The Flying Simulations Chosen by Real Pilots

The toughest evaluators of flying simulations aren't computer buffs. They're actual pilots and flight professionals. And when these flyers talk authenticity and realism, one name comes up again and again: MicroProse Simulation Software. We're used to this kind of stringent comparison; our company president is a former fighter jock with 3,000 flying hours in his logbook.

Take the evaluation of Senior Editor David Martin, in *Private Pilot* magazine's August 1986 issue. Martin, a former Navy aviator who has flown almost everything with wings, reviewed five MicroProse programs, including the bestselling *SOLO FLIGHT* primary flight simulator. "I'd not have believed it possible..." he wrote, "Pilots of all sorts will be fascinated

by these aviation games."

Mr. Martin isn't the only pilot who's spent many of his recent leisure hours with MicroProse simulations. Comparing his experience in training real flyers with the instrument layout found in *SOLO FLIGHT*, Cessna Flight Instructor Mark Rice told us "the instrument flying segments are very similar to the real thing — you're up in the clouds and using your readings to guide the aircraft."

Concorde pilot and former RAF jet flyer John Hutchinson reviewed MicroProse' sport flight *ACROJET* for the British press. His conclusion: "this simulation is one that really does live up to its real-life counterpart... I find *ACROJET* completely absorbing and very exciting." High praise, from the man who flies the world's fastest airliner...

We regularly hear from military and commercial Air Traffic Controllers who rave about our *KENNEDY APPROACH* simulation, and though we can't mention names (they're Federal employees), we can say that many of these professionals tell us *KENNEDY APPROACH* is the most accurate depiction of airport conditions you can find short of a real control tower.

The MicroProse Civilian Aviation Series includes *SOLO FLIGHT*, which teaches the basic flying skills associated with a single-engine propeller aircraft. *ACROJET* recreates the sensitive control characteristics of the world's hottest sport jet — the Bede BD-5J — and includes a wide range of multiplayer competition events. *KENNEDY APPROACH* allows you to guide dozens of commercial aircraft into and out of the nation's busiest airports.

From MicroProse: the flying simulators chosen not only by computer enthusiasts, but also by real pilots...

SOLO FLIGHT is available for Commodore 64 / 128™, Apple II family, Atari XL/XE, IBM PC/PC Jr., and Tandy 1000. *KENNEDY APPROACH* is available for Commodore 64/128 and Atari XL/XE. *ACROJET* is available for Commodore 64/128. All products have a suggested retail price of \$24.95.

Available from your local retailer. If out of stock, contact MicroProse directly for further information on our full range of simulation software, and to place MasterCard/Visa orders.

Commodore, Apple, Atari, IBM, and Tandy are registered trademarks of Commodore Electronics, Ltd., Apple Computer, Inc., Atari, Inc., International Business Machines Corp., and Tandy Corp., respectively.

FEATURES

- Status report D.F. Scott 13
 What does Atari really think of its 8-bit line? D.F. Scott gives us all an enlightening view, based on interviews with Atari's corporate insiders.
- M-Windows Kevin Ravenhill 15
 Don't be left out. With **M-Windows** you can have "windows" on your 8-bit Atari—and up to 255 of these may be open simultaneously.
- Bits & Pieces Lee S. Brilliant, M.D. 29
 This month, our continuing hardware feature gives you the necessary know-how to put together your own light pen for the 8-bit Atari.

ST-Log 45ST
 ANALOG Computing's ST magazine. See page 47ST for contents of this month's ST-Log.

- Cosmic Glob Rich B. Enns 96
 A one- or two-player game—use your spacecraft to wipe out the evil glob lurking in the void.
- DLIs:
 A minute to learn Jonathan David Farley 107
 The second and final installment, delving straight into DLIs. In this issue, we'll be discussing how and where to manipulate them.
- Modem Chess Gary Heitz 119
 Two-player chess—lets you play with an opponent who's a thousand miles away.

ANALOG Computing magazine
(ANALOG 400/800 Corp.) is in no
way affiliated with Atari. Atari is a
trademark of Atari Corp.

WHERE TO WRITE

All editorial material (programs, articles, letters and press releases) should be sent to: Editor, **ANALOG Computing**, P.O. Box 23, Worcester, MA 01603.

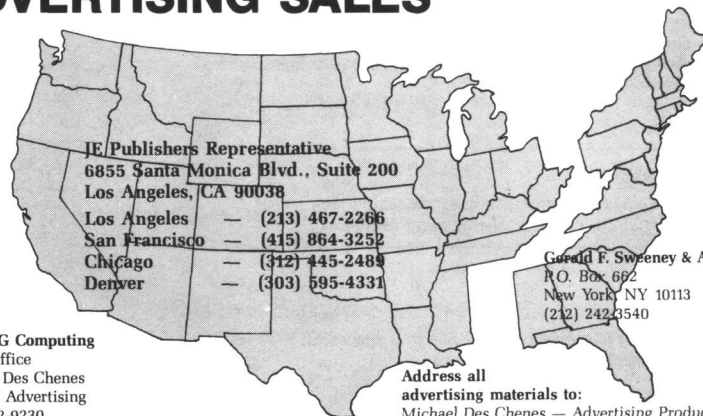

Correspondence regarding subscriptions, including problems and changes of address, should be sent to: **ANALOG Computing**, 100 Pine Street, Holmes, PA 19043, or call 1-800-345-8112 (in Pennsylvania, call 1-800-662-2444).

Correspondence concerning a regular column should be sent to our editorial address, with the name of the column included in the address.

We cannot reply to all letters in these pages, so if you would like an answer, please enclose a self-addressed, stamped envelope.

An incorrectly addressed letter can be delayed as long as two weeks before reaching the proper destination.

PERMISSIONS

No portion of this magazine may be reproduced in any form, without written permission from the publisher. Many programs are copyrighted and not public domain.

Due, however, to many requests from Atari club libraries and bulletin board systems, our new policy allows club libraries or individually-run BBSs to make certain programs from **ANALOG Computing** available during the month printed on that issue's cover. For example, software from the July issue can be made available July 1.

This does not apply to programs which specifically state that they are not public domain and, thus, are not for public distribution.

In addition, any programs used must state that they are taken from **ANALOG Computing** magazine. For further information, contact **ANALOG Computing** at (617) 892-3488.

SUBSCRIPTIONS

ANALOG Computing, P.O. Box 625, Holmes, PA 19043; or call toll-free: 1-800-345-8112 (PA 1-800-662-2444). Payable in U.S. funds only. U.S.: \$28-1 yr.; \$52-2 yrs.; \$79-3 yrs. Canada: \$36-1 yr.; \$62-2 yrs.; \$89-3 yrs. Foreign: \$39-1 yr.; \$72-2 yrs.; \$99-3 yrs. For disk subscriptions, see the cards at the back of this issue.

AUTHORS

When submitting articles and programs, both program listings and text should be provided in printed and magnetic form, if possible. Typed or printed text copy is mandatory, and should be in upper- and lowercase, with double spacing. If a submission is to be returned, please send a self-addressed, stamped envelope.

Editorial

We hope that, after last issue, our 8-bit readers are saying, "How can they follow that act?" Because we can—for both the **ANALOG Computing** and **ST-Log** audiences.

This month, in each section, you'll find a **Status report** loaded with information about the future of Atari. In keeping with our format, the 8-bit and ST portions of the report are separate, but we suggest that you read both articles for a truly complete picture.

D.F. Scott has gathered facts, figures and future possibilities from some of the most knowledgeable personnel at Atari Corp. for these articles. We'll be publishing more of his work in this vein from time to time, as news becomes available. Our staff is excited about the **Status report** articles; we hope you'll find them interesting and enlightening, too.

ANALOGers Lee Pappas and Charles Bachand traveled to Los Angeles recently, to attend the ACENET-sponsored Atari Fair there. It was a terrific opportunity for them to talk with thousands of Atari users. The enthusiasm at the fair was impressive, since this (unlike CES or COMDEX) was an all-Atari show.

Charlie, our Senior Technical Editor, took on all the technical questions at **ANALOG Computing's** booth. Lee reported a warm reception at the fair for both free copies of the magazine and the bonus gift we'd arranged.

Our thanks to ACENET for all their courtesy and assistance at the show—and for the chance to be included.

In an effort to demonstrate our ongoing support for user groups and Atari products, we'll be participating in as many of these shows as possible. The next we're planning on, which will be over by the time you read this, will have been in San Jose.

And, on Saturday, November 22, we'll be attending the PACE show at the Pittsburgh Greentree Marriott, from 8 a.m. to 4 p.m. For more details, contact PACE's John Baker, P.O. Box 13435, Pittsburgh, PA 15243.

Since the **ANALOG Computing** staff is small, we all wear several hats and our schedules are very full. We can't promise to attend every user show, but we'll do our best to be in touch with you. Just one question... how come there are no shows in places like Miami Beach, or Palm Springs, or Hawaii?

On another front, we're pleased to hear of the release of 3½-inch drives for the Atari 8-bits. This should be a boon to all traditional Atari owners—and give a boost to the 8-bit market, as well.

Though we don't have an exact date at this writing, you can look for the **Atari 8-bit Extra from ANALOG Computing** before Christmas. This isn't a compendium of previously published programs; it's a gathering of some of the best articles and software submitted to us that just wouldn't fit in these pages.

Believe it or not, that's a common problem. Every month, we have too much material for both the 8-bit and ST sections; and every month, we swear it won't happen again. We've tried some different ap-

proaches to get these articles and listings to our readers. The ST bonus disk program is one way; putting them up on our Atari Users' Group on Delphi is another; the **Extra** is a third.

We'd love to publish every worthwhile program we get—and we know people want to see **Reader Comment**, too. Unfortunately, there's a prescribed ratio for advertising to editorial copy pages... and we're already exceeding the limit (in the tiniest type readable), in an effort to give readers their money's worth of Atari material.

So, for you 8-bit users, the **Extra** is our special attempt to provide even more. We hope you'll use it—and enjoy it.

Diane L. Gaw
Managing Editor
ANALOG Computing

BOOK I + DISK: (The Original) Thoroughly explains the techniques used by advanced software pirates, and the copy protection methods used to stop them. It offers clear and understandable explanations sophisticated enough for software writers of any scale yet easy enough for a beginner just wanting to learn more about Atari® computers. **A MUST READ FOR ALL ATARI® OWNERS.**

BOOK INCLUDES: • Duplicate sectoring • Custom disk formatting • Creating "BAD" sectors • Hardware data keys • Legal protection like copyrights, trade secrets, patents • Protecting BASIC programs • Self-modifying Code • ROM + EPROM cartridges • Hidden serial numbers • Self-destructing programs • Freeware • Misassigned sectoring • Much, much more.

DISK INCLUDES: • Directory mover • VTOC scanner • Duplicate sector finder • Sector mover • Bad sector writer • Sector data displayer • Autotrun builder • Other useful programs.

This comprehensive book and disk package should not be confused with low quality imitations offered elsewhere.

BOOK II + DISK II: *Advanced Software Protection*. This all new sequel starts where the highly acclaimed *Book I* leaves off. *Book II* is the most up-to-date resource available for the Atari® owner. Includes reviews and explanations of products such as: *The Happy Enhancement*, *The Impossible*, *The Scanalyzer*, *The Chip*, *The Pill* and *Super Pill* & many others.

Book II: Tells you specifically what they copy, what they won't, how they are used, and the details of how they work. *Book II* also includes such topics as: • Transmitting protected programs • Copying disks with more than 19 sectors/track. Includes the newest protection methods by companies like Synapse® AND Electronic Arts* • Data encryption • Phreaking methods • Program worms • Logic bombs • Bank-select cartridges • Random access codes • New trends in software law • Sample BASIC + Assembler programs • On-line security • And much more.

DISK II INCLUDES: • Automatic program protector • Custom format detector • Newest protection demos • Forced password appender • Data encrypter • And much more.

Book + Disk Packages only \$24.95 each or Special Offer both for only \$39.95

COMPUTER EYES, capture software and MAGNIPRINT II+ Only \$114.95

COMPUTER EYES/MAGNIPRINT Camera System
A complete ready to run system for those without access to video equipment. This system includes Computer Eyes, Magniprint II+, a high quality B&W video camera, and a 10 ft coaxial cable with appropriate connectors. Only **\$299.95**

COMPUTER EYES alone (with capture and display software only) **\$99.95**

Computer Eyes Gr.9 Acquisition Software **\$12**

Computer Eyes lets you take any form of video input and saves it as a high-resolution graphics screen. You can use a video camera, VCR, TV output, video disk, other computers, etc. Now you can capture your picture, your friends or any video image and show it on an Atari computer. Computer Eyes is an innovative slow scan device that connects between any standard video source and your Atari computer (see the review in A.N.A.L.O.G. magazine).

- Do a complete Hi-Res scan in under 6 seconds
- Unique multi-scan mode provides realistic grey scale images in 24 seconds, and up for more detail scans.
- Full one-year warranty on parts and labor
- Plugs into your Atari joystick ports and uses a standard video phono plug

Now anyone can create the kind of graphics seen in this ad. When Computer Eyes is combined with Magniprint II+, you get unique capabilities that no other system can offer.

- Print pictures with full shading for a level of realism even better than your TV screen
- Take your Computer Eyes images and modify them with your Koala Pad, Atari Touch Tablet, Micro Illustrator program, or Magniprint's special touch-up feature

MAGNIPRINT II+ MAGNIPRINT II+

TAKE CONTROL OF YOUR PRINTER

Print your Graphics in an amazing variety of sizes, shapes and shades!

- 18** Proportionally correct sizes, including Huge Poster Printing
- 9** Levels of distortion to stretch or squeeze dimensions
- 14** Graphics modes – works with everything from Graphics 0 text to fully shaded Graphics 12
- 16** Levels of Shading for spectacular resolution and detail
- 24** Compatible Graphics Programs = Print your own pictures or those created with PRINTSHOP®, Koala Pad®, Micropainter®, RAMbrant®, B-Graph®, Syngraph®, PAINT®, Microillustrator®, ComputerEyes®, and many, many more.

- + ZOOM** Print the entire picture or zoom in on only the parts you want
- + ALTER** Automatically switch between graphics modes to add details and shades
- + TOUCH UP** Use your Joystick to change the picture, rotate colors, and select your own shades for printing
- + HELP** Instant Help Screen for easy use

TOTAL = MAGNIPRINT II+

Adds up to MORE POWER, MORE versatility, and MORE features than any other print program. And best of all it gives you BETTER QUALITY PRINT-OUTS.

By specially shading each printed pixel, MagniPrint II+ uses your printers full resolution for uncomparable quality and detail. MagniPrint II+ works with all EPSON, Gemini, STAR, NEC, Citoth, Panasonic, and any compatible printers (850 interface or equivalent required).

INCREDIBLE POWER AT AN AMAZING PRICE OF JUST \$24.95

FREE: With every Magniprint II order get "PRINTALL" FREE. PRINTALL prints your programs and files just as they appear on the screen. It clearly prints INVERSE and all the Atari graphics characters, and prints in regular or condensed print. This alone is worth the price.

All new sound digitalizer and synthesizer for your Atari. Tired of low-quality mechanical sounding voice output? Now you can make any Atari speak in your own voice. Tired of four tone sound? Now any Atari can play a whole orchestra complete with a singing choir. "The Parrot" digital sound synthesizer system lets you do all this and much more.

How it works – "The Parrot" system plugs into your joystick port and lets you record pure digital sound from your stereo, TV, microphone, or any other sound source. The special Parrot software lets you play back this high quality sound on any Atari system with no special hardware needed. It even lets you put this unbelievable sound right into your own programs, that will run on anyone's Atari. It also includes digital sequencer software that lets you turn your Atari into a synthesizer comparable to those costing thousands of dollars. Turn any natural sound into a musical instrument, or design your own custom sounds. Imagine playing a song with the sounds of a dog's bark, a chinese gong, a car's honk, your own voice, or anything your imagination can come up with. It turns your keyboard into an organ and lets you instantly switch between up to nine different digital sounds, each with three full octaves of notes. Recording time varies depending on available memory and quality level desired. You've got to hear it to believe it!!!

THE PARROT digital input hardware and playback/synthesizer software with sample sounds and demos.

All for Only **\$39.95**

AT LAST A UTILITY THAT DOES IT ALL. Scans & Analyzes ALL Atari® programs. Works on programs stored on Disk, Cartridge or directly from memory. Converts complex machine language into readable assembler. Transforms ANY Atari® BASIC program into

THE Scanalyzer

NEW AND IMPROVED FEATURES!

- Changes a 4, 8 or 16K cartridge into a binary listable, modifyable BASIC
- Works on programs using regular Atari® load file and source file that you can view & change using regular Atari® assembler. Clearly Duplicates SECTORS and FORCED CRC ERRORS. BAD DATA MARKS. DUPLICATE SECTORS and FORCED CRC ERRORS. Even finds and displays hidden directories. No other program can do this!

NEW FEATURES: Now fully supports DOS 2.0 and includes one pass sector copier for 130XE owners

\$29.95
Complete with instructions in theory and use.

IMPERSONATOR

CARTRIDGE TO DISK COPY SYSTEM

CARTRIDGE TO DISK COPY SYSTEM Yes, for only \$29.95, you can make working copies of all your Atari computer cartridges (16K or less). Our special package will let you save your cartridges to ordinary disk files. They will run exactly like the originals when used with the Impersonator. Each disk holds up to 12 cartridge programs. Now you can put all your real cartridges away for safe keeping and use the Impersonator for everything. YES, IT REALLY WORKS. The Impersonator does everything the high-priced cartridge back-up systems do...and more. **ONLY \$29.95**

NOW for ST Owners

ATARI® ST GOES DIGITAL!!!

HIPPO VIDEO DIGITIZER

Use the full resolution and speed of your ST for incredible results. Capture a high or medium res picture in 1/60th of a second. Flip through 10 frames a second for Photo Quality animation. Use any standard video camera, VCR, video disk, or TV output. Save your pictures in NEOCHROME or DEGAS format for easy touch-ups and adding color. Special Hardware and Software **only \$119.95**

COMING SOON – POWERPRINT

Capture any ST screen and print it out with amazing versatility and styles. Select your own shading and print in hundreds of shapes and sizes. It makes the perfect companion for the video digitizer or your favorite graphics drawing program.

HIPPO SOUND DIGITIZER

Record and manipulate sounds in their pure digital form. Plug in the microphone (included) or hook it up to a radio, tape recorder, TV, etc. Comes with an audio output jack so you can play back through your stereo or PA system. Record, play, analyze, and manipulate pure digital sound using your ST's power and easy mouse control. Comes complete with everything you need for only **\$119.95**

Digitize Your Voice With Parrot

...so good it is being used by professional musicians in a band.

Reader comment

Corrections for Magic Spell and Blast!

If you've been getting an ERROR 136 when trying to load issue 46's **Magic Spell**, run the following program with your **Magic Spell** disk in drive 1. Substitute the filename you gave **Magic Spell** for the FILENAME.EXT in Line 10. The program will create a new **Magic Spell** file, under the filename NEWPRG.OBJ. Note that, if you're using an XL or XE computer, you must first run the translator disk to use **Magic Spell**.

```
10 OPEN #1,4,0,"D:FILENAME
   .EXT":OPEN #2,8,0,"D:NEWPR
   G.OBJ"
20 FOR X=1 TO 4679:GET #1,
   A:PUT #2,A:NEXT X:END
```

The above program will also be useful for those who've had trouble running **Blast!** from issue 44. Just change the number 4679 in Line 20 to 4092 and, of course, be sure to change the filenames in Line 10.

—Ed.

The separation issue: a bit from both sides.

No, no, no! . . . Don't separate **ST-Log** from your fine magazine as has been proposed.

As a long-time 800 owner and enthusiast, I fully intend to purchase an ST in the future, as soon as finances permit. But in the meantime, I can keep abreast of the news and articles about my "future" computer, while still getting the newest and best information about my present system. In fact, the thing that has "sold" me on the ST is the information I've learned about it through your pages and **ST-Log**. I imagine quite a few ST purchasers are former

8-bit owners who've been informed about the new line through your pages.

I feel you would be doing your readers and future 8-bit and 16-bit owners a disservice by publishing two periodicals, and creating a further division between 8-bit and 16-bit owners.

Sincerely,
David N. Osburn
Smyrna, DE

I feel compelled to comment on what appears to be the developing rift between the 8-bit and 16-bit subscribers—and on the Atari 520ST, in general.

First, I have watched the personal computer market closely for some years now, vowing that I too would be a computer enthusiast one day. My wife reminded me of one thing—that I had better plan my purchase carefully, and wait and see what further price drops occurred. Good thing; along came the 520ST, with the features, power, user-friendly interface and price which I found irresistible. I have had my ST for nine months now and plan to get many useful years of computing with it.

Now, about this controversy of 8-bit versus 16-bit. There are many owners of 8-bit machines out there, and I admire the pioneering spirit with which many bought their machines. However, the 16-bit machines are here to stay, and many are grumbling about what to do with their "old hardware". Use it, enjoy it and grow with it; that is the challenge. I prefer to use the ST, because of its mouse, windows and other user-friendly features.

I would prefer to see **ANALOG Computing** publish **ST-Log** as a separate magazine, because I want to learn more about the ST in general, as a novice. Also, this machine

deserves more support in the way of type-in programs, articles, new products, etc.

In closing, I would like to say that **ANALOG Computing** is a fine magazine for Atari owners, one which has been at the forefront of the industry.

Sincerely,
Jeff Cotton
Jenks, OK

I am an 800 user, as well as a professional programmer, but I enjoy knowing what is happening in the ST world. I vote for keeping **ST-Log** and **ANALOG Computing** as one publication.

If you decide to separate the two after all, please keep a couple of pages of ST news in **ANALOG Computing**, and vice versa. That way, we old faithful Atari supporters will keep abreast of how the other half of "our" company is doing.

Eva Dano
El Monte, CA

By all means, take the **ST-Log** section out of **ANALOG Computing**, and make it into a separate magazine. However, keep a page or two about new ST developments in **ANALOG Computing**. I plan to get an ST in the future, and I would like to know about anything new that comes along.

Also, the ads for the new "TCS" say that you will get a \$5.00 line-time credit. However, the information I received in the mail said I would get a \$10.00 line-time credit. Why the unconformity?

Yours truly,
James H. Ellwanger
Tampa, FL

The \$10.00 credit applies for previous TCS subscribers, while the \$5.00 credit is for magazine subscribers. —Ed.

ATARI DISK DRIVE OWNERS . . . HAPPY BLASTS RETAIL PRICE—ORDER TOLL FREE!

THE FAMOUS HAPPY ENHANCEMENT NOW ONLY \$149.95 for 1050 order number HC1G, for 810 order number HC8G

Makes your disk drive read and write faster, and allows you to execute the HAPPY WARP SPEED SOFTWARE. Available only for ATARI 1050 and 810 disk drives. 1050 version allows true double density plus the original single and enhanced density. PRICE INCLUDES WARP SPEED SOFTWARE BELOW, installation required.

HAPPY WARP SPEED SOFTWARE REV 7 (not sold separately)

Includes the famous HAPPY BACKUP and COMPACTOR which are the most powerful disk backup utilities available for your ATARI computer, plus MULTI DRIVE which allows high speed simultaneous reading and writing with up to 4 HAPPY ENHANCED drives, plus SECTOR COPIER which is the fastest disk copier that supports the 130XE RAMDISK, plus the WARP SPEED DOS which improves ATARI DOS 2.0s to allow fastest speed, plus HAPPY'S DIAGNOSTIC which allows comprehensive disk drive testing.

HAPPY 1050 CONTROLLER \$64.95 order number HC2G

For use with HAPPY ENHANCED 1050 disk drives only. Allows easy access to HAPPY 1050 slow and fast speeds and ultimate control of disk drive write protect, including writing to disk back side and protecting valuable data disks. Printed circuit board has switches and write protect indicator LED, installation required.

GET YOUR FAVORITE HIGH SPEED DOUBLE DENSITY DOS

Both of these disk operating systems support the fastest speed with both HAPPY 810* and 1050, and with HAPPY 1050 you get true double density. WARP SPEED DOS XL is HAPPY's own version of OSS DOS XL, and includes under cartridge, under ROM and AXLON RAM disk version, and is order number HC4G at \$29.95. TOP DOS version 1.5 from ECLIPSE SOFTWARE has more menu driven features, operates in all three densities, supports the 130XE RAMDISK, and is order number HC6G at \$39.95. *Note: 810 requires upgrade below.

810 VERSION 7 UPGRADE \$49.95 order number HU3G -XXXX

Allows older 810 HAPPIES to use newer software. Includes custom plug in IC and rev 7 WARP SPEED SOFTWARE. Same price for all HAPPY 810s registered or not. When ordering replace XXXX in part number with the serial number of your HAPPY COMPUTERS manufactured 810 board, or with a 2732 or 2532 which corresponds to the EPROM part number in your HAPPY 810 socket A102 of your side board modified HAPPY (not made by HAPPY COMPUTERS), installation required. Upgrade not needed for new 810 HAPPYS and serial number over 8000.

SUPER PACKAGE SPECIALS

Get a HAPPY 1050 ENHANCEMENT and CONTROLLER and WARP SPEED DOS XL for just \$199.95 order number HS5G, or get the same with TOP DOS 1.5 instead of DOS XL for just \$214.95 order number HS7G. If you already have the 1050 ENHANCEMENT you can get the HAPPY 1050 CONTROLLER and WARP SPEED DOS XL for \$74.95 order number HXL9G, or get the HAPPY 1050 CONTROLLER and TOP DOS 1.5 for just \$84.95 order number HTD9G. For other specials and dealer pricing call (408) 779-3830.

Tokyo for \$19.95

東京

In the continuing evolution of scenery, SubLOGIC introduces the Japan and San Francisco Bay Area Scenery Disks for Flight Simulator II.

- Tokyo to Osaka is a comfortable 240-mile flight. The natural beauty of the Japanese coastline and mountain ranges complement the standard cross-country details.
- The beautiful San Francisco Bay Area "Star" Scenery Disk is perfect for concentrated sight-seeing.
- For the cross-country adventurer, our standard Western U.S. scenery (Disks 1-6) contains major airports, nav-aids, cities, highways, rivers, lakes, and mountains.

SubLOGIC Scenery Disks are available individually for \$19.95. The six-disk Western U.S. set is available for \$99.95. See your dealer, or write or call SubLOGIC for more information.

A little blatant praise. . . your issue 45 was the most information-packed I've seen. I must congratulate you on an excellent report of the West Coast Computer Faire, though I can't decide whether it was **ANALOG Computing's** (Matthew J.W. Ratcliff's) great job of reporting, or just the great stuff you were given to report, that made it so good. I'm really looking forward to your Summer CES report. Also, thanks for the second **Guide to ST Software** in issue 44.

About **ST-Log**: I think you should keep **ANALOG Computing** and **ST-Log** together. One of the main reasons I take **ANALOG Computing** is to keep up with all Atari news. If you make **ST-Log** a separate magazine, I'll no longer have ST news or ST product reviews, and I doubt if I could handle a double subscription. And what about CES and COMDEX reports? There is certainly an increase in ST coverage in these reports (and in their respective shows). If **ANALOG Computing** goes it alone, will I open my magazine to see a (gulp!) half-page report on CES, a page on COMDEX? I say the ST coverage is well worth a price increase, albeit a small one, please.

Thanks for the Delphi information in issue 45 (not to mention the actual TCS changeover). Keep up the great work.

Yours truly,
Donald Lancon, Jr.
(DCLJR on Delphi)

First, I would like to comment on the 8-versus 16-bit controversy. I bought my first computer in September 1981. The system consisted of the Atari 800 (16K), a 410 program recorder, **Star Raiders** and a pair of joysticks. I paid \$930.00 (at discount) for this system. A month later, I purchased an 810 (88K) disk drive for \$470.00 (also discounted).

Needless to say, when I purchased my second computer, it, also, was an Atari system. This new system consisted of: 520 ST (1040K with upgrade), SC1224 RGB color monitor, SF314 (760K) disk drive, mouse and assorted software. This cost \$1080.00 in March 1986.

I guess I should be upset that this new level of sophistication, power and technology are now available. . . I'm not! I most certainly should regret (and perhaps be a bit displeased) that today's 8-bit Atari is not only much less expensive, but a more powerful machine. . . I don't! The point is, I have both machines side-by-side and, yes, I still use the old reliable 800.

There should be no controversy. Improvement and progress should be welcomed. When progress stops, there will not only be a controversy; it will be the end. I'm an Atari enthusiast and would like to see an end to this rift.

I would now like to comment on **ANALOG Computing** and **ST-Log**, i.e. your edi-

torial in issue 45. I, for one, enjoyed reading about the ST computers (in **ANALOG Computing**) long before I purchased the system; you kept me informed of the latest developments. On the other hand, if you increase the size of the ST section, costs and subscription rates will go up. This will penalize those readers not interested in the ST line.

Two separate magazines seems to be the fair solution, those interested in both computers may receive both publications. Those interested in one or the other (or neither) may do as they wish. Perhaps you could have an ST news section in **ANALOG Computing** and a 8-bit news section in **ST-Log**, to satisfy those who are using one system, yet are interested in brief news about the other. Hopefully, this can be done without increasing costs, so that one group is not subsidizing the other.

Sincerely,
Rick Nichols
Torrance, CA

The disk bonus: plus or minus?

I want to comment on something I think is a really bad start. In issue 45, you had

an article for ST disk subscribers only. Yet the magazine is not "disk-bound" (that is, either you buy both or none, like the upcoming **COMPUTE! ST**), and the disk is supplied as a supplementary aid for those who don't want to type. It is supposed to have only programs, listings of which are printed in the magazine. Any other choice treats all the rest of us as second-rate subscribers.

A clear explanation of the policy to be followed and a publication of these articles would be the best solution.

Sincerely yours,
E.D. Varkaris
Troy, NY

The disk-only magazine articles are not intended to make magazine subscribers feel second rate, or even to force them to purchase the disk. We're attempting to make available the best ST software we can get our hands on. Frequently, the listings for these programs are much too large to make magazine publication feasible. If we didn't go to a disk-only format on these items, we would be unable to publish them at all. We don't find that an acceptable alternative.

**THE ATARI
TEN COMMANDMENTS**

**"We shall create a computer
that will be a landmark in the
history of computers."** *Just Frammel*
ATARI CORP.

Recently, a writer compared the revolutionary 1040ST™ to Henry Ford's Model T.™

You may be surprised to learn that we were very complimented.

The truth is that both the ST™ and the Model T were designed to be machines of great power and usefulness at a price that was affordable to everybody.

The only difference is that the 16-bit 1040ST uses the most advanced technology in the world. And the result is a computer that has 1024 Kbytes of memory for the amazingly affordable price

of \$999. That's actually less than \$1 per Kilobyte.

We think Henry Ford would be very proud.

The ATARI 1040ST is at your computer retailer now.

ATARI © 1986, Atari Corp.
ATARI, 1040ST, and ST are TM's or reg. TM's of Atari Corp.
Model T is a TM of Ford Motor Company.

Reader comment *continued*

Furthermore, you don't need a disk subscription to get these programs. They're available in *ANALOG Computing's* Atari Users' Group on Delphi.

We're trying to strike a happy medium, and not go to the total disk-only system other magazines have adopted. When possible, program listings will be printed in the magazine. Some articles will be tutorial in nature, including important routines within the article, while the complete program listing resides on disk. This method assures that our magazine will remain valuable to all readers (and not sport an expensive \$14.95 price tag). —Ed.

Troll War fix.

There is an error in the Troll War game program (issue 45). The program will not survive SYSTEM RESET. The boot header initialization address is 27F9 in Line 230. This address originally contains an RTS instruction. After the program runs, it clears that address. The RTS is gone! Line 230 should read:

```
DATA 0, 23, 210, 39, 102, 43, 169, 0, etc.
```

Yours truly,
David E. Wolff
San Jose, CA

Main Street.

In our issue 46 June CES coverage, Matthew Ratcliff mentioned Main Street Publishing as a company that markets classic Atari software very cheaply—but we didn't then have an address. Here it is: Main Street Publishing, 611 W. Travelers Trail, Burnsville, MN 55337 — (800) 334-3645; in Minnesota, (612) 894-7950. —Ed.

M/L keypad.

I recently typed in Clayton Walnum's BASIC Editor (issue 43), and I was working on some changes when BASIC Editor II (issue 45) came out. It is a much superior program and works very well.

I was interested in Magic Spell (issue 46), so I typed in M/L Editor. This also works well, but I felt a minor change was needed. Instead of being able to enter numbers with only the "top row" (the normal keyboard layout), I felt it would be easier to type in via a keypad.

In issue 14, Randal C. Gibson's Hexpad used a machine language routine to change several characters, so that the right half of the keyboard formed a keypad. I used his routine, with a few modifications, to form a similar keypad.

The M/L subroutine changes the letters

JKL to 123, UIO to 456. The numbers 789 are already in position. Other changes: M becomes 0, as does the SPACE BAR, and the comma is changed to RETURN. I changed the latter because, the way the program is set up, a comma is never typed; all entries are separated by RETURN. This allows for less movement of the right hand.

The program will convert only the keys listed, but as originally written, it would only accept numbers or RETURN. All other keys are unchanged, so either the "top row" keys or the new "keypad" can be used to enter the code.

You need... "function_aid"

- Stop fumbling for your manuals
- Put your Macros in front of you
- Rests on top of your *ST
- Adjust window to suit your light
- When finished, remove & cover keys
- 4 Blank inserts included (2" x 12")
- Designed & made only for the *ST

*ST is a trademark of Atari Corporation

- ★ Indispensible for business programs (word processors, telecommunications and data bases) etc.
- ★ Just about any program you use needs function_aid
- ★ If you own an Atari *ST you definitely need this!
- ★ Unconditional 5 year Guarantee

If you break function_aid, return it and we will replace it at no charge to you.

8-bit news!

TOP GUNNER

Now you can have a crack at downing enemy fighters, in one of the three games in this package. Each of these games was previously released individually, under the titles **Hellcat Ace**, **MiG Alley Ace** and **Air Rescue**. (You may recall, in issue 20, the **ANALOG Computing** staff chose **MiG Alley Ace** as one of our all-time favorites.)

A double-sided disk, complete with a 30-page manual, comprises the set—at \$24.95, that's less than each program originally sold for alone. While none of the games has truly outstanding graphics, their playability is top-notch, and the multi-player capability is among the best.

Hellcat Ace is set over the South Pacific and recreates fourteen US-Japanese battles. From your "cockpit," you hunt down aircraft and attempt to blow them out of the sky. **Air Rescue** is an arcade-type game, on the idea of **Defender/Scramble**. **MiG Alley Ace** has a split screen, to give your view out of the windshield and your opponent's view. Your enemy can be another player or the computer. Each tracks the enemy, the goal being to knock the other plane out of the sky.

At \$24.95, Microprose Software, 120 Lakefront Drive, Hunt Valley, MD 21030 — (301) 667-1151. CIRCLE #101 ON READER SERVICE CARD

BLAZING PADDLES

This all-in-one illustrating program draws, paints and prints your custom pictures. Or you may choose from a variety of pre-drawn shapes and text fonts.

Blazing Paddles works with a myriad of input devices, including light pens, **Koala Pad**, joystick and trackball. Printers supported include Okimate 20, Epson, Gemini 10X and 15X, and Panasonic.

The program allows many drawing functions, among them free-hand sketch mode, individual pixels/dots, circles and ellipses, squares and rec-

tangular boxes, text, cut and paste, predrawn shapes, zoom, spray, and fill. Pictures can be saved and loaded to disk, or graphics hardcopy can be achieved, using one of the printers listed above.

The cost is \$34.95, from Baudville, 1001 Medical Park Drive, SE, Grand Rapids, MI 49509 — (616) 957-3036.

OTHER NEWS

Intellicreations has released a new graphics text adventure game, **Gunslinger**. In it, you take on the role of Kip Starr, a retired Texas Ranger. But events have caught up with him—it's time for action!

Poor Kip must journey through perilous country, including a ghost town and a deserted mine, then cope with ambushes and hostile Indians. This game features a graphics window and a separate text display.

Retail is \$29.95. Intellicreations/Datasoft, Inc., 19808 Nordhoff Place, Chatsworth, CA 91311 — (818) 886-5922.

CIRCLE #190 ON READER SERVICE CARD

XLent Software is offering **Miniature Golf**, which allows you to play any number of holes per game, design your own scenes and set up stationary or moving boundaries.

Up to eight people can play, and you can store up to sixty holes per disk. Geometry, physics, friction and gravity are all simulated.

The price is \$29.95, from XLent Software, P.O. Box 5228, Springfield, VA 22150 — (703) 644-8881.

CIRCLE #170 ON READER SERVICE CARD

Six Fork's **Assembler and Linker** lets you enter in source code using a word processor (of your choice), rather than a unique editor.

Moreover, instead of having a single large source file, everything is divided into small subroutines. The linker gives the option of having a "library" of subroutines you can use in any of your programs.

Priced at \$39.00. For further information, contact Six Forks Software, 11009 Harness Circle, Raleigh, NC 27614 — (919) 847-2740.

CIRCLE #191 ON READER SERVICE CARD

A FLIGHT SIMULATION ADVENTURE

You've become a 21st-century soldier of fortune. Crash-landing on the war-torn planet Targ, your ship beyond repair, you discover other means of transportation. This adventure is combined with a flight simulator and high-speed, 3-D vector-type graphics.

You can "work" for the mechanoid inhabitants or as an independent. As you explore the surface of Targ from the air, you search for an important key. Travel underground to collect valuable objects, or fly to the colony craft orbiting the planet. Your final goal is to locate an interstellar ship in which you can escape from the planet.

For \$29.95, IntelliCreations/Datasoft, 19808 Nordhoff Pl., Chatsworth, CA 91311 — (818) 886-5922. CIRCLE #192 ON READER SERVICE CARD

Status report

8-BIT SECTION

Atari: This is the future.

by D.F. Scott

The material here is part of a complete overview of Atari Corp.'s plans and possibilities. Among the sources drawn from: Michael Katz, Executive Vice-President in charge of Entertainment Electronics; Leonard Tramiel, Vice-President in charge of Software; Shiraz Shivji, chief developer of the ST "blitter" chip; Jim Tittler, developer of the ST's IBM PC-compatibility unit; and other sources who wish to remain anonymous.

This portion of the report deals with the future of Atari from the 8-bit point of view. For an integrated, comprehensive picture, we suggest that readers refer to the ST section of the article, found on page 51ST. The two sections form an informative, insightful image of what we, the users, can expect from Atari.

Entertainment Electronics.

Atari's roots are in game machines, and that's nothing to be ashamed of. The creative genius who invents or programs a computer is the same genius who toys around with it. Still, the 8-bit Ataris have always had to be proven and fought for. It's as if the machines themselves were a cause, like unionization or the abolition of apartheid.

The storm is over now, and the war-torn Atari 8-bits—and even the home video games—are still with us. Within the fast-moving vehicle that is now Atari Corp., there are those who say 8-bits and video games have taken a definite, permanent backseat to the STs and TTs.

Michael Katz doesn't want the backseat. Formerly of Mattel, Coleco and Epyx, the current chief of the Entertainment Electronics division firmly claims his copilotship of Atari, and his presence is certainly felt. He's taken control of the 8-bit product line altogether, renewing the 65XE and the 7800 game system. In terms of marketing, he's turning the Tramiel philosophy completely around. If you live in Philadelphia, you may already have seen the final results of that turn-around: TV commercials.

If you're wondering how the Jack Tramiel philosophy of "newspaper ads only" could have been so directly contradicted, read the words of Katz himself: "Our emphasis is to get better distribution on the 8-bit computers. In other words, get major accounts—whether they're specialty dealers or mass-merchants or department stores carrying the 8-bit line. . . Advertising, which we're thinking about doing on TV, is in the right direction. We just have to get those retailers committed to carrying software and carrying the product."

"We've already produced two new commercials for the video games, that are running right now in the Philadelphia test market." Each TV ad would center on a specific product, Katz told us, not a portion or the entirety of the Atari line. Still, we asked him, isn't that going against what your boss used to say, that newspaper ads are the cheapest way to reach the most people? "That's true for the ST," Katz responded, "which is not a broad-market product right now. But it's not true of the 8-bit computers, which have a mass-market appeal."

So, if you're one of those who marched bravely down the aisles of a computer store chanting, "The XE's not a game machine," lay down your arms. Atari itself is about to tell you that it is. Public Relations Director Neil Harris broke the news officially, when his BBS news file stated the new 65XE promotion would be "as an advanced game machine." Michael Katz explains: "For ads, it's positioned two ways: For the game aficionado, it's the ultimate video game system that's also a computer; for the beginning computer buff, it's the best beginning computer system, because it's low-priced, it's got 64K and it's expandable. So it's the best of both worlds."

Leonard Tramiel has no qualms with this promotional strategy, but doesn't consider it a permanent one: "You can market the computer as an advanced game machine . . . as an introductory computer, [or] as a word-processing bundle. That particular promotion is aimed in that direction."

Does this make the 130XE a "super-ultra-advanced game machine" or a word processor—this year? Tramiel reiterates, "That changes from promotion to promotion. It's just a question of how it's being marketed at a particular time."

"The 130, at the moment, is being marketed bundled with a printer." Will the promotion undermine the status of the 8-bit line? Answers Tramiel, "No, not in any way. That's how most people use them, anyway."

Michael Katz, on the same topic: "It's just been in the last six months that the game market has started to come back strong. So anyone's interest, specifically in

Ⓕ Status report *continued*

game-playing machines, has been fueled by what we're seeing in the marketplace in the last few months. There's definitely a market for video game systems, and there's definitely a market for home computers. There's no reason why there can't be a lot of business in both segments."

Katz feels there'd be a lot more business in his segment if salesmen would just take the 8-bits and video games seriously. "One of the problems," he points out, "is that software distributors are not supporting the 8-bit software as much as they could be. Third-party software companies don't have a constant availability of 8-bit software, even though they've got it in their catalogs. So we're working to try to correct those problems, [such as] consumers and retailers not being able to get enough 8-bit software from either distributors or third-party people."

He doesn't stop there. Katz also wants a piece of the ST's action: "We've thought about the capabilities of the ST as a game-playing possibility. . . It's very good with graphics and sound—and those are important elements in games. We're looking at

the potential of the ST as playing some kind of a role, possibly, in a new game-playing machine."

It appears that even if Atari isn't "back-burnering" the 8-bit projects, its distributors and retailers are. They feel the ST is generating the energy. A peculiar double-standard is revealed here: software publishers say they don't want to produce products where a potential customer base hasn't yet been established. But, where such a base exists, it's dismissed as belonging to the older generation of computers. If a company combines both of these operating methodologies, it will sell nothing—and will be counted among the fatalities of the industrial "shakeout."

The XE exists now. It cannot be ignored. In the fields of telecommunications, number-crunching, record-keeping and game-playing, the 8-bits have their place. Because a company chooses to hitch itself to the ST rocketship doesn't mean it has to abandon more solid ground of the 8-bits. Older generation, yes, but old never meant dead. If a product hangs around the market a long while, it's usually because that product is strong, substantial and solid.

If products die out in their infancy, it's because they can't find that solid ground—remember the Atari Graduate? The 5200? The 1200XL? All these Atari products failed in their attempt to take an existing solid product and make it into something it wasn't. Despite cosmetic changes, the Atari 8-bits have survived unblemished. We mustn't forget that, if not for the revenue generated by the 8-bit line, games and computers, the ST would be dead in the water today—along with its manufacturer.

How will Entertainment Electronics generate the money to fuel development? In the video game department, titles from the 8-bits will be translated over to the 7800, using a special enhancement cartridge Michael Katz tells us will bear a 1-megabit internal storage capacity. These will not be former Atari titles, but games from (among others) Electronic Arts, Broderbund and Katz's former domain, Epyx. Doug Neubauer, who wrote the original *Star Raiders*, is reportedly being employed to enhance the game machines' ongoing library.

In an even more surprising development, Katz has been leading Atari into markets broader than those governed by the microchip alone. As Katz says, "Entertainment Electronics is pretty broad. We still have a definite interest in getting into products other than video games, but it probably will not happen until 1987. . . We hope to have some new products at least by Christmas."

As to what sort of product(s) Katz refers to, we can only speculate—possibly TVs, VCRs, CDs. That's still a company secret. But if Katz's timetable seriously calls for a December 1987 release date for new products, Atari must be pretty far along in

situating itself to market broadly-defined home electronics. We can assume whatever Atari's planning to produce is something close to its home territory. It produces monitors now; it may as well produce TVs. Perhaps they can be packaged with the 8-bits for a discount. Home robots, though, are definitely out—it seems Atari doesn't want to get into the automated house-cleaning industry.

Conclusion.

Nearly two years after Tramiel and sons assumed the debts of the faltering Atari from Warner Communications, the company is no longer ashamed to be producing game machines—as long as it also has a computer product that proves its creative genius applies to reality—not just fantasy. We're beginning to realize it wasn't games that nearly sank Atari; it was a drastically colossal management contradicting itself at every turn, skilled perhaps in marketing tobacco and soda pop, but not computers.

We've come so far in two years, haven't we? STs can be bought for a fraction of what we may have spent on an XLD, so you'd think the only way for Atari to go from here is further up. It isn't that easy. Atari's developers may have served us the future on a silver platter, but does that mean the company's banquet table is open to anyone and everyone? As Michael Katz pointed out, the ST isn't broad-market material; but some will say it isn't vertical-market material either—so just what is it? After Atari decides just what is what, can this same company still sell you *Pac-Man* and *Star Raiders*? On TV? On, perhaps, an Atari-brand TV?

We'll be checking back with Atari from time to time to see how the company chooses to address these issues. **Ⓕ**

COMP-U-TEMP™
ATARI 800/XL, 130XE, & COMMODORE 64

TEMPERATURE MONITORING AND DATA ACQUISITION SYSTEM

FEATURES include display of 8 or 16 temperature channels, range of -15°F to +180°F at approx. 1 degree resolution, electronic interface plugs directly into the joystick port, weather-protected sensors, menu-driven software capable of (1) labeling sensor locations (2) selecting high or low alarm set points (3) hardcopy printouts (4) selection of data sample time intervals for all channels (15 seconds to 4 hours) (5) recording temperature data to disk (optional).

VERSION 1.0 8 Channel \$99.95
Includes 2 sensors, software, electronic interface, and hard copy

VERSION 2.0 8 Channel \$119.95
Includes 2 sensors, software, electronic interface, hard copy, and data storage to and from disk

VERSION 3.0 16 Channel \$179.95
Includes 4 sensors, software, electronic interface, hard copy, and data storage to and from disk

Additional sensors (Each) \$5.75

M-Windows

Now, your 8-bit Atari can have all the windows you'll ever need.

by Kevin Ravenhill

How many 8-bit users feel neglected because windows pop up (pun intended) everywhere but on *their* machines? If you're one of these people, we've got the solution for you. How would you like to be able to open a window with your choice of size, screen position, color and border? Sounds good, eh? What if you could have up to 255 of these windows open simultaneously? If these features are appealing, **M-Windows** is for you.

Listing 1 is the BASIC data used to create your copy of **M-Windows**. Please refer to the **M/L Editor** on page 42, for typing instructions. You should name the resultant file **AUTORUN.SYS**.

Listings 2 and 3 are demos that show **M-Windows** in use. You should type these listings using the BASIC Editor II (issue 47). When you run the programs, you must have booted your system with the disk containing the **AUTORUN.SYS** file created from Listing 1.

Listing 4 is the assembly language source code for **M-Windows**. You don't have type this listing in. It's included for our readers who are interested in assembly language programming.

How it works.

M-Windows is an **AUTORUN.SYS** file that installs itself immediately after DOS, and is transparent to the user. It's also **SYSTEM-RESET**-proof. To open a window, six parameters are required. The first is the address of the open window routine—it's always 7459.

The next two specify the top left corner of the window in X/Y-coordinate format. The X-position values may range from 0 to 39, and the Y-position values from 0 to 23.

The fourth and fifth parameters specify the size of the window. The fourth contains the width, which may be from 1 to 40 characters. The fifth specifies the length, from 1 to 24 characters.

The last parameter is a border "flag." If a value of 0 is passed, no border is drawn. A value between 1 and 127 draws a border in normal video. A value above 127 draws a border in reverse video. If you tried the following: $X = \text{USR}(7459,0,0,10,5,0)$, you'd open a 10x5-character window without a border, at the top left-hand corner of the screen.

Closing a window is even easier. Only one parameter is passed, the address of the routine close the window. $X = \text{USR}(7826)$ would close the *last* window opened. If you try to close a window when there is none open, no harm is done.

Using **M-Windows** is simple, but there are a few things to keep in mind. If you open a window that's smaller than 3x3 characters, you should do so without a border. Otherwise, strange things occur. If you go to DOS, **M-Windows** will be wiped out, unless you use a **MEM.SAV** file. When you open or close a window, it's advisable to position the cursor away from the projected area of the window, like this:

```
POSITION 0,0:? " ";:X=USR(7459,2,10,15,5,0)
```

If the cursor is on the window when it's being closed,

there's a chance of a character not being replaced. If your cursor is nowhere near the window when it's being opened or closed, don't worry about it. POKEing 8045 with a 0 will tell **M-Windows** that there are no windows currently open.

It's a good idea to zero the window counter when you run a program, just in case any windows remain open from previous programs. Normally, reverse spaces are used to draw window backgrounds. This fill character is user-definable. POKEing a value into 7625 will change the character used to draw the window background. Experiment; try redefined character sets.

M-Windows calculates the address of the top left corner from the X- and Y-coordinates you supply. The characters hidden behind the window are stored on a stack that starts at the top of memory and grows down, toward your BASIC program. In addition to the characters, **M-Windows** pushes the parameters onto the stack. When you close a window, the process is reversed. First, the parameters are pulled from the stack. Then, the characters are stored on the screen, restoring its original state.

When a window is opened or closed, the value returned is the address of the bottom of the stack. You should watch this value, to prevent it from colliding with your BASIC program. The top of your BASIC program is stored in locations 14 and 15, like this:

```
TOPBASIC=PEEK(14)+256*PEEK(15)
```

Before you open a window, it's wise to check that the stack value will not go below the top of your program.

M-Windows gives your programs a professional look, without making you buy an ST, or numb your brain learning fancy routines.

Does your computer do windows? Mine does! 

Kevin Ravenhill is a courier for a clinical laboratory. Since this is a mind-numbing job, his Atari 800 provides a source of mental stimulation. He's enjoyed writing utilities in machine language and BASIC over the past four years.

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the *BASIC Editor II* in issue 47.

THE ATARI TEN COMMANDMENTS # II

**"We shall create a computer
that is as smart as the people
who buy it."** *Jack Tramiel*
ATARI CORP.

The real genius of the ATARI 1040ST™ is that the level of performance you want is already built in.

Our competitors, however, think they can sell you a computer with a puny memory, and then charge you a small fortune to expand it.

We don't think that makes much sense.

That's why the 1040ST offers you 1024 Kbytes of memory built in for the incredibly low price of just \$999. That's less than \$1 per Kilobyte.

About the only thing the competition offers is the

chance to spend big bucks to upgrade their systems to where the ST™ started in the first place.

We're pretty sure which computer smart shoppers will buy.

The ATARI 1040ST is at your computer retailer now.

© 1986, Atari Corp.
ATARI, 1040ST, and ST are TM's or reg. TM's of Atari Corp.

C.O.D. charges are \$3.00. In Continental U.S.A. include \$3.00 for software orders, 4% shipping for hardware. Minimum \$4.00. MasterCard and Visa orders please include card #, expiration date and signature. WI residents please include 5% sales tax. HI, AK, FPO, APO, Puerto Rico and Canadian orders, please add 5% shipping, minimum \$5.00. All other foreign orders add 15% shipping, minimum \$10.00. All orders shipped outside the Continental U.S.A. are shipped first class insured U.S. mail. If foreign shipping charges exceed the minimum amount, you will be charged the additional amount to get your package to you quickly and safely. All goods are new and include factory warranty. Due to our low prices all sales are final. All defective returns must have a return authorization number. Please call (414) 351-2007 to obtain an R.A. # or your return will not be accepted. Prices and availability subject to change without notice.

Database Delphi

News and updates about the *ANALOG Computing* Atari Users' Group on Delphi

by Matthew J.W. Ratcliff

The membership of the Atari SIG on Delphi has tripled in the two months since *ANALOG Computing* took over its sponsorship. And nearly every time I log on, I get involved in an interesting conference.

Dan Moore, author of *PaperClip*, is currently developing *PaperClip Elite* for the ST. He's quite active in the forum and has been kind enough to answer a lot of technical questions about software development on the ST. This month, we'll look at some of the new files available for downloading, plus a couple of polls and some of the more interesting messages from the forum.

Not all good article submissions can be published in our magazine—for many reasons. The program may be too long, or it may have a limited audience. Some of these programs, which *ANALOG Computing* feels should be shared, are being put up in the Delphi database areas. The authors will be mentioned here—and paid for their work.

This time, we have another modification for the immensely popular *Home-made Translator (HMT)* by Angelo Giambra, from issue 32. The latest update is a *Font Changer*, by Larry Nocella. This BASIC program, with some speedy assembly language USR routines, will load any font of your choice and write out to your *HMT* AUTORUN file. It gives you a custom font in your custom operating system, a real touch of class.

Charles F. Johnson (username CFJ), one of our most active "siggies" and author of *G:* (issue 35) and the *Koala Slideshow Pro-*

gram (issue 40), has done it again. His newest 8-bit program is the *Player/Missile Creator*. This BASIC and assembly program enables you to edit two P/M graphics shapes simultaneously. The editor is sophisticated and easy to use. As you edit two players, you can see their combined results in developing a three-color player. As the two shapes are edited, side by side or overlaid, you can also see the actual P/M graphics simultaneously. Help and mini-DOS screens are readily accessible from this program, as well. The end results of your fancy players and missiles may be written to disk as BASIC DATA statements, .BYTE statements for MAC/65 or Atari Assembler/Editor, or DB statements for the Atari Macro Assembler.

In the Piracy Poll created by STEVE-GRIMM, 93 percent of those responding claimed that pirated software was not their primary source of programs. One echoed the sentiments of most: "I dislike pirating. It spoils it for the rest of us. I hate copy protection, and pirating is the cause of it." Most of the replies indicated that users pirated for the 8-bit (to some degree), but absolutely do not for their ST system. Many correctly fear that pirating software for the ST will kill its software market.

One of our readers, TELEDATAAUST from Melbourne, Australia reported: "the ST is going strong down here. Recently, we had a PC show—the largest for the year—and one of the star attractions was the ST. There are about 500 or so STarians at the moment throughout the country, and it's growing!" Our SIG has had visitors from Germany and Canada, as well.

I had hoped to have more messages for you from my EMAILbag, but they were all

destroyed, due to my unfortunate lack of familiarity with Delphi. I thought I'd pass this caveat along to you. When reading messages in the forum, you can FILE the current message in your workspace, for downloading later if you like. Well, I was using FILE in EMAIL, since it's a valid command there. The problem is that, in EMAIL, your message is stored in a compressed format. You must reread it from EMAIL to get it uncompressed. You can download a filed piece of mail, but you won't make much sense out of it. To save your mail in a simple text file, you must EXTRACT it at the MAIL> prompt. This, and a few other inconsistencies in the Delphi command structure, take a little getting used to.

In the forum, the topic of dealer support versus mass merchandiser and mail order sales came up. Atari seems to want to support its specialty dealers, but also wants to sell many more machines through Toys 'R Us and other chains. The INSPECTOR, a software and hardware dealer, pointed out the problem from his view. . .

"I believe you can see from the responses that there are problems out in the computer world with dealers getting support. Atari is by no means the only one giving dealers problems, but if Atari could do better than others in this area, I believe it would greatly benefit (all Atari dealers). If you look at the problem from the dealer's standpoint, you can see pressure coming from the consumers. Most people can't wait for long delays in the receipt of equipment or software. This puts immense pressure on the dealer to avoid the loss of a sale. What really irritates me is when a customer buys a piece of software or hardware

Due to our low prices, all sales are final. NO CREDITS. All defective returns must have a return authorization number. Please call (513) 435-6868 to obtain an RA# or your return will not be accepted for replacement or repair. FOR YOUR PROTECTION WE CHECK FOR CREDIT CARD FRAUD. We do not bill until we ship.

at a mass merchandiser, then comes to the local dealer for support. We need money to survive. We don't charge for the help, and it takes time to help a lot of these people through their problems. I think you can see why a dealer fears competition from K-Mart or others. We lose sales, because they can undercut us—and we have to support their customers, because their salesmen or women don't know a byte from a bite. All in all, I hope both machines (the ST and Amiga) eat Apple's and IBM's lunch."

For all you 8-bit diehards out there: you'll find a new file up in the games database, called *The Death of an Apple*, submitted by CUBFANANDBUDMAN (now there's a username). This is a graphics and sound demo that's...well, killer! It was written and placed in the public domain by Scott Emond. This duel to the death between Atari and Apple multicolor logos is a must.

For you newcomers, Charles Bachand has been archiving groups of forum messages in the general interests database. Product reviews and computer show reports are archived here, too.

In the ST programs database, you'll find some new MIDI goodies, sent up by CANONBALL. DFSCOTT has sent up a RESET-proof RAMdisk for the ST.

That about covers the latest in the Atari Users' Group SIG on Delphi. I'm currently working on a serial story board. We'll begin a tale of adventure, let you read along and even let you post new chapters, if you like. I hope it's up and running by the time you read this. We have no formal conferences arranged just now. I'll try to make myself available for conferencing on Sunday evenings and I'll post an announcement by Wednesday, regarding upcoming conference schedules. ☐

THE ATARI TEN COMMANDMENTS # IIII

"We shall create a computer that sets a new standard for speed and performance." *John Trammell*
ATARI CORP.

The revolutionary 1040ST™ has a sizzling clock speed of 8 MHz that the competition just can't touch. And the more speed your computer has, the less time you'll waste waiting for it to do its job.

And we've succeeded in creating this amazing combination of speed and performance for the incredibly low price of just \$999.

Which means the 1040ST sets new standards for speed, performance and price!

It's what you would expect from a system driven by a powerful 68000 micro-processor.

The ATARI 1040ST is at your computer retailer now.

Similarly, the 1040ST delivers one Megabyte of memory for you to work with, which is two to four times more than our competitors deliver.

ATARI © 1986, Atari Corp.
ATARI and 1040ST are TM's or reg. TM's of Atari Corp.

by Arthur Leyenberger

Let me just finish wiring up these AB-619 condensers. There. Electronics Service, Unit No. 16, sure has a complete selection of components. Their catalog says: "components incorporating greater advances than hitherto known in the field of electronics." Anyway, I hope I've got all these parts wired correctly. Maybe now I'll find out what an Interociter is.

It's beginning to get chilly here. Makes me think about vacationing somewhere warm. Maybe I'll do Metaluna this year. Sometimes it's hard to concentrate on the work at hand. What was I saying . . . oh yes, welcome back to **The End User**. Let's get things rolling.

It's truly amazing to see computer hardware prices fall as rapidly as they have in the last couple of years. Four years ago, an Atari 800 which had 16K of memory was \$800.00. Three years ago, an Atari 800XL with 64K of memory went for \$350.00. Two years ago, an 800XL set you back perhaps \$200.00—and now you can get one for \$80.00. The same kinds of price reductions have occurred with a lot of computer hardware.

Take printers, for example (please). Four years ago, the most popular printer in my area was the Epson MX-80 with Graftrax (a dot-graphics enhancement). This printer could be had for only \$500.00. Today you can pick up the equivalent printer, an Epson FX-85, for about \$350.00. Not only has the price come down, but many features have been added to this—as well as other—printers.

One of the more popular enhancements

for dot-matrix printers is called near-letter-quality (NLQ) printing. Many of the mid-priced printers now come with this feature, which allows the printer to simulate letter-quality output by making multiple passes at each line. Rather than using the printer's normal font, NLQ is more precisely formed, to resemble characters produced by a typewriter. Text printed in NLQ mode looks quite good (although, if inspected closely, its dot heritage still shows).

Unfortunately, those who already have a printer without NLQ may balk at spending a few hundred dollars for another printer. For them, a new product from Carolina Engineering Laboratories (CEL, at 818 Tyvola Road, 109, Charlotte, NC 28210 — (800) 222-9073) could be of interest. Called the **StyleWriter**, this accessory can produce NLQ printing with just about any printer (Epson and compatibles, C.Itoh and Okidata). Here's the scoop.

StyleWriter is a black box connected between the computer and either a serial or parallel interface printer. It receives the output of the computer, interprets it and produces the desired result automatically. This is not magic—all special print commands to the **StyleWriter** are preceded by a backslash (\). All commands are one-letter abbreviations, such as \B for bold, \U for underlining, \I for inverse printing, etc. Your printer doesn't need to be able to underline or print boldface, for example, in order for **StyleWriter** to work.

It also has a couple of clever, useful print enhancements not available in any other product I've seen. There's double underlining, which, like regular underlining, can be done either continuously (including spaces) or just with words. Another fea-

The End User

ture called highlighting gives text an interesting look by printing it over a slightly shaded background.

StyleWriter is more than just a dumb black box. An 8085 microprocessor runs the whole show, which consists of a minimum 8K of RAM for buffering, software on ROM and up to six font ROM chips (at \$13.00 each). Almost twenty different fonts are available, including Roman, Sans Serif, Courier, Century, Old English, and many more.

Buffering allows the computer to send output as fast as it can to the buffer memory, while the printer prints as fast as it can. Since printers normally print much more slowly than computers can send output, a buffer frees up the computer for other tasks while the printer keeps on working. Otherwise, the computer would be continually communicating with the printer until all of the text was printed. **StyleWriter's** 8K buffer can be increased in size to 128K. This allows approximately 65 average pages of text to be printed independently.

StyleWriter contains just three push-buttons (ON/OFF, NLQ ON/OFF and RESET) to clear the buffer. When ordering, you must specify your make and model of printer, and your three desired type fonts, which come with **StyleWriter**. The 8K buffer version lists for \$198.00; 64K buffer and 128K buffer models are available for \$228.00 and \$258.00, respectively. These prices aren't all that high, when you consider the cost of a printer buffer alone.

The combination of buffering, command flexibility, speed of operation and low cost make **StyleWriter** a logical addition to your existing system. Best of all, it can be used

with either an 8-bit or 16-bit Atari computer. Quality of construction is first-rate, as well. As long as you've a word processor in which you can embed **StyleWriter** commands, you can produce near-letter-quality output inexpensively, in a number of fonts.

A remote turn-on.

I used to scoff at the idea of turning your lights on and off from a remote control. At the time, I thought it was pure decadence to do so. That was before I learned about the **System X-10** from BSR, now simply called **X-10** from X-10 USA, Inc., 185A LeGrand Avenue, Northvale, NJ 07647 — (201) 784-9700.

The **X-10** system is composed of modules that control AC-operated devices—lights, appliances and other electrical equipment—and a controller used to turn them on and off. Since the controller signals the modules via the AC lines, there's no need for special wiring, just one module for each device you want to control.

Each module comes with switches for you to set its identity. One switch is labeled *House Code*, and the other *Unit Code*. The two settings together make up the unique "name" of the individual **X-10** unit. When you press a button to, say, turn on the bedside lamp, the controller sends out orders by, in effect, calling out the name of the unit and telling it what to do.

A number of products make up the **X-10** system. A manually operated remote control can be used to "give orders" to your electrical devices immediately. You can have as many controllers as you want on your house's AC lines. The **X-10** Timer contains a clock and has the ability to store two on-times and two off-times for up to

eight **X-10** modules. In addition, each device can be turned on or off every day at an exact time or at random times (plus or minus a half-hour from the time you enter). This is the so-called security feature, to give your house a "lived-in" look when you're away.

Once the unit's been programmed, your coffeepot can start perking at 6:00 a.m. (assuming you filled it the night before), your bedside, porch and garage light come on at 6:30 a.m.—and be turned off after you leave. Later, the porch light may come on fifteen minutes before you arrive home, then turn off at 10:00 p.m. Thus, two complete on/off cycles would have been programmed.

The **X-10** Timer is somewhat tedious to program. Further, although newer timers have a battery backup, most older ones don't—whenever power is interrupted, the Timer's memory is lost, requiring you to reprogram. Fortunately, X-10 has gone a step further and come out with the Powerhouse.

This is a computer peripheral that replaces the Timer and works with a variety of computers, including the Atari ST. It can operate and change the daily schedule of lights, appliances and other electrical devices automatically, by remote control. Essentially, it's an **X-10** Timer programmed by the computer—and it is, therefore, more convenient to use.

The **X-10** Powerhouse is attached to the RS-232 port of the ST. The unit is self-powered, and, once programmed, can be disconnected from the computer—freeing that port for other uses. Although X-10 only makes software for the IBM PC, Apple II and Commodore computers, MichTron, a

familiar name to many, has a new program called **Echo** (\$40.00, from MichTron, Inc., 576 S. Telegraph, Pontiac, MI 48953 — (313) 334-5700) created specifically for the **X-10** Powerhouse, all of the **X-10** products and Atari ST computers.

Echo allows you to use the **X-10** system to change the status of up to 256 electrical devices at a maximum of 128 different times in a week. For you VCR fans, that's a 7-day, 128-event system. At any time, up to sixteen devices can be turned on, turned off, or dimmed—in one event. The system will do exactly what you tell it to, even if it's silly or dangerous (you could turn on—and probably burn up—an empty coffee pot).

Echo is a GEM application, so all entries are done via the mouse, and desktop accessories are always available. To create a new event or to modify an existing one, you click on the event line of the control menu. Up pops a new screen where you can enter your assignments and save them in a file. This lets you store alternate timing schedules on disk for use later (like when you're going on vacation).

Once you've created your set of assignments and stored them, the computer can be turned off and the RS-232 connection

removed. The **X-10** Powerhouse will silently control your home. A 9V battery protects the controller's memory in case of a power outage.

Lamp and appliance modules sell for \$10.00 to \$15.00 at Sears, Radio Shack, mail order and electronics specialty stores. In addition, replacement wall switches and outlets that look and work like ordinary fixtures, are available for under \$15.00. The Clock Timer can be purchased for under \$40.00, and a controller for less than \$20.00. The Powerhouse peripheral retails for \$60.00.

I was skeptical of the entire **X-10** concept before using it; I'm now a true believer. The system really does serve many roles, including that of a security system. I've grown used to the **X-10** as an "electronic servant," to wake me with fresh coffee and lighted rooms, while letting me sleep in on Saturdays. Outdoor lights come on at dusk and go off at dawn automatically, and it controls my water heater and air conditioner, to save energy (and money). The **X-10** system makes my life easier and safer.

Disk jockey.

My twenty-year-old *American Heritage Dictionary* defines the word *paradox* as: "A seemingly contradictory statement that may nonetheless be true." I define Paradox Enterprises, Inc., as a new company that just happens to have an interesting, useful and (I guess) paradoxical product called the **Microbyte**.

The **Microbyte-A** is a 5¼-inch floppy disk drive for the Atari ST that comes (as we used to say in my slot-car racing days) ready-to-run. For \$270.00, you get a rugged 360K-capacity drive housed in a metal case, an AC power adapter module, a 5¼-inch and a 3½-inch floppy disk. The ST disk cable is permanently attached to the drive on one end and has a drive connector on the other.

Setup is simple. The power adapter is plugged in and connected to the **Microbyte**; the **Microbyte** is connected to an Atari ST drive; the system is turned on; and a file is copied from one of the supplied floppies to an AUTO folder on the disk in the A drive. In this configuration, the **Microbyte** driver program will run whenever the system is booted. Alternatively, the driver program can be run at any time, in order to use the **Microbyte**.

In addition to letting you store ST programs and files on 5¼-inch floppy disks, the **Microbyte**'s main use is for file compatibility with an IBM PC or clone. IBM PC floppy disks can be read directly by your ST when placed in the **Microbyte** drive. Of course, what we're talking about here is ASCII file compatibility. Any ASCII file created by an MS-DOS PC can be read by your ST—and vice versa.

How does it all work? Very nicely, thank you. I was able to read ASCII text files

created by my AT&T 6300 PC on the ST, and **1st Word** files on the AT&T PC, without a hitch. In addition, I could read Lotus 1-2-3 data files directly by **VIP Professional** (in WKS mode).

My only (minor) complaint is that the ST drive cable plug doesn't precisely fit the jack on the ST drive. Once I got it in, everything worked. Since my unit was a prototype, you may not have this problem with the production drives.

Paradox Enterprises was started less than a year ago. In addition to the **Microbyte-A** (PC and PC-XT compatible), they have a **Microbyte-B** drive for the IBM PC-AT. It sells for \$280.00 and stores 720K on a disk. Both drives are currently available.

The company is also working on an IBM emulator for the ST. Called **MS.EM**, it is said to be near completion and should be available by the time you read this. It offers MS-DOS emulation through software—an ST cartridge. The emulator mimics a Hercules Color Card and runs such programs as Lotus 1-2-3, Wordstar, dBase II and III, and others. It will sell for under \$150.00, from Paradox Enterprises, Inc., 8444 E. 19th Street, Tucson, AZ 85710.

Another product, still in the design stage, is the **ParaBox**. It will allow the Atari ST to use IBM cards (extra serial ports, hard disk controllers, etc.) I'm told that the **ParaBox** will plug into the ST cartridge port and probably provide an extra cartridge port on the box itself.

If you need it, the **Microbyte** is a useful and well designed product. It was folks like these who launched the whole computer industry not very long ago.

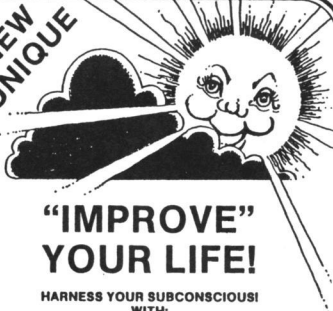

Mourning a friend.

The premature death of anyone is difficult to take, let alone understand. It's especially saddening when that person is young—both physically and spiritually. Such is the case with Frank Pazel, who recently succumbed to cancer.

Many of you knew Frank as the editor of the Jersey Atari Computer Group newsletter. In this capacity, he was the most dedicated person I've ever met. But his dedication and commitment to *all* aspects of his life were what made him a special person. Whether it was setting up the best Atari computer lab in New Jersey (in the Mountain Lakes High School), turning an interest in magic into a part-time profession, becoming a private pilot, or his extraordinary efforts on behalf of the JACG—whatever Frank did, he did well. And he was one of those people who always did exactly what he said he would do, or more.

Frank Pazel was a friend to all Atarians. The JACG, the greater Atari community and I will miss him. ☞

Bits & Pieces

This month, our hardware utility series shows you how to make a light pen.

by Lee S. Brilliant, M.D.

"An Apple a day keeps the doctor away." Or how about "All things in moderation?" Well, too much of a good thing is bad for you. So, this'll be the last of the articles on the digital uses of the joystick ports. But, never fear, there's much more to come about Atari's hardware capabilities, including many simple and useful projects.

There are analog inputs to the joystick ports, as well as to the serial port, audio-video port, power plug and parallel ports. Actually, they're there for you to use—if you know how.

This article will examine more ways to use the joystick digital inputs, including the trigger inputs. Next month, we'll conclude our discussion of the joysticks with the analog inputs.

Back in the third article, we used an optical isolation device called an optoisolator, which is an LED encapsulated with a phototransistor, or a triac. So far, we've used the computer to drive the LED half, but we can turn things around to sense the presence of outside voltages, or to recognize if a piece of equipment is turned on (see Figure 1).

TIL-111 or 4N26 or equivalent

Figure 1. — Optoisolator voltage detector.

Actually, you can cut an isolator in half and use the phototransistor to detect the presence or absence of external light, but it's easier to buy a separate phototransistor and connect it to the input of the joystick port. A phototransistor is one which conducts current when light hits its exposed internal workings, and it acts like a switch attached to the joystick pin (see Figure 2).

Radio Shack 276-145

Figure 2. — Phototransistor input.

When light strikes the phototransistor, it changes the state of the joystick pin from 1 to 0. In this setup, the light beam must be very strong. An intermediate strength beam can create an ambiguous logic state as the input fluctuates. A better approach is shown in Figure 3 (next page).

This uses a 74LS04 hex inverter, so called because it contains six inverter circuits in a single IC. An inverter simply changes the logic of the input signal to the opposite state, so if the input is at logic 1, then the output is at logic 0—and the other way around. Be sure to use an LS series IC, not a standard 74 series. The LS chips use less power, so less light is needed to trigger the inverter to change state.

Using this circuit gives you more reliable switching plus both a 1 and a 0 output (the A and B wires),

74LS04 and 3 Radio Shack 276-145s

Figure 3. — Three channel optical event sensor.

for either the presence or absence of light. Remember that a logic gate in the 0 state is like a short circuit to the joystick pin. So, as wired, a beam of light on sensor 1 would cause a 1 output from the first inverter at IC pin 2, which is chained to the input of inverter 6 at pin 13, and causes a 0 output from pin 12. A small cardboard tube or rolled up black paper placed over the end of the sensor makes it more directional.

Using the optical sensor.

What use is this small circuit? Well, are there any Boy Scouts out there? If there are, then you're probably familiar with the Pinewood Derby. Each Scout is given a wooden blank from which he sculpts a racing car. They then compete to see which car is the fastest.

We built a three-lane ramp track, and installed a set of three sensors and lamps at the end of the track. The program sensed which car was first, second and third, and also measured the elapsed time of each run. The program even registered the contestants, assigned the heats, controlled the starting gate (a three-color starting pole), generated the sound of three engines revving, and could also say, *Drivers, start your engines!* How's that for an application of your "lowly" Atari?

All this razzle-dazzle can be done through the joystick ports, using the simple controllers described in this and previous articles. The three-color starting pole used the high-powered light controller, and the voice was synthesized with **Cheep Talk** (issue 29). The same photodetector circuit used in the racetrack can also be used to build a light pen: read on.

The operating system.

Hardware is useless without software, so let's see how your Atari handles the hardware. The Apple, Commodore 64, and the Atari all use the same microprocessor, have 64K of memory, input/output systems, sound, graphics and more. What makes Atari so much better? First is the use of special hardware such as ANTIC and POKEY, but the main difference between otherwise similar computers is in their operating systems.

The Atari OS is unique in its use of what are called "shadow registers". These are locations in RAM which hold a value used by the hardware, such as the screen color used by ANTIC. The OS reads these shadows and writes the contents to the hardware sixty times a second during the interval between the drawing of each video screen. Changing the shadow changes the hardware register in between screens.

Conversely, the content of some hardware registers is transferred to the RAM. Included in this group are the states of the joystick pins, which are transferred from the hardware at 54016 to RAM at 632 for plug 1, and 633 for plug 2. BASIC reads these locations with the commands STICK(0) and STICK(1). The states of the joystick triggers are transferred from locations 53264-53267 to 644-647 and can be accessed by the BASIC STRIG(0-3) command. Note that on 400/800 computers there are four joysticks and triggers. On the newer lines there are only two, so we'll study only joystick ports 1 and 2.

The transfer to shadow registers occurs every $1/60$ second, or every 17 milliseconds (.017 seconds). This may seem fast to you, but consider that the response time of the phototransistor is measured in nanoseconds, (or millionths of a millisecond). It's easily possible for the sensor to respond to a break in the light beam so quickly that the joystick pin returns to its resting state before BASIC (or even the OS) can sense it.

The 6502 processor, operating at top speed, can sample the state of the joysticks every five machine cycles or every 2.8 microseconds. Listing 1 is a BASIC/machine program that will work with either the three-channel optical sensor (using the A outputs) to detect breaks in three light beams, or with three pushbuttons attached to the joystick, to create the heart of the TV quiz game. This is the core of the program which was used for the Pinewood Derby. For demonstration, you can use a joystick simulating three optical events with the forward, backward and left motions, to imitate three optical events or buttons pushed.

Type and save the program, then run it and see how fast you can go through all three motions. No matter how I tried, I couldn't do any two motions in less than $2/60$ second—so the program can discriminate order of events to 35 microseconds, but can only resolve time to $1/60$ second. This timer is good for most applications, but ties up the processor and prevents it from doing anything else.

Fortunately, there's another way to detect short events without tying up the processor: use the trigger inputs! Plug a joystick into plug 1 and try the following program:

```
100 PRINT STRIG(0):GOTO 100
```

When you run this program, you should see a long line of 1s until you press the trigger. Then you'll see 0s, as long as you hold down the button. Now add the following lines and run again:

```
50 GRACL=53277
60 POKE GRACL,4
```

As before, you'll see 1s until you press the trigger, and then 0s. But this time the 1s won't come back once the trigger is released. This "latch" is controlled by bit 2 of GRACL (a contraction of GRAPHICS ConTrol) at location

53277. A 1 in bit 2 (4 in decimal) sets the trigger latch, while a 0 clears it. So, to reset the trigger register to 1, poke GRCTL with 0. If you hook the photo sensor into the trigger line (instead of the joystick pins) and set the trigger latch, then any optical event, no matter how short, will be captured and held for as long as you want. It will show up in both the hardware and software registers until you reset GRCTL. The only problem is that the triggers are not independent. They're either all latched or not, either all reset or set. This kind of "sample-and-hold" electronics frees the main processor from having to constantly monitor the inputs to detect short events.

Light pens.

Besides the latch, one other thing happens whenever any trigger input is set to 0: the GTIA hardware notes where the electron beam is on the screen face, and records the column and row into hardware registers (which are then copied into RAM by the OS during the vertical blank). The hardware locations are 54284 for the column and 54285 for the row, with the respective shadows being 564 and 565.

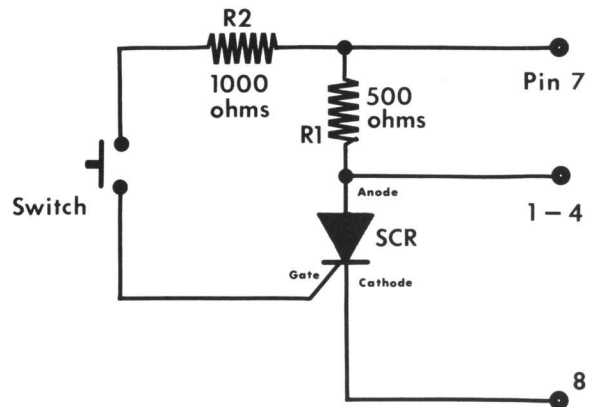

These column/row values are not like those in the graphics screens. The row values correspond to the scan lines on the screen and run from about 16 to 111, depending on how much of the picture is actually displayed by your TV. Similarly, the column value is in "color clocks" and goes from about 67 on the left to 227, then wraps around to about 7 on the right. Again, the amount of picture which is actually displayed will vary these values, and the positions are unaffected by the graphics mode.

All we need to do is build one-third of the light sensor in Figure 3, attach the B output to the trigger line (pin 6 on any joystick) and presto—instant light pen! Use the parts listed in Figure 3 and assemble on a thin piece of perf board, or make a small printed circuit. I added a small pushbutton (Radio Shack 275-1571) which switches joystick pin 1 to make it compatible with other light pens. This little device works because the output is 1 when there's no light on the sensor. As the electron beam crosses the field of the phototransistor, it causes conduction and produces a 0 input to the joystick trigger, which in turn causes the light pen values to be updated. Total cost is about \$10.00. I don't pretend that this is a professional quality light pen, but the circuitry is similar to another light pen I bought a couple years ago.

Mine is very accurate on the row, but often scatters on the column position. You can use the pen to make menu selections, draw on the screen, or perform other inputs. Listing 2 is a short example of how to use the light pen. the luminance of the screen **must** be high to trigger the pen, usually 10 or 12.

Finally.

If you're an Atari diehard (as I am), you may still be using an 800 or 400. If you are, you're lucky enough to have four joysticks to use—comprising a full 16-bit input/output port with four latchable trigger lines. If you use a newer version, you only have two, but you also have a full 64 or 128K of memory available. Unfortunately, there are always tradeoffs. But, if you have an XL or XE and need

Radio Shack 276-1067 or any SCR

Figure 4. — Latch circuit.

more than two trigger lines, or need to have individually resettable latches, then you can use the following circuit on any joystick pin to create a pseudo-latch.

This circuit uses the properties inherent in a Silicon Controlled Rectifier (SCR) to act as a latch. SCRs were originally designed for use in power control circuits, to chop up house current—such as in light dimmers. They allow current to flow only in one direction, but not until the gate is opened. Once current flow begins, it continues until the flow drops below a certain minimum level (similar to a toilet tank starting with the flush, not stopping until the tank is empty). Flow stops when house current changes direction, every $1/60$ second. The SCR will then not allow the backward flow; current drops to 0; and conduction stops until the next gate trigger.

In any case, momentarily closing the switch in Figure 4 causes the SCR to start conducting. This acts like a short on the input line and registers a 0 for that pin. R1 is needed to increase the current flow to exceed the minimum latch needs. If isolation is needed, use a Radio Shack 276,134 optoisolator with triac output (a triac is two SCRs back to back, to allow current flow in both directions), as in Figure 1. To reset the latch, turn the joystick port around to output and drop the latched line to 0, thereby shorting the current flow around the SCR and stopping conduction. Finally, return the port to input:

```

```

The last... finally.

At last we come to the end. Next month, we'll look at analog or paddle inputs and, ultimately, construct a mouselike device to aid in text editing. Until next month: happy circuits, and keep tinkering. **A**

**Astra is excited about the "NEW" Atari...
That's right, we are excited, but not just
about the new ST computers...
We are supporting the 8 bit Atari line
with four precision disk drives!**

The 1001 is where we start. This is where the other drive companies stop. The 1001 is a single or TRUE double density, single sided drive. It has a built in printer interface. The 1001 has a direct drive motor, not a belt driven one.

You say you need more? You are looking for a drive that is single or double density and double sided too. You also want a built in printer interface and direct drive motor with precision formatting. Then this is...
"The ONE" by Astra

Perhaps you don't need to keep 360 kbytes of data on a single disk. You prefer the utility of a dual drive system. Word processing, spreadsheets, and data bases are all made more powerful and easier to use with a dual drive system. And we have...
the "2001" by Astra

Still not enough? You want brute storage capacity! You want a single or double density, single or double sided, dual drive system. You want...
the "BIG D" by Astra
720 kbytes of storage in one system!

Comp-U-Temp

APPLIED TECHNOLOGIES INC.

Lyndon Way
Kittery, ME 03904
(207) 439-5074

Version 1.0: 8 Channels, 2 Sensors,
Software, Interface, Hard Copy
\$89.89

Version 2.0: Same as above, plus data logging to disk
\$109.95

Version 3.0: 16 Channels, 4 Sensors,
and other features of version 2
\$179.95

by Matthew J.W. Ratcliff

Comp-U-Temp is a unique product with a special-purpose application. This hardware and software allows you to connect up to sixteen thermistors (electronic temperature sensors) to a single joystick port on your Atari. They can be monitored, displayed and printed. In versions 2.0 and 3.0, data may be logged to disk, too.

The sensors handle a range from -15 to +180 degrees Fahrenheit. This is an expensive "educational tool" for the home, but may be used in small businesses, where temperatures are a concern (computer rooms, greenhouses and chemistry classrooms).

The autoloading BASIC software first presents a menu for displaying temperatures, editing sensor information (names and alarm setpoints), or printing temperature data. Alarms may be set for high and low limits. You may change locations of sensors and alarm points, editing them after the original list is completed. If a channel is not defined, a default name of *NOT ASSIGNED* is set. All channels are monitored and displayed.

You reboot the computer to get back to the main menu and select a temperature-monitoring function. You may display only, or display and log data (to printer, disk, or both). Before displaying data, select a sample rate, from once every fifteen seconds to once every four hours.

The display (version 2.0 was reviewed)

is a simple graphics mode 2 text screen. Each sensor's identification is shown adjacent to its most recent reading. A flag character is printed next to the reading, if high- or low-limits were exceeded. If any temperatures are out of range, the screen changes color and an alarm sounds. You can send each sample to the printer. Should you have version 2.0 or 3.0 for disk logging, each sample can be "appended" to a specified data file. The program places a maximum limit of 150 data samples total, if you're recording to disk.

My major complaint is with the disk filing. First, you must pay \$20.00 extra for the disk logging version. The program disk may be copied for backup, but the BASIC programs are protected. They cannot be LISTed or LOAded; they are RUN only. So, if you need disk logging, it will cost you \$20.00.

Worse, the program opens the data file for appending (rather than leaving it open, or using random access files). Each time another data point is to be recorded, every file sector (and its link) is read. When you're trying to record data at fixed 15-second intervals, you'll get anxious seeing data points being taken farther and farther apart as the file gets larger.

The limit of 150 data points is absurd, too. A good program would run a directory on your data disk, diagnose free disk space (from the *FREE SECTORS* line), and tell you how many data points you can read. It could estimate total data acquisi-

tion time by checking free disk space against your selected recording rate.

The software is cumbersome, overall. I see no point in protecting BASIC code; it's useless without the hardware. Sometimes one must be able to get data quickly and accurately. Temperatures are typically signals that vary slowly and do not require high sampling rates, but should be faster than every fifteen seconds. The sampling rate should be constant, too. The file append problem noted above is significant for faster sampling rates.

Comp-U-Temp is supposed to have approximately 1 degree resolution. I found my body temperature low by almost 3 degrees—a minor point, but if you want high-accuracy data, you won't get it here (a limitation of the paddle digitizer of the Atari, not the hardware).

To be fair, the **Comp-U-Temp** will give you access to temperature data in quantity, at a reasonable price. The documentation is brief and accurate, but provides no technical information on how the hardware works. I would like to see a less expensive, 2-channel version, along with time and temperature software (indoor and outdoor). I can see this used in smaller businesses, where temperature must be monitored on an "occasional" basis. With programming examples on how to compute temperatures from these "nonlinear" devices, there might be more applications in classrooms, as well. **A**

Infocom introduces four new games

Infocom,™ the crazy people who brought you "Zork"® and "The Hitchhiker's Guide to the Galaxy,"™ has a habit of coming up with games that add a new dimension to interactive fiction. And the best keeps getting better. Case in point: "Leather Goddesses of Phobos."™ It has a scratch n' sniff card and a 3-d comic book to excite all your senses. Once your interest is

piqued, you'll embark on a rowdy romp through the solar system. This hilarious spoof of 1930's pulp science fiction has 3 "naughtiness levels," for the prude to the lewd. "Leather Goddesses" is sure to amuse members of either sex.

One's really warped.

Then there's "Trinity."™ It answers the question of whether a game can be both light-hearted

and profound. You journey through a time warp into a mischievous fantasy world where all atomic explosions are mysteriously connected. "Trinity" takes you back to the dawn of the atomic age and puts the course of history in your hands.

One's a real circus.

It has been said that the circus is the only really mysterious thing left in civilization.

One thing's for sure, there is plenty of mystery in "Ballyhoo."™ While trying to locate the circus owner's kidnapped daughter, you are somersaulted into a three-ring world of deception and crime. To solve the crime

Atari BACK-UP!

We specialize in Atari®
Hardware & Software copy systems.

THE 1050 DUPLICATOR™ The most powerful disk drive copy system ever developed for the ATARI™

**NEW! 3.0
IMPROVED SOFTWARE
WITH MORE COPY POWER
NOW AVAILABLE**

- **The main purpose of the Duplicator is to copy disks!** You will be able to copy just about any disk! The copies you make will run on any Atari drive. **Copies made with the Duplicator will run on any disk drive, unlike our competition whose copies will only run on their own drives.** The Duplicator is fully automatic. You need only insert source and destination disks. Custom formats will be read and in turn reproduced on the backup copy disk. Our device will reproduce any custom format or heavily copy guarded scheme, bad sectors, double sectors, 19 through 24 sector formats will present no problem to the Duplicator.

- **You will still have single density, density and one half, and double density.** When you have a Duplicator installed in a 1050 drive that drive will be turned into true double density. You will have twice the disk storage. Your drive will be compatible with other double density drives as The Rana Indus. Percom, etc.

- **High speed read & write.** Your disk drive will read and load all of your software, saving wear and tear on your drive. The 1050 drive now reads one sector at a time. This is slow and inefficient. With the Duplicator installed you will read eighteen sectors in the time it takes standard, unenhanced drives to read one.

- **User friendly disk software will be included with every Duplicator.** A simple, menu driven program will allow you to copy all of your software. A Duplicator enhanced drive will be a SMART drive. We plan to write many new and exciting programs that can only be run on an enhanced drive, eg. sending a copy-guarded disk over the phone. Since the drive is now fully programmable, future upgrades can be made available to you on disks, should the need arise. No further hardware changes will ever be needed. The Duplicator comes with a full hardware and software guarantee.

* Duplicator price may increase due to component shortage and price increases.

Panasonic KX-P1092

PANASONIC INDUSTRIAL CO.
One Panasonic Way
Secaucus, NJ 07094
(201) 348-7000
\$599.00

by Pamela Rice Frank

When I finally reached the decision that—in order to increase my writing productivity and relieve my impatience—I had to have a faster printer, I followed the same steps which had led to the purchase of my Atari 800XL, 1050 drive, **AtariWriter** and 1027 printer. . . I started reading everything I could find on the subject. A *Consumer Reports* article on computers had convinced me Atari was definitely the right computer choice. A similar article in the June 1985 edition of the same magazine listed the Panasonic KX-P1091 (the model below the one reviewed here) as the dot-matrix printer with the best features and value for the price.

Although I wanted a printer that would give me graphics capabilities, my major concern was the appearance of the print. As a writer, I want my manuscripts to go out with as much in their favor as possible. I figured: the cleaner the copy, the better the chances.

Once I saw the near-letter-quality (NLQ) print on the Panasonic, I knew this was the printer I had to have. In this mode, the print appearance is "true" letter-quality, not near-letter quality. The font created by this printer is hard to distinguish from that produced by a typewriter or daisy-wheel printer.

I also found the Panasonic to be quiet, producing only a low-pitched hum while printing, rather than a shrill-sounding squeal.

Now, the only problem was the speed.

The 1091 is rated the same 120 characters per second (CPS) as the Star Gemini 10X, but takes almost twice as long to print a page in NLQ, rated in that mode at only 19.3 CPS.

Then I discovered the Panasonic **KX-P1092**. Listing at \$599.00, it retails for about \$100.00 more than the 1091. It boasts a draft speed of 180 CPS, 112 CPS proportional type and 33 CPS in NLQ mode. The **KX-P1092** has the 10-inch carriage width, enough to accommodate business-sized envelopes—either individually or tractor-fed, since it includes those options.

Fan-folded, tractor-fed paper is a snap to load. (That was one thing I was able to do without the manual.) The standard tractor is also adjustable, meaning that the printer can take such off-size items as address labels, without the optional adjustable-width tractor some printers require.

The printer does a fine job on friction-fed individual sheets, although dip switch 2-3, the paper out detector, must be placed in the on (or inactive) position, in order to print the entire page.

Setting up the **KX-P1092** was a snap. The manual does an excellent job of explaining this procedure. Even though I'm definitely a nontechie, I was able to get my printer up and running after a quick glance at the instructions.

However, once it was up and running, I borrowed my friend's Star manual for help. Although the Panasonic manual has an index (something the Star manual lacks) the Star manual definitely offers an easier-to-understand format and explanations.

The Panasonic **KX-P1092** is a versatile

IBM graphics and Epson-compatible printer. It supports 96 ASCII characters, 96 italic ASCII characters, 32 international characters (eleven countries), 64 block graphics and 132 IBM-PC special characters. Along with the above-mentioned proportional printing, it also includes pica, elite, italics, expanded, emphasized, (compressed) super/subscript, compressed, etc. However, these custom fonts can only be used in the draft mode. The **KX-P1092** has a membrane keyboard front panel across the left top of the printer. In addition to draft and NLQ modes, the standard italic, NLQ italic and proportional modes may also be selected, by an easy flick-of-a-switch method.

Since I hope to have an ST soon, I chose to use the dip-switch configuration necessary for the IBM mode, which is what the ST supports. With this configuration, I found the Epson RX-80 printer driver supported all **AtariWriter** commands. (I have not yet tracked down a **KX-P1092** driver, so I'm unsure how that works with it.) Also, with this setup, when I chose the Panasonic option in Broderbund's **The Print Shop**, pictures were printed with an extra line feed. Pictures are fine when the AXIOM ST option is used. (Actually, these dip switches are very simple to change, since they're located just inside the front cover. You don't even have to remove the ribbon cassette to reach them. I just hate messing around with that kind of thing.)

Another feature that sold me on the Panasonic **KX-P1092** was the cassette ribbon. I hate fumbling with ribbon spools. The Panasonic's seamless fabric ribbons are rated at a service life of 3-million

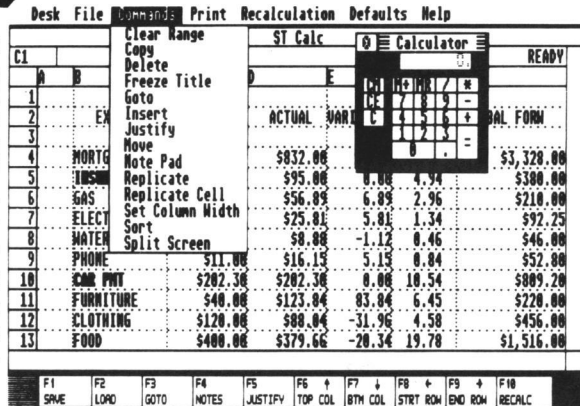

PUTEZ CALC™ TO WORK
FOR YOU AND BENEFIT
FROM THE RESULTS

ONLY \$69.95

FEATURES

- ✓ 300 columns by 999 rows
- ✓ Extensive use of GEM™ windows
- ✓ All commands are under mouse control
- ✓ Built in 10 keypad calculator
- ✓ On-line help windows (No commands to memorize)
- ✓ Built in sort routine
- ✓ Developed exclusively for the Atari ST
- ✓ 10 macros controlled by the function keys
- ✓ Split-screen capabilities
- ✓ Note Pad

EZ CALC™ is a fully implemented GEM™ based spreadsheet for home and business use. This is by far the most powerful spreadsheet available for the price. Better yet, all commands are mouse controlled for speed and ease of use. EZ CALC™ also uses less memory than other spreadsheets for the ST, leaving more room for your data and formulas. If you've never used a spreadsheet before, you'll be amazed how easy EZ CALC™ is to learn and use. The experienced user will love the speed of a mouse controlled spreadsheet.

GEM is a Trademark of DIGITAL RESEARCH, INC.
EZ CALC is a Trademark of ROYAL SOFTWARE, INC.

MOUSE CONTROL

Extensive use of the GEM™ windows make EZ CALC™ a fast, extremely easy-to-use spreadsheet. With over 50 commands available from the mouse, the ease of use is unsurpassed. Imagine being able to move or copy an entire column of figures with a simple mouse control.

CALCULATOR

EZ CALC™ includes an easy to use 10 key calculator that can be pulled down at anytime and operated either by mouse or keyboard. With the point of a mouse, the results of the calculation can then be transferred to the cell of your choice.

NOTE PAD

EZ CALC™ lets you attach a personal note of up to 4 lines to any cell. The cell is then highlighted to remind you there is a note attached. For example, you could attach a note to the insurance cell of your personal finance spreadsheet reminding you that the cell applied only to car and home insurance. The note pad can be pulled down at any time.

★ FULL FEATURED DEMO OF EZCALC AVAILABLE FOR \$5. REFUNDABLE WITH PURCHASE. ★

characters. However, they do cost more than the standard typewriter ribbons used by the Star—around \$9.95. This figures out to about 4 cents per double-spaced typewritten page, around twice the cost of a printed page on the Star.

The KX-P1092 is a 9-wire dot-matrix printer. Panasonic lists the dot configuration at 12x18 in the NLQ mode. (I haven't counted; I'll take their word for it.) The Panasonic printers produce a squarer-shaped dot than others, which could account for the clean, crisp appearance of its NLQ letters.

The KX-P1092 is a bidirectional (in draft and NLQ modes), logic-seeking printer. It prints unidirectionally in graphics mode.

I'm more than pleased with my KX-P1092—I love it! My 1027 has served me well for the last two years, doing the job when I wanted a printer to simply plug in and use, without contending with the interface, dip switches and control codes of third-party printers. But, if you're ready

to expand your printing world. I can think of no better way to enter the fascinating world of printing versatility than with a Panasonic KX-P1092.

CIRCLE #124 ON READER SERVICE CARD

M/L Editor

For use in machine language entry

by Clayton Walnum

M/L Editor provides an easy method to enter our machine language listings. It won't allow you to skip lines or enter bad data. For convenience, you may enter listings in multiple sittings. When you're through typing a listing with M/L Editor, you'll have a complete, runnable object file on your disk.

There is one hitch: it's for disk users only. My apologies to those with cassette systems.

Listing 1 is M/L Editor's BASIC listing. Type it in and, when it's free of typos, save a copy to disk, then run it.

On a first run, you'll be asked if you're starting a new listing or continuing from a previously saved point. Press S to start, or C to continue.

You'll then be asked for a filename. If you're starting a new listing, type in the filename you want to save the program under, then press RETURN. If there's already a file by that name on the disk, you'll be asked if you wish to delete it. Press Y to delete the file, or N to enter a new filename.

If you're continuing a file, type in the name you gave the file when you started it. If the program can't find the file, you'll get an error message and be prompted for another filename. Otherwise, M/L Editor will calculate where you left off, then go on to the data entry screen.

Each machine language program in ANA-LOG Computing is represented by a list of BASIC data statements. Every line contains 16 bytes, plus a checksum. Only the numbers following the word DATA need be considered.

M/L Editor will display, at the top of the screen, the number of the line you're currently working on. As you go through the line, you'll be prompted for each entry. Simply type the number and press RETURN. If you press RETURN without a number, the default is the last value entered.

This feature provides a quick way to type in lines with repetitions of the same number. As an added convenience, the editor will not respond to the letter keys (except Q, for "quit"). You must either enter a number or press RETURN.

When you finish a line, M/L Editor will compare the entries' checksum with the magazine's checksum. If they match, the screen will clear, and you may go on to the next line.

If the checksums don't match, you'll hear a buzzing sound. The screen will turn red, and the cursor will be placed back at the first byte of data. Compare the magazine listing byte by byte with your entries. If a number's correct, press RETURN.

If you find an error, make the correction. When all data's valid, the screen will return to grey, and you'll be allowed begin the next line.

Make sure you leave your disk in the drive while typing. The data is saved continuously.

You may stop at any time (except when you have a red screen) by entering the letter Q for byte #1. The file will be closed, and the program will return you to BASIC. When you've completed a file, exit M/L Editor in the same way.

When you've finished typing a program, the file you've created will be ready to run. In most cases, it should be loaded from DOS via the L option. Some programs may have special loading instructions; be sure to check the program's article.

If you want the program to run automatically when you boot the disk, simply name the file AUTORUN.SYS (make sure you have DOS on the disk).

That's M/L Editor. Use it in good health. **A**

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the *BASIC Editor II*, in issue 47.

P:R: Connection

ICD INC.
1220 Rock Street
Rockford, IL 61101-1437
(815) 968-2228
\$79.00 P:R: Connection
\$15.00 Centronics printer cable
\$15.00 RS232 modem cable

by Matthew J.W. Ratcliff

The **P:R: Connection** (we'll call it **PRC** hereafter) is the best interface produced for Atari computers since the 850. The Atari 850 interface allowed you to connect a Centronics interface printer and up to four RS232 devices to your Atari. Most people didn't need all four—one or two maybe, but not four.

The 850 interface has been scarce for the past couple of years. There have been affordable printer interfaces on the market for Ataris in the \$40.00 to \$80.00 price range, but there was no reliable R: interface for standard RS232 devices.

A techie note: the **PRC** is remarkable. It contains two chips for buffering RS232 lines. The rest of the box is made up of capacitors, resistors and one square custom chip from Rockwell International. That little chip has a microprocessor, ROM, RAM and I/O ports for all the interface ports in the box. It's truly a technical wonder!

The **PRC** consists of a printer interface, P:, and two RS232 ports, R1: and R2:. The first RS232 port supports all the necessary handshaking lines for complete modem control. The second does not include all the control lines, but is still quite usable. (Both implementations are virtually identical to those of the 850.) The printer and modem cables available from ICD are solidly built, a comfortable length of about 6 feet.

The **PRC** box itself is small, about 5¼x3¼x1", so it won't take up much real estate on your desk. The serial bus cable and an extra bus connector for daisy chaining

are on one side, with the three interfaces on the opposite side. The extra bus connector is a nice touch. Most other "affordable interfaces" don't have an extra bus connector, to save on the production costs. Such devices become a "dead end" in your daisy chain. If you have more than one such dead-end device (XM301, 410 recorder, printer interface, etc.), cable juggling will become a real nuisance.

You will find no power switch or power supply for the **PRC**. Since it uses custom low-power circuitry, it can get its power from your computer. This will pose a minor problem for 1200XL owners, since that computer has a "current limit" resistor on the 5-volt supply line. The manual explains (in appendix E) how to replace this resistor with a jumper. If you have a little soldering experience, this is easy to do yourself. Otherwise, a "hardware hacker" friend—or just about any computer center—could do it for you with the information provided in the manual.

My first test of the **PRC** was to replace the old faithful 850. The 850's cables for the 825 printer, Hayes modem and 520ST connection were hooked to the **PRC**. I fired up the printer and talked to it, with no problems from any of my software. I hooked up the Gemini 10X and ran some **Print Shop** graphics dumps to it, without a hitch. I booted up my favorite version of Amodem Plus, and it worked the first time, every time.

Next, I set up Rat*Term in the capture mode (a modem program I wrote ages ago and never finished, but it does support R2: and 9600 baud). I booted up the 520ST with **ST*Term** by Matthew Singer and unloaded a text file. The **PRC** had no prob-

lem accepting the data at 9600 baud.

Just to get picky, I hooked up the 1020 printer at the same time—it also responds as a P: device. With the 1020 off and the 825 on, my LPRINT statements printed flawlessly. Next, I powered down the 825 and put the 1020 on-line. The LPRINT statements went to the 1020 with no problem. I found that, with both printers on at the same time, only the 1020 would respond.

There's also an internal switch for "auto line feed," most printers can perform. This switch gives you that feature at the **PRC**, should you have an older printer that doesn't support it. This auto-line-feed feature is a nice touch for ST owners who'll be swapping the same printer between the two systems. You can just set the auto-line-feed jumper in the **PRC** and forget about fussing with the line-feed dip switch on the printer itself. (A word to the wise: never swap your printer between two computers with any power on. I did this while testing the **PRC**—and zapped the Gemini and the ST. The Gemini was repaired in short order, but the chip to repair the ST was harder to find and replace.) It would be a good idea to get a Centronics switch box if you plan to do this frequently.

ICD has paid great attention to detail here, and has produced a device extremely compatible to the 850. My only minor (very minor) complaint is that the switches, along with a power switch, should have been made available at the side of the box. For example, switching between the old faithful 825 printer and the Gemini on occasion, I need a convenient way to handle the auto-line-feed control.

Some software may not be compatible

with the PRC, because its program makes direct calls to the SIO, bypassing the traditional CIO entries. For software that does cause problems, ICD provides a file called PRC.SYS. It is an "850 translator" that should solve any problems (say, with the newer version of HomeTerm).

If you're thinking about stepping up from an 835 or 1030 to a standard interface 300/1200 (or 2400) modem, you'll be pleased with a couple other files on the disk provided by ICD. The immensely popular 1030 Express terminal program is provided as the new 850 Express. And CompuServe users will be happy to know

that TSCOPE has been provided on this disk as an updated RSCOPE. If you move up to a new modem when you get the PRC, you have excellent public domain terminal software to put you on-line right away!

The manual does an excellent job of describing the XIO commands which control the R: ports. I found it much more readable than the old 850 interface manual. If you want to make your own interface cables, the documentation provides the data. For the advanced user, ICD even supplies PRC's SIO commands and a complete source listing of its R: handler source code.

Eons ago, the 850 interface provided the

standard interfacing we needed for the 8-bit Atari computers, at a pretty hefty price (I paid as much for the interface as I did for my printer). When the 850's price finally came down, it was virtually extinct. At a very, very affordable \$69.95, the PRC gives you all the standard interfacing features you'll ever need. Buying standard interface devices such as Centronics printers and RS232 modems, your peripherals may then be used on other computers, such as the 520ST. The P:R: Connection is my pick for Atari product of the year. I highly recommend it if you still have any unmet interfacing needs. ■

Looks Like a Ferrari Drives Like a Rolls Parks Like a Beetle

Style, Performance and Cost Effectiveness make the Indus GT Disk Drive the best buy for any Atari eight bit computer. Future Systems recently acquired exclusive, world-wide manufacturing and marketing rights for the Indus GT. The GT's exceptional standard features still include:

- Single/Enhanced/Double Density Operation (90/127/180 KByte)
- Faster Read/Write Speeds (Up to 4 times faster) with Synchronmesh
- Digital Displays Showing Current Track Location, Drive Number and Density, Error Codes and Write Protect Status
- Built-In Pneumatically Dampened, Smoked Plexi-glass Dust Cover
- Whisper Quiet Operation
- Includes DOS XL, Wordprocessor, Data Base Manager, Spread Sheet Software
- One Year Warranty

Future Systems has improved the basic GT package by adding:

- GT Speller, a Spelling Checker for the GT Estate Wordprocessor
- RAM130, a RAM Disk Utility for Atari 130XE Owners
- INITSYNC.COM, a utility which speeds up booting by turning on Synchronmesh during boot up.

And has made available a host of optional equipment and accessories:

- **RAM Charger** - a 64 KB RAM Module which plugs into existing GT Disk Drives. For a suggested retail price of only \$129.00 this module provides:
 - **Synchronmesh II** - a faster and more powerful version of Synchronmesh, with RAM buffering functions on any Atari 8-bit computer
 - **CP/M 2.2**, a disk operating system which gives Atari Owners access to more than 10,000 new software titles (including world classics like Word Star, dBase II, SuperCalc), extends the life and protects the investment you have made in Atari Hardware, provides a means where by data files (and diskettes) may be interchanged with IBM Computers, and more.
 - **Extended Warranty** - an additional year's warranty if your's has expired
 - **Technical User Notes and ROM Source Code Documentation** - a programming guide to the GT
 - **Dust Covers** - attractive, heavy-duty weatherproof nylon, additional protection against spills and dust
 - **Head Cleaning Kits** - Wet/Dry kit to clean the read/write head and keep your GT in top running condition

Now
Available
for the
Atari ST
Series

Perfect Balance

Now the scales are in your favor. Dac-Easy Accounting gives you the best price plus tremendous performance. That means value, and the experts agree. Dac-Easy Accounting was recognized by *InfoWorld* as 1985's overall "BEST SOFTWARE VALUE."

No other accounting package can match the explosive user base or the unanimous acclaim from industry experts. Dac is the perfect choice for your first accounting system or for upgrading from a single module system. Either way compare, and you will join over 150,000 people who have computerized with Dac-Easy.

PERFORMANCE

Accurate information when you need it is what performance is all about. Fast, flexible reports give you what you need to know to manage cash-flow, turn inventory and increase profits... Listen to the skeptics-turned-believers.

"Dac-Easy Accounting is so inexpensive... we were skeptical... We expected to find a program that couldn't compete on a feature-by-feature basis... We were wrong."
InfoWorld, 1985

EXPANDABILITY

You never have to worry about outgrowing the Dac-Easy Series which offers Atari software products, support, and ten different business forms. All of our products are top performers offered at amazing prices.

Dac-Easy Payroll is designed to solve all your personnel and payroll management problems, outperforming systems costing thousands more. And it can either stand alone or integrate perfectly with Dac-Easy Accounting to form a comprehensive business management program.

Also available are Dac-Easy Forms and Fast Forms which offer the finest selection in continuous, multi-part forms and checks.

FLEXIBILITY

Dac offers the rare ability to handle either service or product-oriented companies without sacrificing features.

"Dac-Easy Accounting is everything its designers say it is... It is also flexible enough to fulfill the accounting needs of almost any type of business."

Journal of Financial Computing, 1985

FEATURES

General Ledger

- Unlimited multi-level accounts with screen inquiry for three years
- Pencil and pen correction option
- Automatic budgeting by department
- Unlimited journals and departments
- Excellent audit trail and flexible financial statements

Accounts Receivable

- Open invoice or balance forward per customer for unlimited number of customers
- Multi-sorted mailing labels
- Statements and invoices support automatic finance charges and special comments
- Detailed history for three years for number of invoices, sales, cost, and profits
- Customized aging report
- Automatic sales forecasting

Accounts Payable

- Checks handle multiple invoices, unlimited allocations and cash available protection
- Multi-sorted vendor labels and directories
- Customized aging report
- Automatic forecasting of purchases

Inventory

- Average, last purchase, and standard costing
- Physical inventory with perpetual comparisons
- Accepts fractional measure such as dozens
- Automatic forecasting of product needs
- Automatic forecast of product sales
- Detailed three-year history for every product
- Automatic pricing, alert and activity reports
- Screen inquiry for on-hand/on-order/sales/cost/profit/turns/GROW/etc.

Purchase Order

- Inventory and non-inventory items
- Allows up to 99 lines
- Per line discount in %
- Accepts generic deductions
- Accepts back orders and returns
- Purchase journal

Billing

- Service or Inventory invoicing on plain or pre-printed forms with remarks
- Prints sales journal
- Allows return credit memo

Forecasting

- Unique program that automatically forecasts using your three-year history:
- Revenue and expense accounts
- Vendor purchases
- Customer sales, cost and profit
- Inventory item usage
- Four different forecasting methods

OVER 80 ROUTINES AND 300 REPORTS

INTEGRATION

Dac-Easy's seven modules work together perfectly. Enter data once and it's posted to the other modules automatically. Also, most modules can be used stand-alone.

ALSO AVAILABLE FOR IBM & APPLE II

Dac-Easy Accounting is also available for the Apple II series. On the IBM compatible machines we have seven software products including Dac-Easy Accounting, Dac-Easy Payroll, Dac-Easy Word II, Dac-Easy Mate, Dac-Easy Port, Dac-Easy Accounting Tutor, and Dac-Easy Payroll Tutor.

SUPPORT

Subscribe to our toll free support agreement and join the best support program in the industry. Our friendly 12 person support staff are trained to answer your accounting and technical questions. No excuses, and no delays.

Find out for yourself why Dac-Easy is the fastest selling accounting package in history. Call us today!

Stock Performance Tracker

Track stock exchange activities like a pro—at home.

BONUS DISK PROGRAM

by James Luczak

Stock Performance Tracker is an investment tool that allows you to track the activity of a stock over a period of time. Anyone can use **Stock Performance Tracker (SPT)**. You don't have to be an expert. Even if you've never looked at the financial page of the newspaper, you can use **SPT** to follow activities on the stock exchange.

The only requirement for using **SPT** is a newspaper that contains the stock exchange listings. *Standard & Poor's Stock Guide* is also handy, to gather information about the stocks you wish to follow. However, the *Stock Guide* is not necessary for you to use **SPT**.

Features.

SPT tracks up to fifty stocks, for a maximum of 250 quotes each.

Closing prices are stored in revolving files. This means that stocks can be tracked for an indefinite period of time. After the 250th entry, additional entries are stored at the start of the file, replacing the oldest quotes one at a time.

A data sheet is produced for each stock tracked, showing if you made or lost money based on the last closing price. The data sheet also shows what the long-term and short-term taxes are, plus your profit after taxes.

A stock performance chart is produced for each stock tracked. The chart displays the activity of the stock, the historical high, the historical low and the purchase price. If using a color monitor, the stock track will be green when above the break-even price, or red when below or equal to the break-even point.

All data files are easily accessible. You can correct errors or adjust parameters in

any file. Any information you can enter, you can edit.

The data sheet, stock performance chart and a listing of all stocks being tracked can be output to a printer.

A handy stock form can be output to a printer. The stock form can be used to jot down closing prices.

SPT supports both color and monochrome monitors. I hope that you make a killing. **A**

Jim Luczak maintains and operates electronic telephone switching and processing equipment. He's been writing computer programs since 1979. He bought his first Atari in 1980, and has written programs in BASIC, C, LOGO, FORTH, Action!, and 6502 assembly. He enjoys writing dedicated database programs.

IF YOU CAN FIND A BETTER ATARI ST PROGRAM WE'LL BUY IT FOR YOU!

Full GEM interfacing, convenient Quick Keys, and many other unique features of our own.

WORD WRITER ST with Spell Checker

A full-featured, professional word processing system for home and business use. You get:

- A Continuous Spell Checker that identifies misspelled words as you are typing your document.
- An additional 85,000 word, built-in Spell Checker that checks your entire document – at your command!
- On-Screen underlining, italics and boldface – as you write.
- An Outline Processor that quickly organizes notes, facts, and ideas in convenient outline format.
- Every other feature you'll need for everyday word processing, plus most of the features found in more expensive programs.

With Timeworks you get more than software. . .

You Get Our Customer Technical Support Team – free to all registered users.

DATA MANAGER ST with Report Writer

A complete general information Storage and Retrieval System with report writing, business graphics, and label making capabilities. Plus, you get:

- Flexibility that allows you to modify your data base structure by changing the size or position of fields of information – at any time.
- A complete Report Writer that generates customized data reports. You specify the title, location, and sequence of each column.
- An extensive Business Graphics Package with pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- A Label Maker that prints your important information onto all types of labels.

With Timeworks you get our Money Back Guarantee*

If you can find anything that works better for you – and it's available – we'll buy it for you. Details inside every Timeworks package.**

SWIFTCALC ST with Sideways

A state-of-the-art spreadsheet for home and business use. You get:

- 8192 rows and 256 columns provide up to 2,048,000 cells (locations) in which to place information.
- Super Graphics graphically display and print out business information using pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- Windows allow you to work on two sections of your spreadsheet simultaneously.
- Sideways lets you print all columns on one continuous sheet . . . sideways.
- Help Screens, help you use the program – without referring to your manual.
- Formatting – Choice of five formats: Decimal (up to 9 places); Graphics; Exponential Notation; \$ Sign & Commas.

You Get Our Liberal Upgrade and Exchange Policy – Details are inside every Timeworks package.

ST SECTION

Just how is Atari's future (and that of the ST) shaping up?

by D.F. Scott

This article explores issues vital to the future of Atari Corp. Among our sources are: Michael Katz, Executive Vice-President in Charge of Entertainment Electronics; Leonard Tramiel, Vice-President in Charge of Software; Shiraz Shivji, chief developer of the "blitter" chip for the ST; and Jim Tittsler, developer of the ST's IBM PC-compatibility unit. Other sources have asked to remain confidential and not be directly quoted.

The material here is the ST-oriented portion of a complete overview of Atari Corp.'s plans and possibilities. We suggest, to obtain the comprehensive picture, readers also refer to the 8-bit section of the report, on page 13. The future of Atari is dependent upon all of its products.

First things first . . . the TTs are coming.

A new machine is in the works, and it's shrouded in misinformation. From Atari's own corporate heads, with the inconsistencies ironed out, here's what we're free to assume: the CPU of the TT (Thirty-two/Thirty-two) will be the 68020, supporting a 68881 math co-processor. One obvious benefit from the use of these chips: full communicability with the ST. The CPU will not be National Semiconductor's 32000, as previously thought.

The operating system will be UNIX V, the full multi-user version by AT&T. Current implementations of this multitasking system give programs or tasks an operating priority alongside physical devices, as if each program were a "virtual device" in

itself. They also feature exclusive access to a "C-shell," or a type of runtime package which handles C-language routines in a manner more familiar to GEM users.

The TT exists now. Prototype units are running in the labs. Several Atari sources are describing the TT as "VAX-in-a-box." It's obvious someone high up at Atari wants employees and the media to promote the product in that manner.

One Atari source compares the TT to products from Apollo, a company based in Chelmsford, Massachusetts. Apollo now manufactures graphics workstations based on the 68020. These, like the TT, have a 2 Mb RAM base. Using 68881 floating-point co-processors, Apollo's Domain workstations are clocked at 16 MHz. A color raster display of 1280x1024 pixels chooses from a palette of 16 million colors in analog representation. It can plot 100,000 floating-point-transformed 3-D vectors per second, with an area-fill rate of 125-million pixels per second. We're no longer in the Amiga's ballpark.

Atari's projected TT price tag is from \$1,200.00 to \$3,000.00. But Atari's marketing department is stalling. Apollo is a relatively small company, with small sales figures, on the Atari scale. By one estimate, if Atari scores nearly as well with the TT as Apollo has with Domain, Atari could sell 50,000 TTs annually, an amount considered "disastrous" by Atari standards.

Atari is currently considering several final packages for the TT. The leading candidate would use the ST as an input/output device, linked through the TT's Direct Memory Access port. It would then be, in a sense, an ST upgrade (yet another one,

as we shall see). But shipping the TT in this form alone may confine TT owners to a subset of ST owners, limiting the machine's market potential.

Atari also has to consider the question of user support. It disconnected its 800 phone number years ago, so it relies solely upon computer specialty stores for user service and education. Where department stores are concerned, Atari relies on the owner's manual for user support. How then can a corporation market a machine, one it claims will outperform two DEC VAX 760 mainframes, with nothing more from the manufacturer than a 90-day warranty?

There are education and support centers in chain stores, known as Value-Added Resellers. VARs haven't considered Atari products for an instant. The most likely reason isn't the mass-market name, but the need for a big value to add to in order to resell. In other words, "Power without the Price" is powerless to VARs, and VARs are the Apollo domain. Direct competition is most likely out.

So the TT's domain may be the specialty store, where a corporation's systems analyst or consultant may not expect to find a 32-bit UNIX workstation. At the specialty store, it could be sold in a variety of package deals.

Here's where the machine may find its saving grace: it's a multi-user workstation. Buyers would purchase more than one ST for terminals, maybe even enough to outfit an entire office.

On the bad side, specialty stores currently committed to Atari might not be able to afford to keep enough STs in stock for that kind of low-price, high-quantity buying.

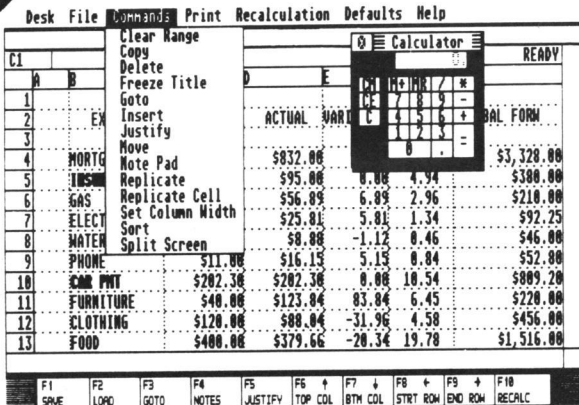

PUTEZ CALC™ TO WORK
FOR YOU AND BENEFIT
FROM THE RESULTS

ONLY \$69.95

FEATURES

- ✓ 300 columns by 999 rows
- ✓ Extensive use of GEM™ windows
- ✓ All commands are under mouse control
- ✓ Built in 10 keypad calculator
- ✓ On-line help windows (No commands to memorize)
- ✓ Built in sort routine
- ✓ Developed exclusively for the Atari ST
- ✓ 10 macros controlled by the function keys
- ✓ Split-screen capabilities
- ✓ Note Pad

EZ CALC™ is a fully implemented GEM™ based spreadsheet for home and business use. This is by far the most powerful spreadsheet available for the price. Better yet, all commands are mouse controlled for speed and ease of use. EZ CALC™ also uses less memory than other spreadsheets for the ST, leaving more room for your data and formulas. If you've never used a spreadsheet before, you'll be amazed how easy EZ CALC™ is to learn and use. The experienced user will love the speed of a mouse controlled spreadsheet.

GEM is a Trademark of DIGITAL RESEARCH, INC.
EZ CALC is a Trademark of ROYAL SOFTWARE.

MOUSE CONTROL

Extensive use of the GEM™ windows make EZ CALC™ a fast, extremely easy-to-use spreadsheet. With over 50 commands available from the mouse, the ease of use is unsurpassed. Imagine being able to move or copy an entire column of figures with a simple mouse control.

CALCULATOR

EZ CALC™ includes an easy to use 10 key calculator that can be pulled down at anytime and operated either by mouse or keyboard. With the point of a mouse, the results of the calculation can then be transferred to the cell of your choice.

NOTE PAD

EZ CALC™ lets you attach a personal note of up to 4 lines to any cell. The cell is then highlighted to remind you there is a note attached. For example, you could attach a note to the insurance cell of your personal finance spreadsheet reminding you that the cell applied only to car and home insurance. The note pad can be pulled down at any time.

★ FULL FEATURED DEMO OF EZCALC AVAILABLE FOR \$5. REFUNDABLE WITH PURCHASE. ★

However, if the price were low enough, (and it should be), a company placing a large order might just find the patience to wait a mere couple of weeks.

The TT also interferes with Atari's plans for the ST. If a more-capable ST than the 1040 were to emerge—say a 2080—that machine would go to the specialty stores, and the 1040 would be moved to the mass-market arena. But the 520 is a smart enough terminal. With half a megabyte and a 68000 CPU, "genius terminal" is a more fitting term. Unfortunately, Atari has handed the 520 solely to the mass-market; and the corporation consultant is unlikely to go to a department store for a set of office terminals.

Atari may have to go back on its promise to mass-merchants and market the 520 in specialty stores once again. Or it may rely on private wholesale distributors to sell the 520 to specialty dealers. The idea has not yet been discussed publicly, but in this reporter's opinion, Atari could produce a downgraded 520 terminal-only machine as part of a TT package deal. This way, the TT may—or may not—connect to the ST.

Certainly the TT is too much computer for checkbook-balancing and recipe-filing. It would play the meanest game of *Star Raiders* the galaxy has ever known. But Atari is afraid the buyer may stare at this colossal product of progress and ask, "So, what's it for?"

Consider the following: the Macintosh has practically created the desktop publishing industry. The ST is giving birth to the home computer artist. I see a revolution in which the TT will be the catalyst: *desktop engineering*. The 32-bit mass-market micro may give birth to the freelance engineer. Optimistically speaking, the whole industry may flip over forward—and the creative, tinkering programming geniuses may finally have their turn in space.

As one Atari spokesman put it, "this is the future."

ST Hardware.

This is the present. If ever there's to be an Atari star, the ST is bound to be it. At every major show, wherever there's an ST, there are hundreds of awestruck people in front of it. The future right hand of the TT is currently breaking ground quite well on its own.

Atari itself, though, sees the ST (Sixteen/Thirty-two) in a different light: as an incomplete machine. Its other half is still in the lab. The promised "blitter" enhancement, for instance—(the chip that can move blocks of memory, virtually at once) is still being tested. GDOS, the portion of the ST's Virtual Device Interface currently missing (the part that would allow the machine to perform object-oriented graphics tasks) is promised in program form for the near future, until its ROM version becomes Expansion #1. Atari admits that

GEMDOS, which controls computer input/output, is bug-ridden, but Digital Research, its author, may not be willing to debug the system. Atari may perform this task itself—which makes for ROM Expansion #2. Finally, when the blitter chip arrives, the entire screen graphics system will change. Output may appear similar, but will be plotted much faster. This makes for ROM Expansion #3.

We can expect GDOS soon, perhaps by press time. The new GEMDOS is slated for January. The blitter may not be ready that soon. Until Atari can finally say the ST is a complete machine, third-party software development may be put on hold.

The blitter chip was originally billed as an enhancement to the 1040, but Shiraz Shivji tells us it's now being worked into the 520's architecture. No decision has been made concerning where to seat the chip in the 520 (the 1040 should have a slot for it) but, as Shivji points out, "It's not going to be through the user port. Our intent is to be able to upgrade all the 520s that are out in the field."

"The way this co-processor works," says Shivji, "is that it sits on the bus until it's invoked. Obviously, you'll need the soft-

ware to invoke it." Which may mean it waits for GDOS.

Shivji also stated that the new chip will not be as much of a graphics enhancement as some have been led to believe: "Let me make this perfectly clear: It will not give you greater resolution. It will not give you more colors. It gives you a lot more speed. I also need to add that it is a *transformation engine* that you can use, not just for display. With the blit operation—block move—you can do the screen, or you can use it for other areas of memory, other applications not involving the screen."

Lab tests are currently showing an average speed increase in the ST by a factor of five with the blitter chip. While it's Atari's latest response to the Amiga, the chip is also reminiscent of technology present in the Atari 8-bit product line, which programmers have grown to respect.

As we've noted, Atari is venturing deep into IBM territory, hoping to carve a niche for itself in the "business," or "serious" market. Atari has no emulator for the IBM corporate image, but that image is either heralded greatly or criticized greatly, and many PC-clone buyers made their purchase just to spite Big Blue. Anyway, Atari

COPY II ST™

BACKUP PROTECTED SOFTWARE FAST.

From the team who brought you COPY II PLUS (Apple), COPY II PC (IBM) and COPY II MAC (Macintosh) comes a revolutionary new copy program for the Atari 520 and 1040 ST computers.

- Copies many protected programs—automatically. (We update COPY II ST regularly to handle new protections; you as a registered owner may update at any time for \$15 plus \$3 s/h.)
- Supports single and double sided drives.
- Includes both a fast sector-based copier and a true bit copy mode for protected disks.

Requires an Atari 520 or 1040 ST computer with one or two drives.

Call 503/244-5782, M—F, 8—5 (West Coast time) with your   in hand. Or send a check for \$39.95 U.S. plus \$3 s/h, \$8 overseas.

is now targeting the market whose buying decisions seem to rely upon reports of what IBM corporate executives ate for breakfast.

Thus the PC-compatibility attachment to the ST—as yet unnamed, so I'll just call it the Big-Blue Box (or 3B, for short). Its developer, Atari's Jim Tittsler, tells us it contains the expected 8088 CPU, which can use the ST's 68000 as a co-processor if necessary, and will support an 8087 math co-processor. Using the ST's I/O (which is reportedly being revised in the new GEMDOS), it hogs the space of the full ST monitor. In other words, the models currently being tested override the ST, though future software enhancements may allow a PC task to run in a separate window of ST GEM, while the ST is doing something else. No word yet whether 3B will have its own RAM, but it probably won't have its own 5¼-inch disk drive—instead, slots will be available for 5¼-inchers, and the current SF354s and 314s may be used for 3½-inch IBM-formatted software.

According to Tittsler, the prototypes are currently allowing upgrades of PC files to ST-legible files, most notably from Lotus

1-2-3 to **VIP Professional**, and from dBase III to **dBMan**. The speed at which some PC applications are run may be faster or slower on the 3B than on the PC, unless an 8087—or perhaps the acclaimed V20 chip—is used.

While downplaying his own product, Tittsler describes its intended market: "Mostly we see this as a bridge to let people take advantage of their older software, because you can get better performance with software that's written directly for the 68000. . . . If (people) have spent a large portion of their lives learning how to effectively use Multiplan or something, they don't want that training to be useless."

Tittsler, further downplaying his product, calls it "just an add-on appendage. . . . It's intended to give the people who have STs—or who want to take advantage of the newer technology of an ST—the ability to still run older-generation software." He admits it's possible, but not likely, that Atari may write software specifically for the 3B.

So it's obvious that Atari is seeking the buyer who was at first taken aback by the ST's dazzling appearance, the one who, after seeing **Neo-Chrome**, **1st Word**, and **dB Master One**, asked, "Yeah, but what does

it do? Can it run Lotus?" The company is also attempting to sway the person who invested thousands in 8086/8088-based software into finally taking the step to use of the next-generation computer.

Atari hopes to speed up progress in plugging the numerous small holes in the ST. But, in reviewing this report, one may get the impression that Atari wants to slow down progress just long enough to profit a bit more from its spoils. It's easy to see why. It would be a major blunder for Atari to cast the yearling ST into the realm of obsolescence by introducing a 32000-chip-based system for about the same price.

So the TT will run on a 68020, and thus become a family member, paired with it like a brother. The box I call the 3B is Atari's attempt to profit from the fact that IBM is viewed as the axis upon which the computer world revolves. At its surface are the clones, held there by the centrifugal force of repulsion from the corporate axis. There's still a profit to be made from the older generation—until the ST's earthquakes settle—and 68000/68020-based machines constitute the new axis.

ST Software.

In the process of turning heads, Atari

Talking Word Processor

Talker does everything you'd expect from a full-featured word processor, plus Talker does just that—talks. It reads your text, word-for-word or letter-by-letter.

So, Talker is great for proofreading, learning to type and the sight impaired.

Talker's pull down menus and

simple commands make it easy to use, and at \$69.96 it's easy on your budget.

Bring your words to life with Talker.

CIRCLE #133 ON READER SERVICE CARD

Corp. has acquired some frustrated ST owners. The library of ST software is growing steadily, but is still not as profuse, or as well-backed, as the older generation of software. The ST owner's frustration occurs while awaiting a breakthrough. It's here we see Atari trying to speed up progress, to make Atari into Big Grey.

To that effect, there's good news: Microsoft is joining the ST league. It is working with Atari to make a GEM-based version of the blockbuster program **Word** for the ST, to be called either **Word** or **Write**. One source says the program should resemble **Word** for the Macintosh. Another states he feels Microsoft is unsure what the program should resemble, since the company must undergo the humiliating task of adapting **Word** to GEM, a product of rival Digital Research. A superior **Word** using GEM may jeopardize the future success of the version which employs Microsoft's own **Windows**.

Word, both for the Mac and the PC, includes extended laser-printer support, beyond mere dot-matrix. It's considered by many to be a tool for desktop publishing, an industry made possible (in large part) by the Macintosh. Of desktop publishing, Leonard Tramiel says, "That phrase is so overused that it no longer means anything."

"As far as being able to support a laser printer is concerned," the Vice-President continues, "there's half-a-dozen laser printers out there, which emulate so many different (dot-matrix) printers that any product can support laser power. . . So virtually every word processor at this point supports laser printers; it's actually difficult to write one that doesn't."

Beyond the emulation of dot-matrix printers, Tramiel is unsure that preprinting layout will be a feature of **Word**, saying, "I'd have to be clairvoyant to tell you." Contradicting other sources, Tramiel confirmed that Atari is working with Microsoft to develop a superior product.

Superior or mediocre, Atari has scored a victory in acquiring Microsoft's assistance. There's only one microcomputer I can name, to date, which has thrived without being somehow shaped by the hand of Bill Gates at Microsoft, and it is the ST. That should be an indication of the machine's strength—it has independence, not "compatibility."

It's not indication enough, though, for Lotus Development Corp. (1-2-3, Jazz) and Ashton-Tate (dBase III, Framework, MultiMate), the two other largest software manufacturers. Both, according to one source at Atari, are ready and willing to write versions of their best for the ST, provided the magic number has been reached: 1,000,000. Once a million STs have been sold, and a huge worldwide customer base established, we'll see the world's best-selling programs running on an Atari.

Then, it will be no contest. All the buyer's excuses will be gone. The ST will run the best, and run them better and faster than anything else. If there's something that wouldn't otherwise run, the 3B box or DataPacific's **MacCartridge** (which Atari is staying clear of, due to possible legal action by Apple) will make it work. But we need a million out there, and that won't be easy.

Where do we stand in the meantime? We have Microsoft on our side now. **Word** will be first; and, of course, there will be MS-DOS for the 3B box. Without the box, the ST will run **dBMan** and **VIP Professional**, which generate results so close to their IBM-league work-alikes that Jim Tittler's men can successfully convert files from one program to the other—without any noticeable difference.

Atari admits the current version of **ST BASIC** is bug-ridden, perhaps even a mistake. Microsoft may remedy that situation, and indications from Atari are that, with the necessary money, we may see an MBasic interpreter for the ST.

With so many companies marketing utilities and programming languages for the ST, what could possibly be lacking? Atari's answer comes in two names: Lotus and Ashton-Tate. Atari would like to see those companies join the list of ST developers, for the sake of their names alone. After all, if the genuine items run on the ST, it must be a solid machine (in the eyes of potential dealers). And that will be seen when there are a million STs "in the field."

So Atari is wondering how to sell a million, and here's where the "TT" comes into the picture. The TT will sell STs for "genius terminals." A small office complex could use (and afford) a TT system networking a half-dozen STs, giving the 16/32-bit machine an entirely new, broad-scope market.

Imagine a TT system with an ultra-high-resolution display. In one corner of the display, dBase III is sorting out metal parts. In another, **Word** shows a document detailing the cost of those parts. In a third, the IBM-emulation window is running a 3-D tally spreadsheet like **VP Planner**. In the ST window, there's a **Neo-Chrome** diagram of a part. Finally, in the center, the TT is rotating a 3-D cutaway image of the future shuttle booster rocket.

This type of technology is not just a possibility; if marketing comes to a decision soon, we may be seeing a TT/ST component system in retail outlets by late 1987. It could carve a new niche as the first 32-bit machine capable of running the familiar software of the 8/16-bit era.

This does pose a problem for **ANALOG Computing**: will this mean another schism in readership? We hope not!

But onward. . . if there's anyone Atari supporters feel threatened by, it's the potential dealer or buyer who publicly

claims that the company responsible for **Asteroids** is incapable of manufacturing the TT—that game-playing and data-processing are two separate worlds, and ne'er the twain shall meet. By now, we're well acquainted with the person whose guilty conscience brings forth the statement that only kids play video games; adults are too busy doing *real* computing to notice. Too often creativity gets tossed aside in favor of "productivity." Still, as presented in Orwell's 1984, the notion that some higher person is watching over our every move, passing judgment over our productivity, is a mistaken one—that is, unless we are captives of our paychecks.

Entertainment Electronics.

Atari's roots are in game machines, and that's nothing to be ashamed of. The creative genius who invents or programs a computer is the same genius who toys around with it. Still, the 8-bit Ataris have always had to be proven and fought for. It's as if the machines themselves were a cause, like unionization or the abolition of apartheid.

Atari began with game machines. The mind that will play for hours will, often, program in a creative way, will invent a new kind of wheel. Having its roots in the game market makes Atari Corp. no less a computer in the business world.

The current ST line is bringing Atari into the ring in the "real" world. It is creating a vital excitement in the computing community. And the "game machine" revenue feeds the growth of all Atari products.

Atari has some choices to make, directions to choose. But, if Jack Tramiel has proven anything, he's shown the world that Atari's options are wide open. ■

OMNITREND'S UNIVERSE II

ENTER A NEW WORLD of unprecedented depth and excitement with Omnitrend's Universe II. It's quite unlike any game you've ever seen before, combining the thrill of role playing with the depth of story possible only in text adventures.

You are a free trader in a cluster of stars known as the Local Group. Through sharp trading, mining, passenger transport, and orbital piracy, you'll try to earn money to fuel your ship, pay your crew, repair parts, acquire advanced technology, and perhaps buy a new spacecraft.

Unknown to most of your crew, you are also an active deep-cover agent for one of the governments in the Local Group. As the interstellar situation worsens, you'll be called upon to carry out covert operations deep within enemy territory.

Universe II is available for the Atari ST, Apple II, Macintosh, and IBM computers. Price: \$69.95. Also from Omnitrend: Universe I for the Atari XL/XE, Apple II, and IBM computers. Price \$59.95.

To order: contact your local dealer or call Omnitrend at (203) 658-6917

WHAT IS ST-CHECK?

Most program listings in **ST-Log** are followed by a table of numbers appearing as DATA statements, called "ST CHECKSUM DATA." These numbers are to be used in conjunction with **ST-Check** (which appeared in **ANALOG Computing/ST-Log** issue 41).

ST-Check (written by Clayton Walnum) is designed to find and correct typing errors when readers are entering programs from the magazine. For those readers who would like copies of the article, you may send for back issue 41 (\$4.00).

CIRCLE #170 ON READER SERVICE CARD

C-MANSHIP

by Clayton Walnum

Everyone give a hearty cheer. This month we'll be finishing up the most grueling details of programming in C, so that next month we can start learning about GEM. It's been a long time coming, but you can't bake a cake until you've heated the oven, right?

Last month's program listing overflowed with new material. Consequently, we didn't have time to cover most of the program's details. So guess what the first item on the agenda is? If you have last month's listing, take it out. Otherwise, just read along; I'll try to make this as self-contained as possible.

Unfinished business.

At the top of the listing, beneath the block of defines, you'll see a function, `fopen()`, being declared as returning a pointer to type `FILE`. If you think back, you'll remember that any time a function is going to return something other than an integer, it must be declared. But what the heck is `FILE`, anyway? We've never discussed this data type, have we?

Actually, in a way, we have. Last month, we talked about structures—data types that are specifically tailored by the programmer. `FILE` is a structure defined in the `stdio.h` file, containing the data elements required to handle file I/O.

Wait a minute. That `fopen()` isn't our function. Except for the function calls, this guy is nowhere to be found in our program listing.

That's true. It's a library function. Now, one would think that, if whoever composed the `stdio.h` file went to all the trouble to set up the `FILE` structure, he would have at least gone to the extra effort to make `fopen()` "ready to go," by declaring it as returning a pointer to `FILE` and finishing the job.

For some strange reason, the version of `stdio.h` that comes with the Atari developer's kit doesn't include the declaration, so we must do it ourselves. If you have the Megamax compiler, however, you can delete this declaration from the program; they *did* award us the courtesy of finishing the job.

By the way, the sample listing we're discussing was developed using the Megamax-C development system. I included the function definition only to make the listing more compatible with the Atari development kit.

As for the file declaration for `fclose()`, you can ignore it. It was included in error and is unnecessary, since this function returns an integer, not a pointer to `FILE`.

A quick look at GEM.

Just beyond the file declaration for `fopen()`, there are declarations for a number of global arrays: `work_in[]`, `work_out[]`, `contrl[]`, `intin[]`, `ptsin[]`, `intout[]`, and `ptsout[]`. If you've looked at some of the C source code for various GEM programs in the public domain, or those published in magazines, you've noticed that these arrays are almost always present. In fact, you've probably seen some of them used in ST BASIC programs, as well.

All the above arrays have one thing in common: they provide GEM a place to store or retrieve information about the program. This information can then be easily manipulated by the programmer.

I know, I know. I told you we weren't going to be getting into GEM until next month. But we are going to learn a little about initializing a GEM program, since the cursor control functions I used in last month's listing are found in the VDI portion of GEM.

What's VDI? GEM is made up of many libraries of functions, each of which is responsible for handling a certain portion of the system's activities. These libraries are

// C-manship *continued*

grouped into two major units, called AES (Application Environment Services) and VDI (Virtual Device Interface). The libraries making up the AES handle such things as windows, dialog boxes, menu bars and event processing. (An event is some action from the user, such as typing a letter or moving the mouse.) The VDI contains the subroutines to control the ST's graphics, as well as some mouse and cursor control functions.

Since GEM is capable of handling several programs at once (such as using a desk accessory with a word processor), there has to be a way of keeping one job separate from another. GEM tackles this by assigning each program and its associated device (in our case, the screen) a "workstation" which can then be referred to by an identifier known as a "handle." The first thing any GEM application must do is open a workstation.

Which brings us back to the arrays that started this discussion. When we open a workstation, we have to tell GEM how we want the system's attributes initialized. What color should the text be? And should it be shadowed? Or maybe bold? What style fill do we want? Solid? Checkered? All these attributes should be placed in the array `work_in[]` before we open the workstation, since that's where GEM is going to expect to find them.

We're not going to worry, at the moment, which elements of the array hold information for which attribute. We're just going to take it on faith that `work_in[10]` must be initialized to 2, and the rest will be perfectly happy at 1.

After we've set up the array, we tell GEM to open the workstation with the `v_opnvwk[]` call:

```
v_opnvwk(work_in, &handle, work_out);
```

The parameter `work_in` is the address of our array `work_in[]`, which contains the attribute information we wish to pass to GEM. And `&handle` is the address where GEM should store the handle, the integer value that will allow us to refer to this program's workstation. In our sample program, it's the address of the variable `handle`, which is defined after the `work_in[]` and `work_out[]` arrays at the top of the listing. The parameter `work_out` is, of course, the address of our array `work_out[]`.

When we open the workstation, GEM will load the `work_out[]` array with all the information a programmer needs about the workstation. For instance, `work_out[12]` will contain the number of hatch styles available, while `work_out[13]` will contain the number of colors that can be displayed at one time. We don't have to be concerned with this information now, but it is important that you understand why we need these two arrays.

You can see the mechanics of opening a workstation in the `open_vwork()` function of the program listing. Also, at the end of `main()`, notice the function call:

```
v_clsvwk(handle);
```

This closes the workstation to further output. The argument `handle` is the device handle passed to you by the `v_opnvwk()` call.

And a peek at VDI.

The remaining five arrays, `contrl[]`, `intin[]`, `ptsin[]`, `ptsout[]` and `intout[]` are directly associated with the VDI. The first

three are used to pass information to the VDI routines, while the last two provide a means for the VDI to return information to the program. These arrays are used by GEM for its own purposes; you need do nothing more than declare them at the beginning of your program. It's ironic that, although C is considered to be a lower-level language than BASIC, when manipulating the VDI from ST BASIC, you must deal with the VDI arrays yourself rather than leaving them to the system.

Moving along.

If you've spent the time to examine last month's program listing, you were probably wondering what was going on with the function call:

```
Cconws("FIRST NAME: ");
```

This function does nothing more than write a string to the screen. Why didn't I just use `printf()` and avoid all this confusion? It has to do with another discovery I made concerning Megamax-C. With Megamax, `printf()` won't print anything until it encounters a `\n`. This makes handling prompts tricky, if you want the user's input on the same line as the prompt. Resorting to `Cconws()` solved this problem.

Another new function call, `fscanf()`, was used in the sample program in the `disk_file()` function.

```
fscanf(p_file, "%d", &num_recs);  
fscanf(p_file, "%s", recp->street);
```

This is similar to `scanf()` except it retrieves and formats information from a file, rather than from the keyboard. In fact, the only difference between the two calls is the addition of one argument, the pointer to the FILE structure. Otherwise, it contains the same conversion specifications as its cousin, followed by the addresses where the data should be stored. The first example above reads an integer from the file and places it in the integer variable `num_recs`. The second reads a string from the file and places it in the structure member `street`.

The opposite of `fscanf()` is `fprintf()`. In our sample listing, it's called within the function `save_file()` like this:

```
fprintf(p_file, "%d\n", num_recs);  
fprintf(p_file, "%s\n", recp->city);
```

This function is almost identical to `printf()`, the only change being the extra argument, the pointer to the FILE structure.

In the first example, we're printing to the file the integer value stored in `num_recs`, followed by a newline. In the second, we're printing to the file the character string stored in the structure member `city`, also followed by a newline.

The VDI cursor stuff.

If you look at the functions `screen()` and `pos_cur()` in the program listing, you'll see the cursor control function calls I mentioned earlier. In order to take advantage of these functions, you must first make the call:

```
v_enter_cur(handle);
```

This gets you out of graphics mode and into text mode. In this function, as with all the following, `handle` is the workstation identifier that was returned to you by the `v_opnvwk()` call.

We can position the cursor anywhere on the screen by

passing the X,Y-coordinates to the function `vs_curaddress()`:

```
vs_curaddress(handle,y,x);
```

Notice that the coordinates are passed in the opposite order of what you'd expect; that is, Y followed by X. Also, keep in mind that we're now in text mode. The cursor location is based on character positions, not raster coordinates. In medium-resolution text mode, the screen's size is interpreted as 80x24, whereas in graphics mode it's 640x200. Quite a difference!

Printer output.

I don't know if it's a difference between Megamax-C and the Atari development kit, or just plain bad luck, but I had an awful time getting printer output. I have a feeling the solution I incorporated isn't as elegant as it might be, but I had to settle for it under the pressure of time. So, with that disclaimer in mind...

Take a look at the function `printer()` in the sample listing. The first thing we have to do is check to see if the printer is on.

```
status = Cprnout(0);
```

The line above accomplishes this by sending a null character to the printer. If the printer times out, a 0 will be returned by the function. Another way to check the printer is with the function `Cprnos()` which returns a nonzero value if the printer is ready to receive:

```
status = Cprnos();
```

We then open a file to the list device:

```
p_file = fopen("LST:", "w");
```

After this call, `p_file` will contain a pointer to a structure of type `FILE`. The first argument passed to `fopen()` is the filename, in this case, the list device. The second parameter tells the function the attributes we want the file to have. There are six possibilities:

```
r...read only
w...create for writing
a...append (write at end of file)
r+...update (read and write)
w+...create for update
a+...random read or write
```

If the open was not successful, the function will return a null pointer.

Now comes the tricky part. The file we just opened is a disk file. We want to send the output to the printer. The pointer `p_file` is now pointing to our `FILE` structure. The fifth member of this structure, `_fd`, is a file descriptor. If we replace the value in `_fd` with a 3, we'll fool the system into sending the output to the printer:

```
p_file->_fd = 3;
```

Now, we can output the data using `fprintf()`. When we're done, we close the file:

```
fclose(p_file);
```

The function `fclose()` will return a 0 if successful, or an EOF (-1) if an error is encountered.

Finally, since we ended up opening a disk file, we want to get rid of the evidence:

```
unlink("LST:");
```

The function `unlink()` will remove the directory entry for the filename passed. It returns a 0 if successful, or a -1 if an error is encountered.

The problem with the above method of obtaining printer output is that a disk must be present in the drive.

Odds and ends.

That covers all the material from last month's sample program. We have a final task to complete, before we can move on to GEM: touching on a few details of the C language we haven't yet covered.

What do you make of the following line?

```
z = (x < 4) ? x : y;
```

Believe it or not, this is nothing more than a shortcut version of:

```
if (x < 4)
    z = x;
else
    z = y;
```

The `?` is a conditional operator that requires three operands. The first operand (within the parentheses) is the expression that's tested. If it's true, the statement yields the evaluation of the second operand (between the `?` and `:`). If the first expression is false, the statement yields the evaluation of the third operand (between the `:` and `;`). Here's another example that'll get the highest value of two variables:

```
highest = (x > y) ? x : y;
```

C also has a construction similar to BASIC's `ON...GOTO`:

```
switch (exp) {
  case 1 :
    printf("exp = 1");
    break;
  case 2 :
    printf("exp = 2");
    break;
  case 3 :
    printf("exp = 3");
    break;
  default :
    printf("exp < 1 or > 3");
}
```

The switch statement works by first evaluating the expression in the parentheses, then checking the following labels to see if there's one that matches the expression's value. If there is, program execution jumps to the matching line and continues until it encounters the statement `break`. But what if there's no match? What if, in the above example, `exp` is not 1, 2, or 3? That's where the label `default` comes in. Program execution will jump to this line if none of the other labels match. Otherwise, if there's no `default`, it'll jump to the next line following the end of the switch statement (after the closing brace).

What happens if we leave out the `break` statements? Remember I said that, once the expression following `switch` is evaluated, the program jumps to the matching label and continues until it encounters a `break`. The program doesn't care if there's no `break` before the next label. It'll go on, past the succeeding labels (ignoring them), and execute every statement it finds—until it either finds a `break` or reaches the closing brace. In the example above, if we left out all the `break` statements and `exp` evaluated to 2, the

output would look like this:

```
exp = 2exp = 3exp < 1 or > 3
```

Under the same conditions, if exp evaluated to 3, we would see:

```
exp = 3exp < 1 or > 3
```

A new loop.

We've become very used to the while and for loop constructions. Both these are entry condition loops; that is, the loop conditional is checked *before* each iteration of the loop. There's another loop construct we've ignored so far, the do while loop.

The do while construct is an exit condition loop. The loop conditional is evaluated *after* each iteration:

```
x = 0;
do {
  ++x;
  printf("x = %d\n", x);
} while (x < 4);
```

The above would print values of x from 1 to 4. Contrast that with:

```
x = 0;
while (++x < 4) {
  printf("x = %d\n", x);
}
```

which will print values of x from 1 to 3.

And now...

break, continue and goto.

We talked about the break statement earlier, in conjunction with switch, but it can also be used to get out of for, while, and do while loops. When used in a nested loop construction, it only terminates the loop in which it's used. The outermost loops will continue normally.

```
while (x < 10) {
  while (y < 10) {
    if (y == 5)
      break;
    else
      printf("y is not 5\n");
    ++y;
  }
  ++x;
}
```

Another method of affecting loop execution is with continue. When continue is encountered within a loop, the loop doesn't terminate, but, instead, starts the next iteration.

```
x = 0;
while ((ch = getchar()) != '*') {
  if (ch == ' ')
    continue;
  s[x++] = ch;
}
```

Finally—though I hate to mention it, due to its inevitable abuse—C has a goto statement. The keyword goto is followed by the label identifying where program execution should continue:

```
goto print_name;
```

```
print_name: printf("Name: %s", name);
```

Quite frankly, there's little or no use for the goto statement in a structured language like C. The same goes, though not as strongly, for break and continue, except when the former is used within a switch statement. There's almost always a more structured and elegant way to get around the use of these statements. If you're a BASIC programmer, it will take you a while to get accustomed to structuring your programs in such a way as to avoid the use of a goto. But, trust me, it can be done—and the results are much more readable than BASIC's typical tangle.

The end again.

Next month, as I promised, we'll begin programming with GEM. I know you've been waiting a long time, but you'll find your patience rewarded. Now that you know most of the fundamentals of programming in C, it's time for some fun! **A**

Atari ST heats up with "Strip Poker..." and more.

Examine Artworx' expanding list of ST software:

STRIP POKER is the classic computer program. Play against Suzi and Melissa; the more you win, the more they take off! **Only \$39.95**

HOLE IN ONE GOLF plays like the real thing and includes an easy-to-use Editor for designing your own golf course. **Only \$29.95**

BRIDGE 4.0 has full graphic display of all hands, allows the user to be dealt good cards all the time and is completely mouse-driven. **Only \$29.95**

COMPUBRIDGE is Artworx' bridge tutorial, utilizing 10 chapters covering all aspects of the game. **Only \$29.95**

PEGGAMMON is a new and innovative approach to backgammon. Play against the computer or with a friend in the two-player mode. **Only \$17.95**

MAILLIST handles medium to large sized lists. It zip code sorts, alphabetizes, selects by keyword, prints labels, and more. **Only \$17.95**

BAKER STREET DETECTIVE brings you back to 1893 London with mysteries to solve just like Sherlock Holmes. **Only \$17.95**

For more information on these and other fine Artworx programs, see your software dealer or write to Artworx for a free catalog.

CIRCLE #136 ON READER SERVICE CARD

IAN'S QUEST

ST news and information

by Ian Chadwick

I think I'll write a column about games. That should be easy, right? I already know and enjoy **Time Bandit**. I'll just drop by the local Atari dealer, watch a bunch of screens, take notes, then come home. Nothing to it: add a passel of sage comments to my notes and I have a column. Okay. . .

"Got anything new in games? Like chess? Or a wargame? Something intellectual."

"Here! I have this wonderful new game. It's called **Rogue**, from Epyx," the salesman said. He leaned over to report, in a confidential voice, "It was taken from a mainframe game." And he winked, conspiratorially.

Mainframe? The last time I saw a mainframe playing games was when the awesome might of the University of Toronto's computer system massed to match me at 3-D tic-tac-toe. It lost. That was back in the days when a terminal meant a printer with a keyboard, and a video output was called a CRT. No one had CRTs then. "Show me."

Oops. He's in medium resolution, and it won't load. I see a message about "Low-rez" on the screen. It must be a translation from a mainframe that didn't speak English. They must mean "low-res"! He changes his modes, regardless. Click, click, he taps the mouse. Ah. . .color, graphics!

"It has twenty-six levels," the clerk mutters, almost adoringly. I type in my name and the first screen comes up, full of neat little walls and a little caricature of a character who looks like Bilbo, being chased by a bat.

"Nice graphics," I say, trying to dodge the bat.

"Watch. Here, go there. No. Open the door, that one. Watch out for the hobgoblin! Oh. Oh, dear."

I'm dead. Well, that was short. Twenty-six levels, eh? I choose "new game." Whirr, whirr, whirr. Back to the same initial picture. What? No reboot without having to go back to square one? Sigh. Try again. Ah, an ice monster. Hack, stab, hack, stab. I defeat it! What five miserable gold pieces? Grrr. . .

Okay, so I go on. I get attacked by bats and emus. Why do I feel like I'm fighting in Australia? Okay, down the stairs. There's an amulet I have to find. Use the zoom; ah, there's the stairway. What? A letter *I* attacks me. Hmm. . . killer alphabets.

// IAN'S QUEST *continued*

"That's an ice monster," the salesman informs me. In the same climate as emus? I wonder. Trudge, trudge. Oops. I throw my bow at a centaur. Sigh; It's lost. Now I go around trying to stab monsters with arrows. Of course, I die. Again.

"Can you win at this thing?"

"I don't know, but it has twenty-six levels!"

"That doesn't answer my question."

"But twenty-six levels! Who cares if you win? Think of all the fun!"

Okay, so it's fun. It's also not very original in concept, but if a new user has never heard of or played *Dungeons & Dragons*™—say, if you just came from Mars—it's a nice introduction. It's not *Time Bandit*, but then again, where else can I fight emus?

Okay, so it's nicely done; I admit it. He beams at me and tells me it has twenty-six levels again. I saw only three of them. I don't know if I could last another twenty-three. At least I can save a game and return to it later (well, it also makes you quit the game if you save it. . .). My version of *Time Bandit* doesn't allow that. Maybe Gord will send me a new one.

"What else have you got?"

"You're gonna love this one: **Temple of Apshai**."

"Huh? I played that on my TRS-80 Model 1. Around the last ice age."

"The Trash 80 didn't have graphics. Or sound. Watch this." He boots it up, in low-res, just in case we get attacked by a "low-rez" warning. Hmmm.

"This has a predefined character called Brian Nailfoot. Sounds clumsy."

"You can change it," he says.

"No, leave it. I don't want to get too attached to him." Let's see, 140 pieces of silver. He's been moonlighting. Better buy a shield, some armor, a what? A Bastard-sword? Don't ask; it's only a game. Buy one anyway. Oops, I'm not strong enough. Can I take a Charles Atlas course first? No? Okay, get the broadsword. What about a bow? Twelve? Offer nine. No? Try ten. No? Eleven? Come on. . .okay, twelve. And it says I'm a hard bargainer—for paying what he asked! Artificial stupidity. . .so buy what you can and save the character. Now, let's try our mettle.

Ah, it's animated. I walk forward. No, not that far, stupid. Argh. Hit by a skeleton. Come back! Wait. No, hit it, bounce off, ohhh. . . I'm dead. Try again. Okay, fire a few arrows. That killed it. Grab the treasure. Hmmm. Trash. Sigh. What are my options? Ylixir? What's that, a Martian pet? Must be from the same guys who put "low rez" in the last game.

More trash. Boring. Who keeps their trash in little treasure cases in a dungeon? Carry on. . . All this trash. At least these are neat monsters. I have mushrooms, a cloak and kelp. Some treasure. I have mushrooms growing in my basement already, and who needs kelp? Maybe if I

wanted to open a sushi bar. . . Ah, there's a likely looking box. And a spider. Surely I can defeat a spider, right? Wrong. I die, again.

"Okay, try this one." He pushes me aside and boots up **Swords of Kadash**, from Penguin Polarware. Penguin? I wonder if it'll be full of polar bears and ptarmigans. Nothing like killer ptarmigans. Nope. It's another D&D™ clone, I think. A slice off the old bologna, as they say. I read the opening message. Accursed villains? My favorite foes. I enter the dungeon. I choose a joystick.

It's not as well done as **Rogue**, even **Apshai**. Maybe on a par with something 8-bit, like **Crypts of Terror**. Remember that game? Ho hum. I keep hitting myself with my own arrows. I die. A lot. Luckily, this game has a benevolent deity, and I get reincarnated. A lot. It's a lot like **Lode Runner**, without quite as much fun. I pop the disk. It wasn't a lot like D&D™ after all, much to its detraction.

"Anything else?"

The clerk looks at me in exasperation. "If you don't like fantasy role-playing games, maybe you'd prefer something more action oriented." Why should I tell him I played D&D™ when he was still in diapers? These are good games, sure, but I'm not all that keen on fighting green slimes and magic centipedes. Orcs give me hives.

"**Mudpies**. Hey, this is fun. You'll love it. Trust me." I shiver when anyone says those words. A lawyer once used them to me. I'm still recovering. **Mudpies**, he tells me, is from MichTron. I wait with baited breath. Another **Time Bandit** perhaps?

"What's the point of the game?"

"You have to throw mudpies at the clowns and clear them off the screen," he says. Mudpies? Not very manly. "Make sure you keep your energy level up."

"How do I do that?"

"See those McDonald's bags? Those are fries. Eat them, the milkshakes and the burgers whenever your food indicator turns red. But not too many."

Not too many is right. I don't even eat that stuff in real life. How can I do it here? Besides, I'm a vegetarian. He shows me how to throw a pie. I bonk a clown. The others gang up on me and throw bowling pins. Sheesh!

All I have are mudpies! More come out of the holes in the walls. Bonk! Bonk! Bonk! Sigh. "I know, don't tell me. It has twenty-six levels, too."

"Look, this is good. **Red Alert**, from Antic. You've heard of them." He nudges me in the ribs. I try not to nudge him back with the disk drive. He boots up the game. "You put your cities anywhere you like, then you put your missile silos and laser bases to protect them." He spreads the items across a map of North America.

"Don't put one there." I say.

"Where, here? That's Toronto! Your hometown."

"I know. Just don't put one there. It would make me queasy if I lost it."

"All right. I'll put it here. That's Detroit." Right. Who cares if they take out someone else's hometown? "Watch." The missiles start coming in over the pole. Zap, blam. Subs pop up and shoot from the oceans. Argh! There goes San Francisco! What? What happened to Miami? The damn Cubans had missiles, and they fired at me! Sneaky weasels! I'll nuke 'em myself. Huh? I can't hit the Cubans? My mood goes black. So do my cities. More missiles approach. My silos are empty, my lasers drained. Boom, boom. Game over.

"Like that?"

"No. Too much like real life. Sort of like watching 'The Day After' over and over again. How about something less violent?"

"Do you like 007 movies? Here, try **Major Motion**."

I do. I'm driving a car with a front-aimed machine gun. Always wanted one of those things on the highway. I blast a few nasties, bump others off the road; then—squeal—I skid into a tree. Some guy with spikes on his wheels ripped my tires! Grr. . . the truck drops me back on the road again. Wait! That guy with the spikes is still there, waiting for me to get out of the truck. Squeal! Grr. . . Next time I get a missile, I fire at him from behind. Hee, hee. . . wait! Nothing happened! Argh. Squeal. . .

Okay, this calls for serious action. I clear the road. What are tourists doing on attack alley, anyway? What! Some F15 slipped down from 12-o'clock high and nuked me. Okay. Try again. "Hey! That's a clone of this car!" I say. "How do I kill it?"

"You don't. You just have to get in the truck and hope it goes away."

"Where's the truck?"

"You'll have to wait." I can't. The clone which I can't kill is very apt at killing me. Too bad. I was just starting to like this game. I never like to play games where I don't have at least a 50-50 on an opponent.

"How about something cerebral?" I ask.

The clerk is a disappointed man. He boots up **Electro Solitaire & 21**, from Soft Logik. "Well, there's always this. . ."

"Now you're talking. Black jack? I'm a whiz. Let's see. . ." I sit down and play a hand. Hmmm. It doesn't bother to tally my score. Sloppy. I think to myself. I win! Dealer goes bust. What? The screen says "Your up \$20." My up what? Could they possibly mean "you're"? Same guys who came up with "low rez," I bet. Must be a conspiracy to have all the illiterates in the world band together and write software. I try again. This time, it's a push. The dealer wins. Huh? Shouldn't it be a tie, and the money stays down? I give the clerk back the disk. "I want a game that knows the rules," I say, simply. I didn't add from someone who knows the basic rules of English.

He just shrugs and gives me **Cards** from MichTron.

"Ah, this is more like it," I say. The clerk beams. Five games in one. Blackjack, Poker Squares, Klondike, Cribbage and Solitaire. Hmmm; just called Solitaire? What's that? Ah! It's La Belle Lucie, an old and popular version of solitaire. Klondike looks familiar, except I can't select the more common three-card (rather than one) draw method. Oh well, let's try Blackjack.

Hmmm. I have 13 showing. At least it tallies my score. "How do I get another card?"

"Press 1."

"Huh? No mouse option? Why not press H for hit? You know, and S for stand? Mnemonics, you know. . ."

"Just press 1," he snarls. I do. I get an eight. Twenty-one. I win.

"What's this?"

"It's where you enter your name and bet amount."

"I just did. Last turn."

"You have to enter it every turn. It's easy; just press RETURN."

"Can't I tell it to use the figures for good?"

"Why? It's easy!"

"No mouse option?" Nope; he shakes his head. I'm a real nitpicker, he figures. I try again. It's a push situation. Ah! It lets it stand. Good work. Someone read the rules before they attempted to program. But the keyboard entry method doesn't overwhelm me. So I won't play Blackjack. The rest look good. "Wrap it. I'll take it."

The clerk falls off his chair in surprise. A sale? From me? I get up to leave. "Wait!" he shouts. "Don't you want to see **Universe II**?"

"What happened to **Universe I**?"

"It's not out for this machine."

"Call me when it is. Meanwhile, I'll practice my solitaire."

"But what about the adventures? **Sun-dog? The Pawn? King's Quest II**?"

"What happened to **King's Quest I**? Don't tell me—it's not out for this machine."

"**Hacker? Borrowed Time? Hitchhiker's Guide to the Galaxy**?"

"Next time!" I say and close the door behind me. I look back for a brief moment and see the clerk grabbing boxes of adventure games from the shelves, his mouth still moving. Calling out games, I guess.

Well, I got something. . . not chess, like I had really hoped, and not a wargame, but something to while away those idle moments when I don't have time for a **Time Bandit** session. Maybe I'll go back and look at the adventures next month.

I walk down the street and pass a McDonald's. I hurry past, afraid some nut with a pie in his hand will come at me. **✶**

Announcing . . . **ST-TERM 2.0**

by
Matthew R. Singer

ST-Term 2.0 is the ultimate Atari ST communications program for the serious BBS'er . . .

ST-Term features the familiar commands of Amodem Plus with enhancements that take advantage of the power of the Atari ST.

Compare the features of ST-Term with Comm packages costing two to four times its 29.95 price and you'll find there is no more feature packed terminal emulator you can buy for your ST.

VT 52 emulation with keypad
VT 100 subset emulation
Full RS232 control
Baud rates 300-9600
Full/Half Duplex
Remote echoing
Line feed toggle
Atari 8 bit Atascii Emulation
Wrap around toggle
20 macro keys with built in editor
Clock
Connect time/billing calculator
Multiple setup files
64K capture buffer

Kermit (Batch file transfer)
Xmodem protocol
Atari 8 bit Amodem protocol
Promoted/Throttled Ascii uploads
Printer spooling
Full status screen
400 entry audodialer with
Redial
10 dialing prefixes
Automatically sets RS232
Full DOS commands without exiting
type copy dir
print delete chdir
format rename chdrv

ST news!

DON'T BELIEVE IN GHOSTS?

A full moon is rising over the tower's battlements as the surf pounds against the cliffs. You're in Cornwall, England at a friend's request, to investigate ghosts in the castle.

While here, you learn of a valuable object hidden somewhere in the castle. So, along with the ghost mystery, you've a treasure hunt—and you aren't the only one looking!

There are four variations to **Moonmist**, the latest text adventure from Infocom, all on the same disk. Each "game" has its own puzzles, hiding place, treasure and solution. Infocom calls this an "introductory" adventure, for ages 9 and up. The company also says this one isn't just male oriented, but has a lot of appeal for women.

In traditional Infocom style, you get trinkets with the game: a visitor's guide to Tresyllian Castle, two confidential letters from your friend and an iron-on transfer.

Retail is \$39.95, for both the ST and 8-bit lines, from Infocom, Inc., 125 CambridgePark Drive, Cambridge, MA 02140 — (617) 492-6000.

Printer graphics tutor

Here's the help your manual doesn't give you, to do bit-image graphics on your Epson, Epson compatible, or Prowriter.

by Matthew J.W. Ratcliff

There is no such thing as a standard when it comes to printer graphics. Epson was one of the first with an expensive "Grafrax" option for their earliest MX-80 printers. Since that time, many "Epson-compatible" printers have come out, none of which is 100 percent. As the demand for inexpensive home printers with graphics capabilities has increased, several standards—of sorts—have become dominant. First and foremost is Epson; then there's the Prowriter. Earlier NEC printers used the same graphics commands as the Prowriter, but their more recent models are Epson compatible.

One of the most widely known Epson compatibles is the Star Micronics Gemini printer series. Their graphics and other features have closely followed that of the Epson, but have always been just a little behind. The SG-10 has an "IBM mode" switch which comes closer than any other previous model, but is still not totally compatible. I've been informed that their newest NX-10 indeed has a 100 percent Epson-compatible mode. Being a true Missourian, I'd have to see it to believe it.

The problem with learning how to do bit-image graphics on your own printer is the printer's manual. I have yet to see one written by a real programmer. If it were, you wouldn't see silly cartoons in it, or the useless sample program listings (which are, more often than not, incorrect). In this tutorial, I hope to show how your computer can speak graphics to your Epson or compatible, or Prowriter. Many other printers follow one of these pseudostandards to some degree, so you should still get some use from these pages.

Printer manuals make two major mistakes in teaching you bit-image graphics. First, nearly all graphics examples are symmetrical, either vertically, horizontally, or both. This is confusing to a novice trying to figure out which comes first, what's the top or bottom, and when the computer starts sending graphic bytes. Also, they always use LPRINT statements. This can cause real "mystery" problems, because the computer tries to help you out. I'll explain more on the technical problems you can run into with printer graphics, after we get the basics down.

Bit-image graphics.

The phrase *bit-image graphics* is used frequently in reference to printers and graphics. Once your printer has been put in the graphics mode with the proper "escape sequence," it accepts subsequent bytes from your computer verbatim. Each byte is made up of 8 bits. Each bit becomes a dot in your final printer graphic. If a bit is 0, then the pin in the dot-matrix print head associated with that bit will not fire, thus leaving a white dot in your printout. If a bit is set, then the pin will fire, to create a black dot on the page. The summation of all these dots, controlled a bit at a time, is referred to as "bit-image graphics."

While learning how to do printer graphics, you'll probably define your picture on graph paper, filling in squares where you would want a dot printed. From here, it's a simple task to convert from graph paper to a binary representation. Each black dot will be a 1, and each white dot a 0. The binary data, grouped in chunks of 8, must be converted to decimal bytes for your data statements. A value is placed on each bit in a byte, as shown in Table 1 below. You simply add up the values for each bit that's set (1) and you have the decimal representation. A programmer's cal-

Bytes to graphics.

The print head in a dot-matrix printer is made up of a vertical column of small pins. When your printer outputs text, it fires these pins in a predefined sequence from a character set "bit map" it stores in its own ROM. When we want to send it bit-image graphics, we must first tell the printer, "accept the following 43 bytes of data as graphics," for example. The printer expects what we commonly refer to as an "escape sequence." When most printers see a `CHR$(27)` (escape code), it knows that a command follows.

After sending the proper escape code, the bit-image graphics bytes follow. Part of the escape code tells the printer how many bytes to interpret as graphic data. That way, escape characters within the graphics data won't inadvertently be interpreted as more commands.

When printing simple text, the top seven of nine pins are used for uppercase, and lowercase which doesn't require descenders. The lower seven of nine are used for lowercase characters with descenders (such as p, y, q, etc.). The bottom pin is turned on whenever continuous underline is enabled, also. When we're sending graphics data bytes to the printer, we take control of the top eight pins. Here, it's best to think in binary. When you send a graphic byte to the printer, each bit controls an individual pin in the print head. For the Epson and compatibles, you can see in Figure 1 that the least significant bit controls pin 8 and the most significant bit controls the top pin, pin 1. In the case of the Prowriter and its compatibles, the reverse is true, as shown in Figure 2. The least significant bit controls the firing of the top pin of the print head, and the most significant bit controls pin 8.

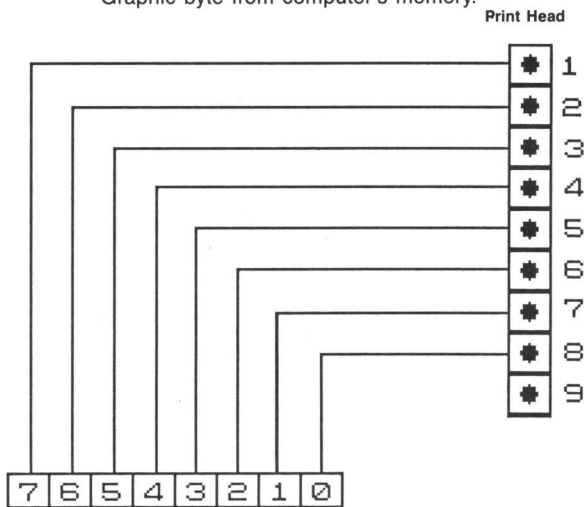

Take a look at Figure 3. Here, a simple graphic of a space shuttle is defined. It's eight dots high and thirteen dots wide. Each dot column is defined by a single graphic byte from your computer. To make it easier to visualize, think of rotating the print head, pivoting at the bottom, to the left for Epson and to the right for Prowriter. In the figure, I've taken care of all the arithmetic for you. If your graphic must be taller, you can create it on a larger grid. You simply break it up vertically in groups of eight rows. You would send the graphics data for the first row (after the appropriate escape codes), print a carriage return (and line feed for the ST), then the next row—and so on. More details later.

The computer and printer.

At this point, you should type and run the appropriate program. If you have an ST and an Epson or compatible, type and run the first program example. It will print our

Epson/Gemini

Graphic byte from computer's memory.

The most significant bit maps to the top pin of the print head, the least significant to the bottom.

Figure 1.

Prowriter

Graphic byte from computer's memory.

The most significant bit maps to the BOTTOM pin of the print head, the least significant to the TOP.

Figure 2.

Prowriter graphics byte to print head control example.

ST DISK FILE: NECPRO.PI3

A DEGAS high-resolution graphics file.

shuttle in single-, dual- and quad-density graphics, respectively, ten shuttles per line. Note that Line 120 has a lowercase z as part of its escape code sequence. That's the code used to set the Gemini 10X (or SG10 in the Star Mode) in quad density. This should be changed to an uppercase Z for Epson and other, *more compatible* printers. The same change should be made for the second program listing, but at Line 130. This is for 8-bit Atari computers equipped with Epson or compatible printers.

Listing 3 is for Prowriter or compatible owners, and ST BASIC. Finally, Listing 4 is for 8-bit Ataris and the Prowriter. If you're using a Prowriter compatible (like an older NEC printer), you may find that all shuttles look the same size. Some are graphics command compatible with the Prowriter, but do not have variable dot densities.

The escape codes.

Each printer has a certain character sequence, usually preceded by the escape character, `CHR$(27)`, that tells it what special function to perform. For the Prowriter, you must send the escape code, followed by the ASCII equivalent of the letter S, which is 83. Immediately following that, the Prowriter expects four characters telling it how many graphic bytes follow. This must be an ASCII string, padded with 0s, if necessary. Graphics density on the Prowriter is set by selecting print pitch, as shown in the sample programs. On the ST, for example, we could use the following to tell the Prowriter that 265 bytes of bit-image graphics data is on its way:

```
LPRINT CHR$(27);"50265";
```

Then 265 bytes of bit-image graphics data must follow.

For the Epson and compatibles, the printer expects the escape character, followed by a lead-in code. This code tells the printer that bit-image graphics bytes are on their way and selects density, as well. Changing print pitch has no effect on the density of graphics, as it does with the Prowriter.

After the lead-in code, the Epson or compatible expects 2 bytes telling it the total number of bit-image graphics characters to follow. The first byte sent will be the low byte, followed by the high byte. So, if we were sending 265 bytes of graphic data to an Epson, it might appear as follows on the ST:

```
LPRINT CHR$(27);"K";CHR$(9);CHR$(1);
```

Why 9 and then 1? What is $9+256*1$? That comes out to 265. Old 8-bit Atarians should be familiar with the high-byte, low-byte format of addressing in the machine. The Epson thinks similarly.

Bit-image graphics density determines the total number of dots per print line, and how close together the dot spacing will be—as you can see from the samples. Single-density graphics on the Epson come out to 480 dots per line; dual is 960, and quad density gives you 1920. On the Prowriter, setting 10 characters per inch (CPI) print pitch will give you 640 dots per line in subsequent bit-image graphic functions. Setting 12 CPI gives 786 dots per line, 17 CPI results in 1088, and proportional spacing will select 1280 dots per line. Look at the listings to see how these are selected with different escape code sequences.

Why not LPRINTs?

Notice that none of the programs use the LPRINT statement any more than is absolutely necessary. The LPRINT poses particular problems on most computers when it comes to bit-image graphics. On the 8-bit Atari, the LPRINT is sent from a 40-character print buffer in the computer. If your LPRINT line is less than 40 characters, then the rest of the line is padded with NULLs, `CHR$(0)`. This really goofs up the bit-image graphics count, set up with the escape code.

On the ST, I found no problems with LPRINT, but avoided it anyway. Note that our space shuttle is thirteen dot columns wide. In the escape code sequence for the Epson, telling the printer how many graphics dots are to follow, there will be a `CHR$(13)` sent. On the ST, the operating system is smart enough to know if an ASCII 13 is being sent at the end of a line, and, thus, should be followed with a LINE FEED, `CHR$(10)`. If not at the end of a line, then only the `CHR$(13)` is sent, unmolested. While testing some of my routines on the IBM PC, however, I found that their BASIC *always* sends a line feed after a `CHR$(13)`, whether it's at the end of a line or not. I used the "out 0" command with the ST BASIC, because I knew this couldn't possibly be misinterpreted by the computer. This simply tells the ST to send a single byte out port 0, the printer, no questions asked. The LPRINT may have some other hidden "features," where it might misinterpret graphic data going to your printer. On the 8-bit Atari, `PUT #1` (where you had previously done an `OPEN #1,8,0,"P:"`), is equivalent to the "out 0" command of the ST.

In the Epson example above, we were sending 265 graphics bytes to the printer. That poses a problem on some computers. Sending the `CHR$(9)` to the printer from the LPRINT works fine on the ST, but another computer I use interprets a `CHR$(9)` as a TAB character. The computer thinks, "a tab character. . . let's help out by converting that to eight space characters." Of course, that will clobber your bit-image graphics, too. The `CHR$(9)` doesn't pose a problem on the 8-bit Atari or ST computers, but it's something to keep in mind if you work on other (heaven forbid), non-Atari computers.

In the ST BASIC sample listings, note the "width lprint 255" command. Similar to IBM BASIC, ST BASIC assumes that your printer is only 80 columns wide. Normally, ST BASIC will automatically send a carriage return and line feed to your printer once every 80 characters you send to it, if you don't. If you're running a 15-inch carriage printer (such as the Gemini 15X or the Epson FX185), then your printer can handle 132 characters per line. This can be set from ST BASIC with a "width lprint 132" command. However, when it comes to bit-image graphics, we may send as many as 1920 graphics bytes in quad density without a return. When ST BASIC sees that you have set the width of the printer to 255 columns, it shuts off all checking and will not send a carriage return/line feed combination, unless told to under your software control.

Additional 8-bit limitations.

One thing many 8-bit owners don't realize is that you absolutely cannot send a `CHR$(155)` to your printer. Why?

// Printer graphics *continued*

The 8-bit Atari uses a 155 as a carriage return representation. The printer driver in the 850, **P:R: Connection** or similar printer interface, always converts the 155 to a standard return value of 13. What if you wanted to send 155 graphic bytes to your Epson on an 8-bit Atari? You can't, because the printer interface helps you out:

```
10 OPEN #1,8,0,"P:"
20 PRINT #1;CHR$(27);"K";CHR$(155);CHR$(0);
```

In the above segment of code, the printer interface would see the 155 coming out and convert it to a 13 before it got to your printer. (The same holds true if you use `PUT #1,155`.) Then your Epson would expect only 13 graphic bytes, while you want to send 155 of them. Of course, the simplest solution is to change your setup to send 156 graphic bytes, instead. You could then send a dummy graphic byte at the end, without messing up the picture.

Usually, with screen dumps and other graphic utilities, you're sending an entire line of bit-image graphics. You know ahead of time how many bytes need to be sent, and can avoid that particular problem. But what if your bit-image graphics line going to the printer happens to have 155s in it? They'll be converted to 13s by the printer interface and goof up the graphic. Many graphic dump utilities for 8-bit Ataris have this little-known bug. A smart graphics utility would look for 155s and convert them "on the fly" to 153s, possibly (which are similar enough in bit-image graphics to go unnoticed).

P:R: Connection owners should also take note of another special feature where they get unwanted help. If you're

sharing the printer between the ST and 8-bit Atari, as I do, then you probably have the line feed switch set in the **P:R:** box. That way, you don't have to change the auto-line-feed dip switch in the printer when you swap it between the two computers. Whenever the **P:R:** sees a 155 going to the printer with this switch set, not only does it convert the number to a 13, it also sends a line feed, 10, to follow up (similar to the problem noted above with the IBM).

This problem never appears in **The Print Shop**. The program avoids the potential 155 problem in a completely different way. **The Print Shop** always drives the bottom seven of eight pins on the Epson, or the top seven of eight on the Prowriter, used for bit-image graphics. This results in the lower seven bits of each graphic byte being used to define the image, with the most significant bit always 0. In other words, the maximum value of any graphic byte going to the printer is 127, so the 155 glitch will never appear. The programmable line feed of the printer is adjusted under software control for proper vertical alignment of your graphic rows.

Vertical spacing on Epson.

It's not likely that all your graphics will be only eight dots high, as are the sample programs. Line spacing for your printer is normally set for text at about $\frac{1}{6}$ of an inch, or sixty-six lines per page maximum. For bit-image graphics, we want each graphic line to stack one exactly above the next, with no extra white space between. On the Epson and Gemini printers, assuming eight bit-image graph-

A DEGAS high-resolution graphics file.

ATTN:
PASCAL
USERS

MODULA-2

the successor to Pascal

FOR
ATARI
520ST

ics, you'll want $\frac{7}{32}$ line spacing. If only using seven pins, as in the **The Print Shop**, then set $\frac{7}{32}$. The vertical spacing is set on the Epson and compatibles with the ESCAPE-A command, followed by a byte (between 0 and 127), specifying the new setting in 72nds of an inch for each line feed the printer does. In ST BASIC, it could be set with the following:

```
LPRINT CHR$(27);"A";CHR$(8);
```

Or, avoiding LPRINT as suggested, the following would work just as well:

```
OUT 0,27:OUT 0,ASC("A"):OUT 0,8
```

Both the Epson and Gemini printers have another programmable line feed control, the ESCAPE-J command. On all Gemini printers through the SG-10 (whether in the Star or IBM mode), this programs the line feeds in increments of 144ths of an inch.

On the Epson, however, it programs in increments of 216ths of an inch. This "minor incompatibility" has been a major source of headaches for Gemini owners over the past few years. Any time you get Epson-compatible graphic software that gives you extra white space between every graphic line on your Gemini, you can bet they're using the ESCAPE-J command, instead of the more universal ESCAPE-A.

Why would anyone want to use ESCAPE-J? Well, the dots line up properly using the $\frac{7}{32}$ -inch increment, but sometimes graphics dump routines need even finer control over the line feed, to adjust for aspect ratio (proportionality) in your output.

If the newest Gemini, the NX10, programs in increments of 216ths of an inch with the ESCAPE-J command, then maybe —just maybe—it's finally 100 percent Epson compatible.

Vertical spacing on Prowriter.

The Prowriter's line feed is programmed in increments of 144ths of an inch, with the ESCAPE-T command. To set $\frac{7}{32}$ - or $\frac{16}{144}$ -inch line spacing, you can use one of the following from ST BASIC:

```
LPRINT CHR$(27);"T16";
```

or:

```
OUT 0,27:OUT 0,ASC("T"):OUT 0,ASC("1")
:OUT 0,ASC("6")
```

A final Epson note.

As more escape commands have been added to newer Epson and Gemini printers, some are followed by a 0 to disable, or 1 to enable a particular feature. For example, the following turn on continuous double-width printing on the Epson and Gemini printers:

```
LPRINT CHR$(27);"W";CHR$(1)
```

or:

```
OUT 0,27:OUT 0,ASC("W"):OUT 0,1
```

(continued on next page)

- FULL interface to GEM DOS, AES and VDI
- Smart linker for greatly reduced code size
- Full Screen Editor linked to compiler locates and identifies all errors.
- True native code implementation (Not UCSD p-Code or M-code)
- Sophisticated multi-pass compiler allows forward references and code optimization
- Desktop automates Edit/Compile/Link cycle
- FileSystem, RealInOut, LongInOut, InOut, Strings, Storage, Terminal
- Streams, MathLib0 and all standard modules
- Directory search paths
- Supports real numbers and transcendental functions ie. sin, cos, tan, arctan, exp, ln, log, power, sqrt
- 3d graphics and multi-tasking demos
- CODE statement for assembly code
- 370-page manual
- Installs on Hard disk and RAM disk
- No royalties or copy protection
- Phone and network customer support provided

Pascal and Modula-2 source code are nearly identical. Modula-2 should be thought of as an enhanced superset of Pascal. Professor Niklaus Wirth (the creator of Pascal) designed Modula-2 to replace Pascal.

Added features of Modula-2 not found in Pascal

- CASE has an ELSE and may contain subranges
- Programs may be broken up into Modules for separate compilation
- Machine level interface
 - Bit-wise operators
 - Direct port and Memory access
 - Absolute addressing
 - Interrupt structure
- Dynamic strings that may be any size
- Multi-tasking is supported
- Procedure variables
- Module version control
- Programmer definable scope of objects
- Open array parameters (VAR r: ARRAY OF REALS;)
- Elegant type transfer functions

CIRCLE #143 ON READER SERVICE CARD

// Printer graphics *continued*

I've frequently seen this shown (translated to ST BASIC) in printer manuals, as follows:

```
LPRINT CHR$(27);"W1"
```

This is wrong, however, and will not work. Many printer manuals show it incorrectly. The Epson and Gemini printers expect a `CHR$(1)` not `1`, or `CHR$(49)`. This does get confusing.

Now, the newer Epson FX printers don't care. They'll accept either of the above as a valid command sequence, but only the former will work properly on the Gemini and many other Epson compatibles. In other words, Epson is making up for deficiencies in their past documentation with updates in the printer's ROM control software. It will, of course, create more confusion among other Epson compatible users.

Normally, if the third byte of an escape code is shown as a `0` or `1` only, then send `CHR$(0)` or `CHR$(1)` not `0`, which is `CHR$(48)`, or `1`, which is `CHR$(49)`. If you use the former, you'll be guaranteed compatibility with virtually all Epson-compatible printers (and older Epson models), not just the newest Epson FX series. (I wonder

if Star Micronics caught this little trick before releasing their new NX/NL printer series? If not, then it *still* isn't 100 percent Epson compatible, is it?)

Wrap up.

I hope this tutorial has helped you understand how to speak graphics to your printer. The sample programs were kept brief and simple, so you can see the essence of computer-controlled printer graphics. Armed with this more accurate information and specific program examples for your computer, you should be able to make more sense out of your printer manual—and tackle that printer graphics utility you've been wanting to write.

I would like to thank Phil Bunch of Comm Tech computer services in St. Louis, Missouri for his valuable Prowriter assistance in developing this tutorial. **A**

The two-letter checksum code preceding the line numbers in the 8-bit BASIC listings here is *not* a part of the BASIC program. For further information, see the *BASIC Editor II* in issue 47.

by Douglas Weir

Time flies, doesn't it? Only twelve months ago the ST was beginning to appear in stores. Soon after that I was compiling my first program with Alcyon C. It finished linking sometime in early February of this year. My second one is a special Christmas project (Christmas 1988). I hope it finishes soon—I'm already behind schedule.

But seriously, folks. . . . When the **Megamax C** compiler arrived, I had been trying for several hours to link a desk accessory version of a GEM demonstration program with DRI's Link68. In desperation I turned to **Megamax**. In less than 15 minutes I had the program compiled and linked. It ran beautifully. I've never used Alcyon since.

Megamax C (MMC) is distributed on two single-sided disks. Included is the compiler and linker, plus a disassembler, code improver, librarian and resource construction program (similar to the Resource Construction Set supplied with the Atari Developer's Kit). These programs can be run from a GEM-driven shell program also included, or directly from the desktop (as .TTP applications), or with any command shell processor (the manual mentions Beckemeyer C-Shell as an example; I used the command.tos from Atari).

The **MMC** shell includes a "make" feature for compiling and linking multiple source files. A GEM-driven editor is also supplied. It operates more or less on the **1st Word** model, but I found it rather clumsy and used **1st Word** instead, with no problem.

Compiling and linking a program is very easy, partly because there are essentially no compiler or linker options. Only one source file can be compiled at a time. The output object file will be written to the same disk (and directory) as the source file. Error messages are written to the screen and also to a file named errors.out, on the same disk as the source file.

A "Megamax" folder is required to be in the root directory of the disk the compiler or linker is on. This folder contains the libraries and header files.

The compiler is one-pass, and as a result it is fast—almost unbelievably so at first (some timings are given in Table 1, at the end of this review). Also as a result, and in the true C spirit, error checking is limited. I never realized I had a redefined macro in a fairly large GEM program I had written, until I put it through the **Mark Williams** compiler. But that's part of the language. As the famous French programmer, Gaston de Gautou, said, "The C, she is a harsh mistress, no?"

The linker's lone option allows you to override the default name (a.out) and destination of the output file. Of course, you can also specify extra libraries to be searched.

The **MMC** library system is very simple. Virtually everything (including AES and VDI calls) comes out of syslib, which is searched automatically. There are two other libraries. Double.l is used for double-precision arithmetic, and acc.l is used when linking desk accessories (the only extra step in creating an accessory). Otherwise, you specify libraries only when you want to use ones created with the **MMC** librarian.

Some peculiarities should be noted. First, the linker builds on its disk a temporary file from which the run file is finally written, and it must have enough space to do so. For those using only floppy disk drives, this means the linker has to have a disk pretty much to itself (except for the Megamax folder and libraries). The location of this temporary file (in contrast to that of the destination file) cannot be overridden.

Second, there is no list of linker error messages in the manual. Some of these can be a bit mystifying. **MMC** does not allow the size of separate data structures (such as arrays or structures), or the data segment as a whole, to exceed 32K bytes. You can easily get around this by declaring pointers instead, then allocating whatever memory you need at runtime with calloc() or malloc(). If you forget about this and, say, declare a 32000-element array of int, you may get a reasonable error message from the linker, saying you've exceeded the allowable data space, but you could instead get the message *couldn't find some local labels*. This is the linker's way of telling you the data segment is exhausted. You can also get the *couldn't find* message by using a label (for example, *goto jail*) without declaring it.

Object modules produced by the **MMC** compiler are, as you might expect, incompatible with anyone else's. Syslib includes bindings for all GEM calls listed in the VDI and AES manuals, but not all of them are documented in the **MMC** manual.

As Clayton Walnum pointed out in an earlier installment of **C-manship**, the behavior of **MMC's** implementation of getch() is rather odd. The function doesn't

return from a call until it encounters a carriage return, so you have to use something like `Conin()` to get a character immediately.

You can get the source code for the entire **MMC** library, including the **GEM** bindings, by sending \$50.00 to Megamax. Much of the code is written for the compiler's in-line assembler, which is a delight to use. In-line assembly code begins with the keyword `asm` and a left-hand curly bracket, and is terminated with a right-hand curly bracket. Macros can be implemented with the `#define` directive.

The assembler adheres to standard Motorola syntax—the only real exception is that register names must be in upper case. Both local and global variables in your program are accessible to the assembly code; the variables are addressed by using register **A4** (external and static) or **A6** (local) as a base register. Since in-line code is located entirely in the code segment of a C program, you can't explicitly write to variable space allocated within the code. However, if you need to use either of these registers for something else, you can save it with the trick in Figure 1.

The assembler has only one bug that I could find. The last line of assembly code must be commented (e.g., see the `;and` return in Figure 1), otherwise you will get an instruction syntax error from the compiler. The `#include` directive can be used in the middle of `asm` blocks to include other assembly code files. Both C-style and Motorola-style comments are accepted; you can use the former to comment out blocks of code containing the latter.

Using **Megamax** to "compile" a large file of in-line assembly code will be much faster than simply assembling with many of the stand-alone assemblers currently available. You can use the **MMC** disassembler as an aid to writing optimized in-line code, but you can't directly "tweak" the compiler's output, since there is no separate assembly pass. The disassembler is as easy to use as the other parts of the package.

A "code improver" program performs branch optimizations on an object file. The manual says that output code is "about 3% faster and 10% smaller" than the original. The improver affects only the nonlibrary portion of your code.

MMC contains the following important extensions: structure and union assignment, and passing to and from functions; character constants can consist of one, two or four characters between single quotes; significant length of identifiers (variable names, etc.) is ten characters; four data and two address registers are available for register variables.

MMC does not allow a program's size to exceed 32K bytes. To get around this, the compiler implements an "overlay" directive that allows you to break up a program

into smaller parts. Note that these are not dynamic overlays; the effect of using this directive is simply to generate a multisegment program, all of which is loaded into memory at runtime. In other words, overlays are transparent to the programmer.

The **MMC** manual comes in a full-size, loose-leaf ring binder. The documentation is mostly well written, and there is a lot of it—over 370 pages. The **GEM** calls (with the exceptions noted above) are covered.

Megamax requires no royalties for commercial programs developed with its C package. It is my favorite C compiler of all those now available for the ST. For users without a hard disk, it's the only sane choice. I love this compiler.

Mark Williams C (MWC) is not just a C compiler—it's more like a way of life. **MWC** came (in my review copy) on two double-sided disks (a single-sided version is available, according to an enclosed note). Installation takes the better part of an hour on a floppy-disk-based ST, just to build the system's directory structure and copy the necessary files. The paperback manual contains over 600 pages, every one of which comes in handy. The result is a system that has a lot of the feel of a mainframe UNIX, but which requires a hard disk for optimum performance.

The compiler is larger than Megamax's; the programs that make up its multiple passes total over 200K bytes, as opposed to 73K for the one-pass **Megamax C**. This means that **MWC** is slower than **Megamax C**. But you get a lot in return: a rich set of compiler and linker options, extended error checking (if desired) and the ability to link to object modules in standard DRI format.

The compiler is only one of many commands and utilities available to the UNIX-like command processor. Others include `egrep`, `sort`, `diff`, `history`, `wc` and `make`. I/O redirection, pipes and scripts (batch files) are supported. This system (called `msh` for micro-shell) is nicer than any of the other ST command shells I've seen.

You must have about 128K bytes of free memory to use `make`. In the command shell, you can type `mf` to find out how much memory is available.

On a floppy system, you obviously can't have access to all of **MWC**'s features at the same time. Instead, you put `msh` and the utilities on one disk and the compiler on the other. There's a full-screen (non-**GEM**) editor, **MicroEMACS**, with source code (which is definitely not "micro"). It's similar to **Mince** and the other **EMACS**-like editors. I used **1st Word** instead, and had no trouble doing so.

Also included is a symbolic debugger that allows you to monitor the execution of a compiled program. The debugger does not require a special compilation of the file to be debugged, but the file must be com-

iled under **MWC**. You can set breakpoints, patch values into memory and disassemble code. You can display the current contents of machine registers, but I couldn't find a way to change register values (none is mentioned in the manual). The debugger works only with TOS-type applications, not with **GEM** programs.

I found it very easy to port my Alcyon and Megamax source code over to **MWC**. The modifications involved header files only.

The advertising for **MWC** mentions "Lint-like error checking." Lint is a program included with some C packages to check for a lot of the little things that normal C compilers don't: variables that aren't used, data type mixups, etc. **MWC** certainly does much more than the usual checking. For example, it caught a redefined macro that slipped through Megamax and Alcyon. It will also notify you of variables that have been declared but never used, violations of standard C rules concerning structures and unions, constant conditionals and data type confusions.

There's a switch that allows warnings of deviations from Kernighan and Ritchie. This is a simple warning with no further elaboration—it's up to you to look at the source code and figure out just what the violation is. As far as I could tell from testing, **MWC** does not check for the following: use of uninitialized variables; use of a value returned from a function that has no return statement (and which is not declared void—this situation is detected); statements which are unreachable for various reasons; statements with possibly confused operator precedences; and cases where too many or too few arguments are passed to a function.

Unless you specify otherwise, a source file is compiled and linked with one command. The linker can be run separately. Various compiler switches allow you to (among other things) define or undefine symbols on the command line, specify include files and libraries, generate assembly source code as output (instead of an object file), substitute other programs for various passes of the compiler(!), and allow nested comments in the source code. The preprocessor can be run separately (for example, to generate macros in assembly source code), and so can the assembler.

However, the letter combinations denoting compiler and linker switches are case-dependent. When you run the compiler as a **TTP** application from the desktop, everything is translated into uppercase by the system, so that many of the options become inaccessible. Since one of these is the library (-l) option, this made the **TTP** form effectively useless for me. However, there is enough room on a double-sided floppy to hold the command-shell program and the compiler, so you can run the latter in the normal way.

An easy-to-use archiver will create libraries from object files. A very useful utility called `drtomw` converts object files in DRI (i.e., Atari) format to **MWC** format. You can then link to these modules, as well. I have tested all these features, and they all work.

MWC provides bindings for all VDI and AES functions. However, the manual does not include GEM documentation.

Creating a desk accessory requires the following steps (not given in the manual): save a copy of `crtsg.o` (the normal GEM startup code) in a safe directory. Then assemble the following code, name it `crtsg.o`, and put it in the `lib` directory (see Figure 2).

After you've done this, compile with the `-VGEM` switch. The output should be a properly functioning desk accessory. The next release of the compiler will have a simple switch for creating accessories.

As I mentioned, the assembler can be used alone, but has its quirks. The assembler directives, data declaration and definition keywords are all nonstandard. The symbol for immediate data (`$`, the dollar sign) is not only nonstandard but an alias of the symbol Motorola uses to denote hexadecimal values. Register lists for the `movem` instruction aren't supported, so you'll either have to hand assemble your own mask values, or push and pull registers separately (making sure you preserve the right order). Within its limits, the assembler works fine. You can easily link to the object modules it generates, and you can

also compile/assemble a C source and assembly source file at the same time, link it, and get a runnable program file—all with one command. There is no in-line assembly feature.

MWC includes many extensions and extra features. It's sometimes difficult to find them, though. Most of the manual (close to 400 pages) consists of the Lexicon, an alphabetical listing of every term, keyword, command or utility in the **MWC** system. There's an enormous amount of useful information in the Lexicon, much more than in most compiler manuals, and, for the most part, it is well organized. But there are, inevitably, omissions. Worse, nowhere in the manual can you find in one place a set of specifications for this implementation of C. Usually, you can look up the relevant topic, but in the case of identifier length and allowable characters, for example, I searched in vain. The section on the assembler gives this information (I assume it holds true for the compiler and external labels), but it isn't indexed. (It seems that all alphanumeric characters plus period (`.`) and baseline characters (`_`) are allowed in identifiers, and only the first sixteen are significant.)

The following seem to be the most significant extensions included in **MWC**: peek and poke statements (in byte, word and longword sizes); void as function and enum as data type; structure assignment, passing and returning structures (as opposed to pointers to structures) to and from functions; `assert` and `#assert` macro and

directive, to check the values of variables and constants at compile and runtime (used in debugging); two sort routines (`shellsort` and `quicksort`), included in the function library; initialization of auto arrays; a Bessel library function; and some other miscellaneous math functions. Three address registers and five data registers are available for register variables in any function. If you let it, the compiler will warn you when it is reducing "register" storage class variables to "auto."

The license agreement at the back of the **MWC** manual states that no royalties or license fees are required for commercial programs developed with the package.

It's difficult to make a hard-and-fast choice between **MWC** and **Megamax C** as the C compiler to buy. For single users, especially those without a hard disk, **Megamax C** is probably best. It's much faster than anything else, and its elegant in-line assembler is a joy to use. Those for whom such issues as object-module compatibility with DRI code are important, and who have a hard disk, may well prefer **MWC**'s many extras. From that standpoint, Mark Williams' command shell with its many UNIX-like utilities and wide range of compiler and linker options make it, in my opinion, the all-round best choice for serious software development on the ST. ☐

MWC floppy version was double-sided, DRI and **MMC** single-sided.

AA Rated Software Atari and Abacus

ST DataTrieve

A simple-to-use and versatile database manager. Features help screens; lightning-fast operation; tailorable display using multiple fonts; user-definable edit masks; capacity up to 64,000 records. Supports multiple files. RAM-disk support for 1040ST. Complete search, sort and file subsetting. Interfaces to TextPro. Easy printer control. **\$49.95**

ST TextPro

Wordprocessor with professional features and easy-to-use! Full-screen editing with mouse or keyboard shortcuts. High speed input, scrolling and editing; sideways printing; multi-column output; flexible printer installation; automatic index and table of contents; up to 180 chars/line; 30 definable function keys; metafile output; much more. **\$49.95**

ST PaintPro

A GEM™ among ST drawing programs. Very friendly, but very powerful design and painting program. A *must* for everyone's artistic or graphics needs. Use up to **three** windows. You can even cut & paste between windows. Free-form sketching; lines, circles, ellipses, boxes, text, fill, copy, move, zoom, spray, paint, erase, undo, help. Double-sized picture format. **\$49.95**

ST Forth/MT

Powerful, multi-tasking Forth for the ST. A complete, 32-bit implementation based on Forth-83 standard. Development aids: full screen editor, monitor, macro assembler. 1500+ word library. TOS/LINEA commands. Floating point and complex arithmetic. **\$49.95**

ST AssemPro

Professional developer's package includes editor, two-pass interactive assembler with error locator, online help including instruction address mode and GEM parameter information, monitor-debugger, disassembler and 68020 simulator, more. **\$59.95**

PCBoard Designer

Interactive, computer aided design package that automates layout of printed circuit boards. **Auto-routing**, 45° or 90° traces; two-sided boards; pin-to-pin, pin-to-BUS or BUS-to-BUS. Rubberbanding of components during placement. Outputs pinout, component and net list. **\$395.00**

Games for your ST

Monkey Business and Delta Patrol

THE OTHER VALLEY SOFTWARE

976 W. Foothill Blvd.

Suite 490

Claremont, CA 91711

Color or monochrome \$19.95 each

by David Plotkin

While the ST is certainly more than just "another game machine," its capabilities and price make it outstanding in that category—when you finish all your word processing, spreadsheets, etc. Software companies are starting to realize this, and games are becoming widely available. I admit to being an unabashed arcade-game lover (I've only solved two graphics/text adventures in my life), so the games reviewed here are for ST owners who still love a fast shoot-'em-up.

Monkey Business is a very thinly disguised clone of **Donkey Kong**. It's written by Ron Fortier, whose name you may recognize from such titles as **Bruce Lee** (Data-Soft) on the 8-bit machines. It's not bad for a first effort, although it doesn't utilize many of the ST's features.

In **Monkey Business**, you play an IRS agent attempting to collect back taxes from "Mr. Big." I'll refrain from commenting on this story line; most of them are pretty dumb, anyway. You must negotiate your way from the bottom to the top on each of three screens, leaping over or avoiding obstacles to accomplish your objective. If you complete all the screens you start over, faster and with more obstacles.

The three screens are remarkably similar to those in **Donkey Kong**. The barrels are there, as are the girders and the "springs and elevators." The fourth screen is missing, however. Also missing is the sequence where the barrels catch fire and chase you. This makes the barrel screen very easy.

Major Motion and Time Bandit

MICHTRON

576 S. Telegraph

Pontiac, MI 48053

(313) 334-5700

Color \$39.95 each

Monkey Business isn't a "polished" program. It suffers from jerky animation and sound quality similar to that of the Apple II. The animation is jerky due to the lack of enough intermediate figures. For example, the ape has only three positions—left, center and right. Also, the supposedly fierce hounds on the girder screen resemble innocent beagles! Despite all this, the game is playable. The skill required rises just enough on each level to keep it interesting. If you're a **Donkey Kong** fan, this is the only game in town.

Don't kill the bystanders
in *Major Motion*.

Delta Patrol, also from The Other Valley Software, is a game wherein you pilot a helicopter across a scrolling landscape, shooting the descending aliens to prevent the destruction of your refueling dumps. There's a marked similarity to both **Defender** and **Choplifter**.

Your joystick controls the chopper, which carries an unlimited supply of ammunition. You shoot at the aliens descending from the top of the screen, dropping

bombs on your many refueling dumps. These dumps are periodically rebuilt by a little dune buggy, so running out of fuel isn't as big a problem as avoiding collisions with a screenful of aliens—who come at you in ever-increasing numbers. As the levels increase progress, more and faster aliens appear, along with new types, which even shoot back! A radar screen at the bottom of the display informs you of the attacking aliens' whereabouts.

Delta Patrol has some cute touches. The fuel dumps are little gas stations, complete with signs for donuts. The aliens themselves are amusingly designed, using bright colors. All screen motion is smooth. Finally, your chopper kicks up clouds of dust when it gets close to the ground.

Delta Patrol is a simple game with few variations. As such, it may lose its appeal after a short while. Like **Monkey Business**, this game leaves virtually untapped the graphics and sound capabilities of the ST, as well as its huge programming space. **Delta Patrol** will leave the adult arcader looking for other challenges.

A worthwhile challenge to turn to is MichTron's **Major Motion**. Based on the arcade classic **Spy-hunter**, it has you using your mouse to guide a car down a vertically-scrolling road, doing battle with all manner of enemy vehicles—while attempting not to injure innocent bystanders or run off the road. Kill too many innocent civilians, and you'll be demolished—by a fighter plane.

Your car is initially armed with just machine guns. You may use the guns to obliterate your enemies, or attempt to run them off the road by ramming them. Since many

ATARI ST

PUBLISHING PARTNER™

CREATES LIKE A PUBLISHING COMPANY WITHOUT THE OVERHEAD

SOFT LOGIK NEWS

AVAILABLE FOR ONLY \$149.⁹⁵

PUBLISHING PARTNER™ HELPS YOU CREATE!

You'll benefit by using your Atari ST to create professional quality journals, newsletters, ads, business cards, certificates, letterheads, logos, art designs, bar graphs, flow charts, *even bumper stickers* and all the forms you or anyone would ever need. Create just like a professional publishing company without the overhead! Publishing Partner is actually three programs in one--Word Processor, Page Layout, and Forms Creator. Expand your potential in becoming a better writer, artist and designer with your Publishing Partner.

WORD PROCESSING

What you see is what you get!

Combine text and graphics easily and quickly from existing or newly created documents. Position entire paragraphs or individual words exactly where you want them. Create one, or multiple color separations ready for printing. Production time will never be the same--it will be much shorter!!

Just take a look at some of its features!

- * GEM based
- * Justifies right or left as you type
- * Edit Multiple Columns on One Screen
- * Search and Replace
- * User Definable Page Size
- * **Bold**, underline, ^{super} and subscript
- * *Italicize*, **shadow**, **outline**
- * **Reverse Image**
- * Backslant Characters
- * Mirror Image Invert Image
- * ep8ml 1011iM * jlv8t jvs8e
- * Auto Headers/Footers, Page Numbers
- * Easily Move Text
- * Reads & Merges other files together
- * Sets Tabs
- * Macros
- * Vertical & Horizontal Printing

PAGE LAYOUT

Whatever you require--cutting artwork from other programs, custom logos, unique borders, unusual mastheads, digitized photos--Publishing Partner is your solution. After all, it was specially designed for you--the home and/or office Atari ST user--by the pro's who realize that there's more to your computer than just typing letters.

- * Vert. and Horz. rules--Exact Alignment
- * Auto Text flow for columns/pages
- * Layout Multiple Columns of text
- * Change columns on finished page
- * Display entire page, 50%, or 25%
- * Easily Re-position Text and Graphics
- * Alternating Headers/Footers
- * Mix Type, Fonts, and Sizes *anywhere*
- * Adjust Sizes from 2pts to 144 pts (2")
- * Adjust line spacing (leading) by points
- * Import other program's graphics
- * Rotate Graphic Images
- * Multiple Patterns, Shades and Colors
- * Enlarge & Reduce Graphics/Exact fit
- * Cut, Paste & Crop Graphics
- * Tool box function/Unlimited patterns
- * Boxes, Circles, Arcs, Polygons, etc.
- * Insert lines directly on the page
- * Adjust Character Spacing
- * Use Hairlines to separate columns

FORMS CREATOR

You can create a variety of forms quickly and easily with your Publishing Partner.

For example, you can create your own:

- Letterhead
- Invoices
- Purchase Orders
- Labels
- Bumper Stickers
- Business Cards
- Certificates
- General Ledger
- Shipping and Receiving
- Routing Slips
- "While you were out" Phone messages
- Templates
- Price Estimate forms
- Requisition forms
- Shipping Logs and much more!

Publishing Partner supports most dot matrix printers, including the Epson™ Star™ and Okidata™ Printers. Also supported are any Postscript output devices such as the Apple Laserwriter™. New print drivers are constantly being released, *so please call to make sure your printer is supported.*

CIRCLE #150 ON READER SERVICE CARD

// Review *continued*

of the enemy vehicles are armored against your guns—and are also bigger than you are—outrunning them is often the best strategy. Periodically, a weapons van appears which can arm your car with additional defenses. These include a smoke screen, oil (to cause skids), a super impulse device (for knocking other cars off the road), and a missile launcher to use against the chopper. The added weapons are activated via the keyboard.

Protect the refueling stations in *Delta Patrol*, from your 'copter.

This is a tough game! The weapons van appears at the most inopportune times, and can get in the way. Unlike the arcade version, you can't destroy it to get it out of the way. Docking with the van can be tricky if you're surrounded by enemy vehicles. Often the van will drop you back on the road alongside a tire-slashing enemy car. The van blocks your way so you can't run, giving the enemy a chance to destroy your car. This can be exceedingly frustrating.

The fact that **Major Motion** can only be played with a mouse also detracts, since I find myself running out of desk space at the worst times. A joystick mode would improve this game quite a bit. On the positive side, **Major Motion** allows you to redefine the weapons keys if the default keys aren't convenient, and maintains a high score on disk.

Time Bandit.

Overall, **Major Motion** is a good game, provided you don't have a low frustration factor. It features good graphics and sound, and nonstop excitement. The limitations of your car force you to plan carefully before running the next gauntlet of enemy cars. And look out for that chopper!

I've saved the best for last. MichTron's **Time Bandit** is billed on the box as "the ultimate arcade game." Of course, software packaging will never win a prize for truth in advertising—except this time. **Time Bandit** represents a truly outstanding feat—an arcade game with action, variety, attention to detail and fantastic graphics. Harry Lafnear and Bill Dunlevy (the authors) can be proud of this one.

Time Bandit opens on a scrolling landscape dotted with small structures. Castles, houses, a spaceship and a pyramid are just some of the items you'll find. Guiding your alter-ego into any of these icons opens up a new world. While these microworlds are similar in many ways, they present a new and different challenge to the arcader. Each of the microworlds is split into sixteen levels, from 1A to 4D. The object is to enter the microworld, battle your way to a variety of treasures, recover keys and, finally, unlock the way out. Each time you re-enter a microworld, the level goes up (from 1A to 1B, etc.), with a major jump in difficulty between numbered levels.

And what a battle you'll fight! Use your joystick to move and shoot your guns, while hounded by multitudes of evil creatures which inhabit the mazelike microworlds. The beings spring from special points located throughout the maze (don't stand on these points). Their touch costs you one life, and they'll follow you—even shoot at you—in the higher levels.

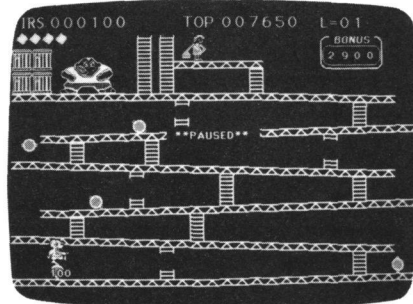

The maze in each microworld is different, and even shifts between levels, increasing the need for memory skills. The points you receive for each creature you destroy depend on how much you move. If you stand in one place, just blowing away attacking enemies, your points-per-creature count will drop to zero.

Time Bandit is full of surprises, which I won't spoil for you. But try the **Pac-Man** maze, and enter the subterranean chamber below the arena. The starship features a difficult text adventure (sit down at the computer consoles), and there's even a quest to recover the lost crown of a king—in return for a king's ransom in gold. Watch out for the wandering spaceships on the main screen, which will throw you into a microworld chosen at random. And read the signs scattered throughout this game; they can be very helpful.

Time Bandit is an example of the ST's capabilities in the game-playing department. The screen abounds with color, and small details are animated to good effect. Such things as flags waving on the castle ramparts and blinking lights on the starship *Excalibur* add a lot to the game. But this game especially shines in its animation. Each microworld features different sets of creatures, from the lions and trolls of the arena, to the roving snakes and eye balls of the pyramid. These creatures move

smoothly and are convincingly animated. Even the manner in which they disintegrate when hit is well done. For example, shooting a ghost causes it to appear in a "No Ghosts" symbol (from *Ghostbusters*) for a brief instant before disappearing. The variety of demises is another example of the imagination that went into this game.

Time Bandit is different; it's unlikely that you could ever finish every microworld

You're an IRS agent in *Monkey Business*.

through all sixteen levels. The authors don't believe it can be done, either. I play to see how far I can get in each structure before running out of lives. This way, each microworld becomes a separate arcade game, making this a good value for your software dollar.

High scores are saved to disk. I'd like to meet Crazy Kev, the fiend who put the high score on my disk—over 500,000 points (I've gotten about 50,000). If you plan to buy just one arcade game for your ST, this has to be it. **Time Bandit** is superb—there's no other word for it. **A**

David Plotkin owns an 130XE and a 520ST, and is currently a heavy Pascal user on the ST. His computer interests lie in programming, games and tutorials.

Attention ST Programmers!

Are you tired of programming with a slow, unfriendly, featureless text editor?

presenting

E d i t S T

A fast, full-screen, GEM based text editor designed for the Atari ST™ by programmers for programmers.

EditST features include:

- Complete GEM support; windows, mouse, function keys.
- Multi window editing, move text between windows.
- User-definable function keys. HELP key support.
- Block editing features: Copy, Move, Delete, Insert.
- UNDO feature. Find and Replace. Auto Indent.
- Printer support from within editor.
- DOS directory, rename and delete.
- 2 character sizes. Up to 40 lines mono, 25 color.
- Cursor positioning by line number, mouse, arrow keys.

Alert boxes from ST BASIC

**A subroutine and tutorial
to get you the help you need,
when you need it.**

by **Matheu Spolin**

One of the most useful features of the ST's GEM system is the ability to call alert boxes—forms that appear in the middle of the screen, displaying a question, with several buttons for input. But, if you've read through the *ST BASIC Sourcebook* in an effort to find a `Form_Alert_Box` command, your search has been in vain. To the casual user, there seems to be no way to call up alert boxes in ST BASIC.

Not so. Now, with `BOXFORM`, the subroutine presented here, calling alert boxes—of all sizes—is only a matter of defining a string, setting some parameters and calling the subroutine.

`BOXFORM` uses the powerful basic command `GEMSYS` to call AES routine 52, known as `FORM_ALERT`. This routine not only creates the alert box and gets input from it, but also closes the box and restores the former screen display.

Using `BOXFORM`.

To see `BOXFORM` in action, type in Listing 1 (in ST BASIC). If you're using TOS from disk, you may have to disable buffered graphics to employ the program. Lines 10 through 400 are part of the demo. They aren't needed to use `BOXFORM` in your own programs. The actual subroutine begins at Line 63000.

To put `BOXFORM` into your own programs, you must define `BOX$` with the text you would like to appear in the box. To separate lines of text within the string, use the logical OR character (`|`). This character is produced by striking the backslash character (`\`) while holding down `SHIFT`.

Next, the buttons you'd like to have appear in the box

must be assigned to the variable `BUTTON$`. Separate the button labels as you would lines of text, with the logical OR character (`|`).

After that, you must store the icon number in the variable `ICON`. The exclamation point, question mark and stop sign icons are numbered 1, 2 and 3, respectively. If no icon is desired, store a 0 in the variable.

Defining the variable `PRIORITY` is optional. It contains the number of the button to thicken, indicating that option may be selected by pressing `RETURN`. If you don't assign a number to `PRIORITY`, no button is highlighted.

After defining these variables, simply `GOSUB BOXFORM`. The subroutine will create an alert box, display it on the screen, read the input, then return to the main program's control. The button number which the user selected will be stored in the variable `KEYCHOICE`, upon return to the main program.

`BOXFORM` is an easy to use subroutine for creating alert boxes in any ST BASIC program. However, as with any call to `GEM`, passing the wrong parameters will cause ST BASIC to crash. So check your parameters carefully. Don't use any square bracket characters in your strings, and don't make any text line in `BOX$` over twenty characters.

Also, please remember that alert boxes can hold no more than three buttons. Defining a fourth will send your ST into never-never land. **■**

Matheu Spolin has been writing computer programs for six years and works in BASIC, Action!, C and 6502 assembly language. He currently enjoys writing programs on his 520ST, while his 130XE runs his bulletin board system, the Towers of Darkness BBS, at (301) 656-3401.

LEADER BOARD™

"Pro Golf Simulator"
By Bruce & Roger Carver

Access welcomes you to the exciting world of professional golf with **LEADER BOARD**. With amazingly realistic 3-D animation, golfers will face multiple 18-hole golf courses that demand strategy, total concentration and control to come in under par.

LEADER BOARD is the most realistic golf game available because it is actually a simulator that gives you a true perspective view of your golf game.

There are three levels of play so you can compete from amateur to touring professional. You'll get all the fun, aggravation and stimulation of true golf competition!

- Suggested Retail Price \$39.95
- 1 to 4 Players
- Choice of Club, Distance, Type of Shot (hook, slicer, putting) and More
- Realistic Sound
- Joystick Controlled
- Multiple 18-Hole Golf Courses
- Automatic Scoring

TIMEKEEPER™ for Atari ST

\$39⁹⁵

TIMEKEEPER™ is a plug-in battery-backed Real Time Clock Calendar for the ATARI ST Computers. The Timekeeper module plugs into the cartridge port on the ATARI 520/1040 ST Computer. A program is supplied with Timekeeper that operates as an accessory like the control panel. A feed through cartridge slot allows Timekeeper to remain installed while using other cartridges.

The Timekeeper program automatically gets the time and date from the Timekeeper modules during the power up or boot sequence. The computer's own clock is set up and the Timekeeper is then disengaged until the computer is turned on again.

A Relational GEM Database

Solve your business and personal needs with our easy to use database. Regent Base makes full use of the GEM system so using any of the available templates is as easy as dragging the Mouse and pressing a few keys. Included with Regent Base are two templates: A Mailing List Manager and A Checkbook Manager. Other templates available include: Accounts Receivable, Payables, General Ledger, Customer Billing, and Invoicing. Many other templates are also available. Regent Base supports over fifteen printers and even "mail-merges" with Regent Word II.

REGENT WORD II:

GEM Word Processor with Spelling Checker

Power through any word processing needs with Regent Word II. Regent Word II makes full use of the GEM system, so editing is powerful and easy! As text is typed Regent Word II reformats the document on the screen to show exactly what will be printed. Bold, Superscripted, Subscripted, Italic and Underlined text are displayed while editing. A 30,000 word Spelling Checker is built in. Insert or delete words — up to 100,000 — in Regent Word II's spelling dictionary with the click of a mouse button! Regent Word II "mail-merges" with Regent Base for instant form letters. On-line Help Menus and over fifteen printer drivers are built in.

EZRAM™

520

512K Memory Upgrade for the Atari 520ST®

Featuring the **EZTemp™** Soldering Guide

Upgrade Your 520ST to a Full Megabyte of RAM

- Increase spreadsheet and database capability
- Dramatically improve RAM disk capacity for enhanced I/O operations

Designed for Simple Installation

- Features the **EZTemp™** solder template. All the soldering occurs on the template not at the RAM chips. Eliminates chip stacking.
- Clear, easy to follow, illustrated installation instructions.

Free Software **Made in the U.S.A**

- Memory check diagnostic software and additional accessory programs included.

S.L.: \$199.00 **6 Month Warranty**

See your Dealer or call us at (617) 232-2317
Brookline, MA 02146

EZRAM and **EZTemp** are Registered Trademarks of Apex Resources, Inc.

NEW!

Backup!

by Dave Clemans

When is the last time you backed-up your hard-drive? Would you stake a month's lost labor on it? Probably not. With this utility, you can backup your hard-drive quickly and easily.

- Restores files from the back-up.
- Backup organizes the whole procedure.
- Pull-down menus for easy use.
- Make full or partial backups by use or date.
- Make file or image backups.

Color and Monochrome \$39.95

NEW!

Dot Driver

by Timothy Purves

At last, a printer driver that makes Okidata printers and C.Itoh Prowriter printers compatible with your Atari ST! Dot Driver processes printer output from any program using GDOS, and prints it on your printer.

Requires GDOS \$49.95

NEW!

Laser Driver

by Timothy Purves

This driver makes the Quadram and Hewlett Packard laser printers work with the ST. It processes printer output from any program using GDOS, and prints it on your laser printer. Includes a special screen-dump utility.

Requires GDOS \$49.95

NEW!

BBS 2.0

by Timothy Purves

A Bulletin Board Service that's full featured, easy to use, and affordable? Only from MichTron! BBS turns your computer and auto-answer modem into a full-blown electronic mail and message system!

- Easy to set up. Have it running within an hour!
- Maintains up to 1024 messages, limited only by disk space and message size.
- Up to 16 Special Interest Groups (SIGs), each with separate messages, file area, and user access!
- Unique message control format lets you make customized menus, complete with user inputs.
- Multi-user capacity lets the operator and one caller use the BBS at the same time, independently!
- Practically self-maintaining. It takes just a few minutes to update user logs and files.
- Call our BBS for a test run: (313) 332-5452.

Color and Monochrome \$79.95

NEW!

Your Financial Future

by William Jenkins

Insight into your finances is vital in planning for the future. With this complete forecaster, you can analyze income and expenses, for a detailed projection of where your budget is headed. Find the strong and weak points, and make your budget more flexible and dependable!

- Detailed projections of your financial situation.
- Change loan conditions to find the best terms!
- Examine one of our times best investments: the IRA!
- Easy to use with pull-down menus and mouse control.

Color and Monochrome \$39.95

More Favorites!

Business Tools - 200 business forms, letters, etc.

Color and Monochrome \$49.95

Dos Shell - Hang up mouse! Dos Shell emulates the famous MS-DOS command structure on the ST!

MARK WILLIAMS C. AN ENLIGHTENING DEVELOPMENT FOR ATARI ST USERS.

If you've tried your hand at developing applications on the Atari ST, you know the problem. Programming tools aren't only hard to come by, they're hard to use. One might even say primitive. But now for some enlightening news: you can have all the power, portability and versatility of the C language from a leader in professional C programming tools, Mark Williams.

BRING YOUR PROGRAMMING UP TO SPEED.

The Mark Williams C compiler produces fast, dense code and supports the complete Kernighan & Ritchie industry standard C. You'll have access to GEM's AES and VDI libraries for programs using graphics, icons and the Atari mouse. And Mark Williams C lets you take advantage of the full 16 megabytes in Atari's 68000 microprocessor.

STREAMLINE DEVELOPMENT WITH POWER UTILITIES.

Mark Williams C is loaded with everything you'll need for professional development. Bring the power of the UNIX environment to your Atari ST with our

Features

C compiler

- Complete Kernighan & Ritchie C plus extensions
- Up to eight register variables
- Full access to AES and VDI libraries for programs using graphics, icons and mouse
- Complete UNIX-compatible libraries allow easy portability to and from UNIX development environment.
- Over 300 Atari-specific routines
- One-step compiling, linking with cc command
- English error messages
- Lint-like error checking

Microshell Command Processor, powerful UNIX style shell includes I/O redirection, pipes, command substitutions

MicroEMACS Full Screen Editor with commented source code included

Make Program Building Discipline Complete symbolic debugger with single-step, breakpoints and stack traceback

Assembler, linker and archiver Powerful Utilities Package: egrep, sort, diff, cmp, pr, tail, uniq, wc and more

Over 600 pages of documentation including 120 sample C programs Not copy protected

MARK WILLIAMS C FOR THE ATARI ST
\$179.95
60 DAY MONEY BACK GUARANTEE

Microshell Command Processor including pipes, I/O redirection and more. Edit your program with the highly acclaimed MicroEMACS full screen editor. Accelerate and simplify compiling with *make* which finds and recompiles only those modules affected by your changes. Then, when you're ready for debugging, call on our db Symbolic Debugger with single step, breakpoint and stack traceback functions. Over 40 commands, including a linker and assembler, provide a total development package for your Atari ST.

DEPEND ON A NAME WITH A HISTORY OF PERFORMANCE.

Mark Williams C for the Atari ST is part of our growing line of C compilers. A line that includes the C compiler chosen by DEC, Intel, Wang and thousands of professional programmers. Now our Atari C compiler is earning its own reputation:

"Finally a great C compiler that exploits the power of the ST"—Sigmund Hartmann, President, Atari Software Group

"The all-around best choice for serious software development on the ST."—Douglas Weir of *ANALOG COMPUTING*

GET WHAT YOUR ATARI ST HAS BEEN WAITING FOR.

Mark Williams C is just what your Atari ST was made for: powerful, professional programming. So now that you can have Mark Williams C for just \$179.95, what are you waiting for?

 300/1200-baud modem \$219.00

by Matthew J.W. Ratcliff

Modems are becoming very common, now that they're so affordable. They can be used to call up CompuServe or Delphi, where you can access a whole world of information—for a fee, of course. There are many "computaholics" (as I affectionately call them, myself included) who set up their own computer systems, with modems and dedicated phone lines, in the form of a Bulletin Board System (BBS). Most often, these are free. On a BBS, you may find files you can "download" from their computer to yours. You can actually receive public domain programs directly over the phone, with a modem and the proper software. Often, such a BBS has several topical message bases and on-line experts who can answer your technical questions.

The **SmarTEAM** 300/1200-baud modem is an affordable alternative to the Hayes **Smartmodem**, the standard by which others are judged. The **SmarTEAM** can operate at 300 or 1200 baud (bits per second). Most modems send 1 "start bit," 1 "stop bit" and 8 bits per character. That means you can transfer 30 characters of information per second at 300 baud, 120 at 1200 baud. Not all BBSs support 1200 baud these days, but those that do will save you a great deal of time when transferring program files.

At four times the usual transfer speed, 1200 baud will be desirable for calling information services, to minimize chargeable connect time. Although CompuServe has

a surcharge for 1200 baud, it's less than twice as much as the 300-baud fee. Delphi has no surcharge for 1200- or even 2400-baud rates. Enough tutorial, now on to the **SmarTEAM** specifics.

The spiral bound manual is readable and covers all the "smart" commands for modem control. There's even a handy pocket reference guide. Considering all the "Hayes-compatible" advertising for the **SmarTEAM**, I found it odd that there was no mention of this compatibility in the manual.

Noting the huge price difference between the **SmarTEAM** and the Hayes, I expected less quality in performance. I first hooked up the **SmarTEAM** to my 130XE system, equipped with an 850 interface. I used a cable originally made for a different modem, and it worked fine. I called several local BBSs and a long-distance one. The modem performed flawlessly, at 300 and 1200 baud. All the Xmodem file transfers worked fine.

Next came the *acid test*: we put the modem on Gateway City BBS. I gave the **SmarTEAM** to SYSOP Jim without any documentation—intentionally, as part of the compatibility test. Jim called a friend who owned a Hayes and duplicated his switch settings. The **SmarTEAM** was then put on-line, in place of the old faithful Hayes 300. It worked the first time, as we would have expected a Hayes to. This proved its Hayes compatibility to our satisfaction. (We were running FoRem XL BBS software.)

Then the *problem* cropped up. Occasionally, while on-line, I would get a gar-

bage character echoed back to me. Other Gateway users indicated having the same problem, at both 300 and 1200 baud. Sometimes this happened while entering a message. I would go back to the line with the garbled character, to edit it out. However, the line would list with no errors. Apparently, the modem received the character properly, but echoed it incorrectly.

We sent the **SmarTEAM** back to ICD, and they replaced it promptly. The next **SmarTEAM** exhibited the same symptom. Just to be sure it wasn't the phone line, we put the **SmarTEAM** on the M.I.C.E. BBS for a couple of days. We put the M.I.C.E. 300/1200 Hayes on Gateway, in the meantime. The echo problem immediately showed up on the M.I.C.E. BBS when the **SmarTEAM** went on-line. These BBSs, when running on a Hayes, have never exhibited such anomalies.

Considering the major price advantage over the Hayes, I think the **SmarTEAM** would make an excellent personal modem (where the above problem would not occur). For a BBS, you may have some minor problems. The garbled characters are occasional (maybe 1 byte in 4K) and have not caused any problems in uploading or downloading files. (The Xmodem file transfer protocol automatically retries on errors.) This minor nuisance would never occur with a Hayes, but you pay a premium for it. The **SmarTEAM** is a good modem for the price, but—to put it simply—it's not a Hayes. **■**

by Karl E. Wieggers

When the Atari 400s and 800s first hit the market, the magic word was *graphics*, more specifically, *player/missile graphics*. You probably learned how to create and animate players in BASIC programs—and have observed that it's a bit cumbersome. Now, we'll see how to do the same thing in assembly language. It really isn't hard at all.

In the last two issues, we created the title screen for "Attack of the Suicidal Road-Racing Aliens," then jazzed it up with some display list interrupts. This time we move on to an actual playing screen, with an alien and a car dashing about. Unfortunately, they're all alone on a blank screen, and their movement is monotonous.

That's the way the tutorial crumbles for this month. In the next two issues, we'll build on this simple player action and get considerably more sophisticated. Be sure to enter this month's listing with the line numbers shown, since we'll be merging additional code with this program in the next two issues.

We really aren't going to create a complete, playable game with this stepwise process. Instead, I'll present the elements of a game, to illustrate the programming techniques involved. If you do want to put the pieces together, just keep adding code at the end of last month's program, rather than starting today's program at the \$5000 address. Also, you'll have to fix the routine for detecting the START button from last time, so that execution continues with the first line of today's program.

PMG primer.

First, a quick refresher on player/missile graphics (PMG). The background screen display is referred to as the "playfield." A "player" is simply an 8-pixel-wide stripe of dots that runs the full vertical height of the screen. We

can selectively turn on whichever dots we want, and superimpose the resulting figure on the playfield. A control register in the operating system lets us select whether a player or a playfield object appears to be "in front" whenever they occupy the same space. Other registers allow us to check for collisions between players and playfield objects.

A "missile" is a 2-pixel-wide analog to a player. The Atari can have up to four players (and their missiles) present on-screen at once. Each player/missile combination has its own color register, but a missile is always the same color as the player with which it's associated. We can double or quadruple the width of each player independently, making them 16 or 32 pixels wide. Other PMG control registers set the horizontal positions of the players and missiles on the screen.

Players can be defined as having either "single-line" or "double-line" vertical resolution. In single-line resolution, the player stripe is 256 pixels (scan lines) high. A double-resolution player is 128 pixels high, where each pixel occupies two scan lines. All players must have the same resolution. Naturally, single-line resolution permits finer detail in the player dot pattern. The price you pay is in memory: single-line resolution requires twice as many bytes of storage as double-line.

Getting started.

The first task when setting up a PMG display is to decide what you want your players to look like. I'll assume you're familiar with the technique of defining a player shape by deciding which of the eight dots in each line are to be illuminated, and computing a numeric byte value from the binary pattern that results. Many good articles on PMG fundamentals can be found in Atari literature. There are also many good programs available (commer-

Boot Camp

cially, and in magazines or books) to help you design your players.

As with most assembly programs, the next step is to allocate memory. Double-line resolution requires 1024 bytes of RAM, and single-line resolution requires 2048 bytes. The starting byte of the RAM allocated to PMG (called PMBASE) must be on a 1K boundary for double-line resolution, and on a 2K boundary for single-line. I usually use single-line resolution starting at address \$3000. The PMG region will thus extend up to address \$37FF.

Table 1.

Usage of the RAM block allocated to player/missile graphics, in bytes offset from PMBASE.

| Function | Double-Line Resolution | Single-Line Resolution |
|----------|------------------------|------------------------|
| Unused | 0 - 383 | 0 - 767 |
| Missiles | 384 - 511 | 768 - 1023 |
| Player 0 | 512 - 639 | 1024 - 1279 |
| Player 1 | 640 - 767 | 1280 - 1535 |
| Player 2 | 768 - 895 | 1536 - 1791 |
| Player 3 | 896 - 1023 | 1792 - 2047 |

Table 1 shows how the PMG RAM is used. In single-line resolution, one page (256 bytes) is used for each of the four players and a fifth page is for the four missiles (64 bytes each). This leaves the block from byte 0 of the PMG RAM through byte 767 empty and available for your use. The location of the player within its allocated RAM section determines its vertical screen position.

I alluded to the various registers used to control PMG functions. Table 2 lists the important ones for today. Notice in Table 2 that there are registers for the horizontal positions of players, but not for their vertical positions. We'll discuss the significance of this fact later on. Now,

turn your attention to the assembly listing and we'll see how it's done.

Table 2.
Important PMG registers.

| Name | Hex Address | Function |
|----------|---------------|---|
| SDMCTL | \$022F | 62 for single-line, 46 for double-line resolution |
| PCOLR0-3 | \$02C0-\$02C3 | color of players 0-3 |
| HPOSP0-3 | \$D000-\$D003 | horizontal positions of players 0-3 |
| SIZEP0-3 | \$D008-\$D00B | player size: 0=normal, 2=double, 3=quadruple |
| GRACTL | \$D01D | store 3 to enable PMG, 0 to disable |
| PMBASE | \$D407 | store high byte of PMBASE here |

Example: an alien and his car.

This month's sample program illustrates how to implement player/missile graphics and how to move players vertically and horizontally under program (as opposed to user) control. The program employs two players: an alien who moves up and down, and a car that moves from left to right.

The listing begins with the familiar CIO equates. All we'll do with CIO is open the screen in graphics mode 3 and leave it blank. Lines 350-430 contain the equates for the PMG registers in Table 2. Some other variables I use in the program are defined in Lines 470-560. SHAPE and PLYRSTRT are 2-byte variables placed in some of the few free 0-page bytes. I'll use these for some loads and stores, with the 6502's indirect indexed addressing mode. I set aside a block of 4 bytes to keep track of the Y-positions of the four players (YPOSP0), and another block for the X-positions (XPOSP0). NBYTES is the number of bytes of shape data in the player currently being manipulated.

Sometimes you may want to confine the movement of

your players to a certain area on-screen. In this example, I want the alien to hang around between specified vertical limits. Hence, the variables TOP and BOTTOM, which will be loaded with the scan lines of my upper and lower movement limits. Finally, DIRECT is used to keep track of which way the alien is moving, up (1) or down (0). I tend to use page 6 for this sort of variable storage, but you can put your variables anywhere where they'll remain intact.

I'm using single-line resolution, so I must locate PMBASE on a 2K boundary (hex addresses of \$X000 or \$X800). Line 620 shows that the PMG region begins at address \$3000. The program itself begins at address \$5000, as is my habit; execute this program at address \$5000.

Recall that only pages 4-8 of the PMG RAM block contain information that'll be shown on the screen. Lines 1910-2000 of the listing zero all the bytes in those five pages, thus preventing any extraneous junk in that section of RAM from affecting the screen display.

The high byte of the first byte of the PMG block must be stored into the register called PMBASE (\$D407), as in Lines 2010-2020. Lines 2030-2100 initialize the player sizes and horizontal positions to 0.

The player shapes themselves are found in Lines 4920-4950 and 5210-5240. Player 0 is the alien, and player 1 is a car. I decided to store these data tables in the unused portion of the PMG block. The alien shape is at the beginning of the PMG block (\$3000), and the car immediately thereafter.

The first byte in each table is the number of bytes of actual player shape data. The alien shape contains 14 bytes, the car 15. This means the alien is 14 scan lines high and the car is 15 lines. The remaining bytes are the decimal values of the bit patterns for each line of the player shape. The last byte in each player is a 0, which doesn't contribute to the appearance of the player, but helps with vertical movement (as we'll see shortly).

Now that memory's been allocated, we need to copy the player shapes into the correct page of the PMG RAM block. Of course, we could have put them in the right place initially. But sometimes you want to have multiple shapes for a single player, (having an alien face to the left, to the right, forward, or backward). In such cases, the various player shapes all have to be stored somewhere, and you must copy them to the right part of the PMG block whenever you want to change the shape. I've primed your mind for this technique by storing the shapes in the free PMG area. (This trick resurfaces in a couple of months).

The code in Lines 2140-2250 copies the data for the alien into a specified portion of the RAM block for player 0. Line 2190 indicates that this block is four pages higher in RAM than the start of the PMG block. Line 2220 sets the initial vertical position of the alien at scan line 180, by storing the player data at an offset of 180 bytes from the beginning of the allocated RAM page. I also store this vertical position in variable YPOSP0, to keep track of where the little guy is. Feel free to play with this number and see what happens.

The subroutine called COPYPLAYER (Lines 3900-4020)

actually performs the copy of the player data (how about that). By writing this segment as a subroutine, I can use it to copy any player data into any player RAM area. The car shape data is copied the same way in Lines 2300-2410, with an initial vertical position of 122. Finally, Line 2420 opens the screen using a familiar subroutine (OPENSCREEN, Lines 3350-3480) in graphics mode 3.

Lines 2460-2490 set the alien's upper and lower limits of movement. The upper vertical position where a player's still visible at the top of the screen is about 32 for single-line resolution, 16 for double. At the other extreme, vertical positions larger than about 224 (single) or 112 (double) will make the player fall off the bottom of the TV. Lines 2540-2570 make the alien yellow and the car purple. Notice that player colors are controlled with special registers PCOLR0-3, separate from the playfield color registers.

Now for the lowdown on the other critical PMG registers. Last month, we learned that location SDMCTL (\$22F) controls whether the screen display is off (store a 0) or on (store a decimal 34). This register also controls whether the players are double-line resolution (decimal 46) or single-line (decimal 62). Lines 2580-2590 request single-line resolution players.

The horizontal size of players is controlled by the registers called SIZEP0-3 (\$D008-D00B). Storing a 0 in one of these registers gives the default (normal) width of 8 pixels. Store 1 for a double-wide and 3 for a quadruple-wide player. Lines 2600-2610 make the car double width. The register called GRCTL (\$D01D) enables player/missile graphics. Store a 1 to turn on the missiles, a 2 to turn on players and a 3 for both, as we do in Lines 2620-2630.

The horizontal position of players is dictated by the contents of registers HPOSP0-3 (\$D000-D003). Allowable values are 0 to 255, but positions below about 48 (left) and above about 208 (right) will be outside the boundaries of the TV screen. In Lines 2640-2650, we place the alien near the center of the screen. Since the HPOSP0-3 registers are write-only, I've created a second block of storage locations called XPOSP0-3, in case I need to find out where a player is at any given moment. Last but not least in this section, Lines 2670-2680 set the initial direction of alien movement as upward.

Now for some animation. Recall that we want the alien to move up and down, and the car to move horizontally across the screen. Occasionally, they may have an encounter session. In a future column, we'll see how to detect collisions among players and take some appropriate action. For now, though, let's just get the rudiments of player motion down pat.

The routine labeled ACTION, beginning at Line 2740, starts with a yawn by calling the subroutine DELAY (Lines 4080-4150). This subroutine does... absolutely nothing. Nonetheless, it's useful. If we let the players move around at top computer speed, things would be far too fast to follow. The delay subroutine simply loops for a number of cycles controlled by the contents of the X-register when DELAY is called. Line 2750 uses a value of 15 in X, but try different numbers and see what happens.

After that ever-so-brief pause, the car (player 1) is moved 1 pixel to the right, thanks to the instructions in Lines 2770-2790. Since this process goes on forever, the car will simply zip from left to right over and over again. Lines 2800-2850 prime the system for vertical movement of the alien (player 0).

Unfortunately, moving a player up and down isn't as simple as moving him left and right. Recall that the vertical orientation of a player reflects a pattern of bytes stored in a particular section of RAM. To move a player up one line, we must shift each byte of the player shape data 1 byte lower in RAM. Conversely, moving data bytes higher in RAM causes the player to move down the screen.

There are several ways to do this. One is to simply copy the player shape from its original storage location into the new desired position in the PMG block, making certain to zero out the old position so no extraneous player parts are visible. A second method is to actually shift the player shape 1 byte at a time within the RAM block. That's the approach I used in this example.

A certain amount of program logic is required to move the alien, as found in Lines 2900-3120. In short, we move the alien up if he's already going up and isn't yet at the top. If he's at the top, we start moving him down, until he reaches the bottom. Back and forth he goes, where he stops only the pusher of the RESET key knows.

Vertical movement is accomplished with subroutines MOVEDOWN (Line 4200) and MOVEUP (Line 4350). I think you can see how these routines simply shift the player data 1 byte in the appropriate direction. What would happen if we didn't have limits on the vertical movement area? Eventually the alien, player 0, would be moved into the section of RAM reserved for player 1, or into the block set aside for the missiles. Either way it's bad news, so I like to set the limits and worry about it no further.

Things to come.

As the alien mimics a yo-yo and the car flashes by, you'll see an occasional flicker or jump in the animation. This jerkiness is particularly noticeable at slow speeds (long delay set in Line 2750).

The fix to this is simple: move all your players while the TV gun is turned off, every sixtieth of a second. To accomplish this feat, we must create a "vertical blank interrupt" (VBI) routine, which gives us flicker-free motion.

Next time, we'll write a VBI that lets you move the alien around the screen via a joystick. I'll throw in a bonus: a procedure for using the VBI in a BASIC program.

Cosmic Glob

by Rich B. Enns

In the year 2500, a giant energy cluster heads toward the Earth. Fighters are sent to intercept; only one returns. Is this the end? The surviving fighter brings little hope.

The media-christened **Cosmic Glob**, it seems, can only be destroyed by chunking it out and neutralizing its core. With the formation trapped in a weakening force field just short of the planet, you must destroy the horror before it destroys you—and the Earth.

Typing it in.

Listing 1 is the BASIC data used to create both cassette and disk versions of **Cosmic Glob**. Those readers who are interested in how the game works may obtain the assembly listing on either the magazine disk version or the **ANALOG Computing Atari Users' Group** on Delphi.

Disk users should refer to the **M/L Editor** article on page 42 for typing instructions.

If you have a cassette system, type in Listing 1, then add the lines shown in Listing 2. Type *RUN* and press RETURN. The program will begin checking the data statements, printing the line numbers as it goes. It will alert you to any problems. Fix any incorrect lines and rerun the program until all errors are eliminated.

When all your data lines are correct, the computer will beep twice and prompt you to *READY CASSETTE AND PRESS RETURN*. Now, insert a blank cassette in your recorder, press the RECORD and PLAY buttons simultaneously, and hit RETURN. The message *WRITING FILE* will appear, and the program will create a machine language boot tape version of **Cosmic Glob**, printing each data line number as it goes. When the *READY* prompt appears, the game is recorded and ready to play. *CSAVE* the BASIC program onto a separate tape before continuing.

To play the game, rewind the tape created with the BASIC program to the beginning. Turn your computer off and remove all cartridges. Press the PLAY button on your recorder and turn on your computer, while holding down the START key. If you have an XL or XE series computer,

you must hold the START and OPTION keys when you turn on the power. The computer will beep once. Hit the RETURN key, and **Cosmic Glob** will load and run automatically.

Playing Cosmic Glob.

This is a one- or two-player game. When it boots up, the title screen will appear, with four options. Joystick 0 changes the options; pull it down to select one. Push the joystick right to change the selected option. Press the fire button to start **Cosmic Glob**.

You have several options for variations in the game: (1) number of players: select 1 or 2; (2) number of ships: select from 3 to 7, or * for an endless number of ships; (3) difficulty: choose a level from 1 to 30; and (4) enable mines: select Y or N to enable mines or not.

Pressing the joystick 0 fire button starts the game. The **Glob** will appear immediately, along with a small defense ship. Your ship will be seen on the bottom. Player 1, on the left, uses joystick 0. Player 2, on the right, has joystick number 1.

Notice that your ship doesn't appear right away. It'll remain protected for about five seconds under a force field, then will appear automatically. Pull back on your stick to appear when you want. Do so only when it's safe.

Push forward on the joystick to move your ship. It'll head in one of eight directions. Push right to turn clockwise, left to turn counterclockwise. Pull back to flip. You may move and turn at the same time.

Contact with the **Glob**, a defense ship, or one of the mines is deadly. Contact with the force field is safe. If you collide with it head on, you'll bounce straight back. Hit on an angle, and you'll bounce off on an angle.

In two-player mode players may pass right through each other. When the two players overlap, a third color is produced. This is done by setting bit 5 of GPRIOR (623).

To fire missiles in your efforts to destroy the **Glob**, press the trigger. Missiles will have no effect on the force field, or on the defense ship. Shooting at mines will cause the **Glob** to regenerate.

In two-player mode, shooting at the other player causes

SERVICE RATES

Flat Service Rates below include Parts & Labor, 60-Day Warranty

- 800 ... \$39.50
- 850 ... \$39.50
- 600XL ... \$49.50
- 1200XL ... \$49.50
- 810 ... \$69.50
- 800XL ... \$49.50
- 1050 ... \$85.00
- 800 Keyboard Repair ... \$25.00

Above units repaired or exchanged with rebuildable exchange. Include \$7.00 return shipping and insurance.

10K Rev. "B" O.S. Upgrade for older 800/400's

End printer/disk drive timeouts and OTHER ERRORS. Many new programs require Rev. B. Type the following peek in Basic to see if you have Rev. B. **PRINT PEEK(58383)**. If the result equals 56 you have the old O.S. **Three Chip ROM set with instructions ... \$7.50. Complete 10K Rev. B module ... \$9.50**

GTIA Upgrade For 800/400

Add additional graphics modes and make your older computer compatible with the latest software. **Instructions included ... \$4.50**

810 Drive Upgrade

Greatly improve the performance of your older 810. Stabilize the speed with the addition of an analog and redesigned rear board. **Instructions included ... \$ 27.50**

XLent Software

HASN'T FORGOTTEN THE 8 BIT ATARI INTRODUCING

**DAVID PLOTKIN'S
MINIATURE GOLF PLUS**

- Comes with 21 challenging holes
- Play any number of holes per game
- Arcade style of play
- Maximum of 8 players per game
- Construction utility lets you design your own miniature golf course
- Set up stationary and moving boundaries
- Enjoyable for the entire family

48K **\$29.95**

XLent Software

HASN'T FORGOTTEN THE 8 BIT ATARI INTRODUCING

THE FIRST XLENT WORD PROCESSOR

- Uses joystick and icon interface
- Full featured word processor
- Edit 2 documents simultaneously
- On-line help screens
- 80 column print preview option
- Combines graphics & text (Epson only)
- Double column printing (XL/XE version)
- Customize for your printer
- Use custom character sets onscreen
- Compatible with MegaFont II+
- Print spooler for Atari 130XE
- NOT Protected

48K/64K versions

\$29.95

Cosmic Glob *continued*

his ship to move in the direction of your missile for a short distance, during which time the other player has no control over the movement of his ship. He may still fire, however. Players can be nasty, forcing one another into one of many deadly objects.

The **Cosmic Glob** moves about your screen in an ominous fashion, annihilating any unsuspecting player in its path. It rebounds off the force field with some uncertainty.

When you shoot at the **Glob**, a small chunk of it will disappear. Keep firing at it until you reach the core, at the same time being wary of the **Glob's** defense ship. It flies around the screen randomly. You can't destroy it, but it can turn you into dust on contact.

When you reach the **Glob's** core, it will explode. The scores will be added up and displayed. For each **Glob** chunk you hit you'll be awarded 1 point. The player who destroys the **Glob** will receive 500 points.

Press either joystick's fire button to advance to the next level. Notice that scores don't change during play. Points are only awarded after the **Glob** is destroyed.

The game ends when all players have lost all of their ships. Getting hit by the **Glob** or a defense ship, or running into the mines are good ways to lose them. Press the fire button on either joystick to go to the title screen.

The game can be paused during play by pressing the SPACE BAR. Press any other key to resume play. The game can be restarted at any time by hitting START. If you're playing with an endless number of ships, pressing START is the only way to end the game.

One final note: the **Glob's** defense ship moves slowly at the beginning of each level, but will speed up after a few minutes.

Enjoy **Cosmic Glob**—save yourself and the Earth. ☠

Rich B. Enns has had his Atari system for about two years. He started programming in machine language about a year ago. His computer interests lie in graphics and game programming, and he enjoys two-player games especially.

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see *BASIC Editor II* in issue 47.

The code is simply a double check for Listing 1; it's of more use with Listing 2.

Listing 1.
BASIC listing.

Now add up to 1 MEG of extra RAM to your 8 Bit Atari. With the NEW "RAMCART"

- Ram upgrade for ALL 8 Bit Atari Systems
- Increases your RAM by 256K, 512K, or 1 MEG!
- Interfaces through The CARTRIDGE slot so works on ALL 8 Bit Machines.
- No need to open up your computer or do any soldering. Just plug RAMCART into the cartridge slot.
- Requires No External power supply.
- True RAM not just a Ramdisk.
- Comes with Ramdisk software, Programmers Handbook, Word Processor that uses the extra Ram for the Buffer, BBS program that uses the extra Ram.
- More Software to come soon from Canoe Computer Services as well as Third Party Software House's.
- Canoe Computer Services will also develop many pieces of software for the RAMCART that will be put in the public domain.
- All units have a 90 day factory warranty.
- Dealer inquires invited.

RAMCART Prices: 256K - \$149.95 (US)
 512K - \$199.95 (US)
 1MEG - \$299.95 (US)

Make all cheques payable to:
CANOE COMPUTER SERVICES

Repair Services! Save!

1050's, 130XE's: \$29 to \$69.
 (Other Atari products: \$Call)
 Estimates: \$20 (refunded if you award us the job). Mail us your unit insured, with \$20 & a description of the problem.

Free Discount Catalog!

To get yours call, write, or use Reader Service.

To order send check or money order to **Computer Garden**, 106 W. Carey St., Plains PA 18705. PA customers add 6% tax. Please include enough postage (overpayments are refunded). Cash COD's call (717) 823-4025. VISA /MasterCard, add 3%.

CIRCLE #172 ON READER SERVICE CARD

CHECK WRITER

FULLFILLING THE PROMISE

YOU CAN ACTUALLY SAVE HOURS EACH MONTH BY LETTING YOUR COMPUTER PRINT YOUR CHECKS WHILE IT AUTOMATICALLY BALANCES YOUR CHECKBOOK.

PRINTING

PRINTS COMPLETE CUSTOM FORMATTED CHECKS ON ANY TYPE OF CONTINUOUS CHECK FORM WITH FAST SIMPLE ENTRIES. AUTOMATICALLY CONVERTS AND PRINTS A DIALOG VERSION OF THE NUMERICAL CHECK AMOUNT. PRINTS ADDRESS LABELS PRESELECTED DURING CHECK ENTRY. PRINTS DETAILED ACCOUNT STATUS AND LIST OF CHECKS. PRINTS ALPHABETICAL LIST OF VENDORS AND CREDITORS.

ADDRESS LIST

MAINTAINS AN ON-LINE DATABASE OF NAMES, ADDRESSES AND TELEPHONE NUMBERS OF YOUR VENDORS AND CREDITORS. TYPE NAMES AND ADDRESSES ONLY ONCE FOREVER !! EASILY ADD, DELETE, CHANGE AND SAVE ADDRESS RECORDS.

ACCOUNT BALANCING

AUTOMATICALLY UPDATE YOUR CHECKING ACCOUNT BALANCE WITH EACH CHECK YOU ENTER. ENTER DEPOSITS AND MISCELLANEOUS WITHDRAWALS. DISPLAY THE BANK NAME AND YOUR ACCOUNT NUMBER. COMPLETE ELECTRONIC FILING SYSTEM SAVES AND RETRIEVES ALL DATA GENERATED DURING ANY PREVIOUS ENTRY SESSION.

FOR THE INCREDIBLE

PRICE OF

\$ 24.77

PLUS \$2.50 SHIPPING & HANDLING

REQUIRES ATARI 400, 800, XL or XE WITH 88K, 80 COLUMN PRINTER, DISK DRIVE AND ANY CONTINUOUS CHECK FORMS

THE AMAZING VOICE MASTER SPEECH SYNTHESIS—VOICE RECOGNITION plus a whole lot more!

Your computer can talk in your own voice. Not a synthesizer but a true digitizer that records your natural voice quality—and in any language or accent. Words and phrases can be expanded without limit from disk. Speech Editor program alters or improves sounds.

And it will understand what you say. A real word recognizer for groups of 32 words or phrases with unlimited expansion from disk memory. Speech playback and word recognition can work together. **Have a two way conversation with your computer!**

Easy for the beginning programmer with new BASIC commands. Machine language programs and memory locations for the more experienced software author.

Exciting Music Bonus lets you hum or whistle to write and perform. Notes literally scroll by as you hum! Your composition can be edited, saved, and printed out. You don't have to know one note from another in order to write and compose!

Based upon new technologies invented by COVOX. One low price buys you the complete system. Includes a host of sample programs! In addition, you will receive periodic information about speech technology, applications, new products, up-dates, and user contributions. **You will never find a better value for your computer.**

ONLY \$89.95 includes all hardware and software.

Available from your dealer or by mail. When ordering by mail add \$4.00 shipping and handling (\$10.00 foreign, \$6.00 Canada).

The Voice Master is available for the Commodore 64, 128, Apple IIc, IIE, II+, and Atari 800, 800XL, 130XE. Specify model when ordering. Apple II+ (with 64K) owners must have joystick adapter. Available from Covox at only \$9.95.

Apple IIE and II+ owners: Enhance speech quality and music capabilities with optional Sound Master hardware card. Installs in slot 4 or 5. Available separately for \$39.95 with demo software, or order with Voice Master for only \$119.95 (saves \$10 when ordered together).

DEMO SPEECH DISK AVAILABLE New! An introduction to Covox speech. The \$5 disk gives several general vocabularies that you can use in any of your own programs. Sample programs include a talking keyboard, calculator, clock, and more. English, French and German selections. Samples of level 1 and 2 speech editing. 28 page booklet included. Price is \$5 including postage (\$7 outside North America). Check, money order, or cash only. SPECIFY COMPUTER BRAND.

For telephoned demo, additional information, or prompt service for credit card orders (except \$5 talking disk).

DLIs

Another minute to learn

by Jonathan David Farley

Last month was the easy part. Now, you can control the (almost) omnipotent display list. Good for you. But don't start thinking about new ideas for your next arcade video game just yet! You still don't know (at least, not from me) what a DLI or—dare I say it?—display list interrupt is. Now that you know about displays lists, read on and find out about DLIs; the concept isn't as complex as you might think.

DLI talk.

A DLI is like a subroutine. The display list command equivalent of GOSUB is 128; add 128 to the display list byte and you have it.

For instance, the computer sees a byte of 130 at DL+16 (where DL equals the address of the display list) and says, "Gee, here's another ANTIC mode 2 line. . .but what's this? An extra 128? I see: the big guy out there wants me to do something. I guess I'll have to finish up what I'm doing now (which happens to be this mode line) and go to it. Then I'll come back and do the next line."

The computer needs to know where in memory the subroutine is; locations 512 and 513 handle that. You must also "turn on" the DLI by poking a 192 into the register NMIEN (decimal 54286).

Save our registers.

DLIs are subroutines, but they're not written in BASIC. They're done in machine language. The first instructions in the DLI subroutine must save the computer's three special registers, called X and Y, and the Accumulator, or A. Why must we save the contents of these registers? When

your DLI is finished and returns control to the main program, the computer expects to have everything just the way it left it. There may have been important data in those registers, and you surely changed them when you performed your DLI.

A DLI.

Sometimes, instead of waiting till the end of a line to start a DLI, ANTIC gets a little ahead of itself. If you use your DLI to change, perhaps, the background color, it will sometimes start changing the color mid-line, producing a ragged boundary (that shakes and changes position annoyingly) between one color and the next; on the same line.

By storing any nonzero value into a location named WSYNC at \$D40A (the symbol for the dollar indicates a base sixteen, or hexadecimal, number) or 54282 decimal, you tell ANTIC, "Don't do this DLI until the horizontal blank."

Remember the horizontal blank? When the color is changed during the blank, you're ensured the new color will start on the following mode line.

```

The *=\$0600 tells the computer to put the first byte of the program into location \$0600 or 1536 decimal, with the rest of the program following. Commonly called page 6, this area (256 locations of RAM) is set aside for the programmer's use.

The next five mnemonic statements save the registers. The accumulator is "pushed" (saved in yet another memory area called the stack). The X- and Y-registers are, in turn, transferred to the accumulator and pushed onto the stack. And the end of the DLI, the register values are pulled back (in the reverse order of the way they were saved) and transferred back to their respective registers. (Just like logs piled onto a stack; the last log placed will be the first one taken off.) After all this, the computer returns from the interrupt and resumes going through the display list—like a BASIC RETURN.

At the start of the actual DLI, the computer loads the accumulator with \$FF hexadecimal (255 decimal). It stores this number into memory location \$D40A, WSYNC. Since this DLI changes the color of the screen, it should start doing so only after the horizontal blank for a clean switch of color. It also loads X with \$0. It stores these registers' values in locations \$D017 and \$D018. You may ask, "So what?"

Poking shadows the hard way.

You may be aware of RAM locations 709 through 712, which determine the screen colors. The byte values in these locations are combinations of luminances and hues, to produce a myriad of shades and colors. These, however, are but shadows of the hardware locations the computer keeps for its own use.

Sure, you can POKE values into hardware locations, and, yes, the screen color does change. However, the screen is updated sixty times per second, and the computer gets the screen color from the shadows. End result: the screen flickers to your color, then, one-sixtieth of a second later, it's business as usual, switching back to the color in the shadow location.

Locations \$D017 and \$D018 are the hardware registers for locations 709 and 710. These registers keep track of the character and background colors, respectively. So... when the DLI routine stores the values in the A- and X-registers into these hardware locations, it's changing the color of the screen.

You may ask, "Yeah, but won't it just flicker back to the color in shadow registers?" Not at all, because you're going to keep poking that hardware register sixty times a second. The DLI is executed just as often as the computer draws the display. So the screen below the mode line with the DLI is the color you're placing in the hardware register. After the vertical blank (when this sort of thing is also done), the hardware register will again be set from its shadow, and hence the screen (up to the line with your DLI) will be normally colored—until the DLI comes around once more, that is. It changes the hardware locations, and everything starts over again (and again).

The DATA is the DLI POKEd into page 6. The DLI is in machine language, the result of assembling our assembly listing.

First, the program will find display list's start, POKE the DATA, and tell the computer where to find the DLI (6*256+0 =1536). ANTIC is told to interrupt after the mode line at DL+16, about halfway down the ANTIC 2 screen, and, finally, NMIEN is set to enable the DLI.

Here's a correlation between the DATA and the assembler routine: 72=PHA, 138=TXA, 152=TYA, 169=LDA with the following byte, 141=STA into the following 2-byte address (the first byte plus 256 times the second), 162=LDX with the following byte, 142=STX into the following 2-byte address, 104=PLA, 168=TYA, 170=TXA, 64=RTI. There you go!

Whether you exclaimed, "Awesome!" or yawned, "Quite trite," I've got some advice.

DLIs are comparable to enclitics on words, or catalysts in chemical reactions—by themselves, they're virtually useless, but, combined with other techniques, they're extremely powerful. The stars are made of atoms, a brain of cells, and a computer (essentially) of bits. What I'm trying to tell you is: learn about your Atari.

Mirror Mirror on the screen.

For now, though, you can still do some "wild and crazy" things. Did you really believe I would leave out something to pop your eyes?

The program *Mirror Mirror* is shown in BASIC (Listing 1) and assembler (Listing 2).

The DLI at \$0600 changes the screen color hardware registers, makes sure the characters are right side up, and puts the characters from the bottom half of the screen onto the top. Let's see how it does this, via a detailed examination of the assembler code.

The *=\$0600 informs the computer to place our DLI program into memory, starting at location \$0600 (1536 decimal). The program then saves the registers and loads them with new values (after taking care of WSYNC). These new values are stored into locations \$D017, \$D018, and \$D401.

What does location \$D401 do?

In *Mirror Mirror*, \$D401 (CHACTL) is used to cause the "flip effect;" it makes the characters appear upside down. Since I changed the hardware register (only hardware locations are usually used in DLIs, as I mentioned earlier), only the area of the DLI will be affected. CHACTL normally contains the number 2. By putting a 6 into it, the letters are flipped.

The most important of this DLI's functions: it must take all the characters on the bottom half of the screen and put them on top, overlapping whatever else may already be there. Remember, the screen RAM is composed of 960 bytes and starts at location 40000 (in a 48K machine). Fur-

thermore, each byte represents a character; 40 bytes represent one line of text.

The bottom twelve lines of text are the last 480 bytes; to mirror them, we must put the bytes of locations 40480-40959 (the bottom twelve lines' worth of characters) in their logically corresponding positions on the top half. The byte, and hence the character, in 40959 for instance, would be flipped into 40040—the vertical opposite but horizontal equal on the screen.

All that part three of the DLI does is load a byte from the location given, plus the value in X. For each new line, X is loaded with #0 and incremented after each byte stored. After every byte, the machine compares X to 40, to see if the whole line has been copied. The computer branches if X is not equal to 40, to do another byte.

Just before the computer pulls the registers back and returns to where it was prior to the interrupt, it does one more task: the DLI stores a \$0 in 512 and a hexadecimal \$40 (decimal 64) into 513. Locations 512 and 513 are the address of the DLI handle, remember? The computer reads these locations to find out where the DLI is when it encounters a DLI instruction in the display list. So, the next time your computer is told to interrupt the display list (in

less than one-sixtieth of a second), it goes to $64 \times 256 + 0 = 16384$ or $\$40 \times \$ff + \$0 = \4000 .

This second DLI also stores the values of A and X into the hardware color registers; these colors are different from those in the first DLI. In CHACTL, a 6 is stored from Y. This value in \$D401 makes all characters under the DLI's influence appear flipped.

As with the first, this DLI has something that makes it special. The earlier DLI moves the bottom of the screen to the top. Because of this, anything typed on the top is changed to its bilateral counterpart on the bottom sixty times every second, erasing whatever you typed. Basically, you can't put anything on the top, though nothing stops the cursor from going there. This presents some problems in cybernetic aesthetics—easily solved problems, of course.

The DLI at \$4000 cuts the screen's vertical length by two, as if something just crunched the screen together. This was done so the cursor could not go into the top, where it was useless. The display is still a normal screen, but only the last 480 bytes are displayed (and mirrored).

A certain memory location, \$54 (84), has a value equal to the vertical position of the cursor. When humans count, they say, "One, two, . . . ten." Your logical Atari, though, says, "Zero, one, . . . nine." If PEEK(84)=0, the cursor's in the topmost row of the screen; if it is equal to 23, it's at the bottom. When you use the CTRL-ARROW key, the cursor goes to Line 23 when you go "over" the screen past Line 0, and to Line 0 when you go "below" Line 23. Location \$54 changes accordingly.

Your friendly DLI at \$4000 is on the lookout for \$54. It constantly loads it into the accumulator and compares its value, to see if it's in the dreaded top half. It is, as I said, compared to \$B (11 decimal). If the value in A (which is the value in \$54) is equal to \$B, a branch similar to a BASIC GOTO is taken, to TRTN. At TRTN, the accumulator is loaded with 0 and stored in \$54. Since the value in \$54 is the screen row of the cursor, the result is that, when the cursor gets to row 11, it's put in row 0. The next statement loads A with the ATASCII value of the ↑ function.

ATASCII values of characters are used in a system subroutine that starts at \$F6A4 (Note: this address was changed on the XL and XE computers. For that reason, the cursor routine in the program won't function on these computers, unless a translator disk is loaded.) This subroutine prints the character whose ATASCII value is in the A-register. In this case, the character printed is the one that moves the cursor upward—since it's on Line 0, it would, after this, be on Line 23.

Why didn't I just put a 23 in \$54 as soon as it got to #B? One of the problems that had to be overcome was that, until a key is pressed, the cursor cannot be seen right after location \$54 is changed. I solved it by "pressing" a key with the subroutine at \$F6A4.

At the end of the DLI, the locations 512 and 513 are changed to \$00 and \$06, so the next time the computer encounters a "go to DLI" instruction in the display list, it will go to the one at \$0600.

The program here gets the location of the display list

BASIC VIEW - THE BUG KILLER

Basic View helps locate troublesome bugs by showing the step by step execution of any Atari Basic program. You control the execution speed, when the program will start and stop, and what variables will be displayed as your program executes. Observe the effects of each programming statement by toggling Basic View's listing trace and your program's output.

"an imaginative programming utility that will greatly aid you during debugging sessions. Basic View can be used effectively with nearly any program you develop." ANTIC

"one of the best utilities this year." M.A.C.E. Journal

"the easiest way to debug a BASIC program." BACE Station

"an ideal teaching aid for beginning programmers." ANALOG

For beginners, Basic View visually demonstrates the elements of the BASIC programming language. For pros, Basic View works with advanced Atari features like DLIs and machine language routines.

Available for all 8-bit Atari computers with at least 48K. Basic View is only \$20.00 (Illinois residents add \$1.25 for sales tax). To order, send check or money order to the address below. (Dealer inquiries welcome).

CIRCLE #177 ON READER SERVICE CARD

from 560 and 561, and puts it in 203 and 204. It loads A with \$F0—that's 112+128=240. It also loads Y with 2. The STA (203),Y means, "Add the value in Y to the address stored in 203 and 204, and store the value of A in the resultant address." We know the resulting memory location to be 2 bytes from the first byte in the display list, or DL+2. Since the first three instructions (DL+0, DL+1, and DL+2), each create eight blank lines, we must store 240 into the last one. Normally, DL+2 is 112, but a 128 added to it gives 240. When ANTIC comes to that, it knows it should execute a DLI. A second interrupt at DL+16 is staged. Since this location is normally an ANTIC mode line of two, it's now 130. Finally, this program tells the computer where to go for the first interrupt (the location is stored in 512 and 513). After that, a \$C0 (or 192) is stored in MNIEN, 54286. When that's done, it goes like clockwork!

The end—at long last.

Finally, you know all about DLIs. You've even explored some genuine assembler programs. It may have taken a bit longer than a minute to learn, but you have a lifetime to master it. ☐

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the *BASIC Editor II* in issue 47.

80 Column Printer Sale

- Word Processing • Program Listings • Graphics • Quiet Operation • Upper and Lower case • All points addressable Graphics • Underline • Enhanced • Much much More

Super Print Quality

This printer was made by Canon® for one of the largest computer manufacturers in the world. The Big Blue printer comes ready to hook up to the serial port of the IBM® PC jr. Plus with low cost adapter cables you can connect the Big Blue printer to the IBM® PC, IBM® XT, IBM® AT, IBM Compatibles, Apple® II, IIe, IIc, Apple Compatibles, Commodore® 64, 128, Atari®, plus many more.

(Also VIC 20)

• 90 Day Immediate Replacement Warranty

• 15 Day Free Trial-Satisfaction or Money Back

Now you can have a full fledged 8 1/2" letter size 80 column printer for less than the cost of a large box of paper. This printer uses advanced thermal technology to print upper and lower case (with true lower descenders), underline, enhanced, all points addressable graphics (works with Printshop) plus More. Print out pictures, program listings, wordprocessing pages, graphics and more. Perfect for the homeowner or student and definitely affordable. Fantastic Printer at an unbeatable price. Panak strikes!

Reviews of the latest software

by Steve Panak

For too long Atari has played second fiddle.

Like a pathetic, quickly forgotten B-side song, Atari has been forced to dance to Commodore's lead. Regardless of the past, the trends of the last few months indicate that something has got to give. There will be change.

The fact that I'm currently testing a game with Atari on one side and Apple on the other supports this line of thought. However, this is only speculation. What is fact, though, is the existence of the games which follow. I hope you find something that suits you.

Assorted Budget Titles

MASTERTRONICS
7311B Grove Road
Frederick, MD 21701
48K Disks \$9.99

It was bound to happen. Once a device is replaced by a "new and improved" version, the price of the old model plummets. After the hardware prices drop, so do the tickets on the various support products—in this case, software.

In the past few months, we've seen a reduction in 8-bit software prices. The average price hovers somewhere around the mid-twenties, down from the mid-thirties of a year ago. So, in salesman's terms, you can now buy about 1.3 games for the price of 1. What you're going to do with the .3 game is a mystery to me.

Of course, you could buy one of these budget titles. But if you do, you'll only end

up with about a third of a game. This is because these cheapies are just what you might expect them to be: rehashes of the old, tired concepts and themes, enclosed in standard graphics and dull packaging. The attempt here is to cut costs—and it shows.

Of the four games tested, my favorite was the slot machine of **Vegas Jackpot**. Combined with a potpourri of games of chance, the slot machine would have rounded out a nice package; alone, it's a boring waste. Without anything at stake gambling loses most of its appeal, so this one-armed bandit leaves you feeling robbed. However, as poor as this program was, the others were even bigger losers.

I also looked at **Action Biker** and **Kikstart**, two motorcycle simulations, and **The Last V-8**, a car-racing game. This last was the most inventive. You're a post-nuclear-holocaust scientist who takes his car, **The Last V-8**, onto the surface, to make contact with the last remnants of mankind. It's a rather creative scenario, especially when contrasted to the simplicity and predictability of the other three games. Unfortunately, like the others, **The Last V-8** crashes and burns in flames... and hardly a tear is shed.

For those of you who want the grisly details, here goes. **Action Biker** jumps over things, usually not very well. **Kikstart** races around town, picking things up for points. And **The Last V-8** simply keeps running off the road. That's about all I

I can tell you about them—the amount of time they held my attention could be measured in seconds. The disks have gone on to be used for a much nobler purpose: holding the words I now write for you. I do remember that some of these games have variable difficulty levels and allow for more than one player although I could persuade no one to join me.

Their graphics really aren't too bad, if you're after old 2600 images, conjured from some Californian silicon cemetery. If that's not what you want, don't bother. And as for control, there was none—or at least it seemed so. I hate to fight with a joystick, attempting to translate normal movement into some sort of jerk or twitch the program code will recognize as a successful maneuver. The games handle like old, overloaded 2600s—tired and out of date.

All four games are packaged cheaply, almost generically. Simple plastic portfolios hold the disks, while paper sheets inserted in the sleeves contain cover art and instructions. Inside, in addition to the disks, may be additional documentation and ad-

Panak strikes! *continued*

ditional documentation and advertisements for other games. Translations to other languages indicate an overseas market. Perhaps standards are lower in other countries.

Although the flippies (floppies with the Atari version on one side, Commodore on the other) are clearly labeled to prevent placing the wrong side in your drive, instructions for the Atari version are not to be found. Fortunately, booting goes easily—if you've ever booted a program before. If you haven't, good luck. And, if you think you'll be told how to play, you're mistaken. These games are truly for experimenters.

While they might be big sellers overseas, I can almost guarantee they won't be here. Even though the price is right, the games offer little in value and cannot be recommended, except for a special enemy on your holiday list. Even if these are the only games you can afford, you're better off saving up for a really good buy.

The NeverEnding Story

by Ian Weatherburn
DATASOFT
19808 Nordhoff Place
Chatsworth, CA 91311
64K Disk \$29.95

Here we go again—when all ingenuity and creativity fail, parade out the movie tie-ins. Similarly, it's hardly a new idea to have an adventure game where you control movement through a seemingly opened story. Adding pictures to the plot is also often tried, although it nearly always detracts from the main objectives of plot and character development. The saying that a picture is worth a thousand words, while true, is only a generalization, and does not apply in all situations—especially where both must exist in a very finite amount of disk space (and a lesser amount of screen area).

The NeverEnding Story.

Add all of these time-tested and world-weary ingredients together and you have **The NeverEnding Story**, a trite piece you'll soon wish would end. In a vacuum, this game might be acceptable, but there are simply too many great programs out there. The damsel-in-distress theme is a dead skeleton on which is hung little plot. Since

I didn't see the movie, I can't tell you how closely it was paralleled, but this story is pretty predictable.

I did see the graphics, and I must report that they're creative. The screen is split into windows, one showing the area you're in, one the results of your latest command, and others opening up to display inventory as you obtain items and acquaintances. These final windows eliminate any need for the time-consuming inventory command issued just in time to find out you're carrying too much (only five items at any one time) as you fumble for the sword.

Unfortunately, these graphics occupy about half of the screen horizontally, cutting down the detail and leaving little room for limericks. In adventures it's often useful to view previous text, and a couple of lines is not enough.

But, while the graphics were rather nice and convenient, the text was virtually unreadable. Reading text on a 40-column screen is always trying, but this game creates eyestrain. Although the prose wasn't too bad, I never really became interested, probably due to poor characterization. The simple subject-verb commands are obsolete (it is almost 1987, isn't it?), and the vocabulary is limited. The game ends up being a treasure hunt, in which you pick things up and try to find uses for them.

On my new 65XE, the first game I tested didn't run. However, the second disk did fine. Since the game requires 64K, the 800 is out (although booting up on an 800 results in an interesting audio-visual display). In any other situation, this might be a highly undesirable narrowing of the customer base. In this case, it only lessens the number of people potentially disappointed.

The manual is equally disappointing, a black and white trifold sheet with Commodore/Atari instructions. Hints, a map and the thin thread of a background story line wrap up the documentation. In all fairness, if through some great misfortune, you end up with **The NeverEnding Story**, all is not lost. You'll probably play it and enjoy it—like all software, until you find something better. But, in this case, it won't be soon enough.

Buzzword

by Paul Granchelli
THE BUZZWORD GAME CO., INC.
P.O. Box 440747
Aurora, CO 80044
48K Disk \$39.95

Because of my *occasional* ruthless nature, games aren't always voluntarily made available for my reviews. Fortunately for consumers, I can root most of these out, and sometimes the search itself has the beneficial side effect of increasing the intensity of my scrutiny.

This month, I received a game with a letter expressing trepidation at the prospect

of allowing me to sink my fangs into it. It's a trivia game, **Buzzword**. If the manufacturers knew how much I hate trivia games, they'd never have sent it. That would have been a crime, since I would never have obtained it myself—despite my prejudice, I must give it a thumbs-up.

Buzzword.

The game is less a trivia game than a computerization of the old TV game show *Family Feud*. Given a category, one or two players try to guess words formed from letters displayed in a distribution pool. Additional clues are possible, such as the first letter of a word and/or the number of letters in the word. The three difficulty levels force you to guess at everything from common words to obscure slang, and one or two persons or teams may play at a time.

Supplementing the game are cards similar to those of trivia games. These give a more complete description of the category, such as "No Nutrition" (things, other than food, that people put in their mouths). We especially enjoyed the category "Buzzword Connection," featuring words with a given prefix. This was often difficult, since the prefix *sea* might contain the words *seahorse* and *search*.

The object of the game is to guess words, earn points and win with the highest score. A pot builds, and there's a bonus round—familiar scoring fixtures from game shows. Do you try to guess just one more word—and risk missing, giving the pot to your opponent—or should you pass and collect a slightly smaller pot? Like most great games, there are more than enough opportunities for strategy.

The screen is set up nicely, with clues and letter distribution displayed on the right, and scoring data on the upper left of the screen. The bottom left contains an animated typewriter, on which guessed words are printed. While the display may not have the highest-quality graphics I've ever seen, it is legible—and, in a word game, that's very important. All control is through the keyboard; your team's best typist should input the answers. After typing in the card number, clues (if any) are displayed, and you begin guessing words.

As for difficulty—the game is tough.

(continued on page 131)

Modem Chess

Makes it easy to play chess
with a telephone partner.

by Gary Heitz

Chess is a game of skill. It's unlike most other parlor or board games, in that luck doesn't play a factor in the outcome. There are no cards or dice to decide who has an advantage. Chess is, really, a game of war. Opponents fight for strategic positions and attack each other's forces. The object of the game is to capture the opposing king.

Now, with **Modem Chess** booted, you and another player can have at it, long-distance. Both of you must have: an Atari computer (400, 800, XL, XE); a modem (1030, 835, MPP 1000C/E, others); one joystick; 48K of RAM; Atari BASIC; and a copy of **Modem Chess**.

Typing it in.

Type in Listing 1, using **BASIC Editor II** (see issue 47). Save the program as "D:MDMCHSS1.BAS", then type **NEW** and **RETURN** to clear your computer.

Type in Listing 2, again using **BASIC Editor II**. Save this program under any filename and run it. This will create a file on the disk called MDMCHESS.DAT. It contains the lines that are too difficult to enter from the keyboard.

Load Listing 1 with the command **LOAD "D:MDMCHSS1.BAS"**. Now, merge the second listing by typing **ENTER "D:MDMCHESS.DAT"**. You now have the running version of **Modem Chess**. Type **SAVE "D:MDMCHESS.BAS"** and press **RETURN**.

Getting started.

Once the person you wish to play chess with has a copy

Modem Chess *continued*

of **Modem Chess**, you're ready. It's suggested that you call your opponent on voice, to allow each of you time to set up—and to determine who'll originate the game call.

After voice contact has been made, so that you're organized, turn on the modem, then the disk drive and your monitor or TV. Place a disk that will automatically load a modem handler into the drive and turn on your computer.

After your modem handler has loaded and BASIC's **READY** prompt appears, remove that disk and insert the one containing **Modem Chess**. Type `RUN "D:MDM-CHESS.BAS` and hit **RETURN**.

When **Modem Chess** begins, you'll see the title screen, and be asked to type your name (a maximum of ten characters). If you have a data disk for **Modem Chess**, this is the time to insert it into your drive. Enter your name and press **RETURN**.

Within a few seconds, the screen will clear and you'll be in the "dial/answer" mode. Here, the screen will display the directory listed on your data disk. If you have no directory on the disk, no phone numbers will appear.

The bottom of the screen will display this menu:

Type: 0-9, Manual, Answer, Originate,
Next page, Increase, Edit

These options are explained as follows: first, the numbers highlighted after the prompt `Type:` correspond to the numbers given in the phone list on the same screen. If there are no numbers listed, these highlighted numbers will not appear.

The next option allows you to type in a phone number manually, to be dialed by your computer. Simply type the letter **M** to begin this process.

The third option is used for answering a call. It's best to wait until you hear one full ring of the telephone before you press the **A** key. This will increase your chances of connecting the first time. If for some reason connection is not made, you'll be returned to this menu, where you may try again.

Press the **O** key to originate the call. If you're actually talking to the other player—and **Modem Chess** is installed in both computers—one player may press **A** for answer and the other **O** for originate. In this way, you don't have to hang up and redial. This option won't work if both modems are MPPs.

The **N** option is used to go to the next page of the phone directory. If there aren't enough numbers on the disk to warrant a second (or third, etc.) page, then you'll be returned to the first page.

The last two choices allow you to create, increase and edit the telephone directory on your disk. Press **I** to create or increase the list. Use **E** to correct a name or phone number that's already in the directory.

After your computer has made the connection, there'll be a brief pause. The screen will clear and you'll be in a full-screen terminal mode. Here you can converse with the other player by typing on your keyboard.

When you're ready to begin your game, only one player need press the **START** button. Both computers will then randomly select which player will have the white pieces

and which black. After this, the screen will display the chessboard.

Playing Modem Chess

The top line of the screen will display the name of the person who is to make a move. Immediately below the chessboard is a line that states `OPTION=MENU, SELECT=SETUP`. At the bottom of the screen is a conversation window, used to communicate with the opponent during play. Simply type on your keyboard, and your message will also be displayed on the other player's screen. This can be used to warn the player that his king is in check, or that checkmate has occurred.

Making a move.

The cursor is in the shape of a square. By moving the joystick, you position the cursor over the chessman to be moved. Press the red button on the joystick, and the cursor will change to a solid box. Move the square cursor by moving the joystick controller to the position where you want the piece moved, then press the red button again. Your computer will execute the move and send it to the other player.

When you receive a move, the monitor's speaker will sound two beeps, to alert you that a move is coming. Your cursor will move to the position where the opponent's chess piece was. The piece that was moved will flash in its new position for a few seconds. If you wish to stop the flashing, simply type on the keyboard, move the joystick, or press the red button.

The game continues in this manner, with players alternating turns.

Options.

As was mentioned, the line immediately below the chessboard says `OPTION=MENU SELECT=SETUP`. This line will display a menu if the **OPTION** button is depressed.

The menu shows: *Return, End, Save, Load and Take back move*. Simply press the first letter of the desired option (**R, E, S, L, or T**). For instance, hitting **R** allows you to exit the menu and return to the game, if you don't wish to make a selection from this menu.

Pressing the letter **E** will allow you to end the game. This option should only be used if both players have agreed that the game is over. The screen will be cleared, and you'll be back in the full-screen terminal mode—as you were before the game started. There you may converse again, disconnect, or begin a new game.

The third option, **S**, will save the position of the chessmen to your disk drive. This feature is useful if you can no longer continue the game, but wish to finish it at a later date.

The **L** option will load the game that was previously saved. The position of the pieces will be loaded from your disk drive, then transmitted to the other player's computer.

The last option here is the **T**, or *Take back move*, option. If you accidentally make an illegal move, or for any reason need to take back the last move you made, pressing the letter **T** will reconstruct the chessboard in the former positions. It will then send the corrected board to the other computer. This can only be used *after* your move,

since—obviously—you cannot take back the other player's move.

Instead of pressing the OPTION button for the menu, you may press SELECT to set up the chessboard. You may never need to use this option, yet it's there—just in case. To use it, press SELECT and answer Y to the prompt.

To use the set up mode, move the cursor over the position on the board that needs altering. Press the red button on the joystick to cycle through the available chessmen. Once the desired piece appears, move your cursor to the next position to be changed and do the same. Once you've completed setting up the board, press SELECT again. This will cause your computer to send updated positions to the other player.

Other information.

Modem Chess will readily accept such moves as Castling (make sure you move the king first) and En Passant. They will be sent as two separate moves and will require a short delay.

Each signal sent over the modem is checked, with the exception of those characters entered through the keyboard. The method used is similar to that of XModem, but is more rigorous. Even so, as with XModem, it's possible that, even after repeated attempts to send a move or the board positions, the phone lines may continually garble the information. If this should happen, it's suggested that you turn off your computer and redial the other player.

Some excellent modem handlers in the public domain are R.BIN by Joe Miller and Russ Wetmore, and any of the Chilcott handlers (HMDRV.XMO, MDRIVE.XMO and SMDRV.XMO). These can be obtained from CompuServe and many BBSs, under the above filenames.

A special thanks to Richard Shier. Without his help and patience, this program would not have been possible. ☞

The two-letter checksum code preceding the line numbers here is *not* a part of the BASIC program. For further information, see the *BASIC Editor II* in issue 47.

Listing 1.

Panak strikes!

(continued from page 188)

There are enough words in each category to keep it interesting for quite a few plays. The introductory package contains 200 cards. If the game is a success, I'm sure more will be issued. And the game will be a success—if enough people talk about it. **Buzzword** is a fun game, and a good vocabulary-building tool.

Well, I finally did it—took the plunge and got a 520ST. While I'd like to tell you about the machine, I've very little space left. This is partly due to the backlog of ST games I have to test, but mostly because of this particular game. If it's any indication of things to come, I won't be having much free time in the months ahead.

Trinity

by Brian Moriarty
INFOCOM, INC.
125 CambridgePark Drive
Cambridge, MA 02140
ST \$39.95

I've been waiting quite a while for this one. Since the first Interactive Plus game from the wizards at Infocom gave me a taste of really large universes (larger than a mere 48K) I've waited for a second serving. It has come not a moment too soon, a double helping of gourmet food for my starving mind.

Trinity.

This taste treat is **Trinity**, the newest work of interactive fiction from Brian Moriarty, the twisted genius who gave us the **Wishbringer** stone. His new masterpiece is as serious as it is challenging.

The scenario is an uneasy one. Amid superpower tension, you decide to take a much-needed vacation and visit jolly old London. Unfortunately for you (as well as your travel agent and the rest of the world's population), the last day of your vacation is also the first (and perhaps only) day of World War III. Not to worry; with interactive fiction, anything is possible. If you should be fortunate enough to survive the first series of puzzles, you'll be treated to another twenty-odd hours of time-travel fantasy.

Trinity takes its name from the U.S. government's experiment of the same name—the test of the first atomic bomb. This standard-level game has over 600 objects and locations to explore, and boasts a vocabulary of over 2000 words. This vastness might be for naught if the prose were not vivid enough. Fortunately, it is.

Visits by the author to the actual locations yield descriptions so real you can almost reach out and touch them. You'll enjoy your travels, from London's Kensington Gardens to the magical world through the white door, and beyond.

While standing on the summit, "as your eyes sweep the landscape, you notice more of the giant toadstools. There must be hundreds of them. Some sprout in clusters, others grow in solitude among the trees. Their numbers increase dramatically as your gaze moves westward, until the forest is choked with pale domes." Even if you didn't know how important the toadstools would be, you'd still want to "Go west, young man." The toadstools are the key, doorways to time travel which drop you in and out of history's major nuclear explosions. The goal: save the world.

Characters populating the world are intriguing. From the giant boy, to the old crone selling birdseed in the gardens, all the inhabitants of **Trinity's** strange lands surprise, confound and entertain you. Puzzles are prevalent, tough enough to keep even the experienced adventurer on his toes. Regular Infocomers will recognize a couple of unique features. These include holding off the title page until you survive the first tricky teaser, as well as interspersed quotes from other classic works of fiction, which add to the drama and quality of our experience. And, while this is a serious theme, tackling a serious topic, there's more than enough of the Infocom lightheartedness to go around.

The superb documentation contains a paper sundial, a map of the **Trinity** site and directions for folding an origami crane—all of which are integral parts of the story. The instruction booklet is packaged with a comic book entitled *The Illustrated History of the Atom Bomb*. Reading this is almost as entertaining as playing the game itself. As usual, the manual more than adequately explains how to play, without giving away any secrets.

Considering all of this, I can say that they've done it again—bigger and better than before. If you have an ST and haven't played an Infocom game, this one is a must. Like all of their works, **Trinity** lives up to your lofty expectations, then surpasses them. Above all, despite its serious overtones, **Trinity** is a blast. **A**

The author wishes to express his appreciation to *The Magic One Computer Shop of Barberton, Ohio* for their constant support in the creation of this chronicle.

A REVOLUTION IN FLYING

THE *MicroFlyte* JOYSTICK

A unique product designed for use with FLIGHT SIMULATOR II™ to give you accurate and proportional control. Includes control Yoke, Throttle, Flaps, Brakes, Gun and Elevator trim.

OTHER FEATURES:

- Software program drivers for other Flight programs available soon
- Use with User generated BASIC programs
- Use with User generated assembly language programs

This is the **ONLY** fully proportional, continuously variable joystick control for Flight Simulator II. Now your home computer can be a truly realistic flight simulator.

"...I flew all over the map with one landing after another and no mishaps." K.C.

"...I am getting more use out of Flight Simulator now and will continue thanks to your joystick" R.T.

WARNING: Use of the MicroFlyte joystick may cause Flight Simulator addiction. Order with caution.
