AMIGA PRO SAMPLER STUDIO

- 16-bit capable sound-capture system at 4 channels, 20KHz
- 60 to 6000 Hz filter of a sampled signal, one tap delay time
- 100% accurate rate address for random location
- 100% accurate rate address for random location
- Random location display
- Random read access
- File named in 80 bytes
- Separate sound location record file link
- Sample search rate and playback speed
- Random read/ write memory address play back
- 100% accurate rate address for random location
- Play-back capabilities rate delay time address
- Address location for read/write when rate address
- Address play back rate play when rate address
- Address play back rate play when rate address
- Address play back rate play when rate address
- Address play back rate play when rate address
- Address play back rate play when rate address
- Address play back rate play when rate address

ONLY **\$69.99** COMPLETE SYSTEM, PLUGS (ECC) ADD'L \$100/1000

DISK/STORAGE BOX OFFERS

- 2040 5 1/4" 1/2" diskette

ONLY **\$6.99**

- 2080 5 1/4" 1/2" diskette

ONLY **\$8.99**

- Diskette - 5 1/4" D78/D
- Top quality, fully packed with cables

ONLY **\$24.99** FOR US

DATA/SWITCH BOXES

- 16/32 bit computer printer to use computer
- 16/32 bit computer to use printer
- 16/32 bit computer to use printer
- 16/32 bit computer to use printer

ONLY **\$24.99**

- 16/32 bit computer to use printer

ST COPY — DEEP SCAN NIBBLER

- Copy as many files — even tightly protected programs — as you like to disks

- Works with one drive or two
- Multiple copy option allows you to make many copies from one original
- Copy 1 or 2 diskettes — up to 100 files
- Special format parameters for non-standard formats
- Making 1000 or copy a whole disk to use just with single drive
- Compatible with 500 and 1040 ST
- Deep Scan Nibbler — displays what disk parameters, including sector distribution, data sequence, structure status, etc., etc
- Full memory option
- Copy to one file device, program saves the memory out of disk loading

ONLY **\$29.99**

DATTEL JAMMER

To complement the Super Studio the Jammer gives you a 64-note keyboard to play and record your sampled sounds

- 64-note keyboard
- 64-note keyboard
- 64-note keyboard
- 64-note keyboard
- 64-note keyboard
- 64-note keyboard
- 64-note keyboard
- 64-note keyboard

MIDIMASTER

- Full 16-bit interface for MSX/2000/1000 (Please state model)
- Compatible with most leading MIDI packages (i.e. Dr.Midi)
- MIDI In — MIDI Out 2 — MIDI Thru
- Fully Opto Isolated
- No need to pay more — Full MIDI standard

ONLY **\$34.99**

PRINTER CABLES

- 20 pin 12' or 20 pin 6' parallel printer lead
- 4 pin or 20 pin parallel printer lead
- 1.5m length

ONLY **\$8.99**

- 20 pin 12' or 20 pin 6' serial printer lead
- 1000 or 1500 — please state
- 1.5m length

ONLY **\$8.99**

DATTEL ELECTRONICS

EXTERNAL 3.5" DISK DRIVE

- Available in 1 or 2 drive sets - up to 10" long
- By choice 512K or 1Mbit
- Through-hole or surface mounting drive drives
- Supports software based on register address
- High capacity
- High performance
- Low power mode for standby in your disk set
- Full 10 pin parallel interface
- Full 10 pin serial interface with automatic handshaking

ONLY **£114.99** POST FREE
 ADD (£10 for Courier delivery if required).

512K RAM EXTENSION • AS00

- Available with/without calendar clock option
- Simply plugs internally into a 68000 slot
- Fixed in position - no soldering etc.
- With calendar, clock informed time/date automatically loaded
- Factory tested to retain time/date

ONLY **£109.99** FOR STANDARD 512K CARD OR

ONLY **£119.99** FOR VERSION WITH CLOCK/CALENDAR

MARAUDER II

It's the slippy the best disk register available for the Amiga.
 (All models)

- Supports disk register will support almost any microdrive
- Special Storage Filter register with user set level addressed protection software
- Flexible user interface - Mouse drives through
- Supports up to 4 drives simultaneously for multiple systems
- Regular system available - no cheap strip for them
- Simply compatible with cheap manufacturing system
- Full operation - specially wired for success
- Full 10 pin parallel interface
- Full 10 pin serial interface
- Highly reliable easy mounted package including 2 Pins, 10 Pins, 15 Pins, 20 Pins etc.
- High speed writing register

ONLY **£29.99** POST FREE

1 MEG INTERNAL DRIVE UPGRADE

- Replace internal 500K drive with a full 1 meg unit
- By choice 512K drive unit
- Full fitting instructions
- Ready fitted to special order request
- Simple plug in replacement
- Available now

ONLY **£99.99**

SOLDER/DESOLDER KIT

- If you need to do you own face upgrade then we can supply the tools
- Quality soldering iron plus a desolder wick and solder

1 MEG RAM UPGRADE KIT

- Complete kit to fit internally into 68000 slot
- 100% of RAMRAM is being your Amiga open a real beauty
- Fitting is a straightforward soldering job - covered by expert 40-line in-line expansion
- Make your help 100% free worldwide
- Complete with detailed instructions

ONLY **£99.99**

- Kit easy to buy
- Useful for many other jobs too

ONLY **£9.99**

permission.

ST AMIGA FORMAT

The complete package for Atari ST and Commodore Amiga owners.

NEWS 7

The amazing Amiga Fax machine, test news for software pirates, and all the month's news.

68000 AT LARGE 13

It isn't only the heart of the ST and Amiga - the 68000 family controls a staggering array of futuristic machines.

THE WORLD OF COMMS 17

Are bulletin boards only for sports fans? Discover what you can really do with a modem.

AMIGA ANIMATORS 22

The world's best gathered in Edinburgh to push the Amiga to its limits. We were there too.

PUBLIC DOMAIN 29

The newest PD software from ST and Amiga user groups reviewed.

73

DISK EXTRA

It's the programs ST Amiga Format users that makes Disk Extra the best! Check out *Hyper Paint* and *Blade Command*, together with more superb utilities and goodies for both ST and Amiga.

SPECIAL OFFERS 94

Exc. Tech, gotta see program? Well why not? They're all here in the Format bargain basement.

GOLD DUST 99

Save Gold readers for the sarcasm and bring you the hottest news from the shady 8-5 of 8.

LETTERS 101

"Dear Ed, my computer doesn't understand me. Signed, Worned of Worktop." Don't worry, Worned, all your problems are answered here.

ESCAPE SEQUENCE 106

Is it the end of the issue, already? Then it must be time for Superheroes to come to the rescue.

GAMES 51

SCREEN PLAY 51

The competitors never been better: this month's coveted Format Gold awards go to *Shogler 2* - of course - and the words but no realisation of Peter Foster's.

GAME BUSTERS 59

A collection of cunning circumstances to get you around *Caplan Blood*, *Alphoid* and all the biggest games.

GRAPHICS

40

VIDEO DIGITISERS

Reviews of three brand new picture peripherals – DigView 3 and DigPic for the Amiga, and Turbo Door for the ST, plus a look at image processing techniques to help you get more from your digitiser.

REVIEWS

**STOS**

25

Can you really write your own ST games, to rival the professional? We test the STOS system out.

**TRUE BASIC**

31

BASIC strikes back at its critics – could this 'official' version be better than Pascal?

**K-MINSTREL 2**

34

Kem's improved entry-level ST music system could be a boon to budding Beethoven's.

**DATA MANAGER PROFESSIONAL**

48

A powerful relational database at a relatively low price. Does it deliver the goods?

85

Three away your C compilers – AM! promises to make programming the Amiga simply a matter of clicking icons.

3D GRAPHIC WONDERS!

Over the few months since the launch of ST Amiga Format one of the most noticeable changes in the software that has flowed through the office is the improvement in the quality of game graphics. At the start of the year a lot of the games material was based around conversions from successful programs in the eight bit world. Too often the graphics were direct copies of the sprites and backgrounds used in the earlier versions. This automatically meant that the full potential of the ST and Amiga was rarely realised.

Recent releases have tended away and more to the polished, digitised scenery and solid 3D graphics, all of which are totally suited to the increased processing power and higher graphics resolutions of the 16 bit machines. No longer are games limited to a few bold and unobscure sprites or wireframe boxes and eight colours

on screen at once. Current games like *Carrier Command*, *Stregher 2* and *Predator of the Frigid* show just what can be achieved and approach true flight simulator quality in both frame rate and scenery mapping. Although there's something of the future in the use of Lightsource 3D, the graphics routines used in these programs are far ahead of the cutting edge of even a few months ago.

The best part of all this is that we're still a long way from the best these machines can achieve. Remember when Elite first showed on the BBC Micro? It took programs on that machine into a new realm. Six months earlier, no-one would have believed it possible on an eight bitter. On current showing, who'd like to guess at what will be making its appearance on the ST and Amiga in six months time?

MUSIC

**INITIAL MIDI**

37

What exactly do you have to do to connect your ST or Amiga up to a synthesiser, and what happens next? Begin our step-by-step here.

**TOOLING UP**

70

A pair of quick utilities to boost your Amiga disk space, and an ST mono/colour screen emulator.

**LEARN BASIC**

82

Part 2 winds its way through WHILEs and REPEAT, comparing with your own type-in games.

**DESKTOP**

88

Secrets for ST users – 100% top secret facts, tips, and tricks you can't wait, steal.

**WORKBENCH**

91

Become Sargon! General of the Amiga's internal engine with these vital tips for users of all skills.

Upgrade your GFA BASIC & get £30 of FREE Software!

Power BASIC and HiSoft BASIC have grown to be the standard BASIC implementations for the Atari ST and now HiSoft has a very special offer for existing GFA BASIC 2 users

Buy Power BASIC directly from us for the regular price of £49.95 ~~plus 14.95~~ return your GFA BASIC 2 interpreter with your order and get a free copy of Saved! (worth £29.95), a free GFA-to-Power BASIC converter and a free mouse mat!

FREE when you upgrade from GFA to Power BASIC

GFA-BASIC converter

Converts GFA BASIC .LIT files into Power BASIC binaries to re-save your GFA BASIC programs as ASCII before returning your disk to us!

Saved! Package

Our invaluable desk accessory and utility package, including the Saved! desk accessory, reset-removable RAM-disk, printer spooler etc.

HiSoft File Selector

Adds drive buttons, type-ahead and much more to the standard GEM File Selector

Mouse Mat

Showing the complete ST ASCII character set offer only available direct from us, offer starts 1.9.93, expires 31.10.93. Prior to 1.9.93, £27 of Power BASIC is £29.95 and the special offer is not available

Power BASIC Features

- Integrated, fast, easy-to-use GEM editor
- Produces faster code than any other ST BASIC
- Compiles from memory to memory for fast development times
- Advanced language, based on world-standard Microsoft QuickBASIC 3
- Powerful Procedures and Functions including local labels, fully recursive
- More than 280 pages of English, black/white documentation with many example programs
- Complete access to GEM AES and VDI
- Complete access to BIOS, XBIOS & GEMDOS
- Includes joystick, mouse & sound commands
- Can produce stand-alone program files on disk for you to give away or sell! No royalties
- Supports short & long integers, single & double precision reals and unlimited string size
- Line numbers optional
- Multi-statement lines & multi-line statements
- Easy access to Atari boxes, menus & windows
- You'll never outgrow it - access GEMOS, resource files, dialog boxes as your skills develop
- Made & Supported in Britain

See the great reviews in PCW June 88, Atari ST User June 88, ST Arango Format July 88

Also Available: HiSoft BASIC

All the features of Power BASIC plus:

- Create your own desk accessories
- Stand-alone .TTP compiler
- Easy access to machine-code (via Devpac87)
- Program profiling

The special GFA offer (see left) is also available when buying HiSoft BASIC (which costs £79.95)

HiSoft

High Quality Software

HiSoft, The Old School,
Greenfield, Bedford MK45 5DE
Orders: (0525) 718271, General: (0525) 718181

All prices include VAT and UK first class postage.

NEWS

Low-cost Laser launch

Thinking of doing an O/P, but worried at the cost? Green Computer Products hope to help you make up your mind by offering the Copypoint Paperpoint II laser printer at a new low price of £875, including VAT. This new price is made possible because Copypoint II, based on the HP LaserJet II printer, has a half a megabyte of memory and standard, for proper O/P, use has increased to just high-quality text. It's getting a further £70.50 from our number 1 MS and HP LaserJet Plus donation, giving you a fully functional PDP printer for only just over £800.

The Paperpoint carries with it a 3-year warranty, and on-site maintenance is available from Logitech for a further £172.50 per annum.

■ Green Computer, 218 Moss Lane, Barnsley, Leeds. (04744) 67044 (955) 31.

■ Copypoint - a name to remember with us, the only of its kind for sale here from Green.

FAST scuppers Scottish pirates

ERG, the Federation Against Software Theft, working in collaboration with software houses Electronic Arts, Giga, Ocean, Microzone, US Gold and the boys in blue from Glasgow's 'D' Division, have conducted their biggest raid yet against alleged software pirates. In a set of simultaneous raids at the beginning of August, 2754 disks were seized from a number of sites. The disks contained over 6000 programs, covering business and utility software as well as a large number of games, and the haul has an estimated street value of over £200,000.

It is alleged the piracy gang had for some while been selling low-priced reproductions of well-known games and business software from a stall at a local Glasgow market. It was only in March of this year, however, that they expanded their operation to offer a postal copying service to customers. It is understood that they were advertising in a number of computer magazines and national sales. The 'company' changed its name several times in the last six months.

During the operation, Green Jeffrey of Electronic Arts spent some time in Glasgow helping to co-ordinate efforts and was "blinded at the extent of piracy" which had been unearthed. He's also convinced that a major factor in the current wave of piracy is the 'loading crew' operating from within user groups. By removing protection from programs and photocopying manuals 'on loan' from groups, these crews can duplicate even UK's top branded software, normally protected by its complexity and the need for a manual.

Later this year the Copyright Design and Patents Bill is due to become law. The Bill will outlaw 'updater' copying devices, through a new offence termed 'Trade Mark Infringement', which will carry a maximum penalty of 30 years imprisonment.

This is the first big anti-piracy raid in Scotland, but it seems likely to lead to follow-up action in other parts of the UK. Bob Hay of ERG confirmed that police reports had been handed to the Procurator Fiscal with a view to prosecution.

Only 24% more disks to try...

■ Formal note: this is the beginning of the law against copying of software, some thought must still be given to the user of that software who has a legitimate need to copy a program to guard against disk corruption or carrier rejection. It's not really enough for software houses to offer a return of post replacement service for damaged disks (and we know of none at yet who advertise such a service). How about

providing a properly labelled second copy of business and leisure software to legitimate buyers? By all means number them and mark them 'Backlog' to discourage passing on. This would at least give the end user, who is the one to have put them in packs or in the first place, adequate protection against the returned. Any comments on this idea to our letters page please.

GAMES GIANTS SPURN PC SHOW

This year's PC Show (formerly the PCF) stand is scheduled to be the biggest and giltiest ever, yet many of the big names in games and leisure software have chosen to do their own thing. Some have pulled out completely and have their own mini-shows in outlying hotels or halls, others have small 'point of collection' stands from where 10% from the trade (that means no journalists, of course) can be whisked off to special presentations at alternative venues.

As the trading show in the computer calendar reaches its eleventh year, and moves into its fifth venue, each larger than the last, the event of names like Medagames, Inter-Action, Electronic Arts and Gemini Graphics, represents quite a hole in the show's programming fabric. As the stands get bigger and more expensive, software companies have to look more and more carefully at the effectiveness of spending on large stands. Ian Stewart, MD of Gemini, put over £40,000 into their stand last year and feels that the "glamour of the show has subsided the industry". The company is putting on its own presentation at Southampton's right-of-the night before, which Stewart believes will make more of an impact on the people that count. Don't bother to go if you haven't got a ticket!

Software houses are thinking more and more about where to put their money. Many now concentrate on magazine advertising (usually - Ad Dept or Point of Sale promotions through dealers). As Lesley Mansford of Electronic Arts puts it, "It's people we need to see are a relatively small band of trade and press figures, who are often most effectively attracted through a separate presentation". This idea is endorsed by Larry Sparks of Medagames, who outlines their three-pronged marketing strategy: to be more cost-effective, to generate a higher profile and to tailor marketing to specific groups. Medagames are concentrating on trade and press at the show with a separate presentation and shareholder shuttle to and from the show. They have a TV promotion scheduled for November to keep their products in the customer's eye.

The outcome of this policy of targeting specific areas of the industry is great for hardware dealers and journalists, but is likely to mean fewer and fewer magazines at the main computer show, and less direct contact with the people who actually pay for the products - you lot.

■ The Personal Computer Show runs from 14th to 18th September at ExCeL Atlantic in London. ■ On the show, why not stop by the Future Publishing booth and meet some of the ST Amiga Forum staff? We're on stand 17.

Barbaric use for new software

The last advertisement for a new piece of programming software is to have someone else something really good using it. It had some one happens to be the same can only that write the programming software, and that something is Barbarian II, the follow-up to the best selling video text game, it all goes very convenient.

The software in question is Duxley Productions' Blood-Run-Up. Combining all game writing packages, and Duxley's Barbarian II is currently being programmed using it. BLOOD is available on both ST and Amiga and offers full gamely design as well as options for graphics and sound. If you too would like to try your hand at writing games, cross your local dealer's palm with £24.99 and walk away with Duxley's latest.

■ Duxley Productions, The Old Forge, 7 Catherine Road, London SE10 9XJ 071 276 2350

■ A Barbarian designed by Walker & Co. or was it John Walker...?

Atari launches Micro Micro

Keeping their high profile of product announcements in recent months, Atari have announced a tie up with Cambridge-based CP Computers, whose pocket PC they will market worldwide. While this might not appear directly relevant to ST or Amiga users, there's actually a lot to be said for Notebook-sized micros with an 80486 133 screen, 512K of RAM, 256K of application software in ROM and crash-protected floppy cache for storage. The key feature of the new machine, which should be available next after Christmas for under £200, is that the included software includes a communications pack, and presumably some kind of facility to connect it to the outside world. This opens the opportunity of recording data on the pocket portable, and transferring it over to your home mainframe back at base.

The pocket version also sports a word processor, takes 1-23 time-table reservations, address book and various other bits and pieces. It could be very handy in its own right, assuming you can get your fingers on the miniature keyboard. Just the thing for showing off to fellow tree-planters.

■ Laptop ST or pocket PC? Which will hit the market first?

SNIPPETS

■ **File software** have acquired the license to BBC TV's **A Question of Sport**, and claim to be producing a game with all the features of the long-running series. But a like-for-like bet is the game of two halves: all the green background screen make you feel as if you're a pundit and will like reproducing the world's most mind-numbing info-fest! Only time will tell. Meanwhile, here's what it will look like.

■ The latest **Jurisdisk** from Georgia Thompson Services includes a handy little utility for anyone worried about virus attacks. **DISK 2.2** will save all the bootblocks from your Amiga disks to a separate "safekeeping" disk, from where you can reinstall them should the worst happen.

This procedure will recover most affected disks, though there are rumours of a "real beast" virus which writes random hexdigits errors all over the disk surface, rather than restricting itself to the boot block. The jump disk also

includes a copy of **MPREX 1.9** to help trap them before they can strike. It costs £8.95 from CES, Popple Lodge, Capon Road, Irvine FK27 8BN, Scotland.

■ There's no market for 800 hand-drawn, so it's doubtful to be delighted to hear that **Frontier Software** have introduced a new **1200MHz SuperDrive** into their product range, to slot in neatly between the 500k and 1999k units. Price for the speedy little drive is a mere £195. Phone Frontier on 0423 631160.

■ **Tripping** have two audio goodies, and out for the Amiga. The **Mixamp 1**, at £14.95, is a small auto amplifier which plugs into the stereo output of the Amiga and draws its power from the serial port. It outputs to a pair of Victorian-style headphones which you supply for pay. **Tripping 2**, which costs £19.95, is a pair of small speakers, again drawing power and audio from the serial, but playing it in full stereo to the outside world. Telephone 0274

■ A Question of Sport screen.

690115 for further details of either.

■ **New Catalogue: Silvia Shop**, the main UK Mail Distributor, has just released its new catalogue describing literally hundreds of £1-rated products. These range from machines, drives and laser printers to games, business and specialist software. Copies are free, and gratis, given a phone call to Silvia on 01-509 1311.

Specialist musical software is what **Audio Software** is all about. Their first catalogue lists hundreds of products for a wide variety of machines, though the ST and Amiga take the lion's share. Each item is given a brief descriptive paragraph, most have screen dumps and all, surprise, surprise, have prices. **Audio Software** is a new venture worthy of more musician's support. Ask for their catalogue on 01-722 8655.

Low-cost Amiga short-wave link

The Amiga's highest graphics are being put to more and more varied uses these days, and ICS Electronics of Annet in Sussex has come up with a novel way of grabbing pictures straight from the ether.

The package is aimed at ham-radio buffs or anyone else with access to a shortwave radio receiver. By connecting this into ICS's analogue to digital converter and hence to the Amiga you can capture live-type transmissions used by radio amateurs and by press agencies worldwide. A typical high-resolution black and white picture will take around 15 min-

utes to receive, and the software can convert them to HP format for further processing or printing. If you have the equipment and the licence you can also transmit pictures using the same software and hardware package.

The conveniently named **Amiga Fax II** doesn't connect to the standard Fax network costs £299.95 from ICS, who intend to expand your potential still further by releasing a satellite receiver for yet more pictures by Christmas.

■ ICS Electronics, PO Box 2, Annet, West Sussex BN18 2NS 0243-696595

■ The jewel in the crown of your Amiga, captured from the airwaves by ICS's Amiga Fax

A new Acquisition

■ It looks like you can even share radio made figures in Taurus's new database.

Version 1.3 of **Taurus Software's Acquisition** database has now hit the streets in a flurry of specifications which would knock the stuffing out of nearly a competent package. With a text size of 10 Mb and a file capacity of 1 Gb, Acquisition has to be one of the largest systems available for the Amiga.

The database manager is fully relational, can handle several separate databases at once, stores text, graphics or sounds, and even has its own BASIC-like language. It comes complete with a text editor, applications generator and password protec-

tion system, with a 200 page tutorial guide as an optional extra. Acquisition requires an Amiga with two floppy drives or a hard drive and a floppy, but at least it only needs 512k of memory. The big shocker, unfortunately, is the price: £295. While big businesses may regard this as a snap, the rest of us will have to wait in hope for the best features to filter through to lower price-packages.

■ **Taurus Software**, Taurus House, 3 Bridge Street, Guildford, Surrey GU1 4BY 02483 576396.

UNLEASH YOUR IMAGINATION WITH

STOS

The Game Creator

Design sprites using the powerful sprite editor.

Set the sprite in motion with the animator section.

Choose from a range of example sprites included with STOS.

Produce a sound for each screen with the music designer.

Create dynamic sound effects and compose a suitable score.

Control obvious screens in the feature-packed Orbit game.

Choose the right parts of the amazing aliens in Zektor.

Beat the computer in the horizontal-scrolling Butler Train.

STOS is a revolutionary package which has everything you need to create fast, exciting games quickly and easily. Whether you've never written a game before, or you're a competent programmer, you'll find that STOS is the perfect way for you to design your own entertainment software.

The STOS package comprises:

- A massive manual packed with easy-to-follow examples.
- A-at-a-glance reference card putting all the commands at your fingertips.
- Three discs containing: STOS Basic, sprite editor, robot designer, character set editor, icon editor, music editor, screen composer ... plus many other utilities and short programs.
- An exciting opportunity to join the STOS Club for expert advice and contact names.

entirely in easy-to-understand Basic, which means you can modify or customise each one to your heart's content. Change the sprites, music, difficulty level, design new screens and so on. And by examining the programming you'll learn how to create your own games from scratch.

PLUS: Three free fast-action games which show you just what can be achieved with this unique package. There's Zektor, Butler Train and Orbit — and each game is written

Please send me STOS — The Game Creator at £29.95 (incl. VAT and P&P).

MANDARIN SOFTWARE

Circle 011 202 579900

Here's just some of the facilities that will be at your command:

- 340 powerful and versatile commands • Move and animate up to 16 sprites at once • Sprites any size up to 64 x 64 pixels • Full collision detection between each sprite or zone • Great sprites from commercial games • Define up to 16 different types of scrolling areas • Roll up to four main programs and 12 subsidiary programs in memory at once • Create multi-screen screens and just one command • Change modes from within a program • Overlay up to 12 windows • Compact Neochrome or Digas screens • or even sections of screens • Zoom and rotate pictures to produce incredible effects.

All this for just £29.95?

You'd better believe it!

FUTURE PERFECT?

Andy Storer anticipates an autumn avalanche of action with previews of the hottest upcoming games.

■ B.A.T.

B.A.T.
SOFTWARE ■ ST & Amiga ■
£24.95

A graphic adventure set in the 23rd century where you find your self working for the illustrious, despicable Terpanotes, a secret organization responsible for enforcing justice and backing down subversives. What's more you've undergone a few modifications - like you have a computer in your forehead working on blood power. Four missions later you off world to the new multiplanetary colonies, all depicted in really brilliant graphics.

ZORK ZERO

SOFTWARE ■ ST & Amiga ■
£24.95

In the beginning, there was Zork. Zork was a million years old and became history's best selling entertainment software. So here comes the huge sequel to Zork, featuring Infocom's new adventure system. Who exactly is Lord Omoot Flattened the Executioner? What's it really like to play Double Fuzzed? How did the Great Underground Empire collapse? Where do Spuns come from? What and where was I too thin? Soon, Everywhere But's anywhere.

FUSION

ELECTRONIC ARTS ■ Amiga ■
£24.95

An incredible strategy title developed in the UK and employing some very pretty animated graphics with

Selectoral parallel scrolling, varied levels, and digitized sounds. And Fusion sounds great - the great voice cast clearly states, 'The objective is total annihilation'. Bridge forming monkeys, plasma snakes, alien mice and explosive mutants as one try to collect and relay the remnants of an ancient board and figure out what 'epigamic' actually do. Kill you in a user-friendly sort of way?

■ ELITE

ELITE

SOFTWARE ■ ST & Amiga ■
£24.95

Possibly the only game to have ever achieved the cult status status makes its solid 3D appearance on our 16 bitters. Do you know anyone who hasn't played it? Featuring 5 missions, 3000 planetary systems and borders of planets, police and bounty hunters you never get to see the faces of the stars in these missions. Looks as though there'll be enough entertainment and updates in time to make the wait more than worthwhile.

CHRONO-QUEST

SOFTWARE ■ ST & Amiga ■
£25.95

Set in the land of a new generation of adventure games from Pigracon, ChronoQuest is a time-travelling whodunnit which looks just great. Four latter has been murdered and you're the prime suspect. But it's not one of those tear-ran-you-probably-also-if-you're-allowed-back-in-time-and-killed-your-latter-alternates. This is the

word too. In fact there's 400k of it in three along with 4 Meg of animation and 30 or 30 cut-scenes of the 10 level action kicking off with an opening library of 30,000 movies.

MAFDET

SOFTWARE ■ ORG2006 ■ ST & Amiga ■
£24.95

The first of three releases by a brand new company offering its wares at a refreshingly low price but hopefully delivering power too. Mafdet is set in Egyptian mythology and you, believe it or not, are Mafdet the cat goddess! Sceptic? Transmuting left, right and centre you're on a search for the Book of the Dead. Somehow it sounds as though you could be wandering around the labyrinths of quite a few pyramids.

■ SPITTING IMAGE

SPITTING IMAGE

SOFTWARE ■ ST & Amiga ■
£24.95

The senior scriptwriters have collaborated on this one to hopefully all the acid humour will leave none of its edge. Popstar, Politician, Barbarian, Betty, Romeo and, of course, The Thatch of wit to take over the world. The madcap combat relies on you destroying their credibility - after all, character assassination must qualify as a shoot-em-up somewhere along the line.

Fernet prior to the longed-for multi-high-speed chess-or-evidence-in-a-mess-article-in-the-magazine - Ed! You have to flip into the future to find the real murderer after first feeding a machine to take you there. As there's always a time like the present you should have bought this tomorrow.

BATTLE CHESS

ELECTRONIC ARTS ■ Amiga ■
£24.95

Real graphics, huh? Battle Chess puts a little arcade action into the greatest strategy game of all time and throws in some digitized

■ FUSION

■ BATTLE CHESS

MOTOROLA COASTER

The 68000 heart of the ST and Amiga is only one of a range of super-chips in the 68K series from Motorola. Richard Monteiro looks further up the range at the high speed mega-processors that give a good insight into the mighty micros of the future.

There's one catch phrase that applies to the ST and Amiga micros. It has to be 16-bit, which is generally taken as an indicator of a computer's power. To an extent this is correct. The device that actually gives a machine its 8-bit, 16-bit or even 32-bit rating is the microprocessor, the heart of the machine. You're probably aware that the 68000 chip is used in several micros, ST and Amiga included. What you might not know is that the 68000 processor family drives devices as diverse as digital cell-phones, equipment for positioning North Sea drilling platforms and electronic controllers in car engines.

Motorola, founded in 1929, introduced the 68000 to the world in 1978. While the 47 processor is commonly branded 16-bit, it is in fact 30/32-bit. Fully 16-bit because it can only communicate with the outside world using 16-bit paths (in the '70s chip packaging hadn't developed far enough to allow more than 16 pins along the sides of a chip) and partly 32-bit because its inner workings are 32-bits wide. The 68000 was the first microprocessor to boast a 32-bit internal structure.

The bit count actually tells you the largest number that can be handled by the chip in one operation. For instance, the 16-bit data path of the 68000 can operate on any number between 0 and the largest binary number that will fit in 16 bits - which happens to be 65535. However, the 68000 can cope with 32-bit numbers internally, or any number from 0 to 4,294,967,295 (or GigaByte). At these figures actually do is to give you a rough idea of processor power. Generally the larger the number that can be manipulated, the more powerful the processor (hence a 32-bit micro will usually be much faster than an 8-bit micro).

68000s have a 24-bit address line (even if Atari's 16-bit 680001 told us it's only 23-bit) which means they can address memory in the range 0 to 16,777,215 116 Megabytes).

Neither the Amiga nor ST micros exploit this to the full. Although the Amiga can address the full 16MB, only 8 MBs can be RAM. The rest is reserved for custom chips. The ST is allowed to access even less: 4 Mb maximum. This is a restriction of the memory management unit.

68000 Plus?

The 68008 was released shortly after the 68000. This really was a chip with the same bit of O, although it claims to be 16-bit, it only has an 8-bit data bus and 256K address bus (occupying 28K of most). After that came the 68010 and 68012 - almost identical to the 68000, but with additional instructions and registers. The microcode, which determines what particular 68K instructions do, is also

more efficient in these chips, than 010 and 012 processors are. Later, less major note on upgrading your computer's 68000.

In 1984 Motorola shipped the first full 32-bit processor, the 68000 (which will now cost you \$120 for the lowest-speed, 12MHz chip). It's a full 32-bit chip because its data paths and processing elements are all 32-bits wide. Late last year the 68000 made its first appearance. This 32-bit chip can operate with earlier 68K processors, but typically only have the processing power.

Apart from the obvious advantage of a huge memory address range (4Gbytes), Motorola's 32-bit processor offers another instruction cache, the 000 also has data caches - small, on-chip memory arrays that give the processor rapid access to

Motorola's 68000 microprocessor: the most recent member of the 68K family. 'On-chip' is often described as a mainframe on a chip. The processor boasts a clock rate of 25MHz, instruction and data caches, parallel processing facilities. Barely 10¢ (a result of spending up information transmission from main chip) and 68K series compatibility. 4-800-P you want too!

68010 CHANGE

In making the change to enter the arena of LT with a 68010, Apple seems to be providing better 68k and 528k buses. The 68010 is compatible with the 68000, which means swapping the chips is relatively easy. Software which uses 68000 instructions will work on the 68010, but it is possible to install a program to detect the chip and alter system instructions that aren't compatible with the 68010. Look for the faster chip to spread fast.

On the Apple side of the coin, the firm is a shareowner of 68010, in that sense it is a 68010. 68010, 68010, and that is a full introduction to upgrading your Apple processor from a 68000. There are also programs packed for removing instructions/incompatibilities. Will be required if you intend the upgrade your computer's processor will be available online from Apple. Don't forget the AppleLink which you are confident of which you are. Contact: PCTV NEWS, 4811 107th St, NE, 98148-1070, WA 98148. If you score 78800, UP.

■ 68000 adds Motorola manufacture mobile communication systems - yes, those annoying portable Cellphones that always ring during late hours.

■ Atari's 68000 chips will have the same graphics capabilities. The resolution is often as high as 1000 with 128 colours, 1024 with 256 with 256 colours, 640 with 640 with 65535 colours and 512 with 480 with 4 billion colours.

■ Apple's Macintosh machines have a quality that most for the 68k processor family than any other computer. The 30 picture area costs a 68000 instead of 68010. The screen has 8 bits (Monitors) 32-bit 68020 and runs at 15.68MHz.

■ High amounts of data can be stored on CD. The drives that extract information from the discs require some very clever error correction circuitry. And what better driver to ensure the job is done properly than a 68k processor?

frequently-used information - providing something 68000 enthusiasts will be familiar with) and very high clock speeds.

Processor control

According to Steve Heath, Motorola UK's applications engineer, there are well over 75 million 68000 processors in existence, and only a fraction of those have been sold to large firms like Apple, Atari and Commodore. So where have all the other processors gone? What are they used for?

While computers and workstations - Apple Macs, Motorola Series 68000, Suns and Apollo's, for instance - are responsible for using up the bulk of 68k processors, a large proportion can be found in photocopiers, CXDMS drives, laser and other advanced printers, video controlled equipment, digital audio devices, telephone exchanges, fault tolerant machinery and classified military projects. The list is seemingly endless.

32-bit 68000s, and 68010s are used mainly for super microcomputers - the type of powerful desktop systems used to design integrated circuits, simulate new aircraft designs, and explore the physics of subatomic particles. Business and office

automation systems also benefit from these processors; from stand alone personal computers to peripheral equipment. The high speed processing offered by Motorola's 32-bit chips, make them ideal for factory automa-

tion, intelligent robots, industrial control systems, and the like. General Motors uses 68000-based manufacturing control systems.

Telecommunications is another area that gains from the power

68000S IN THE ARCADE

And processing power is needed to shift big sprites and huge expanses of background scenery. You can forget 280s and 6800s - they just haven't got the oomph. Certainly not on their own, anyway. But put three such processors in parallel and you might just put it off. Arcade machines like Pac-Man use three 280s to great effect.

The 68000 is definitely the rugged processor of its era, a small machine with 100,000 transistors. About 15% of all machines use a 68000 as the main processor, some from old times. Eggs - one of the most profitable Japanese arcade machine manufacturers - reckon that around 70% of their 1990s models come with a 68000. Usage of the 68000 is on the increase - 68020 and 68010-based boards are their best in the year. They haven't been used to date because expensive custom chips have been failed to work in a 16-bit environment (68010s and 68020s are 32-bit chips).

Inteletron, Manhattan, World Data and Sega America are all part of Maximtron's Super System System of arcade machines. Nothing exciting about that, even if you rip open the cabinet you will find a 68010 board, which is basically a 68000. 68010s are used in arcade machines too. East Midlands Leisure use a long-standard 1040 in their slot system.

Thunder Blasts (above level), which comes from the same stable as Thunderbolt, is Sega's latest machine and houses two 68000s and a 2800. The 2800 takes after 2810 of 16-bit sampled sound. One of the 68000s is used as the main processor while the other generates sophisticated custom graphics chips and over 2MB of graphics data. Around 680k of memory, read/write and read-only, are packed away inside the cabinet. If you're right Sega spare that, you might consider the machine, otherwise you'll just have to keep pumping the 68k pins.

■ East Kilbride. Home of Motorola's Scottish semiconductor plant which produces microprocessors, single-chip computers, custom crystals and memories.

offered by a GMR processor. Advanced telephone switching devices manufactured by Northern Telecom and Siemens use 68020s. AMT's T30 central office switch uses the 68030.

Anything the T30 can do, the T30 can do faster. It's particularly good because graphics-intensive operations. Hence its use in remote terminals, desktop publishing outlets and design systems.

Life begins at 040

What's in the pipeline? Well, there's Motorola's third-generation 32-bit processor which is due later this year. The 68440 virtual memory chip, as it is to be called, shares compatibility with the existing GMR range, a floating point unit, 32 instruction and data caches, and expanded memory management.

The chip is firmly aimed at multi-processing applications — a high degree of parallel processing, context and support for spinning parallel file systems. It software tend to evolve this.

By the mid 90's Motorola will undoubtedly have an 68050 on offer. But what type of chip will it be? The 68050, and by a lesser extent the 68030, already suffer from an identity crisis. Will the processor be CISC, complex instruction set or RISC (reduced instruction set) is unclear. Will 5448 be the next thing? Or will parallel processing and transputer data be the order of the day? Whatever director Motorola's chips take, you can bet powerful micro, new, and machinery will follow.

COMMODORE CHASE 32-BIT SCENE

Recent offer rumors has been blurring Commodore's actual move into the 32-bit marketplace. Now there are plans to produce a 68030-based upgrade system for existing 486000s. As there aren't any 68030-based Commodore computers in Britain.

The first phase of 32-bit action to reach 486000 users will be in the form of an expansion board. This board will contain a 68030 handling around a 1Mbit (the original 68030 processor runs at a comparatively leisurely 10MHz) 68030, a 68010 or optional 68012 cache co-processor (running at 10MHz) and can be configured to run at 10MHz or 20MHz. And the 68030 memory management unit. Up to four megabytes of fast memory, which is accessed by the 68030 via a 32-bit data bus, can be added. It is estimated that the Amiga's performance will be increased four-fold by this board.

All this extra power means you get the Amiga — an operating system that could well be the flavor of the 1990s. Am's main claim to fame is that it is a true multi-user, multi-tasking operating system. It is used in main computers and mainframes where the operating system's networking abilities are exploited to the full. For those interested, the Amiga software will be system 3, release 3, version 1.

Also on the way is the much-rumored Amiga 2500000. One possible configuration is an A2500000 that with a mathematical floating a 68030 and 68010 of RAM, 100MB hard disk, 32-bit operating system, tape streamer and monitor. How much for that little bundle? A whole heap of 40000. Orped 6200 for a configuration like the one mentioned, six stores alone is Commodore.

What about 68030 development? As Dr. Ralfman Ralfman, Commodore's Technical Support Manager put it: "I would be lying if I said Commodore aren't considering the 68030 and I would be lying if I said Commodore have definite plans. So you get the picture..."

ATARI MOVING UP A GEAR

According to Atari's technical support manager, Les Poyner, a 68030-based Amiga engine will be available early next year. The system will run at a meg, giving 10MHz, four megabytes of memory, come with standard 4MB (10) disk and have identical graphics capability to the other Amiga transputer machines. The operating system will be Amiga system 3, release 3, version 2 which is currently under development.

Some rumors indicate that Atari might be planning an ST Plus Amiga System. While Atari won't comment on this, they have stated that announcements will be made at the PC Show Speculation has it that the machine will offer 4096 colors, better resolution and stereo sound. One train of thought suggests that the 68030 processor could make an appearance in the machine.

ROAD WARS

Motorola's chips may make it into electronic engine control modules fitted to many premium European cars. These modules often determine how long a fuel-injected engine can run at full load. The information is stored as EPROM and, yes, hackers have managed to rewrite these EPROMs with the data forcing the car's computer to run the engine at full load for longer periods. The advantage is a faster car. Said not to be long.

RIDING THE WIRES

Mark Higham navigates the electronic ether and presents a sink or swim guide for those still wet behind the ears on the subject of communications. What do you need? What can you do? All is revealed.

Back in the good old days when "hookups" was an RFI or SCS every Saturday and most people thought that a Prestel modem was something you put far outside their front doors, a revolution began to take place. It began relatively quietly - a handful of enthusiastic programmers with access to a telephone line were just the start. Prestel grew gradually more popular and in its shadow a small army of bulletin boards (BBS) began to flourish.

Then along came the fax, the Wiggins, and the revolution hit the labors. Suddenly every DB was a front for the sleek and svelte underworld of computer hacking. Nobody could own a modem without being accused of tapping into top Government computers.

Although public opinion has hardly changed, the world of communications has altered a lot since then. There are now many opportunities to be gained from owning a modem, and for serious computer users, it will be without one.

Getting started

For those of you thinking of buying a piece of hardware to fit the RS-232C socket on the back of your main, there is a legion of excellent modems to choose from. Modems are the boxes which convert computer data into audible signals that can be sent down phone lines. Many, many years ago, shortly after the fax invention was added to the Bible, most home modems used "acoustic coupling", which fitted over an ordinary phone handset and whistled down the mouthpiece.

However, nowadays modems plug directly into a RJ-style wall socket, and there are modems which can

do the phone number for you if you prefer to receive your index finger for other purposes.

Modems basically fall into two subgroups - internal and external (the cheaper of the two). Internal modems automatically configure themselves to the right speeds, and with the right software they can be used to dial the number and report if

the line is engaged. The Modem multiplexed modems live in the category. It offers many comparable options from knowing to the telephone line through an in-built speaker to answering calls should you wish to call up your own board.

The manual modems are more complicated to use, but there is often something reassuring about

COMMS SOFTWARE

Most of the commercial services offer special package deals, sending a modem, software, cables and subscriptions for a fair discount. There are all good deals, and your best way in. If you go your own way, you'll need to buy various software as well as a modem.

■ **HiCom 2** is an attractive package, and is the one chosen for the BT Microbit packages. HiCom is available on both ST (249.95) and Amiga (229.95) - the Amiga version is cheaper because it can't work on 1000-V2 hardware, and so is available for Windows applications. Even the ST HiCom is a lot more flexible (see Windows Names, which is frustrating as it's your phone bill they pocket). Contact Karna at 12 Innovation Park, Pangbourne, Berks RG8 7JH (07357 4200).

■ **FastCom** is recommended for the ST power user. It costs 249.95, and is available from *about* themselves.

■ **FastCom** is generally reckoned to be a good value package for the Amiga, and works much better software in British. It costs £88 from T2 Computing, 123 St. Albans Road, Watford, Herts WD17 3JH (0843 50 181).

■ Modems: the Tancetta 28500, on the left, with Microbit's intelligent modem next to it. On a manual modem you have to set the speed from a panel on the front, plug a telephone in the back and dial by hand. Intelligent modems are controlled directly by your computer.

HACKERS AT LAW

Hacking may not be a National Secret but it is a criminal offense. Recently a computer hacker named Nicolas Mikoyan was arrested after damaging computer records belonging to the South-West University. Mikoyan/Computer Center of South-Western Nevada accused of causing \$80,000 worth of damage.

Even so, the law seems draconian here to handle hacking. Two "whistle-blowers" took action when Scott Koval, author of our last book column was arrested for penetrating the Data of the University of Florida. But all the authorities could do was charge them with trespass. The law seems outdated.

LEARN THE LINGO

There are a few basic terms common here used to describe their systems:

- MS-DOS** - the speed at which characters can be transferred from the file, normally measured in bits per second. You can transfer and receive at different speeds, common ones being 300/300 receive and transmit at 300 baud, roughly 25 characters per second, or 1200/1200 receive at 2400 baud, roughly 100 characters per second.
- MODEM** - an acronym for Modulator/Demodulator, where bits of graphics data needs to be received fast.
- ZIP-FILE** - extra bits of data sent to make the send/recv transfer of data.
- PRINT** - to write out after multiple to act as a check-sum. Party can't even add or total - is ignored.
- Word count** - various uses of the word like 100 or 200 characters down 100 or 200 words - is ignored.

Shades - the multi-user game, in action. The idea is to collect as much gold as possible and then pay it off to the Dungeon when the telephone bill comes in.

having to select the correct baud rates and terminal types from a list of games. At least you know what your modem is doing and it's not likely to cut you off when it decides that your phone call is trying to compete with the National Debt though that may not be a bad idea - US Federal modems have little more than an on/off switch, and you have to appreciate their totems; at the first line of excessive line-probing the modem logs you off with an impish beeping in its Carrier Detect LED.

Computer in action - it's got a wealth of tips, tricks and new items for Amiga and XT owners.

Multiple boards are becoming more professional. This is a screen from The Home of Home, a standalone MS which charges a subscription.

MULTI-USER DUNGEONS

MSD was originally conceived at Essex University on a DEC 10-computer, and survives now only on many bulletin boards. Created as a real-time multi-user game, MSD is essentially an adventure game with a difference: instead of competing against a range of oddly named monsters, goblins and gnomes dreamed up by your computer, you compete against a range of winners, gnomes and goblins with names dreamed up by other online players. You all play the game together at the same time.

You begin the game at novice level and rise up through other levels such as Warrior, Sorcerer and Necromancer until you eventually become a Wizard. As with all adventure games, a host of hidden items are available in all sorts of ways - from drawing in a swamp to becoming the victim of a contract killing.

One of the most useful features of MSD is its chatlines. Players can exchange information about the game as well as hunt a few ill-reputed users for comment. With a debugger which represents the status of inventory and characters out of Labour, MSD will work, freeze and freeze-but-still-run. If you enjoy the ordinary adventure game then you'll love the concept of MSD.

NatWest, here I come....

Once you've unpacked the modem, plugged all the right cables into all the right ports and read the manual from cover to cover, the time comes for you to dial a telephone number.

The first thing most people consider doing with their modem is trying a quick trip into the NatWest computer in its usual vague hope of getting their bank balance. Unfortunately, banking is not nearly so easy as it looks on the television. Banking into the local branch of the Open University is about as close as most people get to banking, however, there are few golden rewards in a system devoted to the likes of photochemists, cosmologists and quantum physicists. Getting into a system is one thing, finding it remotely interesting is another.

Micronet

Proton started up several years ago and as the years rolled by began to establish itself in the communications market and eventually other specialist databases were added to it, among them Micronet.

Micronet might not let you bank funds for Phantoms of the Opera or the current location of Flight 236/24 on its way from Iraq, but not all of us want that. These areas are still the primary concern of Proton. However, Micronet has sections ranging from music to MSD, the 51 and Kings sections have recently been combined, thereby providing a regularly updated service and, revised weekly, letters sections for both computers.

One of Micronet's most popular sections is Shades, it's one of the most popular games, listing up the bad guys during your search for elusive treasure. Shades is an offshoot of MSD's multi-user dungeon (unfortunately, as with almost all the multi-user games, the amount of spunking means that you accumulate it more than can be printed for by the large telephone bills that it takes to get it).

CompuNet

CompuNet has taken the Novadote graphics of Proton one stage further. In most people, the philosophy of an ST or Amiga emulating a Commodore 64 is about as sane as driving a Porsche like a pedal car. However,

X-rated SIGs

Apart from the usual editors, many boards are now distinguishing themselves by offering a myriad of unusual features. For one thing, one of the best boards currently on line for the Amiga is **AMIGAS** in Devonport. It is designed primarily to cater for Amiga users, but the board itself actually hangs on an Amiga. As well as providing Amiga software it has special interest groups which bring news/interesting group talk right into the other board area. Once your package has had been suitably revised, you can access a host of options from tracker boards to an interestingly detailed adult group called 'The Election Center'. (We're sure you get the idea.)

this is what CompuLink demands of its users. Despite this, CompuLink is based upon very sane principles. All of the other systems discussed, most especially the bulletin boards, require your software to convert your computer into little more than a dumb terminal. CompuLink, on the other hand, demands that your processor does some work. For this reason, the software needed to access the system must be specialised.

Because of this, CompuLink is an impressive system, far more appealing than Findex and almost identical to it. It is especially aimed at Commodore owners - C64 and Amiga, but a new T2 section has just opened too. It regularly sets out to encourage communication between its users, with the result that subscribers can do everything from starting their own interest groups to selling their software. The 'Party Line'

was established to promote conversation, and a special 'Rooms' facility allows you to call people into one room for a discussion.

Behind the advantages of the CompuLink system lies one very major drawback. Because of the nature of graphics and text as well as an error-checking routine, CompuLink is slow-loading at times. It runs at 1000/75 baud. By the very nature of CompuLink you are encouraged to send a lot of data. At a standard baud rate of 75 you could do a download, find yourself handed into a crash and created (forming a page of text and successfully read.

MicroLink

MicroLink is a simple text system, and it lacks the flashy graphics of CompuLink or MicroNet, but it has come a long way in its three-year life. It is probably the most business-

oriented system of those discussed but that is not to say that it should be dismissed. MicroLink can be accessed through British Telecom's network of bundled T100 numbers, thereby providing local rates from 300/300 to 1000/1200. These higher rates save a lot of time especially when uploading or downloading files.

Something to learn from John O'Donoghue in Land's End (one of MicroLink's featured might be to hold much appeal for those without offers near the Bank Exchange, and MicroLink has not forgotten that some people have other interests. Aside from extremely powerful mailing facilities, telebanking services and bulletin boards, MicroLink possesses a gateway into Monocraft, a US bulletin board. With monocrift you can be linked, via satellite, to a computer in Springfield, New York. Monocrift is a popular American board with special interest groups ranging from literature to UFO systems. In addition, you can chat to North American users. Interactive computer games are provided such as 'The Calculator Crystal' set in the year 2080 on a Star Trekker ice planet named Cynosurus.

Beyond the fringe

For those of you who don't get a year's free subscription bundled with your modem, a telephone call to the nearest bulletin board - bulletinboard equivalents of the commercial services - is probably the first thing you'll try. Bulletin boards devoted exclusively to the ST or Amiga are now able, offering everything from help in carrying the fourth screen in 'Retail' to information about where you can buy your hands on the latest version of *Armadillo in Space* (only as you know where to send the FAX letters round it, at a price - £6).

In addition to messaging and help sections, the majority of boards now offer the opportunity to download software. There was once a time when the software available on bulletin boards was about as useful as a 30 Meg hard drive for the DBE. However, most software now comes free and can be offered to both the seasoned programmer and the loyal game player.

With a range of boards emerging which are devoted exclusively to individual computers, bulletin boards are now serving a very specific purpose. For Amiga, it is relatively rare board, provides all kinds of help for Amiga owners as well as offering masses of virus-checked software.

Trips around the universe

For ST users, the premier board is the Carthage Alan 08. ST software programs and pictures are available to the registered user. If the thought of downloading software from a 98 computer as opposed to 3000-yellow ST envelopes, then the Spock is well

CHARGE OF THE COMMS BRIGADE

Apart from your phone bills - not an insignificant factor in themselves - what do you have to pay to use the commercial services?

MICRONET - Bureau House, 41 Market St, London EC3M 3EP 043 200 437 7670

Registration fee:

Standard charges: £25/quarter, £1 entry for Tapescan Mail access

Connect charges: 7p/min from 8pm, 12p/min from midnight, free midnight item

Special deals: Pay a year in advance (£179.95) and get a free 600 manual modem. £11.95 96 Baud Super access a year's subscription, modem, cables and software software. Payment of £250-450 in a year's out. Limited simultaneous modem and software connections.

MICROLINK - Bureau House, Arlington Park, Arlington, Massachusetts 02130 617 352-5788

Registration: £3.00, £10 entry for Tapes facility.

Standard charges: £3.00/week

Connect charges: 11p/min peak, 10p/min off-peak

Special deals: Minimum modem (Plus Registration) £80. Instant modem of interest £200 (£145 price includes connecting cables, ST connect software 16-Quint), registration, rates + 1 month's use. Amiga software under development.

COMPU-1 - Unit 26, Shearson Business Centre, Wakehurst Road, Petts Wood, Middlesex TW20 2PP 0797

Necessary software: £24.95 for ST and Amiga

Registration fee: £23.00 (Standard) or £33.50 (Gold)

Connect charges: 40p, from 8pm. Gold members can optionally pay £30 per quarter for unlimited connect time.

■ A fairly traditional bulletin board.

■ Commodore's Em 8000 is a very intelligent machine. What it must be, it doesn't have any buttons. The Em8000 offers extraordinary compatibility, VDI, IEEE/386, ESD, 1200/1200, 1200/75 and PL/38600 - and all for £271.95.

ing to post software to your address if you send them a blank disk.

Those who like to hang around the console or exploring the darkest corners of some mystical paradise may well find the Commodore Plus II of interest. On offer is a list of all currently available multiuser games as well as a selection of special price items into a multitude of MUGS.

As with many systems, the telephone call to either of these specialised bulletin boards can provide you with the telephone numbers of several others. The majority now tend to offer features besides download and software, which appear to a greater extent.

One of these is MIBS Britain which, as well as providing ST software, has some excellent hardware deals, possibly for the Amiga. Everything from an ESE MIBS monitor at £41.77 right up to a 20 Meg Super hard disc for the £1000 at £360.00 is available.

However, if it's shopping by phone that you want then a few calls

to DIGTEL with a credit card number can cause little harm to your bank balance. Purchasing hardware for any computer is quite liberally as easy as pressing a few keys.

No place like Gnome

Without doubt, Windows systems offer that hint of sophistication absent from your common-or-garden bulletin board. There was once a time when Prosal was the only system providing colour on the phone lines and that came at a price, but there are now many fine bulletin boards supporting Windows.

The Gnome at Home board serves anyone with a penchant for both windows garden gnomes. Being a Windows system, the board can take full advantage of colour and graphics with its landscape garden gnomes which are used to guide you around the different sections. These sections include a Chatline, ST and Amiga sections as well as its own game, 'The Swarrior

Reborn'. This board is not entirely free, although there are many features available to those who do not wish to pay, but at £4.50 a quarter, subscription is unlikely to cost too much of a dent in most people's beer money.

Back home...

The field of communications is a rapidly expanding one and it has a lot to offer anybody prepared to make the call. The times when all that bulletin boards had to offer was a list of other bulletin boards and a missing log section has long since passed, now Prosal is no longer a body way of reading the weather forecast. From wide-ranging entertainment to news-sounds interesting and useful disseminates software, the telephone lines are crisscrossed with information. There is a whole new world opening up out there. Whether you want to play multi-user games, or prefer the steady delights of an adult bulletin board, there is something out there for you, pick up the phone and find it.

BITE THE BULLETIN

If you're looking to those readers (and your phone bill) to the winds by exploring the author's bulletin boards, here are a few numbers you could try:

NAME	PHONE	MAIL BOX
CBMS Birmingham	011-430 3261	800
CompuNet Mail 88	01-773 2688	300 1200-75
STV 76	01-678-6183	300 1200
Gnome at Home	01-888 8984	1200/75
AMIBS Birmingham (Amiga)	011-444 2872	300 1200/2600
AMIBS London	081-227 8094	300 1200/75
AMIBS Britain	01-668 0008	300 1200/75
ST to Amiga	01-277 1388	1200

Get your modem to the correct baud rate as shown, dial up, and you'll usually get a welcome screen asking you for your name. In your first time you may only be allowed limited access, but once the Sysop has had time to give you an account and password you'll have fuller usage.

If you're feeling adventurous, it's possible to log on to American bulletin boards, ignoring the cost of the call. The one major benefit in contacting American boards is the different phone times over there.

The majority of UK systems use 300 baud to transfer data. If this is your first time, try the Chicago CBMS/CPMAG board, available on 04-61-604-626-61 (26), it's one of the better US boards. American Sysops love British users and this one is no exception. Tell him that you're calling from the UK and he'll give you a top access level.

SYSPS

A SYSPS is not some new breed of American broadcast news, nor is it an exercise for people with sharpening offset files. SYSPS actually stands for SYSTEMS (hardware and software) the process of change of a full bulletin board.

CARTOON CAPERS

The Amiga is capable of some spectacular animation sequences, but unless there is some stimulus to create animations, the supply could dry up. It's great to see a British company, The Amiga Centre Scotland, sponsoring an animation competition to coincide with this year's Edinburgh Festival. Format's own Andy Storer was there for the judging.

Between 11th and 20th August, those insatiable enthusiasts at the Amiga Centre Scotland played host to an exhibition of Amiga animation as part of the Edinburgh Festival. Up to 400 people a day were greeted by the local real-time digitiser displaying their entrance at 30 frames per second. The dozen machines on hand ran continuous loops of some of the more famous Amiga demos. The Juggler and Basketballer played alongside the Academy Probe Sequence and Shakespeare Newton's Cycle, while the new Fantasmion package from Southampton showed off

its *Demosaic* and *Portrait* movies. A series of workshops organised by The Centre accompanied the exhibition and attracted over 200 people from around the world, giving many who'd never even seen an Amiga the chance to experiment with its various animation packages.

Among this unexpectedly hectic activity was an animation competition which attracted 11 applicants - there would probably have been more if most of the press coverage of the end of July deadline hadn't surfaced in August. Quality before quantity, though, and all the entries reflect the tremendous advances made in micro-

animation since the arrival of the Amiga and illustrate a depth of use of the most popular packages - *Scout*, *Animate 3D* and *Apprentice Animator*.

Submissions could be made on either disk or PAL video and prizes were given for each format. Despite the presence of what looked like the 4th generation TV conversions made with *Power Twice the Same Colour* (MISC) entries from the States, tape entries were more valued than those on disk.

As there was no stipulation on length or content, or even inspiration - the brief was to submit animation 'generated' by an Amiga - several entries simply used the machine to

■ Here's looking at you - instant digitising at the entrance to the Animation

■ Judges Brian Carroll (left) and Paul Marks (centre) compare notes with Ian Anderson (right) of the Amiga

■ Here's digitising - pairs of members display the entries.

entry digitised artwork. Phil Johnson's tape, for instance, consisted of 10 entries featuring masses of graffiti style murals interact with 200 art skills dubbed over with an Amiga original soundtrack.

Scenarist Productions' *Merry Christmas* is the other hand, annual papers to create a supertitley cartoon caper about Don D. Ryle's election Olympics, voted best. Tape entry despite suffering from MISC conversion, displayed an interesting mix of computer-generated graphics and digitised images without using joystick control. Although a lot of the American campaign humor was lost in the flight across the Atlantic, the

resulting highly narrative was deleted detail and shoulders above the rest.

The winners

It was natural which computer via software that captivated judges. Mark Curtis of Scope Pictures and Paul Marks of Premier Computing Studio took the prize. But Bentley's Lampo collected a runners-up prize even though it represents work in progress. Bill Key frame animation featuring his sleek lampo performing a short distinguished dance. Lampo is still at the wireframe stage of production. Given rendering and full rendering the end result would have easily won the competition. These enhancements are extremely hot and cool and time-consuming, though, so it's unlikely to make an appearance in final form before the end of the year. Best 3D Link was awarded to Gary Whithy for *The Moon*, a rotating satellite scene shot with solid 3D text, hands and feet revolving within it. The complexity of interaction between the moving parts of the scene must have taken a great deal of careful planning since the animation was very fast and involved partial object rendering or 'clipping' in its rotating motion paths.

Mark Marks' *MMA Logo* was voted Best Overall Entry. This was a key frame animated text featuring full raytracing. The moving green alien head is an animated sequence stored in memory in compressed form using effects by Itek compressor developed

■ This frame colour rapping chair will give you an idea of things to come - developed using Budget 3D software compressed animation, using up to 16 million colours at a resolution of 1024x768. It can be run on an Amiga but not others in its full splendour.

by Scott 3D's Eric Graham and placed in the public domain. This allows compressed images to be expanded in real time and run at up to 30 frames per second. The *MMA Logo* was built up from a matrix of triangles before treatment by a raytracing algorithm and subsequent ray tracing. The resulting animation includes not only simultaneous left/right/down movement but flexibly allows using changes along with a cascading logo.

TECHIES CORNER

Key-framing? Rendering? Once again the computer industry tries to do it's damndest to finally convince the average person. 3D Amiga Forum, champion to the cause of bringing plain English back into the industry, attempts to 'open either light upon a subject overlooked in Japan.

KEYFRAMING: Before the arrival of computers, animators had the laborious task of drawing every frame of an animation by hand. Each frame required hours of work meaning that even a few seconds of animation could take literally weeks. With the advent of computers, the animator's job has been made considerably easier. Using keyframing, the animator only has to produce the major frames of animation and the computer generates the frames in-between using a system called 'inter-framing' (inter-framing, gosh!).

CLIPPING: Most solid 3D objects within animations on the Amiga are developed using plenty of wireframe representations. Each state the wireframe of an object is called a 'frame'. When an object is moved, its corners can't seem to move through a solid cube. Instead, as a corner moves free, it is 'clipped' as they are properly shown.

CLIPPING: If you've ever played *StarBlaster* or any game with 3D graphics then you will have seen examples of Clipping in action. When a 3D object

appears in the distance, all of it can be displayed on screen at once. As that object moves nearer to you it naturally grows larger and eventually reaches a point when it can no longer be displayed on screen in its entirety. Clipping is deciding which parts of the object are visible in screen, and not bothering to show the rest of it.

WIREFRAMES: Once a 3D object has been built up into a solid wireframe representation, the next step is to build it up into a solid 3D object. The process of Rendering is much like projecting a film over the wireframe object so that it appears solid.

PROCES AND CPU'S: Rendering, after filling the surfaces of a 3D wireframe object, you can still see the edges of the wireframe structure supporting it. Using 'thick or line shading', it is possible to smooth out the edges of an object. This process is carried out during the Rendering of the object.

RAY TRACING: When the human eye sees an object, it is not in actual fact seeing the object itself but the light reflected by that object. This is why we are unable to see most at night. Ray tracing works on this principle by calculating how light is reflected from an object. This ray tracing process can take a considerable amount of time depending on the complexity of the image, as the colour of each pixel and angle of each solid state must be calculated before the final picture can be displayed.

■ The Amiga Center Age - a Budget 3D design

Animated future

Next year the organizers intend to repeat the event with Commodore perhaps taking a more active part in the publicity by arranging limited TV coverage. Animation techniques are advancing rapidly so 1989's competition should be worth seeing. At any rate, you will have a whole year's absence *MOJO* to get rendering and raytracing for the likely price of an A2000 and possible satellite TV coverage!

■ If things progress using Budget 3D - for the shape is shown as a series of wire-frame figures (1), then roughly translated from any viewing angle (2 & 3) and finally fully ray-traced (4). 'Budget Amiga' can use many Budget 3D objects with real-time wire frame preview mode and image compression and expansion.

CHRISTMAS JUST WOULDN'T BE CHRISTMAS WITHOUT THE ATARI USER SHOW

ALEXANDRA
PALACE
WOOD GREEN
LONDON N22

NOVEMBER
25-27
1988

Too early to think about Christmas? Not when it comes to the Atari User Show.

For this is the festive event that has it all!

- LOADSA exhibitors (around 70)
- LOADSA hardware
- LOADSA software
- LOADSA new products
- LOADSA games
- LOADSA happenings
- LOADSA technical advice
- ...and most important of all for you, the visitor —
- LOADSA bargains!**

With hundreds of special show offers to choose from, here's one place you can do your Christmas shopping and end up in pocket.

You can even save £1 a head before you get there by using this advanced ticket form.

If you enjoy computing with Atari, you'll be thrilled with the Atari User Show!

SHOW HOURS

FRI-SAT 10am - 6pm
SUN 10am - 4pm

No matter which Atari machine you use from the 8-bit through to the mega ST you'll find just what you are looking for. And even some exciting things you didn't know existed!

For all the leading companies in the Atari market will be out in force to demonstrate their latest developments.

Traditionally the liveliest Atari event of the year, this pre-Christmas show is shaping up to be the most entertaining of them all.

Don't miss it — and make sure YOU enjoy a Merry Christmas!

How To Get There

Alexandra Palace is so easy to get to by car, rail, underground or bus. It has its own British Rail station, just nine minutes away from King's Cross, and there's a free bus service shuttling between the station and show every 15 minutes.

If you're travelling by road, the show is only 15 minutes away from Junction 25 on the M25. Car parking is free.

ADVANCE TICKET ORDER

Post to: Database Exhibitions, Europa House,
Kingston Hill, Allington, Mansfield N10 3JH

Please tick:

Adult tickets at £4 (over 17) £ _____

Child - 10 tickets at £2.50 (over 11) £ _____

DATABASE EXHIBITIONS

STOS

Is games programming only for whizzkid propeller heads with high foreheads and acne, or can anyone have a go? Mandarin Software would like to persuade you that with an ST and STOS you can move mountains, or a few sprites at the very least. Richard Montano checks it out.

ST version reviewed ■ Amiga version possible ■ £29.95 ■ Mandarin ■ Europa House, Adlington Park, Adlington, Macclesfield SK10 5NP (0629 579888)

Yet another implementation of the BASIC language for fantasy and fairy is given over for that is about STOS, the result of two years work by French software house Java, it, for the country it is being sold under the title of 'Games Creator', and is claimed to take the best work out of game development.

Exploiters have been treated to a host of games creators, at one point it seemed the professional games programmer would become obsolete with so many utilities claiming to speed to market. How many titles produced with three cartridges have made it onto the shelves at B&N and Smith's? Few, and the quality? Few, but it is, some of these programs perform to the expectations of users. So why are Mandarin quietly confident about their package?

What? No GEM!

Remove GEM from an ST and you have a machine that really can perform. STOS BASIC replaces GEM functions - windows, icons, alert boxes, item selectors - with its own proprietary features. If you've ever tried to change resolution while working under GEM, needless to say you will be aware of the confusion this causes the system. No problem with STOS, you just type in a command and it will fit happily from 40 columns to 80 columns and back. Furthermore, as STOS ignores GEM, you have more memory to play with.

If STOS is tested directly from the disk rather than from GEM, you will find it takes 2% of program space - worth having, particularly on 512k models. If you've had any previous experience with BASIC then STOS will look familiar. It's the most interpreted BASIC instructions are executed immediately or at a particular instance (usually when you type RUN) if preceded by an number.

The editor, which is the first part of STOS you see after loading the package, is used for writing pro-

grams, sorry, games. Most things expected of a text processing tool are present. Particularly handy is the ease with which function keys can be assigned commands. Details of these are constantly displayed at the top of the editing screen. Extra options are themselves held in a BASIC file, which can be edited, hence, you can determine which resolution and colours STOS looks up as it, before function keys to store your most used BASIC instructions and even load accessories into memory (none on these disks).

The system can hold up to four programs in memory at once, completely independent of each other. You could be writing the next 'Zaxxon' GEM game, switch to another program (opened by a quick game of Breakout) and then resume your programming. Memory is allocated dynamically to ensure that there is no space wasted. Even better is the fact that you can display all four programs (always on the screen at once).

STOS includes some very powerful functions for manipulating sprites, screens and music. Each BASIC listing uses typical areas of memory known as banks dedicated to data handling, each bank, of which there are 16, has a unique number. Most banks can be used for all types of data, with a few dedicated to just one sort.

Making music

There are numerous commands for accessing the ST's sound chip. The easiest is to type a command such as \$0000, \$0001 or \$0011 - pre-defined and rather basic sounds, but ideal for the beginner. More complex effects and tones are just as easily produced. Music can be composed with one of the STOS accessories. The resulting data may then be played and manipulated by STOS BASIC commands. The music plays in the background (under interrupt) which means you, or your program, can get on with other

things, including editing the rest of your program.

As STOS isn't GEM based the manual makes sure you are aware of this, it should have been easy for Java to provide all 512 colours on screen at once. They haven't allowed this, but as some compensation you can alter the height and width of the screen, and there is a command for cycling through the entire 512 colour palette. Graphic functions are plentiful with many GEM-like instructions, those in rectangles, circles, polygons and lines can be drawn in any size, style and colour. There are 65536 combinations of line-type ranging from dotted to dashed and thick to thin. Stars, shapes, patterns are almost endless.

One of the biggest headaches facing programmers is writing efficient graphics routines that will work in precisely the same way no matter which mode the ST is running in. STOS overcomes this by providing the programmer with DR0 and DR1. These hold values denoting the current width and height of the display area expressed as a fraction of those used in mode mode. Thus DR0 1.0

GAME CREATORS

So what's out there to compete with STOS? Well, on the language side there are Info Power BASIC (04-8446), INFO BASIC, ST BASIC, but its entire computing is full with these packages as its commands are listed. However, that graphics, handling and other instructions necessary for game creation. There's STAC from Activision, but that's specifically for adventure creation and status queries is limited to 256 graphics and text manipulation. Fetch from the Great West Computer Store on the way and DR1, are used to reduce the Sprite Factory but in the meantime STOS is unique in the 512-bit form.

■ STOS's stylish feature in action. All the ST's 512 colours can be cycled through using just one command.

TO CDS/DVD/DVY" would generate a full-screen test box in any real-time.

Left, sprites, left

Probably the most difficult aspect to creating a game is designing and animating sprites. STOS comes with a sprite editor - is necessary form - that is good enough to be sold on its own. Problem number one solved. As for animating the sprites, well, up to 15 moving sprites can be placed on-screen at any time. You don't have to do any work (not supply the flight path, speed, number of frames) and the sprite will work away independently of the rest of the program. That's right, water interrupt. It's fantastically easy.

Two screens are held in memory at any time. The first, the physical screen, is what is displayed on your monitor. The background screen, however, is buried somewhere in memory and is used by sprite commands. Anything that requires redrawing is done on the background screen where it can't be seen. Extra screen data can be managed in memory which can be put to good effect in slide shows.

Other handy tools include zooming, rotating and copying sections of video memory. Also, screens or sections of screens can be loaded into BASIC string variables and then loaded back to video. The possibilities are staggering - but the most useful is to create complete background arrangements out of several defined screen strings.

Scrolling, which is another area of interest to the games programmer, is provided as a STOS function with options for moving portions of the screen at any direction. Up to 16 different scrolling zones are permissible at any time.

Did it move for you?

There is much to STOS that is good. It's a competent version of BASIC with some magnificent commands for aiding the games designer. The idea of text graphics, sound and sprite data in banks really does make it easy for the programmer, and the accessories brilliant. But will it work for you?

Managers hope so. They seem keen to publish games that are created with their systems (WTR's stated that one before - Ed). To prove that they really are serious about STOS,

LOADING AND SAVING

Power is what STOS operations offer. Most BASICs allow you to save data in either ASCII, binary or formatted format. Depending on the extension given to a file, STOS knows the data in a particular manner.

ASC - standard BASIC program.
ASC - (STOS) necessary.
PRG - (STOS) - floppy format screen.
PRG - (STOS) - screen.
PRG - (STOS) - screen.
ASC - (STOS) - screen.
ASC - (STOS) - screen.
ASC - (STOS) - screen.
ASC - (STOS) - screen.

But-only programs can be created simply by saving standard STOS BASIC files with a PRG extension. These files can be executed from the OEM Desktop-like all PRG programs. Files created this way aren't compiled (unless STOS makes

editing facilities) and the BASIC program are saved together.

Most programs written in a high level language will fail to boot from an old-fashioned ROM (unless it's loaded properly in the slot). For most positions with STOS programs, they don't require ROM.

STOS accessories, the things with ROM extensions, are special BASIC programs that is stored in the ST's memory and invoked. They are used with the correct files, the being edited and are, in fact, suitable BASIC programs. Therefore, they work in much the same way as OEM accessories and can be anything that screen commands in sprite designers. A most astonishing, you can have (if necessary) in memory at any time. Any BASIC program can be saved in accessory program simply by adding an appropriate extension.

THREE DISKS WENT SAILING BY

STOS comes with three disks. One contains the BASIC language itself, another contains accessories and demo files, and the last holds three STOS-created games.

The games: Balled Train (horizontal scrolling action), Zeller (action on up action in three days), and (Advanced course) while they are all available you wouldn't expect to pay for them. (Ed, an American says the games were written in a short space of time that there's reason to be impressed. The games are not that large either between 100 and 1000.)

Even accessories come with the video version, although how many come with the final version is another question. They're all either designed to take the strain out of programming, included in a screen compressor, font generator, font editor,

memory monitor, pointer finder, music composer and sprite creator.

The music composer offers you to assign notes to tones. Three tones are provided, one per channel. Unfortunately notes can't be placed directly on the screen, instead they must be entered in the form C4, E, F and G - very straightforward and extremely convenient for the learner.

Two sprite designers are available: one for manufacturers use, the other for colour. These accessories really are classic. Options for flying, rotating, animating and grabbing sprites exist. Sprite data can be purchased from commercial software and used in your programs (cheaply, but also, backgrounds may be loaded as that sprite can be checked for colour shading.

■ Sprite objects can be moved around the screen with ease.

Managers are setting up a club for users to swap ideas and programs. They also intend to add extra features to STOS like 3D vector graphic routines, landscape generator and graphic extensions (this will give you facilities for loading and stretching images). These additions will come as files which simply slot into the STOS folder; once they are there, the new commands become available. You will be able to add commands to the system, but the information will only be changed through the user disk. STOS programs are by no means slow, but with the addition of a compiler (specified in the November)

some incredibly snappy programs could result. Price for this will be around £20.

Last without these extra features, STOS is amazing. Price, power and performance guarantee its success. Whether you use STOS stickers on the shelves of books remains to be seen. That's up to you.

for

- Three packed disks
- Novel banks and accessories concept
- Powerful interrupt-driven sprite commands
- Shared object programs can be created

against

- Good command of BASIC necessary
- Shared computing access may be poor

STOS FAST FACTS

Number of Commodore 620
Language cost: 2.95
Sprites area: 2000
Animated sprites: 15
Accessory level: 12
Programs to memory: 4
Soundly enhanced: 1/24

SERIOUS USE

Although STOS is being featured in a games context, it has plenty of functions for general design and database reference. You can random access the hard-disk and floppy disk, for instance. Couple that with all the graphics commands and you could produce some very interesting results using video.

Champanne Suite &
Exhibition Centre
Newport, Hammersmith, W6

And you just won't miss the wonderful world of Amiga - where you'll be able to see for yourself the ultimate in personal computing.

No matter which Commodore machine you use - from the C64 up - you'll find just what you are looking for.

All the leading companies bringing each week of the Commodore market will be on hand to demonstrate their latest developments.

Traditionally the bestest Commodore event of the year, this year's Christmas show is one you can't afford to miss.

How to get there

By Underground: Newport tube station is Hammersmith (Piccadilly Line) or Uxbridge (Central Line).

By Bus: 290, 704, 736, 290, 38, 33, 33, 74.

Car parking facilities available at the Newport

DATABASE EXHIBITIONS

PD UPDATE

Every month dozens of new Public Domain programs are written for both ST and Amiga. How do you know what's out there and what's worth getting hold of? Ben Taylor and Elliott Stein begin a regular monthly report.

AMIGA

The ubiquitous Free Public Domain Library (the label because it is crafted by the energetic Californian Fred Fall) just keeps on growing. Since our last article in Amiga PD in issue 2, twenty more disks have been released, numbered 126 to 146.

Featuring strongly on the agenda for this new batch are demonstration animations from the latest 'Budget Like Contest'. For the graphically inclined, these are the results of an annual animation competition held by the San Francisco Bay Area Development Group (SNDG). There's not much to say except that they're of very impressive, and particularly if you have aspirations to be a technical graphics programmer you will find useful to get hold of **Fish #132** with the 'Sensart' animation. This is a complete arrangement of splines and objects, complete with the source code used to generate it.

Off on the animation/graphics theme, **Fish #148** carries a demo copy of *i-Light*, a commercial ray tracing program for calculating shading and reflections to add 3D realism to your graphics. The demo version can only handle ten objects per screen, but it *is* useful for learning what ray tracing is.

Here are some of the more noteworthy specific programs:

DROP CLOTH - Disk 128

Even the boring old blue background screen on your Workbench annoys you? Dropcloth takes a picture file and uses that as a backdrop to all your windows. The only restriction is that, because the Workbench only uses four colours, your backdrop that'll be a four-colour picture, in low resolution bit-bit-bit-bit format. Most pictures, it has to be said, look pretty okay when reduced to four colours, but it's an annoying novelty.

■ Dropcloth (Amiga, Fish disk 128) with a Rebel X-wing as the Workbench backdrop.

PD MOUSE - Disk 145

This little utility was written by an angry mouse man. When you have 25 windows open on the screen at once it can get very annoying to have to click on the scroll-to-front/back gadgets of each to find the one you want. With *Mouse* active, your mouse's operation is changed. Whenever the mouse is moved onto a window, that window becomes 'active', you don't have to click the mouse button on it.

Clicking the mouse button anywhere in a window will bring it to the front - you don't have to find the tiny gadgets at the top right of the window.

PD BROWSER - Disk 134

If you would dearly like to use all the PD software you can find, but just can't understand how to use the GUI, then this could be for you. *Browser* is a program which can be run from a simple Workbench icon click, which shows all the files on the disk whether they have icons or not.

When you first run it you get a small window showing all your disk names; click on one, and its root directory appears. All files are in white, and subdirectories and its files are listed. You can copy files by dragging them to other windows, rename or delete them and create new directories all from a Workbench menu (what you can't do, unfortunately, is run them). You'll still have to open a GUI window for that.

SBPROLOG - Disks 140/141

A heavyweight entry for serious programmers here. This comes as two

SKULL CRACKER

The prog for the most famous Amiga PD program will soon go to disks 137 and 138. The first includes a 'Skullcracker' utility which lets the second is a fully featured controller complete with simple icons of the skull, brain, heart and spine. Could be handy if you have already succumbed to the brain virus.

■ Browser (Amiga only, Fish disk 134) in action. You can view all files without icons from the Workbench.

PD PLATINUM

What is PD Platinum? PD Platinum is an accolade for titles of such quality, originality and convenience that you ask, "Why isn't this being sold everywhere?" It also covers titles which gradually become an indispensable part of your machine. This year's really say a king's ransom for

skill, one for the program itself and be second for the source code (though, in case you don't know, stands for "Programmer in Chief") it was a French invention, which is why it's back to front), and is the language much touted as being at the forefront of Artificial Intelligence research. Although we haven't had time to test it thoroughly, it looks to be a full implementation of the language with some very useful extensions. It comes courtesy of Arizona University's Department of Computer Science, so has a good pedigree. One warning though - don't even think of using it without a megabyte of RAM, and two a further.

ST

MILEGAME

This month on the ST we'll concentrate on PD games.

Milegame is a car race with cards. The object is to be the first to accumulate 1000 miles per game and reach one 1000 to win the lot.

To start out, you play a Roll card - and if one of the five cards you are holding isn't a Roll card you continue

■ Laser Chess (ST) sets up for a battle

to discard and receive another till you get one. After you play a Roll card, you can play a mile card - 200, 100, 75 or 25 miles, and you score that number of miles.

Instead of scoring miles, you can elect to prevent your computer opponent from racking up miles by playing a hazard card such as: Out of gas, Accident, Stop or Flat Tyre... to which your opponent must continue to discard and pick up another till replacing the correct corresponding remedy card: Gas, Repair, Spare Tyre.

There is also the 90 MPH Speed Limit which can only be exceeded by playing an End Speed Limit card and the Right Of Way, Extra Spare Tyre, Permanent Spare Tyre and Oiling Ace which provides game-long protection from particular hazards.

If the rules sound complicated, fear not - after one game you immediately get the knack... you can also become very addicted to this one so beware: you might be up to the early hours of the morning playing with it!

PD LASER CHESS

What do you get when you take the age-old challenge of Chess and bring fantasy into it? You get Laser Chess.

Each side comprises a front line of Triangular Mirrors, a Diagonal Mirror, the Laser, a King and a Hypercube. The second line consists of Triangular Mirrors, two Blocks, a Beam Splitter, a Horizontal Straight Mirror and a Vertical Straight Mirror.

When your Queen rook normally stand you have your laser; some of the other pieces act the laser by possessing a reflective surface. When properly aligned with your laser they designate an opponent's piece... when improperly aligned with the laser or opponent's reflective piece, a car designate one of yours... even your laser or King, losing you the game.

When a Hypercube is moved into another piece, that piece disappears from its original position and reappears in a randomly selected empty square. This is a double-edged sword; you can relocate a piece to a vulnerable position or instead make it possible for the piece to capture an important piece of yours on the next move.

In the center of the board is a Hypercube. It absorbs laser beams and acts like a stationary hypercube - any piece moved to it disappears and reappears randomly on an empty square.

LaserChess is a thoughtfully devised game designed for two players only. Recently a future update will allow one to pit their abilities against the computer. It is a must for any chess-maniac who wishes a slight diverting novelty to the classic game.

THE SUPPLIERS

In the UK, the following companies that are known to supply ST and Amiga PD software, there is no ST containing system like the Amiga Plus numbers, but the good ST libraries will carry a wide selection of popular programs including the ones in this article - list out.

0270851 THOMPSON ASSOCIATES, Amiga, Osprey, Bristol, Southwark ST 660 (077 882 234), Amiga only £3.00 each.

THE AMIGA PD LIBRARY, 140 Southsea Road, Southsea ST 630 (0702 848425), Amiga only £3.00 each.

BOYVILLE, 85 Highgate Avenue, Northbrook, Sandy ST 777 (0703 248606), ST and Amiga titles £3.00 each.

FLOPPYLIBRARY ST, 90 Square Cottage, Northlake, Alderley ST 888 (0624 89089), ST only.

PAUL G, PO Box 861, Southport ST 108 (0507) 213006, ST only.

THE SOUTH WEST SOFTWARE LIBRARY, 9 Stone Oak Way, Stone Orchard, Bristol Avon ST12 8RZ, ST only.

STAR UK, 80 Squire Street, Alderley, Scotland AB 2,08 (0224) 202824, ST only.

If you visit a Software Library and would like to be mentioned in this list, or if you are a library or programmer with 6000 worth of material please let us know.

For the Amiga, write to Amiga PD, ST Amiga Forum, 4 Queen Street, Bath ST1 2EL.

For the ST, write to UKPD Mail, c/o BPS Entertainment, 67 Sutherland Avenue, London W6 8PE.

PD ROCK HARD SOFT!

The next diversion is an intriguing game of wiles pack. Using the mouse, you position the pointer on the table in the direction which you want the cue ball to go... A speed indicator at the bottom of the screen registers the speed at which the ball will travel. By manipulating the speed of the cue with the pointer's aim, you soon acquire the skill necessary to reach scores over 1000.

A few games of ball and a dose of emulation to what a game of pool is really like. Balls, cue and chalk not provided.

MACALIKES AND MORE

PD not only means that you're free to use the software but it also means that you're free to add into and modify it as well.

In PD, creating the non-traditional features are many potentially interesting programs and applications in need of modification to make them truly extraordinary.

Perhaps the most interesting which needs a Maciker's expert touch is MACCARTOP - an alternative operating shell for the GEM desk top which in many ways is better. Your ST's own system isn't that of an Apple Macintosh, it is available from Turbo PD Service - disk ROM 20.

It looks truly impressive and is in many ways superior to the standard GEM desktop except for one important fact: most of its functions aren't strictly functional yet!

There are only variations of different computers for the ST which could benefit from a programmer's expertise as well as dozens of applications and programs. More on these next month.

■ The opening screen of Mile Stone (ST only).

PROGRAMMING

TRUE BASIC

BASICs come and BASICs come and sometimes you wonder if they'll ever stop coming. True BASIC claims a better pedigree than most, however, coming from the keyboards of Kemeny and Kurtz, the originators of the language. Richard Monteloro examines its lineage.

\$60.00 ■ ST and Amiga ■ Precision, 6 Park Terrace, Worcester Park, Surrey, KT4 7JZ (01-330 2089)

In the beginning there was only one and it was free. Now there are hundreds, some free and some not. The latest is definitely not free, but is hailed as being The One. What are we on about? BASIC? The creators of BASIC, led up with all the innocent BASICs that fail to follow the straight and narrow decided to produce a language that is all things to all programmers. Or something like that. True BASIC is the result. It boasts portability, structure, speed and price.

The portability bit doesn't refer to the weight of the package (two 300 page manuals put paid to that), but to the fact that programs can be written on one micro — an Amiga, say — and run on another — an ST, say. Versions of true BASIC exist for Amiga, ST, PC and Apple Mac computers. One language guaranteed to be the same on any micro, an exciting prospect.

Truth dilates

The main editing window takes up the whole screen and like most editing software lets you move freely throughout the file, cutting, copying and pasting, searching and replacing. The most noteworthy feature of the editor is its Mac-like delete function. BASIC lines are highlighted by clicking and dragging the pointer and one click at the Delete key gets rid of the lot. It's a pity this won't happen further when highlighted text could be replaced simply by typing in fresh text.

Most features are accessed via drop-down menus or keyboard sequences, though some have become names. For instance, 'show' deletes files from a disk and 'Go Unshow' removes line numbers from a listing.

Powerful formatting operations are available from the alter menu. The Go options are particularly useful, letting you run a preprocessor (formatting applied over your current file, along with other things. These Go pro-

grams are True BASIC listings which means you can create your own. All manner of things are possible: you could convert programs from other dialects of BASIC, display your BASIC programs using a specific layout, force all variables to upper case and so on. Four Go operations — Format, Run, Unrun, Re-run — come as standard.

True BASIC programs are compiled before running — this doesn't mean you can create stand-alone programs (another package is needed for that), but it does mean that routines are recompiled fast. There's also a command window, though, which which accepts BASIC input directly. Instructions are executed immediately as is common with interpreted languages.

Most menu options and other house-keeping directives can be executed from the command window, and several commands can be executed in one go simply by sequencing each with a semi-colon. Longer sequences of instructions can be saved as script (batch) files and executed in one step from the command window.

AMIGA AND ST DIFFERENCES

While the layout and general working of True BASIC is the same for both machines, the ST version offers additional BASIC and command window instructions. For example, **DIR** displays file and directory information, **RENAME** does the obvious, **DO TRACE** keeps tabs on a program's variables, **ASCII** organizes files and directories.

Additional BASIC syntax includes **AND** (and &), **SET/RES TEXT** (ASCII), **SET/ROW** (PRINT/PRINT), **SET/ROW** (PAGE) and **SET/ROW**.

Also for ST users are **OPEN TOPIC**, **LOCAL** and **OPTION RESULT**, **OPTION TYPIC**, which is placed at the beginning of a program, checks the syntax of every variable entered into the listing. An error occurs if a variable is spotted that isn't declared by the LOCAL command. **RESULT** merely allows you to end LIST statements.

It may sound as though ST users are getting a better deal than Amiga users. Not too. The Amiga-Clear Guide is a longer and containing much more material. Also supplied with the Amiga package is a keyboard overlay.

True blue

True BASIC can handle ridiculously large numbers. The smallest positive number is 5.562881014 while the largest positive number is 1.700000000. It's unlikely you'll ever write an application which comes close to these limits — it would take more than 10¹⁴ iterations to count to either limit. And, anyway, number accuracy is only guaranteed to 14 digits. Even still is the fact that an array can have 255 dimensions. By creating a 255-dimensional array with bounds greater than one — two, say. That would require 255 bytes of memory (2¹⁴ is 16M)! If such an array were possible, there would be enough room to log all the particles in the universe.

Only one command per line is allowed, shorthand for REM is the exclamation mark **!**. **LET** must be used to assign variables, **WHILE** **WHEN** loops don't exist (though **DO WHILE** **LOOP**'s do), **IS** concatenates strings, and 'digits reserved' words exist. Most other features are in line with current versions.

Mathematical functions are present in basic: **SIN**(*x*), **EXP**(*x*), **LN**(*x*) and **LOG**(*x*) and **EXP** returns the small-est number that can be added to be subtracted from a zero that the result

Software from the Creators of BASIC

BASIC BOOKS

Whether the Reference Manual or the User Guide will boost your programming. If you want a more guided introduction to True BASIC by any of the following:

- True BASIC — Programs and Subroutines, John Clark King, Tap Books, ISBN 0-8001-550-5, £12.00
- True BASIC — A Complete Manual, Henry Simpson, Tap Books, ISBN 0-8001-670-4, £11.95

These are available from Able Writers & Co., Distribution Centre, 1 Olden Way, Maidenhead, West London, PO2 0SA. Phone 0283 776677.

TRUE BOOSTERS

Age 400-000 to the end of the True BASIC language system and TrueBasic will add to its package allowing you to use its functions, True BASIC programs, True BASIC source, as it is called, creates executable programs from compiled True BASIC files.

True BASIC System also provides several library files of functions that require the user to be entered. Other libraries are offered from TrueBasic include Developers Toolkit, Sorting and Searching, Advanced String Functions, 3D Graphics, Business Graphics and Scientific Graphics. Each costs \$29.95.

offers from a 486 Stubby-fingered account as it's useful. MICROJUL works out the remainder of a divided by 5.

There are plenty of structured commands such as DO WHILE, and DO UNTIL loops, SELECT CASE constructs and parameter-passing modes. This allows you to write well-structured programs, though you're still allowed GOTO if you occasionally go color-baby.

Each point on the graphics screen is assigned x and y coordinates, and if you want to draw a graph showing the population increase of learning materials with books included in book plates and capable of ruling into a tool using True BASIC, you might express the x co-ordinate in years from 1980 to 1987, and the y co-ordinate in thousands of animals. Neither coordinate relates to the number of pixels on the screen. True BASIC translates your coordinate range into screen co-ordinates automatically, giving a truly portable graphics interface.

True BASIC on the Amiga

features

- Memory-sized constants
- Transportable code, including graphics
- Handles very large numbers
- Programs can be restarted, even after changing constants of variables

against

- 32 Year Guide not up to standard of Amiga processor
- Extra required to make most of the system

STREET BASICS NO MORE

Back in the days of those power, horns and hair love (heavy days - 80), two men - John Kennedy and Thomas Kelly - completed years of work with the introduction of BASIC. As their project was considered simply to aid students at Barnmouth College, Kennedy and Kelly thought little of their creation and consequently placed it in the public domain.

The slow BASIC reader (that BASIC) was the spark needed to attract thousands of people to computers. BASIC was simple, it used instructions common to the English vocabulary and it was free. Between then and the proposed APOL (American National Standards Institute) standard, hundreds of dialects of BASIC have been developed for hundreds of machines.

True BASIC was designed with a particular machine in mind. They also kept access to the machine's hardware. True graphics, editor and mixed tables are clearly more similar to two classes of machine, are expected to be fast.

But these BASICs are built on so Kennedy and Kelly would like to be better. They are 'street BASIC's' great for single machines, but hopeless for transferring to other computers. It's not fair to ignore not only the journey are of True BASIC should wish to discover other versions which don't offer structural programming, the full features of a particular micro, portability from one computer to another or near-8086 compatibility, after all. They

True to your roots

The advantage of being able to transfer code from one machine to another without being restricted to a particular machine. Whether True BASIC can do enough to make this possible remains to be seen. The system works well for simple programs, but extra modules are necessary for interfacing to GEM or Intuition - a separate package costing as much again as the interpreter

is needed to create standalone programs.

That said, the manuals, editor and range of commands are excellent. Considering the amount of work the compiler does to ensure the code runs on any of four 16-bit machines, even the execution speed is acceptable. Will it be the BASIC for the next generation of home computers? Time will tell.

BENCHMARK TESTS

The 100,000-loop floating point absolute test shown here may not be the most rigorous of benchmarks, but it's a reasonable guide for judging performance speed. The routine actually calculates Pi. The listing is in True BASIC. It runs unmodified on Amiga, ST, Macintosh and PC machines. Simply changing the DO WHILE LOOP to WHILE WHILE will allow the routine to run on most other versions of BASIC.

Don't take the results too far. Several different versions of BASICs have different strengths. For instance, STOS is excellent for fast screen updates too. Power BASIC is particularly well equipped for interfacing to GEM and T-BASIC really does like maths.

LOOP count	AmigaBASIC -	101s
SET zero	T-BASIC (ST) -	15s4
SET 1=1	SPA (Amiga) (ST) -	48s
SET signed	SPA BASIC (ST) -	11s
DO WHILE (countdown)	SPA 2 compiled (ST) -	18s1
LET zero=zero/1000	Power BASIC (ST) -	15s1
LET 1=1=1	ST BASIC -	18s
LET signed=zero	STOS BASIC (ST) -	56s
LOOP	True BASIC (Amiga) -	10s* 8
PRINT pi	True BASIC (ST) -	47s4
ENTER count		
END		

* True BASIC programs run marginally slower on the Amiga due to the machine's slower processor speed and multi-tasking operating system.
 † Compiled BASIC - programs are interpreted.
 § Produces intermediate compiled code before executing a program.

FERNANDEZ MUST DIE

In the distant jungles of Central America, revolution is in the air. The government of the Democratic Republic of El Diablo has been brutally overthrown and the evil despot known only as Fernandez rules the land.

Summoned by the exiled leaders of your homeland, you must free your people from the oppressive yoke of the dictator by destroying the military bases that have protected

Fernandez from the wrath of his people.

K-MINSTREL 2

If you're trying out music on your ST for the first time you'll not want to spend a huge amount on software before you've got a feel for the subject. Chris Jenkins examines an entry-level music processor from Kuma.

K-MINSTREL 2

£29.95 ■ ST only, all models

Kuma ■ 12 Heronbee Park, Pangbourne, Berkshire RG8 7JW (07357 4395)

Not everyone wants to turn an interest in electronic music into an all-consuming passion, yet much of the ST music software on the market is aimed squarely at semi-professionals with stacks of MIDI equipment, and plenty of spare cash to spend on complex sequencing and editing software. There's definitely a space at the lower end of the market for the dabblers with very little MIDI

■ The update menu gives you access to MIDI equipment

using the familiar pull-down menus, mouse pointers and windows. The single 3.5-inch disk comes with a ring-bound 20-page manual, and owners of K-Minstrel can upgrade to K-Minstrel 2 for £10. It's also possible to transfer music data files from the

original version of the program.

There's only one main display screen in the program: this shows a conventional music stave, with both bass and treble clefs. At the top of the screen are a series of pull-down menus; at the bottom, a series of

■ Composing and editing on-screen

equipment, or even none at all, who wants to use his ST for music without spending a packet.

Kuma's K-Minstrel was one of the first UK-developed pieces of software to make use of the ST's MIDI facilities. Now it's been revised and updated, and the resulting package, once proudly entitled K-Minstrel 2, serves as an even better low-cost introduction to both conventional music and MIDI. As you'll see, though, there are some strange omissions which may make you think twice before adding it to your collection of music software.

Conventions

K-Minstrel 2 works in bytes (note it not in kilobytes), colour modes, on a standard 640x480. It's fully GEM-based,

MIDI FEATURES

Composing pieces to send to a MIDI instrument can be carried out in two ways. With the MIDI timer off, each note you press has the same pre-determined note value, so you are really only entering the pitch. With the MIDI timer on, you are in effect recording in real time, with the length of the key depression determining the note value of the note. You can record on any MIDI channel, though you'll be dismayed to find that K-Minstrel 2 can't cope with chords through MIDI: it only recognises the highest note played. If you want to use chords, you have to go back to the start and add another Minstrel channel, experimenting with the MIDI rate.

You can stop in and out of MIDI 88 mode in the middle of a piece (though goodness knows why you'd want to) and you can edit your initial notes afterwards using the mouse. To make your composition even more subtle, Minstrel's channel can be assigned a MIDI channel and patch number. Then it's just a matter of choosing whether to have the internal notes pitched on or off, and selecting PIANO for tone colour.

The most ridiculous omission in K-Minstrel is in the lack of any MIDI re-sequencing facilities. You can't make it check out a single MIDI device, nor can it be stopped from any MIDI equipment. This means that if you do decide to invest in a little more MIDI gear, specifically a drum machine, K-Minstrel 2 goes straight out of the window.

PRETTY POLY

To create polyphonic chords you need to combine some of K-Minstrel's notes on different Minstrel channels. With 4 Minstrel channels you can create chords of 4 notes, for example. (Start plans on writing any polyphonic though... with the limitations described in the next few pages you're limited to a maximum of 50 pages of 30-note polyphonic music.)

note stems and indicators.

K-Musical 2 can be used for on-screen composition with the mouse, or in real or stepwise with a MIDI keyboard. Music can be played using either the 386's built-in sound chip, obviously limited by its hardware to four simultaneous voices, or using external MIDI equipment. The number

stems, you can add triplets and dots, or alter the length, and build up chords by combining several intervals at notes. When editing, you can delete either individual notes or complete chords, or change the pitch of a note or chord simply by moving the notes. It's also possible to add new chords in the middle of a piece, after opening

■ Completed staves can be printed out to an Epson-compatible printer. The one is courtesy of reader L.V. Rothstein of Germany.

of pages of music which you can compose depends on the number of channels you wish to have. You can choose 4, 8, 12 or 16 Musical channels, which are not the same as MIDI channels. The number of pages of music available drops from 200 to 50 depending on the number of channels - and unlike some professional MIDI sequencers, which have up to 64 polyphonic channels, K-Musical 2's channels are monophonic, each capable of playing only one note at a time.

The presentation features of the bottom of the screen allow you to select notes and rest lengths, and such features as accidentals, rests, stems and triplets. If some of these musical terms mean nothing to you, don't expect any help from the manual; it assumes a depth of musical knowledge normally limited to serious music students. Good thing, isn't it?

Editing

If the far left of the edit line, which appears a note of the current value, you can change notes by clicking on a different note icon. Also available are pitchbend marks (which increase the length of the piece by four units), double-stem (the repeated), bar lines (used for rehearsal), crescendo marks (which increase the playing volume by one unit), decrescendo marks (the opposite), and star lines, which control the lengths of few separate notes. Star is used that star lines have no effect on notes of different pitch transmitted via MIDI.

Also available are a number of different rest values, sharp and flat, and reversed note stems. A scrolling dot in the middle of the display allows you to move the bar lines up or down to fit in what you played. The whole MIDI range, C8-C3.

There are six note lengths available, from demisemiquaver to sem

ibre. You can add triplets and dots,

or alter the length, and build up chords by combining several intervals at notes. When editing, you can delete either individual notes or complete chords, or change the pitch of a note or chord simply by moving the notes. It's also possible to add new chords in the middle of a piece, after opening

Getting it down

Composition is simpler when you have the notes you require displayed in the edit box. Copy it into the clipboard by clicking at the appropriate position. The drop-down menu let you play the whole composition from the start, or from the start and end points of a chosen sequence and play that section alone. Marked sequences can be copied and inserted into the manuscript, deleted, or moved to a new position. You can also save a marked sequence rather than a whole piece, or merge a saved piece into any position after a marked point.

The 'Select' menu allows you to edit the parameters for each individual Musical channel. Volume can be varied from 1 to 127, affecting both the internal sound and transmitted MIDI key velocity data. Each Musical Channel can be assigned a MIDI channel number (up to four Musical channels per MIDI channel - confusing, isn't it). Each can also be assigned a Port number, which will select the appropriate patch on your external synthesizer.

The Attack, decay and sustain settings of the 32 sound chips' four channels can be changed to give some variety to the internal sounds, but this will of course not affect any external synth. Under the 'Options' menu, the Channel Data window lets you call up all the settings for any of the four Musical channels, and amend

■ You can transpose the key of a piece, among other goodies.

the data in the window. This includes the colour for the notes on each channel, although only four different colours are available.

Use under Options, you can change the key of the piece at the end of any page (not in the middle), change the name of the piece, transpose it into another key, switch a melophone click on or off, or print out any page using a 300dpi Epson-compatible printer. The Set Selection options let you toggle the internal sound, playback scrolling, and MIDI file save.

Key package?

Though K-Musical 2 has many good points, its price being the main one, there's public domain software which which serves better as a MIDI sequencer, and programs such as Music Construction Set from Electronic Arts, which offer better facilities for external sound synthesis. MIDI also offers a block-composition system which requires no knowledge of musical theory, unlike K-Musical 2 - which seems to assume that every one interested in music must be a music student.

K-Musical 2 is pitched at a good price, and if you're prepared to put a bit of hard work into your composition you'll get on well enough, particularly if you only want to use it for education IT compositions. A bargain then, but, if you intend to interface with MIDI instruments, one with some inconvenient limitations.

for

- One of the least expensive music packages

EDUCATION AND GOVERNMENT ORDERS WELCOME

READY, MIDI, GO!

So you've bought yourself a synth and you've got a MIDI interface. What on earth do you do next? Chris Jenkins presents the first in an occasional series on practical MIDI.

Over the last few issues we've introduced the theories behind computer music, and explored something of the concepts of MIDI and the arcane arts of sequencing, synthesizer patch editing, sampling and recording.

This month it's time to look at some of the hard practical details of setting up a working music studio based around your ST or Amiga. With careful planning you can make a start for around £400, and keep expanding the system as you have the time, space, and money. Let's assume for a start that you have an ST or Amiga - otherwise you wouldn't be reading the magazine. For ST users, who already have MIDI ports built into their machines, the first thing you might consider is a memory expansion. Some professional music software packages, such as Steinberg Pro 24 v1, need 1 Meg to operate. Others

will happily work on a 528, but benefit from the extra music data storage space offered by a 1048. Consider the options of trading in your 528, or expanding its memory using one of the many RAM kits available.

Computer World

For Amiga owners, the first necessity is a MIDI interface. Though MIDI software is becoming easier to find, notably through De T distributors, MIBASIC 2.0/4.0 if you shopped Latin at school, you will have to make sure that the package you want to use is compatible with the interface you choose. Probably the best buy at the moment is the latest MIDI Master, at £34.95. This is available in different versions for the A500, 1000 and 2000, and is compatible with a wide range of music packages including Electronic Arts' Serious Blues. It has a MIDI IN socket, MIDI THRU and three

■ You too can have a great room like this, if you want control.

MIDI OUTs - we'll explain the use of multiple OUTs later on.

Oh, so you're set up to communicate with MIDI equipment. Now you want your MIDI music composer software.

There's a baffling range of music sequencing software available, but most packages have the same basic functions; to record in MIDI data form a sequence of notes or chords played in 'real time', or entered separately in 'step time' from a MIDI keyboard, and

DIY MIDI

Amiga owners notice of the ST's. Your initial MIDI setup here might cost only a little longer. Even so you need the the Personal Buffers are worth buying - without the memory - we'll shortly be publishing an article on how to build your own Amiga MIDI interface, saving you a few pounds on shop prices. Watch this space.

■ A schematic of a full MIDI setup. 1 - Monitor speakers; 2 - MIDI switching interface; 3 - MIDI drive machines; 4 - Top to MIDI patchbay; 5 - Computer; 6 - Eight-track recorder; 7 - Keyboardless MIDI synth module; 8 - Keyboardless MIDI computer module; 9 - Multi-channel mixer; 11 - MIDI digital effects units.

■ Yamaha DX100 MIDI-controlled 'overs' unit. You get 60 preset overb effects, for around £200

to allow you to edit, transpose, chain, copy and replay the data to produce a complex and professional-sounding composition.

THE CRACKDOWN

There are several traditional first-choice keyboards. The Yamaha DX1100 features four octaves of miniature keys, pitch bend and vibrato wheels, and 150 variable digital Frequency Modulation sounds, at around £190. Roland's Alpha Jam II has more traditional 61 white and 13 black analogue synthesizer sounds, with a four octave full-sized keyboard, while the Korg Poly 800 MIDI has a similar spec to the Roland, though the sounds are a little better.

The Casio CZ-101 features four octaves of miniature keys, a pitch-bend performance wheel, 32 variable sounds, and powerful Phase Distortion sound synthesis at around £195. If you're happy to use unobtainable preset sounds rather than further programming your own, you can try the Casio CZ-200, with 99 of the same kind of Phase Distortion sounds, built-in speakers and a drum machine.

Several points to note about these keyboards. Firstly, they're all no longer being manufactured, although they're still readily available second-hand or at reduced prices from music dealers. Unless you're a professional musician, second-hand is probably your best option. Secondly, none have velocity- or pressure-sensitive key boards allowing you to play louder by hitting the keys harder, or to introduce effects such as vibrato by wiggling the keys. Few effects like these you'll have to make do with at the £100-£150 market, looking at one keyboard such as the Roland K1, Yamaha DX11 or Roland JX10.

There are several excellent packages around the £40-£50 mark which allow you to make a start without even owning a MIDI synthesiser. We looked at several in issue 2. Good examples include Electronic Arts' Musical Construction Set for the ST and Instant Music for the Amiga, and Microbot's SuperConductor for the ST. All of these allow you to play music using the computer's sound chips (instant music uses Amiga 87 sample files). SuperConductor is a surprisingly powerful and versatile MIDI sequencer too.

MINI MIDI COMPETITION

Electronic music isn't just a home user's toy - professional musicians put their albums together using much the same techniques, albeit on more expensive kit. As a test of who's doing what in the field, we can name the six artists responsible for the albums whose titles form the first paragraph headings and are also the title of this article.

The first three artists entered drawn out of the hat with a copy of the AMP (Amiga) compilation LP of synthesisers, one amp and ambient music. Send your entries with your name and address on a postcard to: E2 (Amiga) Festival Competition, AMP Records, PO Box 187, London N12 9SF. Closing date is October 23rd.

Into Battle

Probably the biggest choice instead is getting a MIDI studio in your first instrument. You'll have to choose a keyboard. After that, if you want to increase the number of instruments you can have simultaneously, you'll already got one keyboard with which to enter the notes to your MIDI system.

OK, you have your computer, software, and first synth. Linking everything up using your laptop or 500 MHz cables is straightforward - it's best to lay the vital thing rather than cheaper audio equipment. Unless you have a Casio CZ200, or any other MIDI keyboard with built-in amplifier and speakers, you'll need to link up the audio output of the synth to your hi-fi AUX IN socket, or try a cheap combination amp/speaker to 'control' about £50 for a basic model, to hear your musical creation.

Organisation

You'll have less of the preset sounds in your synth, but in most cases you will be able to edit them using the panel controls. To make the best of the quick and easy, there's a vast range of sound editing software packages for the ST and Amiga, which are looked at in detail in last month's issue.

Transposing, editing and replaying your compositions using any synth soon becomes boring unless you're exclusively interested in, say, baroque harpsichord music. There are two ways to expand the complexity of your pieces. Multitracked synths, like the Casio CZ101 and Yamaha DX11, allow you to play more than one sound at the same time (either from a sequence or sending messages on individual MIDI channels), or by digitally 'routing' the keyboard into several zones each playing a different sound. Alternatively, you can use more keyless MIDI synth modules, such as the Roland D-110, Yamaha DX112 or Oberlin MS6. These are normally manufactured in a standard 19-inch wide format suitable for mounting in studio equipment racks. Practically every MIDI synth now has a modular expansion (which is, obviously, a lot

cheaper). By setting each module to respond to different MIDI channels, you can use a sequencer to play a complete multi-track composition. Once you have more than one synth, you will begin to appreciate the advantages of having a MIDI interface with multiple outputs (or a splitter box such as those manufactured by Akai or Polyblend - otherwise you would spend hours unplugging and reconnecting different MIDI leads).

Whether you have one synth or more, for the best results you will have to get into multitrack tape recording. Before you throw up your hands in horror at the prospect of such an expensive and complex process, bear in mind that, as with the synth market, there are great bargains to be had second-hand.

The Plan

The normal procedure for recording is to plan out in advance exactly what you're going to record (preferably write it all down on a sequencer), then set up the sounds using the equalisers, level controls and effects units on the audio mixer. Record the rhythm tracks (drums and bass) first, then, while listening to the recorded tracks on your speakers or headphones, lay down your chords and melodies on the remaining tracks. You'll realise that on a four-track system this doesn't leave any tracks for vocals or harmonies. There are two solutions, either learn the specifics art of 'layer panning' (introducing three recorded tracks simultaneously onto the fourth, then erasing the originals allowing the tracks to be used again) or buy an eight-track tape recorder (or sixteen-track or twenty-four track...) if by the time you've got to the stage, you'll know whether music making is going to be a hobby or career!

Remember, if you hope to make anything worthwhile of your studio, the final result should be a stereo master tape. From there you can explore the industries of commercial music, demo production, or even the CD business, depending on where you want your music to take you.

Dig It

MIDI equipment now comes in many guises. Some, such as MIDI guitar, drums, wind instruments and even microprocessors like Digigun (IBMPC compatible) or MIDI-CO (control voltage converter), such as those manufactured by Philip Ross or Telex, will even allow you to incorporate cheap pre-MIDI synths into your system, and as you expand you will find new uses for your computer, such as automated mixing, score writing and sample editing. We'll be covering their subjects, and many others in future issues - meanwhile, if you have any queries on computer music, drop us a line.

THE FIRST AND THE BEST HIGH SOUND SAMPLING SYSTEM FOR THE ATARI ST!

Sampling sounds ranging from 1KHz to 40KHz

with accompanying facilities to store quarter year memory size.

Uses CMOS audio hardware for all sample setting features.

Filtering, Editing, Rough and Realtime Mixing.

Comprehensive facilities for G, Assembly, Post and ST Bank.

2 Year polytronics with 20K copies maximum over 9 months keyboard.

Velocity sensitivity that is variable and adjustable.

Assigns MIDI channel per note, use of pitch bend wheel for effects.

Forward, reverse and freeze freezing capabilities per note.

Ability to load two banks of key codes to enable looping.

Mastered master allowing single master editing for entire program.

16 BIT DIGITISER with MIDI SOFTWARE only..

£94.90 including VAT and DEC Postage.

Don't be tempted until you've had a byte at YORCOM.

■ Images of this quality and better are quite attainable on an Amiga or ST. A video digitizer, a video recorder or video camera, and a good subject are all that's required. This particular shot, captured with Digi-View, demonstrates the Amiga's RGB mode. Show appreciation.

Doubtless you've seen graphics on your ST or Amiga that no artist could ever dream of producing. The sort of thing that makes you wish your fingers were out, and owners of laser machines in tears.

What is it about these graphics that make them stand out from other good "prints"? By all means, they're beautiful, detailed. The sort of thing that just isn't possible with an art package, no matter how large the colour palette.

These near-photograph quality images are only possible by grabbing a picture, minimizing object or live subject and reproducing it on a computer's screen. The hardware which does this is the video digitizer and the resulting pictures are known as digitized images. There's nothing mysterious about the way this is done: a video camera or video recorder sends signals to the digitizer, which assigns colours or shades of grey to each picture element (pixel) that eventually appears on the computer's screen.

Of course, once an image has been captured and transferred to the computer's memory, it can be manipulated like any other graphic. You can take the image and enhance it, by removing unwanted background, touch up bits that don't come out as you wanted and alter the picture's colour palette. And then what? How about using the pictures for producing startling demonstrations like Half-Price Hill on the Amiga or Revisiting Dads on the ST, forming the basis of comical sprites for games, the backgrounds (scenery) for games and adventures - in fact, for anything that requires graphic impact.

So what are you waiting for? Head on to find out what you need for your particular setup, which digitizers are available, the software to enhance and manipulate grabbed images, and techniques for getting the best results.

DIGI-VIEW 3.0
Amiga only (512k min,
1Mb recommended) ■ All
screen modes supported ■
£130 ■ HB Marketing
(0800 444433)

If there's one product available for the Amiga that every Amiga owner has at least heard of, it must surely be Digi-View. Digi-View has been available for a couple of years and during that time has become one of the most successful add-ons for the machine. The manufacturer, NewTek in the States, claim to have sold units to users in nearly every country including the Soviet Union.

The first thing that strikes you when opening the Digi-View box is the

DIGI-TIGERS

Jealous of those sparkling screens you see on STs and Amigas in shop displays? Video digitisers aren't just a new way of taking photos - they open up a whole new world in image processing. Richard Monteiro and Jason Holborn polish their pixels in search of the ultimate.

size of the digitiser - to describe it as small would be an overstatement! DigView plugs neatly into the parallel port of the A2000 (but you'll need the DigView adapter available for an extra £15.95 to be able to use it on either an A500 or an A2000). The actual video signal is fed into DigView via a standard phone socket on the front of the box.

The DigView software comes in two versions on a single disk: an American MISC version and a UK version. To be able to use the UK version you'll need at least 1 Megabyte and even then available memory can get a little tight. DigView supports all the Amiga's graphics modes and can produce from two to 4096 colours.

Version 3.0 of DigView encompasses several nice features over its predecessors, such as automatic half-toning, extra half tone lines, it is quite flexible and has a live art mode. All these

are fully new to Amiga users, as most art packages offer little if any support for them.

Included with the DigView is a program wheel segmented in four different colours: red, green, blue and clear which is attached to your video camera and used to capture colour pictures. To capture a grey scale picture, DigView requires only one scan of an image. Colour grabbing involves taking three different exposures using the red, green and blue filters. DigView then builds the three exposures into a colour picture, holding them all in memory at once. This is why it requires so much memory.

The software includes a limited number of image processing facilities such as changing the saturation level, brightness and sharpness of an image. Using these functions can sometimes have disastrous effects but thankfully the software includes every user's friend, Undo. The soft-

ware also supports printing but in practice this is not very practical as it's not possible to connect a parallel printer at the same time as DigView.

Overall quality of captured images ranges from extremely impressive to unrecognisable, but with a little tweaking most grabbed images can be made to look very good. The only negative thing about DigView is the amount of time it takes to grab an image. Grey scale images can take around 10 seconds while a colour image, requiring three scans, can take as long as 30!

SCREEN MODES

So you've never heard of Oni? Sure, in the same way you've never heard of the world's first Oni console, comprising all the elements of Amiga software games. Been completely.

Oni is a very handy tool to enhance the video screen in the system, rather than a usual window in the system. Easy that Oni is an Amiga-specific mode that allows for the dynamic stretching of a screen's colour palette. In practice, the extra colours available are only taken in 1/4 of the lower half of the palette.

"Metacomco's product has no equal
in the realm of ST assemblers"

ST World USA (July 1988)

"Is one of the most complete assembler
packages available. The documentation
is of a very high standard and this
is complemented by Metacomco's
consistently good user support"

ST World UK (December 1987)

You might expect that with such
critical acclaim for version 11 of our
macro-assembler from both sides of
the Atlantic we would put ourselves
on the back and put our feet up.

But Metacomco is dedicated to
providing its users with high quality
software which reflects advances in
programming methods as they
happen.

So we are pleased to announce:

METACOMCO MACRO-ASSEMBLER

New Version

VERSION 12

Now Includes
Tempus

● NOW INCLUDES REMARKABLE TEMPUS EDITOR.

Very high speed GEM-based text editor
which scrolls a 50K program in 15 seconds. Fast
searching and block copy/paste/delete functions.
You can edit 4 programs simultaneously. Twenty
programmable function keys.
"A first class piece of software" ST World (April 88).
"The ultimate text editor" Atari ST User (March 88).

● **LIBRARIAN ADDED.** The new librarian is menu-
driven and easy-to-use. It allows you to create and
maintain libraries of frequently used routines in a
single file.

● **BRAND NEW LINKER.** Don't blink or you'll miss
the link stage! Our new linker is so incredibly fast that
the time of your development cycle will be dramati-
cally reduced. Supports GST output format.

● **ENHANCED ASSEMBLER.** The assembler itself
has been improved so that it is now considerably
faster than previous versions. It also has many new
features including: Support for absolute code to allow
program development for ROMs or other chips and
the facility to produce Motorola ("b-record") format
or Intel ("Hex") format, from more advanced macro
handling than before; Motorola specifications plus
VLCR, STRLEN, LEFT, RIGHT and BEND; Recognizes
complete 68000/008/006/012 instruction sets and
address handling.

● **IMPROVED RESOURCE CONSTRUCTION
EDITOR.**

● **RAM DISK NOW INCLUDED.**

● **IMPROVED DEBUG+.** A unique symbolic debug-
ger and link loader which allows fast and efficient
debugging.

*"I rate this debugger very highly indeed, even com-
pared with Devpak's Mon-ST, and yet it's refreshingly
easy to use"* Atari ST User (April 88)

£59.95

● PLUS THE WELL-PROVEN FEATURES FROM PREVIOUS VERSIONS.

- Full compatibility with Lattice C and Metacomco Pascal
- Standard Motorola mnemonics
- Supports position independent or relocatable code
- Very large range of directives
- Text, data and BSS supported
- Fully formatted listings
- External references to allow linking with other language modules
- Conditional assembly
- 50 character variable names and 32 bit expressions
- MEMORY directive to copy a binary file into the output file
- Local labels and multiple sections supported
- Options of infinite scoring of macros, includes and B's
- Disassembly
- GEM libraries for VDI, AES, GEMDOS, BIOS and XMSX calls
- Memory shell command environment
- MAKE utility
- Neatly printed 500 page manual which has been further improved

● All these features combine to give you an unrivalled, fast and powerful assembler development environment on the Atari ST.

DIGiPiC
Amiga (512k min) ■ Low
res only, 32 colours ■
£299 ■ Precision Software
(01 300 7166)

DigiPic is a relatively new arrival on the Amiga digitising scene that boasts an impressive specification, while DigiPic doesn't support fancy features such as OverScan, Edge and Line and HMI, in terms of speed of operation it leaves DigiView standing.

Included with the digitiser is a separate piece of hardware with the rather grand name of Extended Grey Scale Adapter. This little wonder is connected between the Amiga and its monitor to modulate the Amiga and to double the number of grey shades available. The only snag is that the £224 hardware must be present before an extended grey scale image can be displayed. DigiPic supports full colour digitising using the same three digitiser method as DigiView and a similar colour wheel.

Any form of hardware is only as good as the software that drives it, and DigiPic's software is robust. Both DigiView and DigiPic use standard Windows pull-down menus to access all digitising functions, leaving the main screen unobscured.

With DigiView, the image processing tools are rather limited, but DigiPic's are much more comprehensive, with a list including Quantize, Contrast, Threshold and Edge. The overall quality of grabbed images aren't really of the standard that you would expect from a digitiser costing £200, but if you require a fast converter then DigiPic is worth investigating.

TURBO DIZER
v2.0

ST ■ Low and high res supported ■ £149 ■ Software
Express (021-328 3885)

Turbo Dizer certainly isn't new, and now proudly proclaims a Vcr 2.0 tag. The 2 refers to the software, not the hardware which still comprises a long thin interface for plugging into the ST cartridge port. A VCR-video male socket is the digitiser's only distinguishing feature, and the only way of focusing it to the real world.

You connect your lead and take, or source choice; either PAL-standard video recorder, video camera or

TV with external socket. Then an easy five television with video-out to make sure you have another acceptable video source before buying this, or indeed any digitising, product.

The software is responsible for deciphering the image the camera sees, or the video recorder outputs, and displaying it on your ST's screen. Colour is translated to grey-scales which means the image on your ST screen can look garish when viewed in low resolution. From the main menu you can set the grayscale level (2, 4, 8, 16), toggle allowing on or off to active grabbed pictures, alter brightness and contrast levels, select colour settings, load or save images, determine picture format (Macintosh, Origin, Art Director and so on), enter an annotation vector or commence digitising.

Not all functions are available for both high and low resolution digitising. For instance, colour is unavailable in high-res (and normal and normal, annotation is only possible in low-res and only high-res pictures can be saved with an RGB extension for inclusion in BMP packages like First Street Digitizer.

The time taken to digitize a picture is proportional to the number of grey scales used. For every grayscale add 0.025 of a second to the digitizing time. At least, that's what the manual says. Going by their figures, it should take 0.2 of a second to grab a frame using eight grey scales. Wrong. Such a picture actually

■ What's this? Members of Turbo Dizer and ACE invading the Format office.

TURBO DIZER
FACTS

- It does, showing what the annotation vector is capable of, it includes the software Express (021-328 3885) for £4.95.
- The digitiser is used by both the British Museum.
- It includes annotations in Macintosh and TrueType. It also includes the digitiser for use in schools.
- The picture resolution you open onto a test file to keep information on how images are grabbed on screen.

FORTHCOMING
ATTRACTIONS - AMIGA

There's a lot happening on the Amiga video digitising front and details of several impressive sounding new systems are appearing. Probably the most interesting new digitiser is the long-awaited (VCR) and (NewTek's Good Luck, Effects, Video Digitizer combination) and with the rather obscure name of 'Video Tracker'.

(VCR) which is already available in the US, was originally described to be a Commodore product that for reasons unknown was dropped by Commodore. (VCR) has similar features to DigiView but it's main claim to fame is that it operates in real time. (VCR) also uses video digitisers, (VCR) is a true colour digitiser which means that it doesn't require colour filters like those used with DigiPic or DigiView. (VCR) achieves this by actually decoupling a video signal to colour information and using it to reproduce colours within the resulting image. The PAL version is still under development in the States, but should be available in the country sometime in the autumn.

Video Tracker, from NewTek, is best described as a complete video mixing desk which in game mode you make off. Tracker combines an industrial standard board, full video effects system and a real time video digitiser in one package, with a host of other add-on such as dedicated video re-processors etc. The digitiser included in the Tracker package costs (VCR) to show when it comes to speed of digitising. NewTek states it can digitise in 1000 real-time (30/60 frames a second). Video Tracker has been demonstrated at several major Amiga events including the recent AmigaEx in Chicago, but even these demo systems are still only beta versions of the final product.

As with all things, price doesn't come without a price (sorry Alan) and it seems certain that the Video Tracker undoubtedly won't be cheap if you're a video professional, though Video Tracker could be the answer to your dreams.

For further information contact either Amiga Centre Scotland or 020 357 4360 or 01 666993780 or 0201 644423.

■ That's better than I can just mean ally face than you! Software having a good game. (Holding special was used from a couple of magazines that he owns) - Ed, We just came in front of a very old black and white video camera and chose the blue points. Software and hardware did the rest.

takes between 1 and 2 seconds. Still, the manual could have a printing error.

Pictures take up a lot of room - typically 32% - which is why Turbo Deer uses a compression technique for storing animation sequences. Rather than storing the full picture, the software simply stores the differences between each frame or picture. This can mean a 75% reduction in memory used.

Control over animation is good, but tricky to implement. Sequences

can be grabbed individually or automatically, the time between each shot being taken in auto mode can vary from seconds to 98 days. Animations can be played from within the package, but sadly the software doesn't allow you to create stand-alone sequences.

Documentation is poor, the C source files that exist on the disk contain German comments (and the manual, digitising is slow and that works best with stills. Move it apart, with a little

padding good results are possible. Pictures can be converted from one format to another easily and the price is agreeable.

features	3.0

DO IT YOURSELF

bitmore utility. What you need is an old package of sorts - and there are many - to clean up the image (remove stray pixels, perhaps break the contrast or even change the colour palette) and tailor it to your requirements.

Changing the palette is not as outrageous as it sounds. If you're creating a game set on an alien world you'll want the background in unusual colours - red sky and various shades of orange for the countryside (sounds like home - lol, Experiment.

Look out for graphic packages that offer image stretching, shrinking and twisting. You won't always want to use pictures the size that you grabbed them; having the ability to change their height and width is essential. Don't increase picture size if possible as the results will be awful - poor mapping starts and looks really ugly. Resizing an image has the opposite effect; it often enhances the picture. Most art packages come with horizontal and vertical flip which are ideal for creating objects not of full an object. For instance, if you digitise a disk and part of it looks odd, it is easy to copy the good half and flip it along the appropriate axis. This is simply a matter of joining the two halves.

Once you've got a clean image you'll want to do something with it.

REAL-TIME?

What is real-time digitise? Is there any video digitiser that doesn't do real-time (should capture and digitise it a rate of at least 30 frames a second, as 30Hz video capture is required) - a few promising 30 frames can record over Interim-MPC standard, but not to capture real-time, some happen after the fact, others, that use time images which appear as though possible to real-time eyes. This can be achieved at much lower frame rates.

If you've got the choice, always use a black and white video camera for grabbing images; they have a higher resolution than their colour cousins parts. Most digitising hardware doesn't require a colour camera to grab colour pictures, monochrome cameras are much cheaper.

The best images are always taken from still subjects. If your video is up to it, freeze the picture before grabbing. Still cameras work, you must ensure the subject is well lit, show as many lights in the general direction as possible. For professional work use three or four spot lights.

Most photographs and pictures don't digitise well. Use glossy pictures for the best results.

Once you've grabbed a few images, using your digitiser you'll probably start wondering what you can actually do with them. Unfortunately digitising software often lacks facilities for tidying up pictures or modifying them in any way; the best you're likely to get is a

OTHER DIGITISERS FOR THE ST

Ultimate Animation Machine (UAM) from Star Systems, available at £299 (MSRP), is the only other video digitiser still sold in this country (it's the D7 and Realtime having long gone). UAM was going to be reviewed in this feature but didn't arrive in time. Still, here is what Star claim it does:

UAM's great claim to fame is not its price - £299.95 - but its ability to grab pictures from video cassette or video camera in real time. Normally this means you can create any frame and it will appear on your 27 screen Mon-Max and (only) 15-10000 for resolution pictures can be grabbed though.

Instead of saving one individual frame of incoming video signal, you can save entire sequences. This on a 500, 24 or a 1040, 50 or a 2Meg ST and 100 on a 4Meg ST.

The software allows you to animate digitised sequences of any speed, forward or backwards, and in freeze mode.

It seemed impossible, but with a little help from Digit Flow, Motion Paint and a 2 Meg floppy we did it.

POWERDRONE...

It's not just a game anymore ...

- *Fast, Realistic 3-D Graphics with Digitized Sound.*
- *Head to Head Challenge via Dual Machine Datalink.*
- *Horrificous Crusher Gates, Obstacles, Crashes and Tunnels.*
- *Practice Solo, or Race against 4 Combat-Hardened Galactic Rivals.*
- *6 Challenging and Tortuous Tracks set on 6 different Planets.*
- *Automated Robot for refuelling, bodyparts replacement and complete tuning.*

■ These pictures were captured using Digipix in low resolution with 4096 colours. Using a picture with such a high colour resolution can restrict you in the choice of available art packages as most only operate in 256-colour modes.

One of the most widely used applications for digitised images is for producing graphics for games. Game sprites and small images as graphics if the art package has such a facility. The memory savings are immense. Backgrounds should always be saved in compressed form (not possible with all art packages) as can knock the size down by half.

Getting the data read by your program out of that programme... the Amiga's standard I/O file format means that any image will load into your program - regardless of what it is written in. With 5% the problem is a little trickier, however, most languages have facilities for loading pictures from the more popular graphics packages.

The easiest way to admire your digitised work is to ensure you save all images in a standard format and use a slideshow program to recall them automatically. There are hundreds of things you can do with a digitised image. It's all down to your own imagination.

THANKS

We at Format would like to express our gratitude to **Joe Bowering** at **Two Graphics** for the use of his digitised work in this month's Format. Joe can be contacted on 0274 710000.

CAMERAS

With all their options, you still need to look out of a video camera to make them work. You may need a dark coated black and white camera, a 3000 Turbo-Sync in mono, or a Digipix and Digipix II. Both create colour-its own taking colour images.

A good friend of the Panasonic WV-2420 is if you're looking for the HiFi 1000 which has a better lens. There also is a new Pixel Survey package which provides the best picture for you.

Please say from reader to dealer but never sell an A1000 for the price of an A1000 to the BBC.

ST PARTY TRICKS

Spags 3.12, distributed by **Electronic Arts**, or **PixelManiac** from **Blair** are recommended for displaying digitised images. They have a good range of cut, copy and paste routines to play with. **PixelManiac** is restrictive as it only works with 16-colour low-res images, but it's very easy to use. **Spags** works in any resolution and so such is perfect for detailed 640 by 400 work.

Electronic Arts from 3.12 is ideal if all you want to do is colour all your digitised pictures. Hundreds of 256 colour images can be loaded and converted to obtaining 3.12 colour efforts. **Spagman's** editing features leave a lot to be desired and you may need to do your clipping and changing in another package.

CLEANING UP WITH THE AMIGA

If you need fast image processing power, probably the most popular heavy weight package is **PIXmate** which is distributed in the country by **Photron Software**. **PIXmate** uses algorithms originally developed by **AAA** for enhancing pictures received from space probes such as **Protopig 2**. The real difference that separates these image probes from the mass means that the strength of any signal is inevitably weakened.

PIXmate uses the power of the Amiga's filter to speed up graphic processing by a factor of ten over conventional image processing programs. It uses a system called **Super-Filtering**. **PIXmate** includes over 1000 different image processing effects all of which are increased through a standard **Intensity** (level) environment.

Effects include adjusting colour limit, colour extraction, **Pixel Averaging**, **Local Contrast Enhancement**, **Median Filter**, **Pixel Randomising**, **Threshold Adjustment**, **Laplacian Convolution**, **Photographic Equalising** and **Bit-Set Conversion**.

Probably the best all-round art package available for the Amiga is **Photron Paint from Activision**. We reviewed **Photron Paint** in issue one and ever since it has been a favourite of the Format team. The most powerful facilities within **Photron Paint** are its brush manipulation features. Using these facilities you can produce some unusual effects by picking up areas of the screen, stretching, shrinking and tiling to your hearts delight and then pasting the result back down onto the image.

■ The eye, to both the Intensity features of **Photron's Art Filter** and **Golden Brush** into a remarkable face. When a separate screen the right-hand side of the screen face is pasted down, flipped, and pasted down again. The mouth is stretched and **Golden's** looks of face are reduced to mere dots.

A - MAGIC Turbodizer (VIDEO)

The A Magic Turbo-Dizer was developed especially for the Atari ST. It is one of the fastest video digitizers on the market. Simply plug the small (12 x 7 x 3cm) block into your ST's PCAdapt (also ST slot) and you're ready for action. From now on you can display everything on your 9M 124/125 or colour monitor. All you need is a PAL video signal, which is supplied by any TV, video-camera or VCR.

You can digitize using your ST in 2 - 32 graylevels and process with the image using the following programs: Degree (Elite), Neo-chroma, Colorstar, Monostar (+), STAD, Art-Desator, D.P.A. etc.

With two gray levels it is possible to digitize up to 25 pictures per second (realtime). What else can you do with the digitizer?

Advertising - Illustrations - Room Monitoring - Animation - Subtitles

- Technical data:
- Hardware:
- resolution 640 x 400
 - grayscale contrast
 - Power supply from computer
 - input signal through BNC socket
- Software:
- resolutions 640 x 400, 320 x 200
 - gray levels 2, 4, 8, 16, 32, either red, blue, green or gray

DATA MANAGER PROFESSIONAL

Tom Massey wrestles with fields and records to form an opinion of the new ST database release from Timeworks.

\$69.95 ■ ST only, all models ■ Timeworks, Electric Distribution, 8 Green Street, Willingham, Cambridge CB4 5JA (0954 80318)

Every facet of daily living, both personal and professional, has a legitimate use for a filing system of some kind for efficient management of daily affairs. Yet of the many database systems available, few are what the average user would consider user-friendly. Even those do, very few systems encourage users to find "extra" applications for their—until now.

Timeworks' latest release, Data Manager Professional (let's call it DMP) is big brother to their Data Manager ST, and should go a long way towards overcoming user reluctance to testing useful applications for efficient management of all information.

Open the box?

DMP is a full feature professional grade data management tool which can be used with the ST's OS/2 full disk format, or for the majority of its options, directly from the keyboard.

(Once you have made the neces-

saryed working copies of your master files and got going, you will notice that DMP is designed around individual program modules, namely: DEFINE - For designing new record forms and editing or adding variables to existing records.

MANAGE - DMP's operational module. Records are viewed, inserted, edited or modified with this.

REPORT - Used for designing the format of your output files, setting up the parameters for merging blocks of text with definable details from your records.

CONFIGURE - Allows you to alter the default options for data style, default drive for your data files, and printer configuration.

Relating to it

The most difficult part about using any database is the planning required to set it up so that subsequent use of your information will provide you with useful information about your data.

Data Manager Professional is certainly no exception, letting up a database is usually referred to as "defining its structure". The design of your records is partly determined by the type of variables you will be using.

A particularly important Data Manager Professional feature is that you are allowed to modify the structure of your data files even after data has been entered.

Each data entry in a record (or "file" each is called a "variable" and is placed in a field later or more terms in a record) headed by a single label relating to the variable. Each field has a value for each record. Each variable also has a type: Text, Number, Block, Class or Date.

TEXT FIELDS are represented by character strings which are absolute, or are not intended to be modified by mathematical or other processes.

NUMBER FIELDS are used where mathematical processes may be involved. Timeworks recommends that text fields be used for telephone numbers.

CLASS FIELDS are variables consisting of two or more keys of continuous text.

CLASS FIELDS - Are used where the range of data is limited to either yes/no or a user-defined range of values for report.

DATE FIELDS are used as references to date field in a record and may consist of current reference dates (ie, subscription renewals) or dates of historical significance.

Before your eyes

Once you have acquired a degree of familiarity with the system, you should need to make very little reference to the extensive ring-bound manual because each program module includes its own extensive range of help pages.

Moving through a file is done in any of several ways. Once you select the "Display" option, you may move forward or backward in a file, with the first and last records defined as

A Standard OS/2 IBM PC Window

■ Adding a variable to a database form

file terminators, by using the up/down cursor keys.

Alternatively, you can use the mouse and QDM to select the "Previous Record" from the control menu. Smaller jumps representing about 10% of the file may be incremented by clicking on the QDM slider bars.

As top-flight databases go, QDM's capacity is not massive, but files of up to 32,000 records are competently managed. New files may be created from selected parts of existing files by copying or joining, using the system's full set of relational operators.

Another powerful feature allows you to "project" defined parts of an existing file, so that a new file may be built by extracting specific records from the original, with an optional automatic deletion of duplicate entries in a file. Command sequences for frequently used relational operations can be defined and "saved back".

Working in QDM-based and, according to the manual, QDM will cut 1500 records in about 30 seconds. Manipulation of a group of records may occur in any of several ways. Customized reports may be generated in which you have the options of containing and/or excluding individual blocks of data.

Highly demonstrating the real power of QDM, you can also use mathematical and conditional expressions to transform your data into text and figures.

Data output

Small databases may only require examination from one end to the other, browsing through the range of records until you come to the one you are looking for. Large or complex databases, whether single and menu driven, names and address records or stock maintenance and control, usually benefit from an option to sort the data by any of several parameters.

Extracting information from a

■ Browsing through the geography database prepared with QDM.

■ How to extract a report from the data for a person

QDM file may be done by a defined ordering of a group of records. Multi-level selection allows you to extract records by matching them against expressions involving use of most criteria, like "All men under 5'0" living in Hill and earning \$30,000 or more". Repeating the selection process occasionally refines the group of records. QDM's Report module provides you with facilities for building reports in one of three ways: where a report consists of data from a single record,

a batch of records, with common data values such as books from a single publisher; or, a summary report where information data is reduced to statistical averages, rather than details from specific entries.

Another option provided is that, if you started with Fireworks Data Manager 3D and have upgraded to the Professional package, you can use the COMERTAPP utility to transfer files to your new system.

DEMONSTRABLY EASY

QDM's demo file consists of information relating to 123 countries. Data includes the usual information regarding capital, population, continent, tall and so on.

If you need to practice adding new fields, start at the "Define" module from QDM's front end and load the demo file. Press [F6] to select modify, and [F7] to add a new variable. You will be presented with a box into which you type the name of your new variable. You will also have several options for defining the type of field, defaulting to "Text".

Having completed and accepted the input sequence, the screen is updated by the record-hand, with the names, types and lengths of existing fields. Overtyping the record-hand is a box containing your new variables, which you can reposition as required.

Move the pointer over the variable and hold down the left mouse button to "grab" the variable. Still holding the button-down, move the variable using the mouse, until it is in the correct position.

Releasing the left button will raise the bar and install the variable. You then have the option of altering the length of the variable by moving the pointer to the closing square in order and dragging it to the left or right. Existing variables can be modified in a similar manner.

Once you have made the required alterations to the record layout, save the file under a new name. It really is as easy as that.

for

- Relational operators allow powerful data searches
- Exceptionally easy to use
- Easy to alter structure of working files
- Exceptionally good report facilities

against

- Manual would benefit from a better index
- Professional workload examples would give a better idea of applications

WHAT USE?

Applications for databases are as varied as it is possible to be. Virtually every aspect of human activity can benefit from a well-designed system.

Household and personal management applications include library records (titles, logarithms, videos, books), names and address.

Records in which may be included recurring annual events and other time-critical information, household inventory for insurance purposes and much more. The hallmark of a good database is a variety of sophisticated features, which stem very simply.

The person should not need any computer experience.

SCREENPLAY

3D intergalactic epics are all the rage this month so, slipping into his green lucrex jump suit and donning his laser filtered plexiglass helmet, intrapud space cowboy Andy Storer jumps aboard his faithful star-steed Trigger and heads for the nearest bar.

August saw 18 new games leaping into our efforts and, while that's a 50% drop on the last three months, we've currently got 155 up and coming titles listed for release in the next year. A quick check with our **DEVELOPER ORGANIC CONSCIOUSNESS** reveals this to be a release rate of 1.770492 or so a day. This would mean that in **AN IDEAL UNIVERSE** you'd be able to spend something in the region of \$10,000 a year on games if you so wished. Luckily we're forced to be more discerning and Format will continue to test only the best.

Summer Olympiad Tyrosit	68

Format Gold

At one point this month we thought all the games we reviewed would feature tiled 3D graphics. Then **POWERSHORE** and **GLUE** were delayed. No matter - possibly **THE** two best **SOLID OBJECTS** of the year made it in time.

STARBLASTER 2 won its **FORMAT GOLD** hands down. From the moment you boot you feel yourself handling a **REAL SERIOUS SCIFI SHM** - no wonder the Japanese are working on a **STARBLASTER** simulator - if you had a 50 foot screen and **3DPS-SURROUND ATMOSPHERICS** for this one you'd never be seen again.

The same could be said of **AIDESADUCE** or **FIRE TRADERS**, our other **FORMAT GOLD** winners.

Expertly tiled 3D graphics, 3D-style controls, an onboard computer and a play area of around **25 BILLION TRILLION SQUARE LIGHT YEARS** make **SOFT** a **MASSIVE PROJECT** you could spend more than a lifetime playing.

And there's more...

The large version of **CARRIER COMMAND** scored our top mark of a **COOL 100** MPH and we are extremely familiarised ourselves with all 50 pages of instructions and 63 control codes. **CARRIER** is one of the few true **ASYNCHRONIC ACTION** games on the market - 50 battles in 60 seconds and surface vehicles at **ANY ONE TIME** - if you're still alive.

Staying alive is the whole point of **HOSTAGES**, the latest Intergames release.

That and killing. Although you're put in command of a **FRENCH HIT SQUAD** you're charged with steering rather more than in that failing respect is **Accident** however. In **PER IDEAL** the graphics are **PER EXCELLENCE**.

STARWAY scores high in the graphics department too - if you ever fantasied your thumb playing **STARWAY**.

If you love the one, though your thumb won't. In **MULTIPLANE PARALLEL SCROLLING** looks as good as it sounds. We'll just say we love the way the foreground moves faster than the horizon. Simple, but **ULTRA EFFECTIVE**.

AND FINALLY to **SUMMER OLYMPIAD** a game with brilliant graphics which demands a bit of wit. Your **MOJA**, **OBJECTIVE** is to win as many golds as possible without leaving your chair. Featuring a **HIGH DIVE 30 HIGH** you'll reach **TERMINAL VELOCITY** before you hit the water, we can only conclude that **OLYMPIAD** takes sports to new heights. (Gems.)

Ready for the **SHIMMEL FUN** too? Turn the page and do a bit of **INTER-SALACIC CRUISING**...

FROM THE CUTTING ROOM FLOOR

Apologies first to the 11 publishers who didn't make it. And you who've dropped the rather silly but of **POSSIBLE GREAT**, the unpublished scenario of **IMPOSSIBLE MISSION 2**, the second of chapters of **ARMY MOVIES**, the street cred carriage of **STREETFIGHTER**, the tangled messes of **DEVELOPMENTS**, and the unpublished scenario of **GLUE** and **POWERSHORE** (**POWERSHORE**). Love 'em or leave 'em is what we say, the last 'em.

In the 17 games we cut the appalling green frogs of **MERLAIN**, the Aquino pages of **FRANK ASSEMBLY**, the alien battles of **PHOENIX** and the wacky pages of **HELL'S BOY GALS FEM**. You can't have 'em all. But many could say 'em all of 'em.

So there you have it, a month where there were more things than 87 releases - what on Earth is happening?

STARGLIDER 2

ARGONAUT/RAINBIRD

Amiga - £24.95. Joystick, mouse. Reviewed

ST - £24.95 Joystick, mouse. Colour and Mono.

The release of *StarGLider* two years ago not only heralded 16-bit power as the future format for games software but convinced players that it was time to fork out the ready for the hardware. No other product gained so much coverage and sales and yet, ironically, as a technical achievement the look was distinctly 8-bit. Okay, so the wire frames moved fast and there were a lot of them, but at the end of the day *StarGLider* was no more than a straight shoot-'em-up with limited strategy. The sequel is a different game entirely and owes little to the original save for the name and the context. Sound, graphics and gameplay have all been radically overhauled.

■ Why not take time out and watch three guys hunt a go at each other?

■ Better still join in...

■ ...and of the thousands of planets

AIM

In fulfil of the Pioneer Council you have been dispatched to the Solara System in a bid to prevent the Egron from building a space station near the Outermost planet of Atara to launch a satellite powerful enough to destroy *Powers*. *Beam* Propellers are being deployed on each of the seven moons of an inner world, *Milax*, to protect the space station's construction. In your *Icarus* cruiser, you must visit the 15 worlds of *Solara* and collect the components, materials and the scientist required to produce a neutron bomb - the only device capable of taking out the space station. Along the way you will encounter pirates, alien creatures and, of course, heavily-armed Egron opposition so it's best to regularly save your position.

YOUR ICARUS CRUISER CONTROLS

■ Some of the dilemmas you'll encounter

■ You can sit and watch the beam projectors being constructed.

■ When the work is done you simply fire off a docking beam.

■ You watch all that work get in place.

STRATEGY

After learning to fly your cruiser - simply a matter of pulling and pushing the mouse for altitude and direction, and clicking the right mouse button for thrust - it's time to test out your gas plasma beamers by clicking the left mouse button. Thankfully, just about everything that moves can be annihilated with consummate ease. Once the computer base becomes active it's a matter of hitting it from time to time to get a status update and seeing where Upton Beams and Projectors are being built. You can then activate your star drive and fly to your destination planet. Remember to shut down the drive just before planetary, though, or you'll lose your shields.

Most combat encounters occur between planets where planets hang out and spend most of their time shooting each other up. Since they're preoccupied it's quite easy to take hundreds of them out. Some objects however, like beam projectors, require bouncing. So first of all you must search the Solace system for underground ammo deposits. (Alphabetically named nebulae) are found on most planets and moons and provide safe access to other areas up top.

Depots are difficult to find and usually require a trade before you can take what they have to offer. Though like all true blue things space renegades you'll be pleased to know you can also steal what's on offer with your tractor beam. This facility is very handy for when you're just looking to see of the many asteroids to be found in a belt ring - just look up at your energy levels will recover. Other weapons of your arsenal, if you can find them, are Time-Warp catalysts - running little drills which blow away droppings into the path of whatever you shoot them at - Fire and Flew missiles which lock on to nearby derelict objects and finally the neutron bomb - designed to destroy the Upton beam station. To use this you must locate its designer and the necessary components to build it.

ST vs AMIGA

Starblaster 2 has been cleverly coded using a dual format system which, like our own, holds both ST and Amiga programs on one disk. However, Argonaut have taken this a stage further - a game position saved on the ST can be reloaded into the Amiga and vice versa!

The game was developed on Amiga and ported over to ST's where it was found to run 10% faster. But ST owners needn't feel too smug - all you have to do is take a speed game around to a friend's Amiga and be hooked out by the fabulous lampshaded sounds. This transforms the atmosphere entirely and more than make up for what is a fairly noticeable loss of speed.

■ Time for a little underground exploration down the tunnel entrance.

■ You make your way along a shaft.

■ ...and come across a stack of missiles.

GRAPHICS AND SOUND

You might imagine Starblaster 2 as a combination of Mercury and Dike and you'd be right up to a point. Here though there are 100 filled 3D objects most of which are animated. On the ground you come up against stampers, walkers, patrolled lines, parameciums, bouncing balls, cars, tanks and ships, whilst in the space atmosphere you can find space whales, rockets, trays, tanks and starfighters. To keep you on your toes you will have to complete against 17 types of aggression.

The array of 3D phenomena is brilliant, each moving object perfectly defined, rich solid and fast. Every object encountered can be accessed and manipulated from a list any option available on start-up. An excellent feature which could have been maintained on a stand alone basis. Starblaster 2's major achievement is to get so many filled vector graphics on screen simultaneously with no apparent loss of speed. You may also switch to any one of 7 independent 'interceptor' style external shots of your choice plus 9 different receipt views of your current position. The instrument panel itself is worth a mention too for its laser, energy, fuel, speed and altitude indicators - each depicted by unique 3D columns designed to be holographic displays. Also of note is the currently selected weapon indicator which, with a hit on the shift key, flips between grid oriented values, bouncing bombs, missiles, lasers and mushroom clouds.

Sound is excellent too. From the fit of thunder and cannon fire to the thrush of stampers striding across the landscape the overall effect is a very convincing atmosphere throughout your mission.

CONCLUSION

It's hard to find fault with Starblaster 2 - it scores so highly in graphics and sound you'd be prepared to overlook any lack of gameplay. But it doesn't lack gameplay - you can play it as strategy even rise or load up and get out blasting everything in sight. In game time facility too, you combine each approach with-out problem. Other way it leaves its predecessor stand ing.

FUEL FOR EN

Your plane has ditched on a mountainous plateau somewhere in desolate Tibet. You and your companions are alone. A large dragon swoops towards you. You rub your eyes in disbelief... a Dimension! — wherever you... and where? Flaming, monochromatic 3D graphics and 16-bit stereo sound as you team not only for survival, but also that your companions are not all they first seemed!

One phrase sums up the humour and appeal of Arknoed — 'It's not how another god'. Arknoed is a addictive, clever all the capabilities of the latest means this game now is almost an exact replica with all the excitement of the original Taito console smash hit. This is Arknoed — the bookends.

Exceptional graphics, creative game design and definition of 3D all surround the atmosphere generated in this addictive, 16-bit strategy game. The original story you can play through, selecting missions for assignment, who all encounter the enemy and the enemy (body) traps in your own. The enemy's strategy is to destroy the enemy. On every 16-bit screen you will see them and a team of your enemy will surge at you. You'll see the enemy when the the enemy they, making you know the atmosphere isn't enough to kill.

ENTERTAINMENT

DALEY IS BACK Enter the 1988 Olympic Challenge with Daley Thompson as you 'work out' in the gym, where your efforts will directly affect your performance in the competition itself - another find from Ocean.

The Olympic events include Long Jump, Shotput, High Jump, 100m Sprint, 400m, 1500m Hurdles, Discus, Pole Vault, Javelin and 1000m. You will need all your skills to build on what you hope was an impressive work-out, and, as is necessary for all top flight athletes, your judgement to select the most effective equipment for each event is now vital - a decision which can win or lose you a place on the podium.

This isn't just another sports simulation, this is a Daley Thompson 'event' where all his talent and humour burst through to make a thrilling and enter-taining game play for all the family. Go for the Olympic Challenge!

OF THE ART

FEDERATION OF FREE TRADERS

PAUL BLYTHE/GREMLIN GRAPHICS

ST - £29.95, joystick

Avidge - under development

A perfect game could be one that is open-ended. There's no finite point at which you can say it's over - there's sufficient depth, breadth and randomness to ensure you visit it in your drive time after time. *Federation* may not be perfect but it has all these qualities in amongst its immense play area of 32,768 square miles of galactic space. With the legendary *Elite* finally making it onto the 68000, you can judge just how much the space trading adventure genre has changed in the three years that feel like three decades.

■ You select a galaxy from the 32,768 available and pinpoint a system

GAMEPLAY

The *Federation of Free Traders* is an adventure in which you can choose to trade between 32,768 galaxies each comprising 254 solar systems of 16 planets in your Milky Way starship. You begin the game as a Federation trader and through successfully completing various missions, work your way through the eight ranks up to Fleet Phase status.

At first you are given fairly odd, low-risk tasks such as delivering packages to distant planets or securing receptors in the more remote areas of space, so you must use this time to trade goods and build up sufficient capital to enhance your ship's capabilities.

There are 15 missions involving scanning, investigations, destructions, evacuations and interceptors, each winning different credit. Using *Galnet* - a galactic communications network - you are able to access stock market data on a range of commodities and buy, deliver and sell accordingly after time slipping or hyper leaping to dock at space stations or planet-bound orbit. You may choose to opt out of the *Federation* career structure at any time by opening mission levels and simply playing the market. Perhaps you'll buy Class L lasers, shields and missiles with the proceeds and thereby acquire the offensive and defensive systems required to reap the ladder of success.

Of course, in a play area of this scale, there's bound to be a whole host of aggressive adversaries amongst all the other traders, so you'll be relieved to know you can communicate with passing ships via an *Inter-ship* screen before deciding whether to confront them in the *Federation of Free Traders*. Both *Galnet* and *Inter-ship* are accessed through *Libble* - your ship's computer - a friendly little tool which'll be only too pleased to let you load in a supply of a dozen or so sub-galaxies to help pass the spare time.

■ You check each planet in turn for the best place to trade your wares

■ A quick glance to see if all systems are go

■ The probe decides to intercept your journey

■ But you lock on with class 2 lasers

■ and it's goodbye

■ You call up Cohen.

■ And from the range of options.

■ Choose to view the commodities available

■ Frying some furious metals might be a good idea

■ If you feel like a little light relief on your long journey there's always Dalek the ship's computer to help you out

CONCLUSION

FOFT scores very high in graphics and scale and envelope, some truly brilliant solid 3D graphics. The grand design is only marred by minor details but if you're looking for a game you can make a career of then this should definitely be on your list. It has all the compassionate alternate reality of Diku and more. Made in three years' time we'll all be crying out for the 3D-bit conversion.

GRAPHICS AND SOUND

FOFT uses tiled 3D vector graphics for all moving objects and planetary surfaces. Movement is extremely smooth – a distant ship (bearing a full-screen presence) will ease. Possibly the most advanced tiled vector graphics to be seen on any system are to be found on planet surfaces where terrain mapping reminds of green plains, valleys, hills, forests, rivers, lakes and oceans, and gives the impression of tiled fractal geometrics.

As beyond the atmosphere lie 32 kinds of spacecraft which, whilst perfectly solid, do lack a certain design flair. The most interesting is your own ship which, unfortunately, you only get to see when you've been destroyed. But exciting plenty in the color system maps and the larger immensity of

the galaxy's speeds are well crafted. Whilst such sophisticated vector graphics are employed (it's a pity that the Laurel and Ribble windows consist of the standard 57 icons laid on a green background – sharper, clearer data screens would improve the overall look immeasurably).

The innovations in visual presentation are reflected in the sound department. Although FOFT comes with a disc full of original classical music, galaxy soundeffects are a bit dull. Possibly this is due to the 3D's sound chip and perhaps the single version will embrace the sounds of lasers and explosions but in the meantime the SFX are nothing special. (This is a shame because the graphics undeniably are.

BETTER DEAD THAN ALIEN

■ ST and Amiga

Find the Quabbar Reference Codes for getting to any level.

ELEKTRA	FAUCET	ACQUATIC	TIGRIS PDM
STYFBI	PELAGIC	TORTRICK	KNIPPE OCLL
SWABRUC	WOODADA	JAWBROCKY	SEPLUD-RE
FLUG	PARADOXIC	INMIGCAL	ELUHEMOM
SOFRANO	DESTRAYIC	CORNUCOPHA	GABAMAGAN
MIRONWAZ	FRINK	PUNASH	DRECCOFORD
			QUARRINTE

Amiga - load the game as usual and wait for the options screen to appear. Type QRAMF and you've activated the cheat mode. To display instructions on its operation, press HALLP followed by fire. Wonderful weapon combinations are now possible. For instance, machine gun, spear-rod and double zap.

Richard Garlow
Dumfries, Leeds

ST - at any point in the game type EFX press (RE)F twice and then fire till mouse button. A screen appears, explaining the mechanics of the cheat mode.

Steve 'I call myself Steve'
Dunning
Walsoken, Bristol

Lambert Conversion, this, and a full fuel tank will get you through each level. Buy Lives when you have the money, followed by Deferring Items for disposing of barrels and Smart Bombs (the following everything on screen. Don't bother with Flame Bombs or Turbo.

■ Jordan
Farnborough, Herts

ARKANOID

■ ST and Amiga

ST - press Caps Lock when the life screen shows and enter RL. This shows you to start from the level that you died on in the previous round. Alternatively, press Caps Lock and type DEATHISLAND. If you press S during the game you will automatically pass to the next level. If you type DEATHISLAND PRU during loading, you will be transported to the last level.

Paul Dunn
Wimborne, Shropshire

OVERLANDER

■ ST

Go for the highest value cargo. Fill up with fuel and save the rest of the money for the next level. Keep your speed between 100 and 120 mph; the green speed indicator should be one step above the blue light. Going at this speed ensures you get through the Gunshot Alley safely - make sure you stay in the centre of the road through Laneswing like driving through the linked traffic lights in Slough - [L]. Once through this stage you must maintain your speed by two or three green lights. You should finish the level comfortably.

ROADBLOCK: keep nudging them until they crash into a tree or rock. When you're on a straight stretch of road and see a car in front, loop to the centre of the road with machine guns pounding as the car gets close it will veer into your bullets and blow up.

BARBAGE: keep in the centre of the road with guns firing. The cars veer from side to side - you'll get most of them by remaining in the same position.

OFFROADERS: loop to the left with barrels. Heading for the first three levels. Bombs will drop to the right of you out of barrel's way. On higher levels it is broken as barrels are dropped on either side.

The best thing to buy is the

Amiga - on the UK version it is possible to access a further 30 levels which simply aren't present in the colour game. Press F3 for a one-player game or F4 for a two-player game (either on F1 or F2).

Andrew Davidson
Bournemouth, Dorset

MARBLE MADNESS

■ Amiga

Leave your marble stationary at the beginning of level one for a nice surprise.

Mark Henderson
Geesham, Newcastle upon Tyne

Complete the level three times and jump off the ledge. You will receive a jump bonus and you'll be transported to the secret water level.

Robert Mulla
Leicester

CAPTAIN BLOOD ■ ST

A few tips plus the solution:
 1. In the beginning, Kingpin, Torpedo and Inzaghi give out to avoid information. So get the items to say something other than "Please Sirs Forbidden - Code" only with "impossible level".

Finding doors over talk to the Yoko - he will tell you to find Maxon. You should then return Yoko to an unactivated plant (only will die). Leave this there and make for a hidden plant. Once there, say "Yoko" to the robot and he will give you a list of instructions. Follow the coordinates; you will find Yoko (thing being rescued by a clone). Give him the identity of the plant where the Maxon can be located (this is Randomness 87) and he will give you the coordinates of your first clone.

Clone two: ask the Major called Maxon three.

Clone three: ask clone two.

Clone four: ask the Yoko's president of Tokyo. His coordinates can be found from a Rugged.

Clone five: same place as clone one.

Clone six will get you the coordinates of Tokyo in the beginning. When all the clones have been deactivated, find Tokyo and teleport her. She will be respectively across the cockpit of your ship. All the items will flash and Blood will start to shake. This is the end of the game.

Miles Foster
 Lingfield, Surrey

IKARI WARRIORS ■ ST

When you get a high score, enter the name FREDDO - this gives you membership.
 Jason O'Lea
 Leeds, Yorkshire

SOCCER SUPREMO ■ Amiga

Love or money? Then set a couple of players and take on some opponents. Sell the accessories in Season 4 for around 6400 - the price jumps according to Division. For instance, it is possible to sell players in Season 3 for 140,000 (although it can be as little as 14,000). Keep selecting and until you are offered a decent price. Don't sell too many players as the program will crash.

If you want to win every match you play, load your position at the start of the season and play one match. Load in your saved file if you lose or draw the first match; change the team and keep on playing until you win. Save the winning match. It is possible to reach the top of the Division by continuing with three tactics:
 Mark Palmer
 Chesham, Essex

FLIGHT SIMULATOR II ■ ST

How to attain a certain height, but can't be bothered flying around for ages, turn SUON on and press key 00 to rise up. Stop down with key 00. Turn SUON off and away you go.

Andrew "Has anyone managed to fly under San Francisco Bay Bridge while doing a barrel roll" ... I have! Jackson
 Hayton, Liverpool

HACKER ■ Amiga

At the LOGON prompt enter one of the following:

CONG BILL
 MM CONG
 WMM

and during the game try at:

ROD GARD
 WHITE WHITE-0
 L Pham
 Garsport, Kent

PREDATOR ■ ST

Reset your computer, insert the ST language disk into drive A and double click on the drive A icon. Double click on the PREDIC.PRG icon when it appears. Type in the listing exactly as printed. Insert Predator disk 1 into the drive and type RUN followed by a tab of the Return key.

ELIMINATOR

HEWSON

ST - \$29.99, reviewed. Joystick only

Arriva - \$19.99, out now

From the author of *Impossible* and *Reflexes*, John Philips, comes some burnin' roadster violence in *Eliminator*.

You fly a hover-ship along an unending road that twists and curves through and over barren wastes, forests, towns and space

bridges. You control only its horizontal movement - height and speed are pre-set - but since the distance you can see ahead is constantly changing this is more than enough to accuse you. To make matters worse, there are masses of bizarre alien firing bus choppers as you skirt strange obstacles and barriers that bar the route, making this journey a highway to hell.

Fortunately, you have a range of weapons of your disposal, collected by driving through revolving data pyramids. Their ammo can be recharged by manoeuvring through orange cubes. You can switch between dual-fire cannons, bouncing bombs and spike launchers by pulling or pushing on the stick, though each time you're blasted you lose one of the five weapons available.

Adrenalin

Eliminator takes practice. Once you've worked out how to negotiate the twists and turns of the first highway stretch, it's on to the next and your trial and error starts again. Luckily, there's a password system for entering higher levels once you've mastered lower ones. At some points you find it difficult to be sure whether you're coming in going or certain sections make repeated action when you're flying

■ You burn up a spot of Australian Highway

across down along a road hanging in the sky! Like the recently released *Overlander*, the earliest stages are the most difficult and require masses of patience, but once you have every weapon in the world to blast the living daylights out of all that means, it's the kind of patience that's never been a virtue.

In sum, a tortuous drive through hell requiring assiduous reserves of colour and courage for adventures with turbo charging adrenalin.

■ Frantic or calm? Your hover-ship bleats with full cannons

VECTORBALL

MASTERTRONIC

Arriva, \$14.99, reviewed. Joystick only

ST, \$14.99, out now. Joystick only

MAD MAD MAD, or *Mastertronic's* Added Dimension as it says on the packaging, *Vectorball* is a curious blend of ice hockey, football and bowls played on a chess of metallic pithers between two discs. The spirit of the game, curiously enough, is to score more goals than your opponent - this is great but when you're playing a friend but the computer is almost impossible to beat.

You score by manoeuvring the ball to the end and goal mouths, though you're unable to move with the ball - you must remain stationary and shoot by pressing Fire. You can judge the power of the shot by checking out the length of your disc's track! (The lighter the little head moves along the track the more welly in the kick. You can also work out exactly when your

opponent's about to shoot and tackle him by running straight into him. Play can be quite confusing, as the pitch scrolls to follow the movement of the ball - if your disc is out of sight you have a hard job working out which way to manoeuvre around the surface humps and dips.

Ditch pitch

Your play area may contain ditches, hills, valleys, ridges or a combination of each and all. On the Arriva version you can also choose between a duffed or shaded pitch - the latter takes ages to generate but is well worth the wait as the resulting play area takes on a 3D metallic 'look'. As you progress to higher levels, the pitches become more and more irregular and difficult to negotiate.

■ Shades of football, ice hockey, cricket, bowls and more in *Vectorball*

You can also change the mass of the balls and discs, and versatility factors such as disc acceleration, braking and friction.

While sound is largely confined to quiet FX of bumps and crashes, the graphics are fine. At the end of the day, it's the kind of game you should be able to see as a desktop accessory.

CARRIER COMMAND

REALTIME/RAINBIRD

Amiga - £24.95, mouse, joystick, Version just out.

ST - £24.95, mouse, joystick

Carrier Command caused a sensation by combining arcade action with a strategy game when it was released for the ST a couple of months ago, and now Amiga owners can get a slice of the action.

■ The equipment stores and the range of hardware you'll find there

■ Four Marins is about to launch

- Click here for manual control
- Here to plot a course
- Here for aircraft setting
- Click here for aircraft traffic control
- For updated status reports on defence side

GAMEPLAY

You command the ACE Exeter, a 200 tonne aircraft carrier equipped with 3 Marin fighters, 3 Ralos amphibious tanks (AMTs), aerial reconnaissance drones, a laser turret and a whole host of tactical assault weapons.

Your task is to secure an archipelago of volcanic islands from the rebel ACC Omega carrier in a bid to tap precious seismic energy. You achieve this aim by deploying your military resources in a war of attrition - systematically establishing bases on each island by dispatching an Automatic Control Centre Builder pod. You have three types of ACCB at your disposal: Defence - for protecting the island network already under your control; Resource - for mining and refining raw materials and factories - for manufacturing equipment from raw materials.

If the island is already under enemy control, a different strategy is called for. First you take out ground and aerial enemy defences - your AMTs are able to perform on autopilot or can be manually operated using the mouse and/or joystick. A quick click on an icon enables instantaneous switching between vehicles.

Arcade action is smooth, fast and furious. Heavily defended islands require a prolonged coordinated assault. The crop de grace is clearing of the island's control centre, necessitating the use of a laser turret which utilizes the enemy's computer and miraculously puts it under your control.

Carrier Command involves a complex combination of strategy and arcade action. If the task seems too daunting you can opt for an action game on start-up which prepares a random but equally hot armed scenario designed to take place midway through a strategy game.

GRAPHICS AND SOUND

At the time of its release on the ST, Carrier Command received acclaim for its fluid 3D animated graphics almost on a par with the Technemos' Zark. However, the sight of a Marin strag off from the Exeter's deck, pluming a red-on, and then accelerating away with the shot planning to maintain the Marlin's position mid-screen leaves even Zark/Virus 3D routines far behind. Accompanied by stereo sound and an increased number of specheffects, the Amiga version pushes excellence to the max.

Although Carrier Command's most enduring feature is the real-time icon control of multi-view synchronised action, there are a range of other screens to view. The revolving wire frame damage status screen, the cargo hold supply screens, the intelligence report updates and network status displays are all part of an impressive (on down command) system designed with great care and attention to detail.

■ Go up and away

- Various weapons available
- Automatic pilot
- Click and plish flight controls
- Click on the blue to increase flight speed
- To activate radar window
- For rear view of action

CONCLUSION

The gameplay of Amiga Carrier Command is a significant improvement over the ST version where the wall-staters evaded while the Exeter huddled between islands were almost long enough for you to just an order Battlefield set as your head. The result is as conclusively brilliant as all departments as you're likely to encounter without 100 MHz chips and hi-def monitors.

HOSTAGES

INFOGRAMES

ST - \$24.99, joystick. Reviewed

Amiga - \$24.99, joystick. Due September

The first of ten infogrames titles to be released over the next three months, *Hostages* is a strategic arcade game allowing six characters to be simultaneously controlled in a bid to storm an Embassy and free captives. Yes, urban anti-terrorism has made it to the micro and here it's a French SAS squad you command. Perhaps an assault on the Rainbow Warrior would have been more true to life!

■ A chopper delivers your kit over to the roof

GRAPHICS AND SOUND

Hostages' graphics are impressively smooth and atmospheric. The exterior shots depicting the mission's locations and views stand as finely detailed back grounds over which animated foregrounds contain flowing animated action inside the Embassy movement between rooms is temporarily halted by fast screen wipes which have the effect of disorienting the terrorist. When you enter a new room, the brief pause for a screen change gives you just enough time to glimpse your strategy map before you hit the trigger in anticipation of an encounter that may leave you with a calendar for a stomach.

Sound effects feature some of the best gunfire samples around out with the grains of dying men - well, what else would you expect in a game that deals with a distressed gung about its warlike duty?

■ Ducking your way to a doorway as the searchlights beam in on you

■ You should down the outside wall looking for a window

■ Inside, you come across your first hostage

■ There's a justice size and can take in the sights

GAMEPLAY

It's 3.45 a.m. and you're testing out your strategy. After selecting the level of difficulty - determined by the total time to complete the overall mission - you have to place three marksmen of safe hostage points around the Embassy in preparation for a further three to be sent in by helicopter to its roof. One by one you position your marksmen along three sides of the building by guiding them with joystick between the terrorist's searchlights scanning the perimeter. There are various doorways and walls to take heed as you dodge the sprays of machine-gun fire on your way to a pre-selected position. Dodging the fire involves a number of leaps and cuts which would naturally require high-speed reflex reactions. Thankfully, you appear to be well protected all round as bullets bounce off you for quite a while before you finally hit the mark.

Once in place, you can look to a sniper's eye view of the Embassy windows you're covering and attempt to take out the occasional figure you might sight behind the glass. But beware, the terrorists get hostages in the window from time to time.

You are then shown the arrival of your assault squad on the roof and select the first one to shoot down and get behind through a window. Once inside you view the proceedings from behind the handle of a machine gun. A small map indicates your position and that of any terrorists on that floor. As you move from room to room, fast close-up shots depict nearby doorways. As you to the tension. Suddenly an armed teenager will appear out of nowhere and you have no choice but to pump him full of lead. Action is very fast and you need to be pretty quick on the stick to turn him into a target. As there are 14 guys all ready and waiting to cut you in half, you'll be switching through to your second and third backups to flush out all fears and find and rescue the hostages.

CONCLUSION

Maybe a little dubious in the content department - but that's never driven offshoots of shoot-outs in the past - *Hostages* manages to effectively capture what we can only assume to be the edge status of an armed target. Graphically, the game is up to the usual high standard of infogramme releases, so if you're after convincing atmosphere, tension and the chance to test the sharp end of the entrance team you'll find *Hostages* quite a liberating experience.

THE VERY BEST IN

ATARI ST ENTERTAINMENT

STARRAY

HIDDEN TREASURES/LOGOTRON

Amiga - \$24.95, mouse, joystick. Reviewed.

ST - \$19.95. Under development.

Logotron's pioneer Amiga shoot-'em-up *StarRay*, is the first game we've come across to feature a fast game option to prevent you from playing it all day. Invoke this and you

have to reboot to play again - essential when there are other, less enjoyable, things to do. Also a sure sign that the programmers know they're on to a winner.

■ This kind of action requires mountains of patience

■ The order number of objects (besides you) in the center and the installations at the bottom are active and flexible

■ The shield bar above your remaining energy supply

■ The register above - you have a count down left

■ guess what?

■ In the jungle and up against all kinds of enemies

■ In some alien worlds somewhere...

GRAPHICS AND SOUND

Each landscape is ingeniously coded to present fast moving foregrounds against slower moving horizons. This multi-plane scrolling has the optical effect of speeding up action considerably. Here vehicles move quickly and with flicker-free stability irrespective of the number on screen. Along with visual spot-effects such as explosions, the laser fire and vaporation effects are sharp and clear.

Sound effects are also particularly impressive - spanning an entire screen of stars is greeted by what sounds like deep digitized groans. Loading and inter-screen music helps complete the overall sense of atmosphere.

GAMEPLAY

StarRay has seven levels of multi-plane parallel scrolling screens through which you fly your fighter armed with lasers and smart-bomb vapourers. The action is thick and fast and requires the kind of aerobic skills you may have acquired in *Defender* and its clones. Your mission is to protect energy, robot and antigen installations against alien hordes. The most common aliens are Landers which not only return fire but attempt to land on installations in order to transform them into gun emplacements. Other opponents consist of green spheres which explode to shower several pursuit UFOs in your direction, trails of manoeuvring bombs, molecular fires and saucers, alien worms, hardware leaping springs and alien blue hunkerbunns. You can guess it, the action is frenetic and cerebral to boot.

Luckily, some Landers have installed bonus balls behind when you've terminated them. These produce a variety of effects if you can collect them by running through them - you can improve your acceleration and speed, gain rapid fire, greater laser penetration, limited vulnerability, continuous fire and bonus points. If you are especially good at dodging efficiently with the alien damage merchants you may come across an Arbo which you have to make as mobile as shooting down. So like an American agent? - Eh. Oh exploding, an Arbo rewards a capsule which boosts your energy to max if you catch it. There is no other means of increasing energy and the game ends when you're out. Fortunately, an option has been included which allows you to restart a game at any level from 1 to 4, though only in the first level will you possess maximum energy.

■ Striving to save the score layer

CONCLUSION

A great first for Logotron's 16-bit market plans, *StarRay* provides state of the art multi-plane scrolling and with frantic action. Although the game bears more than a passing resemblance to *Defender* this should be considered a positive feature since the original concept has been enhanced with a great deal of class and style. As Steve Bak is working on the ST version expect an equally comprehensive alternative aimed at that machine too.

SUMMER OLYMPIAD

TYNESOFT

ST - £19.95, reviewed, joystick

Amiga - £19.95, joystick

Modern Olympics have been held since 1896 but it seems our American cousins haven't really caught on yet; this game has been released as 'Summer Challenge' over there. Ironically, this is probably more appropriate

since the five sports events in Olympiad: the game - Triple Jump, High Dive, Fencing, Hurdles and Skat Shooting could hardly be described as representative of Olympiad: The Games.

Jump a fence?

Just about to land after the with attempted take off.

Shoot that skat!

Mid you enter the pit!

Hardly hunting over the hurdles?

GAMEPLAY

Up to 5 players compete in a pentathlon after a brief opening ceremony, you find yourself with a shotgun in hand ready for a rapid or slow shooting. You can opt for either mouse or joystick to move the cursor across the sky controlling an animated figure with a gun. Each round has seven 'stations' requiring an average of 2 to 3 shots to complete. Thankfully you don't have to be too accurate.

Triple jump is next on the list and is the hardest of the five. You need to toggle your joystick from left to right very rapidly to gain maximum speed and then pull back to lift-off. Hit the when you meet the take-off board and the animated figure hops and stays until you pull on the joystick again to determine the degree of jump.

Fencing is controlled by the joystick too and you play against a computer opponent whose pat-

terns and lunges are pretty consistent. The three rounds last 60, 70 and 80 seconds respectively and in those times you must score as many 'tapes' hits as possible.

The High Dive is perhaps the most fun since it's so high that a real person would probably stutter as you shoot. With the joystick you control the speed of tumble and amount of back before you pit and attempt to enter the pool as gracefully as possible. As the dive is so long it can get really complex - how about 30 forward rolls without with slow motion cartwheels?

Finally, Hurdles has some of the best animation ever seen to be used on a home screen, as you race with four competitors to a finishing line in the distance. Running into a hurdle doesn't lose you points - just time.

GRAPHICS AND SOUND

Olympiad's graphics are of a very high quality. All screens are clearly drawn, smoothly animated and feature true perspective graphics. Each event is preceded by a different background music track and excellent start screens of hand drawn artwork. Tynesoft's programmers have concentrated on the animation of the competitors - most effort has been put into the movement of the hurdles, the event commences with a tilting gun view, moving down-

front or high to track level. As the hurdles dash off, your view remains constant, just behind your chosen competitor. The smooth animation of the hurdling is first class.

Sound plays a useful ambient role. From the gun shots in Skat to the sound of running feet in Triple Jump, from the splashes of High Dive to the crash of a hurdle as you hit it, special-effects are very convincing.

CONCLUSION

Despite excellent graphics, sound and gameplay, it's well as though your real life performance in any of the five events would improve as a result of playing the game, so it wouldn't seem to appeal to the sportsman. However, it's graphics are second breaking and you should check it out for those who.

QUICKIES

A pair of utilities come under the Format microscope — one to allow you to run mono and colour software all on the same ST monitor, another to save you Amiga disk space. How do they rate?

OMNIFILES

£39.95 ■ ST only, all models ■ Eidossoft, Ltd 07, Royal Mills, Esher, Surrey, KT11 5AB (0372 89922)

If you've got your ST hooked up to a colour monitor or television then doubtless you will have looked or is aming at the excellent picture-quality offered by Atari's 58824/58825 all-mono monitor — not to mention all the very mono-forme software that's out there. Similarly, if you have a monochrome monitor you'll probably have gazed in awe at the technicolour games and paint programs available to colour-monitor users. Stop frowning sorry for yourself! Eidossoft's Omnifiles utility might just be the answer to your problems.

Omnifiles displays the same meaningless alphanumeric menu no matter which monitor you have connected —

meaningless because each item is called 'OmnifileX' where X is simply a number. If you're emulating a colour monitor then the display consists of black and white, four grey scales and 35 grey scales. 7080 and Mega ST owners can also select a fast-updating version that uses 35 grey scales. The last four options are for colour programs that try to read the screen colours during execution.

Historically the lower grey scales used, the faster screen updating will be. Colour pictures displayed on a monochrome screen look very sharp, but animations (games) can be reduced to full speed.

You're probably aware of what a

more emulator is capable of — especially if you have toyed with Max World's version supplied with our own issues 1 and 2 disks. Omnifiles only offers two versions of the monochrome emulator. The first version is for standard 520s and the other for machines with one megabyte or more (screen updating is faster).

The monochrome emulator has five display modes: a scaled representation of the 640 by 400 screen, an expanded top half of the screen (giving a true mono screen aspect ratio), an expanded bottom half of the screen, and an expanded version that can be scrolled from top to bottom using the mouse. You can flip between these modes at any time.

Programs which stick to GEM's rules work well with other emulators. Protected games and other auto-launching software does not. Check with Eidossoft that Omnifiles will work with the programs you wish to run. There are hundreds that do work and hundreds that don't.

■ Omnifiles emulating a colour screen on a mono monitor. Colours appear as shades of grey. All the features of Real Max are available, including speed game speed is restored.

DiskPro +

DISKPRO+

£22 ■ Amiga only, all models ■ Amiga Centre Scotland, 4 Hart Street Lane, Edinburgh EH1 3HH (031-957 4242)

Why is it that no matter how large the capacity of your disk drive, be it 1MB, 30MB or even 100MB, your disks still seem to fill at an alarming rate? More often than not this is due to old files you are keeping, just in case, although they may be of no immediate use. One solution to this problem is to compress all your archived files and then decompress them only when they are required.

DiskPro+ is a file compression utility that claims to decrease the size

of a file by up to 50%. Four programs come on the disk that can be run from either the Workbench or from the CLI. The main program, Disk Doubler, allows for the compression and decompression of files from within a friendly contexted text edit, while the other three programs are freely CLI-based.

In our tests, several different file types were fed through DiskPro+ including an ASCII text file, an RT-10M picture file, a Program file and

an RT-1000 (owned) compiled file. The files shown in the box were produced (all figures in bytes).

The figures gained are on the whole representative of what you would expect from most file compressing programs. The extra 35k added onto the RT-10M file is rather disturbing and demonstrates that there are definite flaws in the program's compression technique.

One thing that you should consider before looking out for DiskPro+ is what it offers that PD compressing programs available in the Feb or Amiga Libraries don't. Quite simply, nothing. Over £15 for a PD disk.

File Type	Normal size	Compressed	Saving
RT-500X	41288	49773	0.8%
ASCII text file	14900	8841	40.1%
RT-10M	58670	78028	-25.6%
Program	13844	13601	10.5%

features	3.0
performance	2.5
ease of use	3.0
manuals	2.5
format verdict	1.5

COMPRESSION METHODS

For those of you who are interested, DiskPro+ uses a modified Lempel-Ziv technique. This basically works by searching for common substrings and replacing them with variable sized codes. The compressed file is then saved with a .Z extension (or .Zv) in its compressed form. A file is not lost to attrition and it is not through the decompressing program.

DISK EXTRA

ST Amiga Format's unique dual format disk gives you the best of both ST and Amiga worlds! Jason Holborn details this month's cover disk programs.

ST

74 PIPE PANIC

Big deep underground for 'Black Gold', while avoiding obstacles. It looks good, sounds good and plays great! What more could you ask for?

75 MANDELBROT GENERATOR

Mathematics can be fun! Create screens full of chaotic color with this Mandelbrot pattern generator.

77 SPELLER

Avoid those embarrassing spelling mistakes with this great little Spelling Checker program. Speller even lets you add your own words to its dictionary.

77 ST_INIT

Local only for accessories you want. ST_INIT lets you keep your ST completely under control.

77 PRO CALCULATOR

Whether you're a programmer or just hopeless with numbers, Pro Calc will help you figure out the figures and save all the sums.

77 RAT TRAP

Keep those mouse firmly fixed to the menu bar until you want them. Rat Trap is a clever little mouse-click controller.

AMIGA

74 MISSILE COMMAND

Defend your cities from another alien onslaught in this fast and furious arcade game. Missile Command uses sampled sounds for extra realism and will have you glued to your Amiga for hours on end.

75 IFF2PCS

This great little game turns any low-resolution ST picture into a picture. We've even included a region's gallery for you to compare with.

76 VT100

Communicate with the outside world using this fully-featured communications program. Join the console brigade with VT100 and a modem.

76 LENS

Take the strain off of the old eyes with this fancy little screen magnifier. Lens lets you zoom in on any part of the Workbench screen.

79 MCG8010 UPGRADE

Keep up with the Joneses by upgrading your Amiga to a more powerful processor. Replacing the 68000 with a 68010 can speed up some programs by as much as 50 percent.

WE'RE PAYING £800 FOR GOOD SOFTWARE ON OUR COVER DISK

We're looking for good quality software to fill our cover disk each month. If you're a nifty programmer you could earn big bucks from your labours - games, business applications, utilities, or anything of general interest. We're also interested in any specially original graphics you may have created with art packages, either for inclusion on the disk or printing in the magazine.

Turn to the end of this section for more details on how to get your software onto the Format cover disk.

ST

First, copy and load the disk as described at the end of the Disk Extra section.

PIPE PANIC

by K. Swaine

Colour STs only

FILENAME: P_PANIC.PRG

Top of the bill on the ST this month is Pipe Panic, a game which features excellent graphics and sound. Written completely in BASIC, the program is a superb example of what can be achieved with the language: professional programmer's tool to file.

The aim of the game is to collect all the oil blobs scattered about the screen while avoiding the underground debris. Once you've completed one screen, it's on to the next in a challenging series of fifty. After forty-five screens there's a unique bonus game where you try to collect all of the blobs in the fastest possible time for a high score.

Load Pipe Panic, either by clicking on the P_PANIC.PRG icon on the

desktop or by selecting it from our CLICK_ME menu program. Pipe Panic is written completely in Fast BASIC and uses the custom system from that language to produce a stand-alone program. Once the runtime program has loaded, you have to load the game from disk by selecting

'Load Program' from the File menu. A file requester box appears listing all the files in the root directory of the source disk. Click on the P_PANIC folder and then double-click on the P_PANIC.BAS to load it. Once it's loaded, select 'Run Program' from the File menu, and the game starts.

AMIGA

First, copy and load the disk as described at the end of Disk Extra. These programs run on all three Amiga models. We have been unable to test them on the early version of the Amiga 1000.

MISSILE COMMAND

Public Domain ■ All Amigas

FILENAMES: MISSILE_COMMAND, MISSILE.DOC

If fast and furious arcade action is your bag, look no further. Missile Command contains all the elements that make a great arcade game:

great graphics, shattering sonic, and immediate playability.

The aim of the game is to prevent the oncoming hordecast of alien missiles, rain down on your planet. Using a system Frame Resizer would be proud of, you aim to destroy the missiles in mid-flight, before they reach the ground, spelling certain doom for the human race.

You can load Missile Command either from our open disk menu program CLICK_ME, or by clicking directly on the Missile Command icon on the Workbench. The sampled sounds are not loaded but need to be copied from within the program. Do this by selecting 'Load Sounds' from the Sounds menu. The program always tries to load the game's sounds from drive #0; so always play Missile Command from disk in your Amiga's internal drive.

If you have access to a sound sampler or any sampled sounds in #0 format, it is possible to replace the included samples with sounds of your own. All the Missile Command samples end with _sound to you should have no problems finding them. To actually replace a sound, copy the new sound file into the Missile Command disk with the same filename as any of the existing _sound files.

MANDELBROT GENERATOR

by J.Kalk

Colour STs only

FILENAME: MANDEL.PRG, MANDEL.DOC

Over the past few months, Format has been flooded with Mandelbrot sets (and I forget my tanks - Ed. How indicative testing of all of them, J. Kalk's was judged the best).

A Mandelbrot image is the visual representation of a mathematical expression involving the area around the

origin of the complex plane. Complex numbers aren't really within the scope of this magazine, but the results of getting the Mandelbrot set are. The patterns are generated by this program on your ST - all you have to do is enter a few parameters and off you go!

It would be wrong for those who expect instant results. Mandelbrot sets require a lot of very complex (and mathematically and even the mighty 68000 processor can get a little sluggish) to be prepared to wait, but instructions on the Mandelbrot set can be found in the program's documentation file, MANDEL.DOC.

BT2PCS

All Amigas

FILENAMES: BT2PCS,

BT2PCS.DOC

BT pictures are all very well, but they're not of much use once they're finished. It's a bit of fun drawing them, but once they're completed, they are usually just left on a disk for posterity - a classic case of left for art's sake! BT2PCS is an enjoyable puzzle game with the added advantage of making use of your BT art.

BT2PCS takes any picture, or colour BT picture and cuts it up into pieces. The size and number of these depends on the level of difficulty. The game isn't that demanding and if you've ever puzzled over a jigsaw then BT2PCS will look very familiar.

BT2PCS is run by clicking on one of the *pic* files in the same directory as the main program - it can't be run by clicking on the program icon itself. Alternatively, you can load BT2PCS from our menu program, CLICK.ME. Running from CLICK.ME automatically loads BT2PCS with the same image each time, so to use any other you should load the program from the Workbench.

Any BT picture (65 colour picture) can be used with BT2PCS, as long as you first make a simple change to the default tool menu *BT2PCS* information file, so that it automatically loads the picture program. To do this, select the BT file's icon by clicking on it from the Workbench, and press the right mouse button to show the Workbench menu. Select *Info* from the Workbench and the BT file's icon information is

displayed. Find the 'Default' tool field and click somewhere within it. If there is already text within the field (eg a *CHART* picture file will show something like *CHART.CHART*), delete this,

enter *BT2PCS* and press *Return*. Select *SAME* and your picture file is all for use as a puzzle, as long as BT2PCS is in the root directory of your disk.

SIREN

SOFTWARE

SECOND DISC DRIVE

Add an extra drive for only £84.99

Our superb drive can really help you make the most of your ST allowing complex software to be run without disc swapping etc. This drive comes complete with all cables to connect it to any ATARI 1040 STF or 520 STFM

- ★ Ultra quiet
- ★ Slim styling, colour matched to the ST
- ★ Top quality Citizen/NEC drive mechanism
- ★ 1 megabyte capacity (unformatted)
- ★ Full one year parts and labour guarantee.

Available now only **£84.99** inc. VAT & P&P

NEW

... AMIGA SOUNDBLASTER ...

NEW

Everyone knows that the Amiga has the best sound facilities available on any popular computer today. Unfortunately until now, unless you could connect your Amiga to your stereo system you could not appreciate the quality of the sound.

The AMIGA SOUNDBLASTER is a small stereo amplifier that comes complete with 2 high quality 20 WATT 3 way speakers. It is easily connected to your Amiga 500/1000 and adds a new dimension to all games.

- ★ Comes complete with 2 high quality stereo speakers
- ★ Twin volume/balance controls
- ★ Headphone socket
- ★ Very easy to connect
- ★ Compatible with all software/hardware

★★ Free stereo headphones with all orders for a limited period ★★

Amiga Soundblaster is just **£39.99** including VAT and P&P

SPELLER

Public Domain

Medium,16-Bit STs only

FILENAMES: SPELLER.TOO,
SPELLER.DOC

How nice a spelling checker! Sending letters rotated with spelling mistakes to your Basic Manager (our two November - C&E) is a certain way to impress him. If you're just one of the those people who never could get the hang of the English language and its peculiarities, then Speller will be of great use to you.

It scans an ASCII file, checking the spelling of words by comparing them with its own dictionary of commonly used words. The dictionary grows each time it finds a word that it correctly spell but not already within it.

When Speller finds a word it thinks is misspelled, it stops scanning the file and you can choose to ignore the word, change its spelling or enter it into the dictionary.

You can run Speller from CLICK.ME or by directly clicking on its icon from the desktop. Once loaded, you will be prompted to enter the filename of the dictionary. The dictionary included on the cover disk is called SPELLER.DOC; enter the same including the full path to the file and the dictionary is loaded into memory. Finally, you enter the filename of the ASCII file you want to check and Speller starts doing its stuff.

RAT TRAP

by A. Thomas

All STs

FILENAMES:
RAT_TRAP.ACC,
RAT_TRAP.DOC

How many times have you accidentally moved the mouse pointer over the menu bar on the GEM Desktop and dropped down a menu that you didn't want? It can get annoying after a while can't it? Help is at hand in the form of Rat Trap, an incredibly simple Desktop accessory.

Rat Trap alters GEM so the menu, only drop down when you click on the menu's heading in the menu bar, the way the Macintosh does it. Two modes are available, 'full' and 'partial'

PRO CALCULATOR

Public Domain

All STs

FILENAMES: PRO_CALC.ACC,
PRO_CALC.DOC

One nice feature of the Amiga's SMP system is the very handy calculator included on every workstation disk. This little gem (part of a program is available) component in the Amiga's Workbench arsenal. With Pro Calc, ST owners can also benefit from having a calculator resident on a Desktop

accessory. Once installed, select Calculator from the Desk menu and a powerful programmer's calculator is instantly at your disposal.

Pro Calc is an accessory program and therefore cannot be loaded like a conventional program from the CLICK.ME menu. To use any accessory file it must first be put in the root directory of your boot disk. Copy the PRO_CALC.ACC file into the root directory of your disk by dragging it from the CALC.DOC directory of the cover disk. Reset your ST and insert your work disk into drive A. GEM automatically loads Pro Calc and any other accessories and lists them in the Desk menu.

Desk File Flow Options

ST INIT

by S. Walker

All STs

FILENAMES: ST_INIT.PRG,
ST_INIT.DOC

Desktop Accessories are wonderful things, but they have two disadvantages: only six can be loaded at once and they take up memory all the time they're loaded, even when they're not running. Wouldn't it be nice if you could choose which accessories are loaded when the ST boots up? Well, now you can with ST_INIT.

ST_INIT displays lots of useful

information about your ST during boot, lets you set the system time and date and select which accessories are to be loaded.

You can load ST_INIT either by selecting it from CLICK.ME or by clicking on ST_INIT.PRG from the desktop. Although ST_INIT runs live from the Desktop, it was designed to sit in the AUTO loader of your work disk. Copy ST_INIT.PRG into the AUTO folder by dragging it to the AUTO load or icon on the root directory of your work disk.

Full instructions are included with the program under the filename ST_INIT.DOC.

and if Mac menus don't appeal to you, the Trap can be turned off altogether.

Rat Trap is a desk accessory and therefore cannot be loaded like a conventional program from the CLICK.ME menu. To be able to use any accessory file it must sit in the root directory of your boot disk. Copy RAT_TRAP.ACC into the root directory of your disk by dragging it from the RAT_TRAP directory of the cover disk. Reset your ST and insert your work disk into drive A. GEM automatically loads Rat Trap and any other accessories and lists them in the Desk menu.

DISK DOCUMENTATION

Many of the programs on ST Amiga format disks are Public Domain, in such cases we've simply passed on their standard documentation files unchanged, as is required by the ISO code of practice. Some of the programs in this category that we list, or please don't count as for our ratings!

VT100

Public Domain

All Amigas

FILENAMES: VT100,
VT100.DOC

If you've read the rest of Format, you'll be aware that this month's issue features a packed article on communications. More and more people are getting into comms and every day we hear news of new bulletin boards around the country. No matter what your interests, there's nearly always a bulletin board that can cater specifically to you. To get involved with the exchange of interest in comms, you'll need a modem and suitable software. The choice of hardware is entirely up to you, but for software we present the VT100 emulator, a full-featured communications program.

Even if comms isn't of interest, VT100 can still be useful. If you're the owner of more than one computer (ST and Amiga?) then you can use VT100 to transfer files between the two, through their serial/RS232 ports. Both the Amiga and ST feature standard RS232s and we at Format use VT100 to transfer files between our Amiga and STs and Macintoshes. Of course you'll need a similar package on the other machine, but these are readily available commercially and from the Public Domain.

You can run VT100 by either clicking on its icon or by selecting it from the **CLICK ME** menu. VT100 requires access to the archive/scene file in the **DEVS** directory of your Workbench disk. When you're prompted for your Workbench disk, follow the on-screen instructions and VT100 loads and runs with minimal hassle.

Full instructions on the use of VT100 can be found within the same drawer as the VT100 program in the file **VT100.DOC**. This file is definitely recommended reading.

MC68010 UPGRADE

Public Domain

All Amigas

FILENAMES:

MC68010.DOC, DECIGEL

As this month's **Future** feature on 68000 processors explains, the 68000 used in the Amiga and the ET is a rather dated piece of silicon. The latest addition to the 68000 family, the 68010, runs at an astounding 30 MHz. Upgrading your Amiga to a 68010 or higher is a tricky task because the chips are not pin for pin compatible with the 68000. Luckily the 68010 has the same pin arrangement and it's therefore possible to swap the old chip for a 68010 with the problems.

Installing a 68010 in your Amiga can improve its speed from 8 to 50 percent, depending on the program

being run. Any program that accesses the Amiga's custom hardware will be slowed down to half everything in bits, but speed improvements really start to show with programs that

crash out a lot of heavy number crunching, such as **Scotch 3D**.

Sounds great doesn't it, but there's a slight snag. The machine code instruction **MOVE.W** is free on a 68000 but it's illegal on the 68010 in some cases. Any program which uses this instruction on a 68010-based computer is therefore likely to crash the system. Luckily there is a software fix for this problem in the form of the **PD** program, **Dev2Dev**. **Dev2Dev** sits in the background and intercepts **MOVE.W** instructions, replacing them with an equivalent legal instruction. We've included the **Dev2Dev** program with the instruction file, **MC68010.DOC**, so everything should go smoothly.

FORMAT WARNING: This upgrade is definitely not for the faint-hearted. Amigas are very delicate machines and can be easily damaged. Upgrading your Amiga will void its warranty.

LENS

Public Domain

All Amigas

FILENAMES: LENS, LENS.DOC

LENS is another intriguing addition looking for a problem to solve. It's great fun to use so we've included it anyway - perhaps someone will think of a good use for it. The program provides a 'zoom window' similar to those found in art packages like **Delux Paint**. By moving the mouse pointer around the screen you can view a close-up of any part of

the Workbench screen.

On the side of the **LENS** window are three gutters, a '+' sign, a '-' sign and a question mark. Click on the '+' or '-' to increase or decrease the magnification, and on the question mark to bring up an information window showing details of the author so we can all add to the knowledge.

Load **LENS** by clicking on its icon on the Workbench or by selecting it from the **CLICK ME** program. A short text file from the author is included with the program.

GIVING IT AWAY

Any program from our disk listed as **Public Domain** can be freely copied, through your own club, bulletin board or whatever. Other programs, the ones credited to specific authors, are copyright to those people. They are not **PD**. If you want to sell copies of these programs, Format can put you in touch with the authors.

HOW TO USE THIS DISK

The ST Amiga Format cover disk is a special format disk which both the ST and the Amiga can read. Even if you are a seasoned computer user, please read these instructions carefully or you could inadvertently destroy your copy of it.

The first thing you must do is make a backup copy of the disk. Because of the special format, the normal disk-to-disk copying methods, as recommended in the Amiga and ST manuals, won't work. Instead you will need to format a blank disk and copy the files individually. Don't panic, this isn't at all difficult.

DISK TROUBLE?

We have done our best to check that the programs supplied on this month's disk are simple to use, error free and have no hidden viruses. However, we cannot answer telephone queries on using the software and we do not accept liability for any consequences of using the programs.

We duplicate 40,000 disks a month, and it is inevitable that a few will be faulty. If after use you are sure you have followed the instructions on this page correctly, you are convinced that your cover disk is defective, you can send it back for a free replacement.

ST Amiga Format October Disk, OnStage Labs, 28 Byth Close, Blacksmith, Northampton NN6 6DN.

Please allow up to two weeks for your disk to be processed. **AMIGA OWNERS:** If your Amiga refuses to recognise the disk, before sending it back try using the **DISKFORMAT** utility as described on page 83 of issue 1. Don't worry that every track gives you a "hard error" - this is the Amiga being unable to read the ST parts of the disk.

WE WANT TO GIVE YOU MONEY!

If you've got any programs for either ST or Amiga which you think other readers would find useful, interesting or amusing, we'd like to know. Here's how to go about securing international fame for yourself!

1. Only send in programs on 3.5" disks; we cannot accept printed listings.

2. Make sure your disk is clearly labelled with your name and address and the program name(s), and is marked ST or Amiga.

3. Make sure there is a documentation file on the disk called **README**.

4. Provide a clear covering note explaining what the program does, and if you possibly can please also send a printed or typed on-disk documentation file. Remember your address and telephone number. Include a stamped return envelope for the disk if you want it back.

5. **THIS IS IMPORTANT!** There must be a signed statement that the program is yours and that you are prepared to assign publication rights to ST Amiga Format. Use the following wording:

The program/s (with the title here) is/are submitted for publication by ST Amiga Format magazine. It is my own work and has not been submitted for publication elsewhere.

Signed - If we accept your program, we will get in touch with you before publication to agree terms and payment rules. We will evaluate all submissions in a batch once a month, so please allow up to 40 days for return of your disk/s. We will only send back disks with adequate return postage and packing.

6. If you send us a disk with a virus on it, we reserve the right to send round the infected disk in the usual form and do not accept liability for any damage to your pet computer. Seriously, since we've already received virus-killing programs (see issue 1), do check your disks very carefully.

ON THE ST (Assuming a single drive machine)

1. Take a blank disk and format it in the usual way.
2. With the blank disk still in the drive, double click on the A disk icon to open up the formatted contents window.
3. Now drag the icon for disk B into the open window of disk A. This will copy all the files one by one off the master disk to your new disk. Make sure that the master ST Amiga Format disk is well protected (the sliding tab should be back so the hole is open) and put it in the disk drive when asked for disk B.
4. You will now be prompted at various times to insert disk A and disk B while copying takes place. There will be a lot of swapping to do on a single drive ST. Disk B should be the master disk, disk A your newly formatted copy.

If you want to cut down on disk swaps, and understand enough about the IBM, you can set up a RAM disk using the utility provided on the July 1988 disk and use that as an intermediate step.

If you want to cut down on disk swaps, and understand enough about the IBM, you can set up a RAM disk using the utility provided on the July 1988 disk and use that as an intermediate step.

ON THE AMIGA (Assuming a single drive AMIG)

1. Start your Amiga up with your normal Workbench boot disk.
1. Take a blank disk and initialize it in the usual way.
2. Make sure that the master ST Amiga Format disk is write protected and put it in the disk drive. Double click on the disk icon that appears. Drag any icons you see in the contents window into the "RAM disk" icon.
3. When the disk activity light has gone out, put your newly formatted copy disk in the drive instead. Double click on the RAM disk to open its window up, and drag icons from that into the new disk icon. This will copy the files one by one.

The programs you put out of it in the RAM disk will occur on an ASD0 - so whatever will fit, then after step 3 copy them from the RAM disk by clicking once on each and holding the right mouse button down, selecting. Clicked from the Workbench menu. Repeat steps 2 and 3 for the rest of the icons.

USING THE PROGRAMS

ON THE ST

When you turn the ST on and put your working copy of the disk in the drive, you will see a window opened with the contents of the disk displayed.

One of the icons is called **CLICK_ME_PPC** - just do what it says, doubleclick to run it. Up comes a list

of the disk contents. Type the number of the program you want to run, and you are asked whether you want to read the disk help file or not.

You will now be asked whether you want to run the program in real. As an alternative to using **CLICK_ME_PPC**, if you know enough about IBM you can click directly on the icons for individual programs. These normally end **PPC** with the documentation files having the same name as the program to which they refer, but with a **DOC** suffix. Always read the documentation before running the program.

ON THE AMIGA

Most of the programs on the cover disk are run from the Workbench, which must be loaded first from your normal startup disk, as described in the Amiga manual. Once at the Workbench, put the ST Amiga Format disk in the drive and doubleclick on its icon to open it.

You will see an icon called **CLICK_ME** - this is a menu program which takes you into the program and their documentation. Double click on its icon to run it, it will ask you for a couple of disk swaps, so just follow the on-screen requests to load the program.

Most of the programs on the disk can be executed from **CLICK_ME** by selecting them from the menu and choosing either to view the program's documentation or load the program. If a program fails to load from the menu (this, sometimes happens through shortage of memory on unexpanded systems), you can load it

from the Workbench instead, by clicking on its icon.

To load a program from the Workbench, you must first click Open the drawer which contains it. For detailed comments from the program's author click on the **DOC** file icon in the same folder; to run the program click on the main icon.

When you click on a documentation file, a new window is opened and the text is displayed in a scrollable at a time. Press any key to move from one scrollable to the next, or click on the mouse gadget in the top left-hand corner of the window to cancel the display. The **README** icon gives you a brief summary of the disks' contents and how to use it.

PROGRAMMING

LEARN BASIC

This month Intrapad programmer Richard Monteiro spends his time going around in loops but only after reaching the right decision. Here are all the right conditions for getting the most out of BASIC.

On day to day life are generally influenced by conditions when the clockwork goes off in the morning it's time to get up, if the million-man's less than football are out, if it's raining then take an umbrella to work, 'folding acts faster than thought' - so take nothing. Similarly, many BASIC instructions look out for conditions or occurrences and, if they are met, divert the user's attention to another part of the program to execute specific commands.

There's a wealth of BASIC instructions devoted to condition testing. For instance, FOR/NEXT loops check for a condition they continue looping round until a variable reaches a particular value.

```
FOR counter=0 TO 1 STEP -1
LOCATED 1,1
PRINT "condition" until condition
is met or a wall...
NEXT counter
```

This program keeps printing a number and message until counter reaches one. This should be nothing new to you, if you followed last month's article it contains which is itself an example of a condition.

Now you've seen FOR/NEXT loops in a different light, check out a few other condition-testing statements. Possibly the most popular conditional test in BASIC is IF - its semantics and usage are almost identical to those in English. For example, if your test are equal to zero then you are done could be written as BASIC as IF (100000=0) THEN PRINT "done".

In many decision-making commands are associated with IF that following the logic of the test structure can be difficult. However, here are the rules of syntax. Stick to them and you won't go far wrong.

```
IF <expression> GOTO <label>
IF <expression> THEN <statement>
IF <expression> THEN
```

```
<label>
IF <expression> THEN 1
<label>
IF <expression> THEN
<label>
IF <expression> THEN
<label>
IF <expression> THEN
<label>
```

According to the first and second rules, the examples

```
IF <expression>=0 GOTO <label>
IF <expression> THEN <label>
IF 1
```

and

```
IF <expression> THEN
<label>
IF <expression> THEN
<label>
IF <expression> THEN
<label>
```

are all acceptable. So how does it of work. Well, if the result of expression is true or a certain condition is met (checked out the point on logic if you're unsure what we're talking about then the TRUTH table is included in the program listings) if GOTO is used instead of THEN.

Statement GOTO, with IF ELSE, IF THEN ELSE and ELSE IF can contain nested IF THEN ELSE

AMIGA BASIC

Amiga

LOCATING STRINGS

The BASIC function has the for out. INSTRUMENT, INSTR, INSTR2 and returns the position of the first occurrence of one character or string using INSTR2 with another string. INSTR1 starts in an optional string variable specifying the start position of the search within string.

INSTR returns the following values:

- 1) the start position of string2 in string 1, if found.
- 0) zero, if start is larger than the length of string1.
- 0) zero, if string1 is a null string.
- 0) zero, if string2 can't be found.
- 0) zero, if string1 is not specified, string2 is a null string.

RELATIONAL AND LOGICAL OPERATORS

Relational operators are used to compare two values. The result of the comparison is either true (which is more formal is normally equal to -1) or false (normally 0). The result of this type of test can be used to make a conditional branch, using IF THEN, WHILE/WEND or that sort of structure. The relational operators are:

Operator	Relation tested	Example
=	equals	if year=1989
=>	does not equal	if year<=1989
<	less than	if year<1989
<>	less than or equal	if year<=1989

Power BASIC also offers == (almost equals) which can be used to check for near equality.

Logical operators can also be used for making conditional branches. They perform bit manipulations (producing one bit of a byte against another), or boolean logic tests. Logical operators return results from a combination of True or False operations. The result is either true (1) or false (0). The True or False combinations (and the results of a logical operation are known as truth values). The six logical operators are NOT, AND, OR, XOR (exclusive or), IMP (implication) and EQV (equivalence). The table below shows the result of these operators: 1 indicates a true value and 0 a false value.

	NOT	AND	OR	XOR	IMP	EQV
0	1	0	0	1	0	0
1	0	1	1	0	1	1
0	1	0	0	1	0	0
1	0	1	1	0	1	1
0	1	0	0	1	0	0
1	0	1	1	0	1	1

If both operands are either 0 or -1 then the logical operator will return 0 or -1. For instance, NOT 0 -1 AND 0 returns 0. It is possible to use logical operators to test bits for a particular bit pattern. AND can be used to create a set one of the bits of a status byte. OR can change two bits to create a particular value. Heavy stuff that we shall be covering in more detail in a later issue.

DOES. But the following example works, though it's quite tricky to follow:

```
IF not="Simon" then
  IF amount<10000 THEN
    PRINT not's "fantasy life"
    wait wait
  ELSE
    PRINT "Amazing population
    of 100000."
    END IF
  ELSEIF not="Sam" THEN
    IF amount<10000 THEN
      PRINT not's "having
      problems on the amazing
      size."
    ELSE
      PRINT "Population explosion
      predicted."
    END IF
  ELSE
    PRINT "Who are you?"
  END IF
```

So how does it work? The first IF checks the contents of not; if the string is found to be "Simon" then control passes to the first statement if structure. If the condition is false, though, then it, not does not equal "Simon" then the program jumps to the ELSEIF. Again not is checked, but this time for "Sam". If this test proves false, control passes to the last ELSE and a message asks who you are. The program then hits END P and stops.

Word a while

That's enough P's for a while. WHILE and WEND expressions execute a series of statements in a loop as long as a given condition is true. For instance:

```
WHILE DOB<=upper("P")
  PRINT "Enter any numbers ",
  cur
FOR col TO cur
  IF cur="max" THEN PRINT
  I="1"
  WHILE I<=cur
    PRINT "Put again
    (Y/N)";
    PRINT
  WEND
WEND
```

As long as query1 doesn't contain "N" the loop keeps looping. WHILE and WEND loops may be nested to any level for instance:

```
WHILE DOB<=1000
  WHILE DOB<=1000
    WEND
  WEND
```

WEND.

Take care not to leave any unbalanced WHILEs or WENDs - you'll get an error message from BASIC. Also, do not direct jump into the middle of a WHILE WEND loop as this will really confuse things. The following is wrong and should never be used:

```
DO WHILE DOB<=1000
  PRINT
```

DOING IT FOR THE FIRST TIME

Using BASIC for the first time? Here's how to get the program up and running. Amiga BASIC first. Insert the computer and insert your Workbench disk into a drive. When the Workbench appears, replace the disk with the Amiga Future/News BASIC disk. In Future disk will appear. Double click on the icon and wait for the contents of the disk to appear. Double click on the AmigaBASIC icon when you get it. Amiga BASIC is now ready to run. Insert either issue 2's cover disk or Apple's Power BASIC disk and press the next key if you're using the cover disk, double click on the BASIC.MLPRO icon when it appears and then select the appropriate item from the menu. For the full version double click on the POWER.PRG file icon (or BASIC.PRG if using the 479-01 package). You're ready to run. Also read the rest of the article to find out how you can create BASIC programs.

```
WHILE not=0
  Location:
  area1
WEND
```

Computed branches

By using ON GOTO and ON GOSUB it is possible to branch to one of several specified lines depending on the result of an evaluated expression. GOTOs and GOSUBs of this nature are usually known as "computed" branch commands. The syntax is ON *expression* GOTO *line1-line2* and ON *expression* GOSUB *line1-line2*:

```
onkey
on=0
IF not=" " THEN GOTO 1000
ON DOB,not,"12345" GOTO not-
1100,not,not,not,not
GOTO 1000
not=not
PRINT "Program section over"
GOTO onkey
not=not
PRINT "Program section over"
GOTO onkey
not=not
PRINT "Program section over"
GOTO onkey
not=not
PRINT "Program section over"
GOTO onkey
not=not
PRINT "Program section over"
GOTO onkey
```

The program section executed depends on the value returned by DOB. If the value is "1" then section 1 is executed, if "2" then section 2 is

executed, if "3" then section 3 is executed, if "4" then section 4 is executed, etc. GOTOs rather than GOSUBs:

```
not=not
FOR not TO 3
  ON not GOTO not,not,not,not
  not+1
NEXT
PRINT "Subroutine One" GOTO 1000
PRINT "Subroutine Two" GOTO 1000
PRINT "Subroutine Three" GOTO 1000
```

MORE CONDITIONS

From BASIC offers extra conditional structures for the programmer. DO, LOOP, REPEAT, END REPEAT, END DO, END R, END LOOP, END FOR, DO LOOP structures allow the statements within the loop until the conditions are true or FALSE is used. REPEAT contains a series of statements that will run again until an END statement is encountered. END instructions allow setting of loop structures.

POWER BASIC
Amiga Edition
Atari ST Computers

LISTINGS ON DISK

To complement this month's article on conditional loops we have a version of the classic Boulder game on the disk. It is primarily about and simple so that you can follow the logic behind it and improve it.

Loading listings into AmigaBASIC.

Insert your Amiga and insert a Workbench disk. When the Workbench environment appears, replace the Workbench disk with an AmigaBASIC disk. Double click on the AmigaBASIC icon after opening the Amiga disk. AmigaBASIC loads. Get the Project menu and select Open. Click on the filename register box. Insert the cover disk containing the BASIC files, type in LEARN.BAS and press Return. The file loads. You may run it by clicking inside the BASIC window and typing RUN (don't forget to press RETURN).

Loading listings into PowerBASIC (issue 3 drive only).

Insert your ST and place the issue 3 cover disk in the drive. Double click on the BASIC.MLPRO icon and then choose Power BASIC (P1) from the menu. Power BASIC loads. The BASIC listings are loaded into Power BASIC by selecting Load from the File menu and double clicking on the LEARN.BAS file that appears in the file selector box. The chosen file loads ready for running.

AiRT 2

Does programming scare you? Jason Holborn plucks up his courage and investigates a new system that promises to take the pain out of it all.

£55 ■ Amiga only, all models ■ Amiga Centre Scotland, 4 Hart Street Lane, Edinburgh EH1 1 031-557 4242

The main claim to fame of machines such as the ST and Amiga are their ultra-friendly user interfaces. All those windows, icons and pull-down menus add up to one immediately usable computer. But if you've ever tried programming the Amiga then you'll know that the situation suddenly becomes very different. Not a single icon is light and even the mouse, the workhorse of a WIMP-based system, is left straggling in a corner of the desk. (Sneath those user-friendly WIMP systems, nothing seems to have altered where pro-

gramming is concerned.

AiRT hopes to change all this. Using AiRT requires no typing of incomprehensible commands and meaningless functions. No longer do you have to worry about the positioning of braces and semicolons, and sort-dick, and that's it.

AiRT is a programming language that uses icons to represent its commands. Each command has its own specific icon and you program by bringing several of them together on a grid. In this sense, programming under AiRT is very similar to con-

ventional programming, apart from the fact that your program ends more in the form of a flow-chart than an ASCII text file.

The range of icon commands is extensive and includes most of the commands you'd expect to find in a good programming language. These are commands to control the logical flow of a program, including jump, loop and subroutines. Although these control commands are adequate for most uses, if you're used to highly structured languages such as Modula 2 or C, then the omission of case

HOW TO BE AN AIRTIST

► AiRT's program editor gets to grips with a program, bringing the icons up in the correct order.

► The 'Forms Editor' allows you to set up the screen as you want it for your program's output.

► Control of AiRT's editing functions.

► The current frame being edited.

► This is just a small fraction of a single 'window'. Each icon sits in its own cell.

► The icon menu - scrolling left and right along this menu gives you full access to all AiRT commands.

► Scroll bar for scrolling through the icon menu.

WHAT'S NEW IN VERSION 2?

Version 2 of ART features several enhancements over its predecessor, as well as the expected bugfixes. Support for IV pictures that has been added, as well as the ability to use the processor for one year in a program, thereby cutting down on the amount of disk space. Another useful addition is a random number generator which enhances simple games. But the majority of features in version 2 are related to ART's IVs. They facilitate easier tasks in the handling of forms very much easier. One that adds the advanced user will appreciate is the ability to add fragments of conventionally-programmed code (C or Assembly) to a user.

Incidentally, WHILE, REPEAT loops and the like may prove annoying. As well as the standard program control icons, ART has a comprehensive list of commands for screen scrolling, file control and input/output control. Using all these different icons lets you edit most programs with a minimal amount of knowledge of the language.

Amiga specific, such as search systems, 80th and graphics are all accessible from within ART and even picture and music files can be read by the IV 'LIBR' and 'SOUN' file formats respectively. ART programs can also call external programs written in other languages using a system of library modules. Using these modules gives the ART programmer access to some powerful facilities only available in fairly low level languages such as C and assembly.

First catch your program

To write a program under ART you first load the editor which is included with the package. This consists of a Frame Map containing 75 frames, each of which is divided into 75 cells. Each cell can contain a single command icon, after you've selected a frame, the screen changes to show you a window of the frame's cell map and you 'enter' your program by clicking on the icons you require and copying them to cells on the grid. A new screen is then displayed, showing all the information for that particular cell. By clicking fields on this screen you can add parameters to the command represented by the icon (a list of variables to be printed, for instance). Most icon commands require at least one parameter to be passed to them before they are entered into a program.

The ART editor includes many of the facilities you'd expect in a text editor such as overlay based command with toggleover mode in a text editor, and insert and delete, which means inserting and deleting lines is a text editor. One nice feature is that the editor automatically updates the rest of your program when you insert or delete lines, so jump commands refer to their correct destinations.

The usual program included in the ART package is a Frame Editor which does those included with the more powerful relational database systems such as Superbase Professional. The ART forms editor allows you to load IV pictures for use

as a backdrop to your screen display. Once an image is loaded, you can place all the required fields onto the form. Once the completed form is saved, it can then be recalled at a later date for use in your programs.

Once you've written your program you can compile it to an executable program. Under most Amiga computers, ART's is assembly level. Once you've clicked on the compiler icon from the Workbench, a small window

ART programs are not bindingly fast but still a good deal quicker than AmigaBASIC.

In the limit

So what kind of person would benefit from ART's approach to programming? The authors, RUI Software, feel it is probably best suited to the programmer who requires a rapid solution to a programming problem, or to the inexperienced first time programmer. While a beginner would certainly benefit from ART's approach, it's doubtful whether the professional programmer would change the habits of a lifetime and switch to ART's method of working.

ART is probably best suited as a learning tool. Its design encourages structured programming and top-down design and could be an invaluable tool in teaching the principles.

IFF FORMATS

IFF is not the same quality. Describe the standard sets for most Amiga pictures or music files.

Using IFF format most of which the most popular are as follows:

- LIBR - Pictures
- SOUN - Sound Samples
- FORM - Formulas
- SMBL - Music

IFF is an interesting file format that is designed to cover all file types. Now IFF FORMS are created as needed as. The most recent addition to the IFF file type is for multi-color fonts. Expect to see a lot more about these in Workbench 2.0 when it finally arrives.

PROGRAMMING WITH ART

Writing a program under ART is a simple process and is more like designing flow charts than conventional programming. If you've ever worked with flowcharts then programming using ART should be simple.

The listing in this panel is an extremely simple example of an ART program. It prompts the user for two numbers, adds them together, displays the result and waits for [RETURN] to be pressed before finishing. Seven variables or 'fields' as they are called in ART have to be defined, three of which contain the actual screen text.

Icon 1 - Every program must have a start and finish and these are marked by a connector and a terminator icon. The connector icon is automatically placed into your program

grid when you select an empty frame.

Icons 2 and 3 - display a text string on the screen to prompt the user to enter a number. Two parameters must be supplied, the string to be displayed and the name of the field to hold the user's input.

Icon 4 - adds the two numbers together and stores the result in a separate field.

Icon 5 - prints the sum of the two figures on the screen, complete with a title message.

Icon 6 - pauses the program until the user presses [RETURN]. ART automatically opens and closes an output window at the start and end of a program. This icon is used to prevent the output window closing so that the final message is displayed.

allows you to show the current state of compilation. If any errors are found, they're automatically written to a log file, which can be viewed at your leisure. The actual error messages are not very helpful and can in fact mean to confuse things. The final compiled program is not completely standard, as it requires ART's run-time system, ART.Loc, to be in the same disk as the program.

Also included on the ART disk is a utility for obtaining a hard copy of your program. This lets you print your program either as text, like a conventional programming language,

or as a graphic display of all the icons in your program. The printout displays all fields, and parameters used by each icon and can be an invaluable asset when debugging. Compiled

for

- Wide full range of basic programming features
- Easy way of learning programming
- Editing/debugging simple
- Can include Amiga IFF pictures/digitized sound in programs

against

- Can be laborious to build even simple programs
- Ultimately not as flexible as a conventional language

TIPS

DESKTOP

And now from our medical correspondent we have a report on recent developments in anti-viral treatments for all STs. Also invaluable tips on keeping your machines in tip-top condition. Martin Saunders carries off the £30 cash prize for his invaluable virus dodges.

Virus is the disease

A disk virus isn't a physical disease, it can't be transmitted by rubbing disks together. It doesn't destroy disks, files, and the data on them. If you format an infected disk, the virus will be destroyed though it could still be in memory. A disk virus is basically a destructive program. When you start up your ST the drive reads the first sector on the disk. The information stored in this sector tells the computer where real or real data. It virus usually works by splicing itself into the boot sector of a disk to ensure it is loaded into the ST, from where it can start destroying data or programs. Once a virus is in memory it links itself to the read or write function of the disk operating system. From there it writes itself to boot sectors of other disks as they are loaded into the system.

To reduce the chances of infecting your disks follow these guidelines:

- Switch the machine off and on before running any new program.
- Keep disks write-protected if you don't save data to them regularly.
- Check your disks for viruses with the Virus Killer supplied on our first issue disk (remember, standard format disks only — you could use commercial games software which often uses special formats for its disks).

There is a new virus which spreads by attaching itself to one or all files with a .PRG extension. This new virus cannot be killed off in the usual way (with the Virus Killer, that is). To hear the story visit them!

Label a PRG file (by single clicking on its file icon, pick *Show info* from the file menu). Change the PRG extension to .RPN and

click on OK. So this to all PRG files. This protects them from the virus which only looks for files with PRG extensions.

The problem then is naming the newly named programs — you can't. However, that is, you modify the 005010P.M file. Open a window from the Desktop and Save Desktop from the Options menu. Use a text editor (First Word, Protext or even the Word400 accessory supplied last month) to load the 005010P.M file and alter the line 40 00 FF 1 PRG8 00 to read 40 00 FF 1 RPN8 00. Remove 005010P.M, reset the machine and you will then be able to run all files with the filetype RPN.

The only problem is having PRG files in an AGIO folder — IOS can only automatically run files with PRG extensions. You can mess with 005010P.M if you like, it won't have any effect. The only recourse is to remove everything from the AGIO folder (obviously this isn't always what you want).

Martin Saunders
Breadstone, Dorset

Text file dodges

When displaying a non-program file from the Desktop by double clicking on any file that hasn't got a PRG, TSS, ACC or TIF extension and clicking on the INFO box in the requested file icon the conventional one line at a time by pressing RETURN, a page at a time by pressing SPACE, or exit with either CONTROL or Q.

J Tyler
Sunderland, Tyne and Wear

Bug off

Certain versions of Career Command have a bug which prevents you getting enough fuel to complete the game. You can check for this early version app for a strategy action game and,

when faced with a front view of the carrier, press CONTROL-Q. The version number is displayed — 1.01 is the old and 1.06 the new. Unfortunately will upgrade your game if you load them the old version.

Tony Effers
Kirkcubrick, Slough

Gids again

If you love the demo, but hate waiting for the program to reload after playing a game, try this next for the text to disassemble (after typing) and then keep any text you

need. The directory is usually on the second track, subdirectories for contents of folders could be anywhere, but are easy enough to find.

When a file is deleted the first character of its directory entry is changed to its ASCII decimal — the rest is left alone. To retrieve a deleted file simply alter the 05 character to an ASCII value in the range 02 to 07.

If you have loaded other programs into the disk, once tracing the file, you may well have overwritten the space it originally

occupied. This re-starts the demo without it accessing the disk.

Undelisting files

Using any sector editor — such as *Bytecopy* from last month's cover disk — it is possible to recover recently deleted files. The disk's

occupied, in which case it's highly unlikely the old file will still work properly. The sooner after deletion you try to recover the file the better your chances of success.

Warning: sector editors are dangerous things if used incorrectly or by the uninitiated. Writing garbage values to sectors can cause irreparable damage to disks. If

you're unsure how to use a sector editor, ignore these tips. It is hard to make a backup of a disk before altering sector data.

I Wood

Cowenry

GFA Compiler bug

If you write large programs using GFA's BASIC interpreter, chances are you won't have enough memory to run them (especially on a SOCL). No problem once the program has been compiled though, since you won't then need the interpreter in memory. The compiler usually reports errors it finds during compilation and refers you to the interpreter. However, one place where it falls down is in the

passing of parameters to procedures.

Sup you write a procedure that accepts four parameters (using of function) and, during the main body of your program, call the procedure with only three parameters - the mistake won't be highlighted by the editor's syntax checker. When you come to compile the BASIC program the compiler will crash. Most disappointing. The moral of the story is take care with procedures and parameter passing.

MONEY MONEY MONEY

Yes, you have the chance of getting your mits on (read: profit) that at what cost to you? Is the lousy bits of time in getting the best out of a software package, or a hardware modification, or how to use the Desktop more efficiently or anything you feel will increase after 1000000 uses.

The star folder each month gains instant fame and good wealth (well 10000000). Its name can change your name with 1000000 other readers. And perhaps it'll be your lucky day. Rush your \$100 to Desktop, IT'S Simple Format, a Queen Street, Bath, BA 1 1L.

BEGINNER'S CORNER

Questions you'll see when the collection of the icons that appear when you insert a disk in the drive and double click on the drive A icon. There are only three types: the data file icon which resembles several sheets of paper with one of the corners folded over, the executable program icon which has a diamond bar along its top and the folder icon which looks like a folder.

If you've been following Beginner's Corner, you should know what happens when you double click on either a data or program icon. But just in case you don't, double clicking on any file with an extension other than .TGS, .PMS or .TTR will result in a window to pop up asking you to Show, Print or Cancel. Show displays the contents of the file on screen. Print sends the file to printer and Cancel takes you back to the Desktop. Double clicking on a program icon runs that program.

That leaves folders. Naturally they are used for organizing files and other folders in the root categories. Folders are neither programs nor data; simply convenient areas in which files and folders may be held. For instance, if you have a window displaying an amount of files, it can become almost impossible to find any particular one!

CREATING FOLDERS

Get organised: create a folder. Make sure you have a disk in the drive with a display of the files on screen, point at the file icon on the menu bar and click on New Folder. A dialog box appears asking you to give the folder a name. Click on Cancel at this point if you don't want to proceed. Otherwise type in the name (single characters plus a further three-character extension followed by (Notes) or a click on OK. After some delay starting you should open the field at in the currently active window.

You can't create as many folders as you like, but don't go crazy as they gobble up disk memory fast. You can even create folders within folders, up to eight levels of them.

FILES INTO FOLDERS

First open the folder by double-clicking on its icon. The current directory is replaced by the folder's directory, which at this stage should be empty. Open another window by double-clicking on the current drive's icon and check that the files you want to move into the folder are visible in the second window. Now, select the files you wish to copy into the folder by holding down (Shift) and single-clicking on their icons. Bring the highlighted files into the folder window. The files are automatically copied. You can then delete the files from the original directory by selecting them and dragging them to the trash can.

RENAMING FOLDERS

You can't. Well, you can, but it's a very awkward process. First create a folder with the new name, then copy all the files from the old folder into the new one and finally erase the old folder with its entire contents. Sounds easy, but if the old folder takes up a lot of disk space it may be necessary to copy one file at a time, erasing the old copy each time to keep enough room on the disk.

AUTO FOLDERS

It's possible to create a special folder, appropriately named AUTO, that at startup automatically runs any files with a .PMS (Startup) stored inside it. Any number of PMS files can reside in the AUTO folder - they are executed in the exact order in which they are saved into the folder.

1 Making folders is fun. First ensure you have a directory showing and then click on the New Folder option from the File menu.

2 Enter a name for the folder and press (Enter).

3 After a few seconds of flick starting a folder will appear in the directory.

4 Now get organised. Copy files of a particular type into the folder.

WORKBENCH

Expand your Amiga's consciousness with this mind-blowing collection of top tips. Creating and editing icons is the major theme this month, for which a £30 prize goes to Norman Little of Preston.

Creating double icons

Normally, when you click once on an icon it gets into a kind of 'help state' colour scheme to show it is active. Many icons for commercial products, though, have a 'fast image' - when you click on them, a white icon image appears. This is often used to create a pseudo-animation effect. For example, on the month's cover disk there are drawer icons: click once, and the drawer opens.

You can create your own dual icons, with the aid of a utility on the standard Amiga 'Extras' disk called IconImage. First, you need to create the two separate icon images. For this you need the icon editor, IconEd. As an example, lets create a new icon for the Workbench clock tool, so which the clock hands move round when you click it.

Run the icon editor - this is covered fairly well in the Amiga manual, on pages 5-31 onwards - make sure you are only working with copies of any master disks. From the Workbench, open the System drawer at your Startup disk and double-click on the IconEd icon. Once it has loaded, an information box about 'fast icons' appears - click on 'OK'.

You can now load an icon to change, and edit it as though you were in a paint package. Load the Clock icon from the 'Clock' menu choice. Load data, click in the same box on the box that appears, type 'CLOCK' and click on Load. Now you can make the image to your heart's content.

When you come to save the changed version, choose 'Save Data' from the Disk menu. You now have two choices: 'Frame and Base' or 'Save Full Image'. You will have noticed that the icon doesn't usually take up all of the box that it's edited in. If you click on 'Save Full Image' then the whole editing area is saved. It's often more use-

▲ 1 - The Icon Editor is in the System drawer of your Workbench disk. Load up the supplied Clock icon to edit it.

▲ 2 - Save the control image as 'CLOCK1', with 'Save Full Image'.

▲ 3 - After getting IconEd, you'll find IconImage in the 'Tools' drawer of the extra disk. Follow the prompts to create a new 'CLOCK' icon combining

▲ 4 - Centre the icon in the frame with IconEd's 'Move' menu.

▲ 5 - Now you can edit the icon to move the hands round, then restore it as 'CLOCK'.

▲ 6 - Before and after... look at the Workbench, your 'Clock' icon is now animated.

to save just the icon, click on Frame and Save and imagine a rectangle framing the icon image. Click at the top left and bottom right of the area to be saved.

The only complication if you're going to use icons like a that the key icons to be changed must be exactly the same size, or you get a bad effect. For this reason it is best to save icons with 'Save Full Image', since it is almost impossible to 'Frame and Save' two sized icons by hand.

So, after loading the GUCS icon, save it the full image unchanged as GUCS1. Edit it to make the hands round, and save that image as GUCR2. Quit the icon Editor program.

Put your Lotus disk in the drive, and from the Root drawer set iconsMg. Put the disk on which you saved the GUCR1 and GUCR2 icons back in the drive. Follow the prompts, typing in DRACLOCK1 as the name of the first image and DRACLOCK2 for the second. Then type DRACLOCK as the final icon name. RETURN. This overwrites the old Clock icon.

After the program has finished, your keyboard is visible. First, close and reopen the window containing the Clock icon file. This makes the image reveal the disk to register the new icons. You'll find the icons for GUCR1, GUCR1, and GUCR2 are all on top of each other - drag GUCR1 and GUCR2 to the 'Transfer' so you can see GUCR2 properly, then click on the Clock icon to make the hands move, and click on a blank part of the screen to deselect the icon and reset the hands. **Newsline**

Phyllis Lantz

BASIC types

Amiga BASIC will produce your icons for you as you type them in, to trap your typing mistakes. Make sure Ego LRM is off so you are typing in lower case. After you press [Enter] at the end of each line, Amiga BASIC converts all keywords such as TO, FOR, NEXT into upper case, leaving variable names in lower case. Look at each line and check that the words you expected have been capitalised. **Andrew Ripoll**

Barnes, Herts

More hidden messages

Those hidden Amiga ROM messages keep cropping up. Local 'Preferences' will only see two graphical representations of your lovely mouse. Teasing the buttons on these mice as 1, 2, 3 and 4

from left to right, click on:
1, 2, 3, 4, 1, 2, 3, 4, 1, 2, 3, 4, 1, 2, 3, 4

Next select 'Change Printer' and click on the square of the printer selection menu until you run off the top. This reveals a cute cartoon message!

Alan Tucker
Leicester

BASIC speed

One tip for BASIC programmers who are frustrated at being limited to 75K - use the CLEAR command. For example, CLEAR *XXXX gives you 75K of program space to play with.

Alan Tucker
Leicester

3D Digitising

It is possible to produce 3D pictures with the Digitiser digitising kit - as reviewed this month. It uses the software rasterises method instead of old 3D files, so you'll have to buy some red and blue cellophane and make up your own gear to see the result for use the Digitiser colour ahead.

Digitiser constructs a colour picture by taking three different views of a scene - red, green and blue - and combining them into a colour composite. To get a 3D scene, first take a red scene of the scene, then carefully move the camera a few inches to the right (about the distance between your eyes) and take a blue scene. Don't bother with the green.

Display the colour picture in 320x64 mode, and turn the green slider to a minimum. Hold the digitising colour ahead in front of your eyes with the blue filter over your right eye and red over your left, and key presto - 3D! Of course, you only get 3D if you were digitising a true 3D scene originally, not a flat photograph.

You may get better effects with some images if you use red and green at just two colours, red and blue. It depends on your camera and the colours in the scene. Experiment. **Aron Garbo**

Thornhill, Soling

Silent running

The Viewd program on issue 1's disk is great. If you put it in your Startup sequence it works, but even if you use the command RUN VIEWD it leaves a CLI window open, which is annoying.

What you need is a PD program called RUMBAC, which runs a program without its window. It's on Flop disk 66. Copy it into the C directory of your boot disk, then with VIEWD in the root directory include in your Startup sequence

'Project' icons have the name of the Tool (ie, program) they call up written into the file. To convert a file from a standard name like a BASIC executable file, change the Default Tool file to read "RMBAC".

the file

REVERSE VIDEO
and it won't leave you with a dead CLI window hanging around.

If you have a copy of Mastertronic's Space Ranger, you're in luck. Look in the C directory of that disk and you'll see RUMBAC there for you, saving you the additional cost of a Flop disk! It may well come with other programs too, so look out for it.

K. Mottiswaight
Market Drayton, Salop

Wenderson editor adds: A version of RUMBAC called RUM BACKGROUND can be found in the C directory of 'The Very First' disk, the internal disk supplied with recent 68000 sales. So you won't even have Space Ranger!

Creating icons

Now you ever wanted to make an icon for a program, created an image and named it accordingly, but had the Amiga do nothing but bark madly at you?

Creating icons for programs from scratch can be tricky, but there is a PD program called ICON to do just that. You'll find it on Flop disk 102, or alternatively in the MBRAC directory of issue 1's cover disk or in the VIEWD directory of issue 2's. Here's how to run a set of CLI commands from a Workbench icon:

1) Copy ICON from the relevant place on the Format cover disk to the root directory of your boot disk.

2) Using the ordinary Amiga keyboard utility, create a file con-

taining the CLI lines you want to execute. For example:

```
icon "working up icon  
disk ..."
```

Save it on the icon disk.

3) Save the formatted file.
4) Edit the icon information (click once on the file you have just created to highlight it, then from the Workbench menu choose the Info option. This displays a screen showing the icon's details, one of which is a line saying "DEFAULT TOOL". Workbench/Info/Notepad). Click on this line and with "Delete/Notepad" to read "Icon".

5) Delete all the first bytes lines at the bottom of the screen by clicking on the 00C loc at the bottom right until they are all gone.

6) Edit by clicking on Save. If you want, you can use the Icon Editor to edit the icon's appearance, to change it from the Workbench standard.

8) Now double-click on the icon and a CLI window opens and the command file runs. Click on the Done gadget to return to the Workbench alternative.

7) You can also use ICON to display text files. Create your text file with the Notepad, amend the icon file as before, but also edit the Tool Types line of the icon control block on ADD to say "icon:con" - the upper and lower case is important. Now when you double-click on the icon the file is displayed a page at a time, allowing for you to click the mouse on the bottom of the window to continue, or type CTRL-C to exit.

DELUXE PAINT II AMIGA • £59.95 (RRP £69.95)

This is something else – Electronic Arts' graphics program which comes from the US with gushing praise. You can paint on a 'canvas' that is bigger than the monitor screen – 1024 by 1024 pixels, using 32 colours in low resolution or 16 colours in high resolution. Full percentage colour mix includes hue, saturation and contrast for each colour. Other features include full zooming with special animation effects

including Colour Cycling offering near-infinite movement possibilities. Also an unlimited variety of paint brushes, a complete set of shape and line tools and a range of special effects for banners, calendars, cards, newsletters – anything can be done with a splurge of style which really lets your imagination loose!

FREE DISKS
A pack of 6 high-quality 5.25 disk disks is yours when you buy Deluxe Paint II from us!

Order Code **FO22AM**

THE ST AMIGA DISK WALLET! Just £6.95 including free disk!

This handy wallet holds ten 3.5 inch disks and guarantees them safety from X-ray devices. The wallet, in grey nylon with black edging and gold embossed logo on the front, is hard-backed and has two velcro stickers. An essential purchase for anyone on the move needing to keep disks safe.

Order Code **FO41DW**

THE ST AMIGA FORMAT DISK ORGANISER! Just £7.99 including loads of paper!

This standard Filofax (B) size ring binder is an essential purchase for any self-respecting ST/Amiga owner. The 60 pages are divided into four sections – blank sheets, a filename list, a disk list/space organiser and a directory or folder list.

With gold embossed logo on black, the Organiser lets you keep track of everything in your software library – and transfer them from and to other standard size binders too.

As well as that there is a list of the street dated for every issue until December 1991! Go for it – you won't be disappointed!

Order Code **FO40DO**

POWER BASIC Atari ST • £39.95 • HiSoft

One of the frustrations Atari ST owners face is the relatively poor BASIC supplied with the machine. HiSoft's Power BASIC is superior in many ways, which is why we've made it the basis for our BASIC programming

FREE SOFTWARE!
A disk containing powerful Atari ST utilities is yours when you order HiSoft Basic from ST/Amiga Format!

- Compiler creates stand-alone programs
- Unlimited string length
- Complete ABS and VDI access
- Joytick access
- Multi-line statements
- Load and save resource files

If you want your ST to run the best BASIC programs, this is the one you'll need.
Order Code **FO21BT**

DIGICALC Atari ST and Amiga • £29.95 (RRP £39.95)

This spreadsheet from Digis International has already established a reputation for itself on both the ST and the Amiga. Features include fast recalculation speed, full sheet field entry in memory and user defined function key macros. Reviews items in issue 2.
Order Code **(ST) FO20ST**

THIS MAGAZINE IS RUBBISH.

DISK BOXES AND MOUSE MATS ARE USELESS.

THE SPECTRUM IS THE WORLD'S GREATEST COMPUTER.

If you agree with any of these statements, please turn the page now. For those still reading, we'd like to make an offer you'll find hard to refuse. Take out a launch subscription to *ST Amiga Format* and we'll send you a complimentary gift pack, consisting of a high-quality, hard-wearing mouse mat (RRP £5.95) and a smart, lockable disk box (RRP £12.95).

A 12-issue subscription costs just £29.95, and that of course includes a disk packed with software on every issue.

We hope you'll agree that *ST Amiga Format* offers spectacular value for money and provides valuable coverage of all aspects of your computer. If so, you'd better guarantee yourself a monthly copy, because you can be sure of one thing: the magazine won't be hanging around long on newsagents' shelves.

NO QUIBBLE GUARANTEE

If after receiving three issues of *ST Amiga Format* you decide you no longer wish to subscribe, you may write to us and claim a full (and refund for all outstanding issues) - you would still be able to keep your gift pack.

FREE WHEN YOU SUBSCRIBE!

- Smart, high-quality **disk box** holding up to 40 3.5in disks.
- Hinged, smoked perspex, lockable lid keeps away the dirt.
- Supplied with dividers for easy disk filing.
- Normal retail price £12.95.

plus

- High-quality, hard-wearing **mouse mat**.
- Rubber base, nylon top for smooth mouse movement.
- Helps prevent mouse getting clogged with dirt.
- Normal retail price £5.95.

HOW TO ORDER

Please use the FREEPOST form on the following page or the identical card attached to the outside of the magazine. Alternatively dial 0458 740711 with your credit card details.

Katakis. Bless you

US Gold's latest feature magazine, Katakis, has taken four of industry mighting - it seems to have been well and truly stopped on by the salacious of American, very Melanesic lady did they change their name?, as being too similar to their own *It's Yours*. They've got together a 'look and feel' equation which looks and feels as though it's going to

STAMIGA

Issue 5 of ST Amiga Format hits the streets on Thursday 20th October - pick one up before someone treads on it.

stick, since Gold have capitalised and withdrawn their own program.

The best of factoring is not unknown in the fast moving world of educational simulation being known as the games software industry. US Gold themselves are currently taking action against Ede, claiming that Overlander violates their bookbinders design!

It seems to have caused much trouble for magazines though fellow publishers. Hatched will now have to withdraw the USA cassette cover promotion of Katakis that they have already printed and mounted on the October issue of their games monthly. June 84. Focus Publications also lost a double page review and competition around Katakis for the launch issue of their new Computer Games Week. Looks like the prices, if ever decreased, could be something of a collector's item.

Cover Price

It's surprising that - you will probably have noticed the increase in Format's cover price. Unfortunately the 3.5" disk short age has finally caught up with us, resulting in a 25% increase in the cost of blank disks and their duplication. However, even at £2.95, we hope you'll still appreciate what good value Format is. Our main competitors are around the £2 mark, but don't supply a cover disk with over 400k of program code each month. Even at 75 software prices, you don't get a disk for £1.

Little Darlings

Simulator fans may have played some of the games that have spawned out of Code Masters (though there are precursors too available for the 16-bit machines), you're lucky. You only have the games to control with.

Code Masters is the software house put together by the world's leading firms, with the help of most of the rest of their family and emiable league partners, Bruce Linnis. Darlings' best, as marketing man, seems to be to produce an ugly photo of some member of the Darling entourage each month, with a witty' caption, and send each to help suffering fools like ourselves.

We leave you to judge the effectiveness of this policy for your sales. Here are the last three months' offerings - is it too much to hope that some talented Peter Pan will fly away with the Darlings?

For a limited period you can still get round the price increase by subscribing to Format. The rate for a full 12 issues remains at

£29.95, and still entices you to a free disk box and mouse mat. Subscribe now, it's even more worthwhile.

Superheroes, Inc.

by Sarkar

The games they said couldn't be written

QUADRALIEN

ST Screen Shot

You are entering Jupiter space. Your destination, Astra, the vast cybernetic nuclear-fusion complex they orbited mid-21st century. Something strange has happened there. Astra has sealed itself off from the outside world, the control mechanisms won't respond, the temperature rising. Meltdown is nigh. But it's worse than that, for in the very heart of the reactor itself, the sinister QUADRALIEN forces have established their foothold in our solar system. You have just six days to sort it out.

QUADRALIEN is ACTION-STRATEGY-TENSION-101!

ST, Amiga €19.95
PC £24.95

STARGOOSE!

Amiga Screen Shot

What happens when a team that's ranked up two MMT number ones decides to tackle the classic theme of the vertical scroll-and-blast? The result is StarGoose!, the latest from Steve Cain and GP (Kenny) Everett, and boy is it weird! Until you've tackled the mind-boggling variety of devious forces in the 3-D world of Neon, you're still in Straight City. StarGoose! ingredients include: The bestest scroll-FULL screen width and Variable speed. Unique relief landscapes. Unique supply tunnels and the best

ST, Amiga €19.95
PC £24.95

STARRAY

Amiga Screen Shot

We won't mention the super-smooth parallax scrolling...the stunning backdrops...the amazing hi-res graphics...the next-to-hand-before sounds...the gameplay that turns humans into jolly...the alien that just get winder...the unique Lost Game Option...

We'll just say:

"Quite possibly the best arcade action yet written for any niche"

Amiga (2 disks + Audio Cassette) £24.95

ST £19.95

CD (Disk + Audio Cassette) £14.95

PC £24.95

Your quest is interstellar wealth and to hell with glory

The wildest matches before you. 8 million worlds await your exploitation. Unimagined wealth is your destiny. If you can master the art of interstellar navigation, harness the lethal powers of the photon drive and reject the deadly space pirates. Forget the medals, forget the honours, forget the glory. As a member of the Federation of Free Traders you live for money and will probably die for it.
