball from Basic? – Richard
Taylor, Prestwick.

– The only game which has
a specific trak-ball mode
– as opposed to those which
can use the trak-ball in the
joystick emulator mode – is
Missile Command. This is a
shame, as such games as
Centipede would be great in
the trak-ball mode.

You can read the trak-ball
in the same way as a joy-
stick – by using the STICK
and STRIG commands. For
the first joystick, STICK(0)
will return the direction
value, and STRIG(0) will tell
me if either of the buttons
have been pressed.

If STRIG(0) returns a zero
then the button has been
pressed and a one indicates
no action.

You can work out the
direction from the following
table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Returned</th>
<th>Direction</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>RIGHT</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>UP/LEFT</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>DOWN/LEFT</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>LEFT</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>UP</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>UP/RIGHT</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>DOWN</td>
<td></td>
</tr>
</tbody>
</table>

Revised opinion

I HAVE a 800XL with
revision B Basic and the
guarantee has expired. I
have been trying to buy a
revision C cartridge for
some time without success.
Could you please tell me
where I might purchase one
and the cost of it?

I have typed in Dots from
the January 1986 issue of
Atari User and have used
Get it Right to check it.
Everything seems OK and a
friend has also checked it for
me, but I keep getting an
error 9 at line 5. Is this
something to do with
revision B Basic?

Also, is there any way I
can stop Get it Right from
changing colours other than
by using Control+1? The
last line of checksum also
disappears too quickly for
me to check it. – S.D.
Sargun, Hastings.

– For a Rev. C cartridge,
try Silica Shop or Software
Express – they cost about
£9.95.

The error 9 could well
be caused by the Rev. B
problem, as DIM is one of
the commands that shows up
the bugs.

If you want to stop Get it
Right from cycling through
the colours, simply add line
101 as:

```
101 POKE 770,
```

The last line will not dis-
appear if you haven't
pressed any keys since the
current checksum was
started – assuming you are
using the updated August
1986 version, of course.

Loading cassettes

I HAVE recently bought a
1050 disc drive and an Atari
800XL. Is it possible to use
a normal cassette recorder to
load cassette games, or
must I buy the special Atari
data recorder?

Also, could you tell me
how to use the COLOR
command in different
graphics modes? I have
tried using this command in
various modes, but it
doesn't seem to display the
number of colour
mentioned in the manual.

Also, how does the
SETCOLOR command work,
as it is not very well
explained in the manual?

Lastly, is it possible to
have more than one
graphics mode on the
screen at the same time? –
Francis Sreeves, Alcester.

– Firstly, you will indeed
need an Atari recorder for
use with your computer, or
a special adapter which is
nearly the same price any-
way.

The COLOR and SET-
COLOR commands in Atari
Basic are quite powerful. In
mode 9 you have only one

*MicroLink*

ALL program listings in
Atari User are now avail-
able for free downloading
on MicroLink, the UK's
fastest growing elec-
tronic mail service. They
join hundreds of programs
already available on
Britain's national on-line
database.

PEN PALS

Jim, Toumanakakis Dimit-
tris, Pericleous 5, Kato
Akarna 13677, Athens,
Greece would like to hear
from English pen pals.
And Fred Swanepoel, 169
Alton Drive, Beaconsfield
PO, Canada H9W 221 is
especially interested in
hearing from Dutch Atari
owners.

Mercenary compendium

I AM interested in your spe-
cial reader offer in the Feb-
uary 1987 Atari User for the
complete Mercenary com-
pendium, but the "suitable
for" box states Atari
XE/XXL.

The question is will Mer-
cenary run on my 48k Atari
800 – something I would like
to know before I order a
compendium from you. –
Peter Boulter.

– There are two versions of
Mercenary which come on
the disc or tape. One is for
48k machines, and will
therefore work fine on your
800, and one is an enlarged
version which has extra fea-
tures and operates in 64k.

At PAGE 6 Magazine we recently had a readers survey. Here's what some of our existing readers said.

"For all the Atari半月刊, I love it. Keep going..." - Robert Jones
"I run a small Atari magazine and I wouldn't be
without it. Keep up the good work." - John Smith
"I'm a long-time Atari user and this magazine
has been excellent. Keep it up!" - Jane Brown
"I found the Atari半月刊 very useful and
informative. Keep up the good work." - David Martin

DO YOU REALLY WANT TO MISS PAGE 6?
You should find PAGE 6 at your local Atari specialist but if you subscribe, we'll tell you about the special offers, disk library and much more available only to subscribers.

Annual Subscription (bi-monthly): UK £7.00 Europe £10.50 Elsewhere (Surface)
£10.50 (Air) £16.00. Sample copy (UK only) £1.

PAGE 6 - COMPLIMENTING AND EXPANDING THE WORLD OF ATARI

March 1987 ATARI USER 49
More EXCLUSIVE special offers  
- plus even BIGGER savings  
for Atari User subscribers!

Starglider is "simply the best arcade game seen on any 68000 based machine" [Popular Computing Weekly].
It's the first ever game to feature stunning, fully animated vector graphics - and the first to include high-quality digitised sound ... even messages from the ship's computer throughout your hair-raising flight are in digitised speech! Thrill to low-level flying, exhilarating defence and attack manoeuvres - it's all here, and much, much more!

The package includes a 64-page novel that sets the scene -- and gives you vital information to help you succeed in your quest!

Now - the COMPLETE
Mercenary Compendium

Here's all you need to get the last ounce of fun and excitement out of one of the most-talked-about games of 1986. This is what this package contains:

**Escape from Targ.** A unique combination of flight simulation, adventure and arcade action, PLUS high speed 3D vector graphics! You crash-land on planet Targ's Central City and you have but one aim - to escape!

**Targ Survival Kit.** For help when you need it most. Includes maps of Central City and its subterranean complexes. And a novelette, "Interlude on Targ", with more hints and tips.

**The Second City.** Thought you'd got away? Then load in this extra data set and think again! No hints or clues this time - you're on your own!

**Exploit the POWER of your Atari ST to the full, with...**

Fast ST Basic is a totally new implementation of Basic for the Atari ST range. Running faster than almost all other languages, it supports true structured programming. And it has an easy-to-use word processor-like editor that makes full use of Gem. Up to 10 separate programs can be held in memory at once – each with its own editing window. There's even a built-in 68000 assembler to let you harness the power of your ST at machine level. And if you order through Atari User you'll save £10!

Fast ST Basic is compatible with all versions of the 520 and 1040 ST.

**WHAT YOU GET:** A ROM cartridge that simply plugs into the side of your ST, a fully detailed 390 page manual, a quick reference card listing all keywords and parameters, and a disc containing many example programs that demonstrate all aspects of Fast Basic from simple loops to full blown Gem programs.

**RRP £89.90**

**ATARI USER OFFER**

**£79.90**

**SAVE £10**

---

**9 useful functions that are ALWAYS available when you are using your Atari ST.**

Back-Pack is a versatile desk accessory on ROM. It sits in the background while other application programs are running, but can be called up and used at any time. It contains:

- **Scientific Calculator**: Click on the numbers with the mouse or use the numeric keypad to access a large range of scientific functions.
- **Clock and Alarms**: Tell the time with an analogue or digital display. Use the alarms to ring or display a dialogue box.
- **Diary**: Open a page to show a whole day's events. Unique classification feature enables you to search for similar category events.
- **Notepad**: Access up to 31 pages of notes, any of which can be transferred into the application.
- **Typewriter**: Use it to send codes and short messages to the printer while working on other programs.
- **Printer Buffer**: Put aside any amount of the ST's ram as a buffer, allowing long documents to be printed while the computer is still in use.
- **Address Book**: Gives you simple and fast access to names, addresses and other details which can then be used in other programs.
- **Mini Clock**: Place a digital clock anywhere on the desktop.
- **Ramdisk**: Set aside any amount of ram as a Ramdisk, to act like an ultra-fast disc drive. Speeds up any program that normally uses discs.

**RRP £49**
