SoftSide magazine is continually seeking original articles and software for publication. Imagination and variety in concept and content are the rules at SoftSide — not the exceptions. Articles are purchased on a per-page basis, based on content and applicability. Our policies with respect to software purchase are highly individualized, and offer the programmer several options, including one-time publication rights, outright purchase, and royalties on sale of pre-recorded cassettes. For more information, please write: **SoftSide**, PO Box 68, Milford, NH 03055.

For uniformity, we have adopted the Radio Shack TRS-80 Level II BASIC as the BASIC dialect used within the pages of this magazine. It was chosen because it stands to become the most commonly used dialect among microcomputer users and because it shares a common heritage with the many microcomputer languages produced by Microsoft.

SoftSide is published monthly by SoftSide Publications, 17 Briar Cliff Dr. Milford, NH 03055 Telephone: 603-673-5144. Subscription rates: USA bulk rate-\$15 per year. USA first class, APO EPO, Canada, Mexico, overseas surface mail-\$22 per year. Overseas airmail-\$27 per year. **All remittances must be in U.S. funds.** Mail subscription inquiries to: **SoftSide Subscriptions**, PO Box 68, Milford, NH 03055. Entire contents copyright 1979 SoftSide Publications. All Rights Reserved.

Just to let you know...

Outgoing Mail

People often ask for my opinion of the Radio Shack computer. Most likely whenever someone parts with nearly a month's salary for something, they expect perfection, and I'm probably as guilty of that as anyone. I'm greatly troubled by the lack of lower case, the double letter problem and the lack of reliability in tape and diskette input/output routines. I would like to see better graphics, preferably in color. It looks like highway robbery when Radio Shack offers memory chips for \$200 while others are selling them for a mere \$75.

Despite all this, I feel the TRS-80 is a bargain. These days, you could spend \$600 for a college course in BASIC programming and not learn as much as you can with your own TRS-80 (and the college doesn't give you a computer). The challenge of designing a program to conform to a particular application, or writing a game from your own imagination, is more fun for me than any other hobby I've had — and I have had quite a few. It's also the most profitable hobby I've ever had, because it's easy to sell decent programs.

I'm delighted by the service I have received, especially the high quality customer support that my local store manager, Carle Smith, has provided from the time I ordered my original 4K Level I TRS-80. Repairs have been prompt and the policy of renewing the warranty period for an additional 30 days whenever a computer is serviced or a new part is installed is fantastic.

The Shack is certainly imaginative and creative in marketing and salesmanship. By the time you read this, their store managers will have contacted nearly every school in the country to explain how to obtain computers complete with courses in BASIC programming and algebra, with the Federal government footing the bill. They even provide the exact wording for the funding applications. It wouldn't surprise me to see the schools purchase a million TRS-80 computers! So, that means our readers will have to contact every high school student in the country to tell them about **SoftSide**, the best magazine for TRS-80 computerists!

The computer is even useful in some serious business applications. Not far from my home there's an analytical

laboratory that uses a TRS-80 computer to analyze coal samples from the mines. It does so much work that they have to buy ribbons for their printer by the case. As I was working my way through college, I once spent two weeks performing a matrix multiplication on a Friden mechanical calculator. When I think of that time ten years ago, I'm horrified that I endured that agony when a TRS-80 would have done the problem in seconds. (Of course, it would have taken me an hour to enter the matrix, but I wouldn't have had to enter each figure over fifty times!)

The one flaw in TRS-80 applications is in commercial use. Decent business software isn't available yet, although BIZ-80 will help to solve that problem. The lack of lower case is a major stumbling block, as word processing is one of the most important business uses for small computers. Potentially even more serious is the lack of disk reliability, especially since a common disk failure can irretrievably wipe out the data in memory. I have been personally recommending the TRS-80 for educational and scientific applications, games, and to programmers in BASIC and FORTRAN and people who want to make money writing programs at home. I haven't been recommending it for commercial use. Frankly, I hope that will change, and I would like to hear from any business users who can report solid success.

Our publisher and myself have been having a running discussion over the merits of sound in TRS-80 applications, especially now that Radio Shack has decided to support its \$10.95 200 mW audio amplifier with computer programs. You simply connect the amp by plugging it into the cassette output jack — for just under \$11.00 you've added a decent sound unit. I've already seen several good programs using the device. If you want programs with sound, let us know! (Isn't it unfair to ask your readers to argue with the boss? I suppose I'll have to tolerate a few letters from those of you who aren't interested in cheap sound, just to keep him happy.)

That's enough of a break to read the mail. Now, get back to the keyboard and start ENTERING **Safari**. I had so much fun playing it that you almost didn't get this editorial. Of course, you cassette subscribers are probably playing it already. We can still send the cassette version of **SoftSide** if keyboard time is precious to you. The price for subscribers is \$30 for six months. To start a combination magazine plus cassette subscription (6 months), is only \$38.

Don't let the headhunters get you!

Surveillance Report on Activities of:

TRS-80 Software Exchange

17 BRIAR CLIFF DRIVE MILFORD, NEW HAMPSHIRE 02055

DISKETTES

DYSAN

5¼ inch one-sided certified error-free diskettes. Conform to industry standards. Box of 5
Price, \$24.95 + \$1.00 postage

Add \$5 for hard plastic storage box.

VERBATIM

Compatible with TRS-80, engineered, self-checking calibration. Box of 10 diskettes.
Price, \$34.95 + \$1.00 postage

CASSETTES

•Premium Quality •5-Screw Casings

C-10 Box of 10
\$6.50 + \$1.00 postage

C-20 Box of 10
\$7.50 + \$1.00 postage

This activity certain to promote high levels of reliability in tape and disk use, duplication and information storage. **Take immediate action — purchase all available stocks —** curtail further influx of certified media throughout the microcomputer industry.

RENUMBER

No, it's not a game, but it CAN make renumbering your programs seem like child's play!

LOADS FROM AND OPERATES ON EITHER DISK OR TAPE BASED PROGRAMS!

If you find yourself renumbering to provide room for additional lines, or just to make things neater, this program has got what it takes to make life easier... it can renumber a 12K program in just 32 seconds.

User has complete control over which lines are renumbered — and how — including all GOTO's and GOSUB's. You can even renumber the middle and leave the beginning and end alone! If an undefined line is found, the program will display both the line which caused the error and the unfound line number, thereby making corrections much simpler.

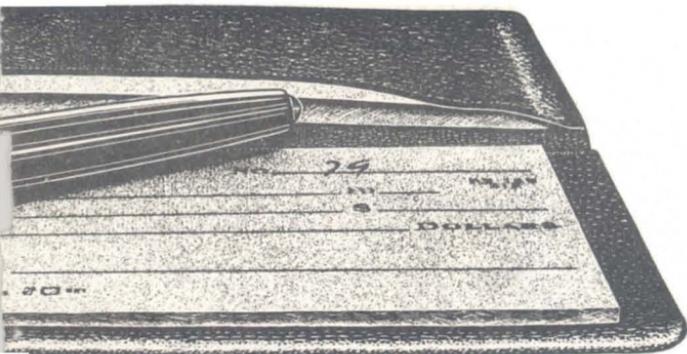

You may have seen other renumbering programs, but **NONE** with this many features: no external tables are used, runs in 1300 bytes of high memory regardless of program size, loads from and operates on either disk- or tape- based programs.

Versions available for 4K, 16K, 32K and 48K machines. (Unless specified otherwise, 16K tape automatically supplied) Also available on disk or as source listing

Level II tape (specify version) — \$15.00
Diskette (all 4 versions on one disk) — \$25.00
Source Listing — \$20.00

FINANCE

micklus

CHECKFINDER

a total of the amount of all the checks it finds. A negative amount means expense, and a positive amount means income, since some of your account should be for deposits. You can even have the program locate all your paychecks — hopefully, the amount will be positive, indicating income. If not, you should probably seek new employment.

By keeping a CHECK FILE tape for the entire year, you can use the program to locate all your alimony payments (or any other category)

and get the total amount paid for the year to file in your income tax.

Good procedures dictate that you test this program very carefully, then run it in parallel with your current system of checkbook maintenance. **We can assume no responsibility for consequences resulting from the use of this program.** I have used the complete Personal Finance program) both **Checkbook** and **Checkfinder** to maintain my own personal account for several months and have found it to be reliable and valuable in managing my family's money.

TRS-80 PROGRAMMING HINTS

To simulate in INPUT statement with INKEY\$, after printing a question (using the question mark), print a prompt. The method is to print CHR\$(95) for the prompt and then a backspace to erase it CHR\$(8), followed by a space. A sample program would look like this:

```

10 PRINT"WOULD YOU LIKE TO PLAY A GAME (Y/N) ?";
   CHR$(95)
20 I$ = INKEY$: IF I$ = " " THEN 20 ELSE PRINT CHR$(8);
   " ";I$
30 IF I$ = "Y" THEN 100 ELSE END

```

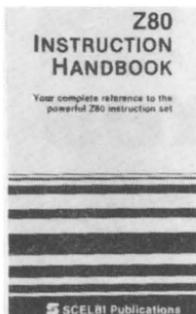

If you want your remark statements to stand out and be easy to find, type a line feed (lower case down arrow) and 5 spaces right after the line number. You could even follow your first remark with another line feed and spaces. This doesn't use a lot of memory, but prints nicely:

```

10
      REM*PROGRAM      *
      *BY A. PROGRAMMER*
20 PRINT"THIS IS THE NEXT LINE."

```

Reference

Z80 Instruction Handbook Scelbi Publications

Convenient pocket-size manual describes Z80 capabilities in easy-to-understand terminology. Designed as a practical reference to mnemonics, machine codings and usage — for programmers of every level, from beginner to professional ... anyone working in Z80 machine or assembler language.

Price, \$4.95

The BASIC Handbook

Dr. David A. Lien

Definitive reference work explaining over 50 versions of the language in detail. All you need to know about the major statements, functions, operators, and commands pertaining to use in micro, mini and mainframe computers.

Rabbits and Foxes

by Russell Starkey

As spring planting time approaches, here's a program to warm the hearts of gardeners everywhere: a simulation of how the proper ecological system could protect gardens from those pesky rabbits.

Now, if only garden supply stores could sell foxes!

Russell Starkey has given us a fine demonstration of what a BASIC program should look like when you LIST it, and his bar graph routine is very attractive as well.

"MESSAGE"

Owners of the TRS-80 computer game **STARTREK III**, version 3.3, written by Lance Micklus, should be aware of an error in the program.

The problem occurs in the quadrant display of the ships computer. To correct the error and update the program, make the following changes:

1. Change line 15 in the program to read "Version 3.3A", and change the copyright date to February 1979.

2. In line 1655, change it to read as follows fixing A(263) and A(264).

```
1655 PRINT " ", "Stars:"; A(264), "Planets :";A(265)
```

The use of lower case characters in making the above corrections is optional, but users should be aware that upper and lower case letters are used in all PRINT statements in the program.

The author wishes to thank Mr. Victor C. Solomon, of Rochester, New York, for calling attention to the error.

SINK 'UM!

by Rev. George Blank

"Man the torpedoes...enemy ships approaching...fire!" Sorry, captain, the tubes are being reloaded.

And so it goes, in this action simulation of battleship warfare. Shrewd maneuvers and keen timing are required by the ship's captain, otherwise, who always goes down with the ship? Level II, 4K-\$4.95

HAM RADIO

by M. Kalleher

If you're into Amateur Radio, whether tickling your neighbor on QRP or rocking Gibraltar with a "California Kilowatt", this powerful Level II 16K program can put a lot more fun into your hobby — and that's what it's all about, isn't it?

Here are a few of the features:

- **Amateur Frequency Allocations**

Frequency, Mode, and Licensing requirements for 80, 40, 20, 15, 10, 6 and 2 meter bands

- **ID Timer**

Counts down to next station ID and issues prompt using manual reset or automatic timer functions

- **Q Signal File**

Complete Q Signal file at your fingertips

- **Propagation Forecasting**

Computes radio wave propagation conditions when given current Solar Flux Index and current K-index

- **Amateur Log Routine**

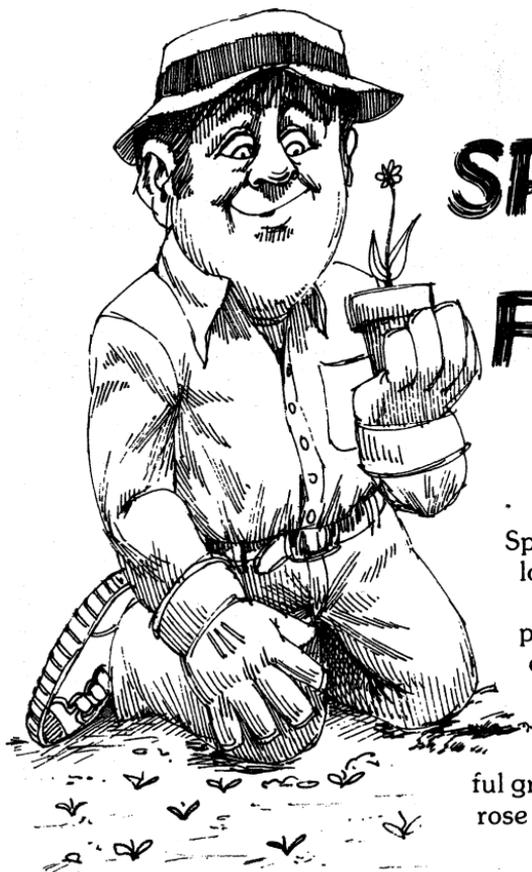

Stores to tape log of station activity by Callsign, Date, RST, Mode, QTH and other information, and permits review of previously recorded Log tapes

Available for Level II, 16K — \$9.95

SPECIAL DISK-ENHANCED
VERSION — \$19.95

SoftSide Presents:

A Page from The BASIC Handbook by David A. Lien

The INKEY\$ function is used in the TRS-80 Level II BASIC to read a character from the keyboard each time INKEY\$ is executed. Unlike the INPUT statement, INKEY\$ does not halt execution waiting for the ENTER key to be pressed. The computer just keeps "circling" until it receives a message from the keyboard. Until a key on the keyboard is pressed, INKEY\$ simply reads an "empty" string (ASCII code of 0).

Since INKEY\$ doesn't wait for you to enter a character from the keyboard and "ENTER", it usually is placed in a program loop to repeatedly scan the keyboard looking for a pressed key.

For example:

```
10 IF INKEY$="X" GOTO 100
20 GOTO 10
100 PRINT "YOU HIT 'X' DIDN'T YOU!"
```

The INKEY\$ function repeatedly looks for the letter X at the keyboard to meet the condition of the IF-THEN statement. When the letter X is entered, the condition of the IF-THEN statement is met and the computer branches to line 100.

TEST PROGRAM

```
10 REM 'INKEYS' TEST PROGRAM
20 CLS
30 PRINT "PRESS ANY KEY ON THE KEYBOARD"
40 AS=INKEY$
50 IF AS="" GOTO 40
60 PRINT "YOU HAVE JUST PRESSED THE ':'AS:' KEY"
70 PRINT: PRINT "PRESS THE ':'AS:' KEY AGAIN TO START OVER"
80 IF INKEY$=AS GOTO 20
90 GOTO 80
99 END
```

SAMPLE RUN (using R)

```
PRESS ANY KEY ON THE KEYBOARD
YOU HAVE JUST PRESSED THE R KEY
```

```
PRESS THE R KEY AGAIN TO START OVER
```

VARIATIONS IN USAGE

None known.

Each player (or Bwana) is in charge of a safari camp and must organize filming parties including camera crews and bearers, to search the vast 169-region safari country for wild animals. Scoring is accomplished when you successfully film in a region containing an animal. The player with the most film contract points at the end of the game gets the big movie contract and along with that, the usual fame and fortune. When only one person plays the object of the game is to score as many points as possible.

To begin play, you indicate the difficulty level you want (beginner, average or expert). This determines the number of disasters and hardships you will

encounter in safari country (30 to 45 % of the regions). After the names of the players have been entered, a map of the entire country will be displayed to give you an indication of the number of animals in all the regions. Even though the locations of the base camps are displayed, you won't know which one is yours unless you are playing alone.

camp. In yours, you have four scouts, six cameramen, twenty bearers, three cameras and five thousand pounds of supplies. When you're at base camp, you must prepare a safari party to venture through safari country by selecting men and material to take along with you.

First, enter the number of scouts you'll need. Each of the four scouts can 'look ahead' only in his specific direction (North, South, East, or West). For example, if the North scout is in your safari party, he will report to you whether or not there's an animal in the region located directly to your North. You may use none, some or all of the scouts for your party.

SAFARI

by David J. Bohlke

encounter in safari country (30 to 45 % of the regions). After the names of the players have been entered, a map of the entire country will be displayed to give you an indication of the number of animals in all the regions. Even though the locations of the base camps are displayed, you won't know which one is yours unless you are playing alone.

Base Camp

At the start of the game, each player is located in his base

camp. In yours, you have four scouts, six cameramen, twenty bearers, three cameras and five thousand pounds of supplies. When you're at base camp, you must prepare a safari party to venture through safari country by selecting men and material to take along with you.

Next, enter the number of cameras you want to take. For each camera, you get three reels of film (you can shoot one picture for each reel). Each camera requires two cameramen to operate it. These men will be included in your party.

Finally, you must enter the number of bearers you will need. Each bearer must carry one hundred pounds of supplies, so the more bearers you take, the further you can venture from your

TRS-80

HOTLINE

If you ever find yourself in need of some fast answers, an easy solution or just a sympathetic ear, call **SoftSide's TRS-80 HOTLINE**. From 7 to 9:30, every Tuesday evening (EST), our resident programmers will be "on line" to offer BASIC programming assistance to Level I and II TRS-80 users in need of a fix.

HOTLINE 603-673-5144

TRS-80 Programming Hint

If your programs fail to run due to syntax errors, even though they come from reliable sources such as **SoftSide**, perhaps the puzzle can be solved by being careful not to hit the **SHIFT** key out of habit at the start of a line. With this type of syntax problem, the video display appears normal, but apparently, the letter goes onto the screen normally but the CPU doesn't get the message. Retyping the line containing the syntax error (taking care not to hit the **SHIFT** key) cures the problem.

base camp. But, the larger your party, the sooner your supplies will be depleted. When you run out of supplies, your bearers and cameramen will begin to starve.

On Safari

After you've organized your safari party, you're ready to begin exploration. During each bwana's turn at play, he need enter only the direction of movement for that day. One day's journey will move your safari party one region (North, South, East or West) from your present location.

Before you move, check your scout's report. This is the map in the upper left of the video screen. A path consisting of six blocks indicates that there's an animal in that adjacent region. A path of four blocks means the scout has nothing to report; and a path of three blocks indicates that you don't have a scout in your party for that specific direction. A solid path indicates a base camp is directly ahead (not necessarily yours), and no path means no passage. Unfortunately, scouts are unable to report any possible dangers ahead.

The scoring takes place when you journey into a region that contains a wild animal. At that time, the video screen will display a camera lens and the animal. You must position the lens so the animal is inside the viewfinder, then shoot the film. To move the camera lens, press the arrow on the keyboard which corresponds to the direction you want to go. In order to expose the film, press **ENTER**.

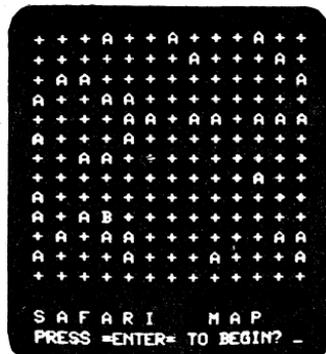

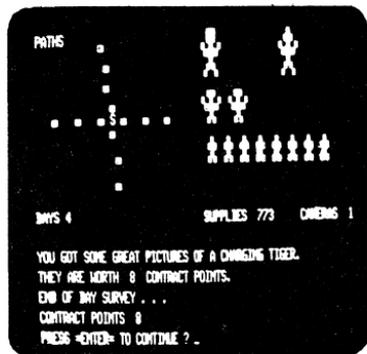

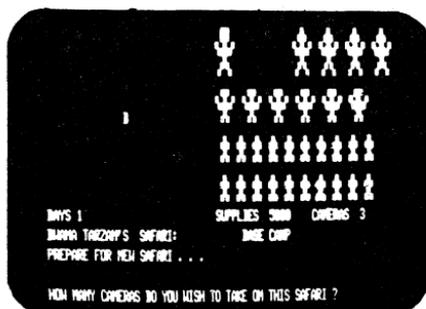

If you are the first to film in a given region, you will receive an

initial eighty contract points; the next bwana to film there will get fifty points, and the third to film in that same region earns thirty points. All others will be too late to get any points. These initial points are decreased according to the time it takes to position the camera and film the animal. However, since movie producers place higher values on remote locations, the contract value is increased by ten points for each day's journey it takes to reach the filming location.

In the safari country, you will also encounter many dangers and hardships. It's even possible to lose your entire safari party while exploring for animals. Should you become lost (or your scouts disoriented) you may send one of your scouts to search for the base camp, and he will return with a

map. To order a scout to look for your base camp, press L for lost when asked for direction. The scouts may also bring you a map without your request if they feel you are, indeed, lost in safari country. The map will show your location S with respect to your base camp. Maps are extremely hard to come by — to get one, your scout will forfeit his life! You must decide between starving your bearers and wandering about lost, or finding a passage to base camp by sacrificing a scout.

During each player's turn to move, a base camp or safari party survey will be displayed in the upper right corner of the video screen. This will show you the number of scouts in your party, the number of cameramen and cameras, the bearers you have taken along, the pounds of

supplies remaining, and the number of contract points you have earned to date. Although the number of days (turns at play) is also displayed, it has no significance in game play. An updated end-of-the-day survey will be shown after each player's move. When you press ENTER to continue, the next bwana's turn will begin.

Strategy

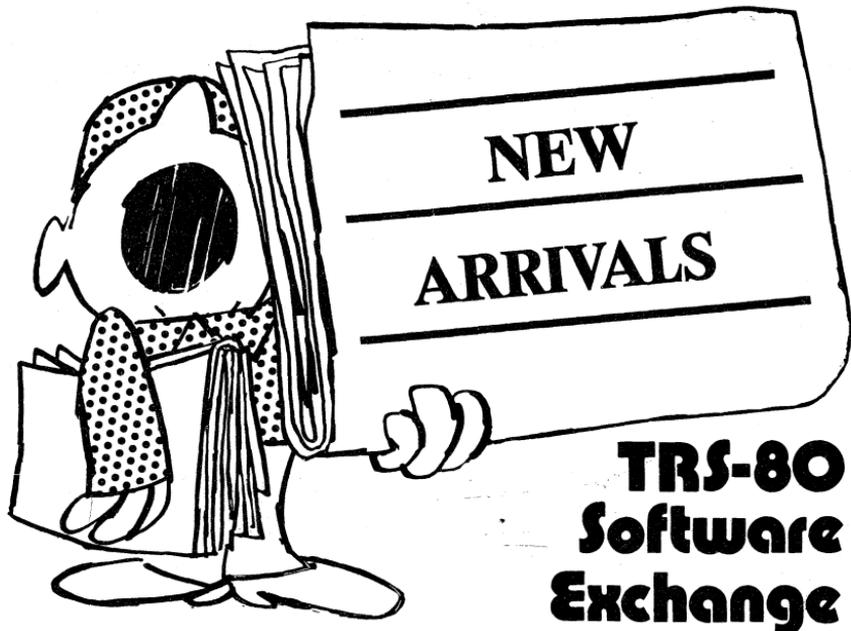

It's always important to remember the location of your base camp with respect to your present location, as well as the number of films remaining in your safari party's cameras. When you return to base camp, you will be able to resupply and prepare for another filming expedition. Each camera you take from base will have three rolls of film. You may also wish to use different scouts when you explore in another direction.

In the early stages of the game, it would be wise to take just one or two cameras, one or two scouts, and six to twelve bearers. These can economically be used to search the regions adjacent to your base camp for wild animals. The best time to use all your scouts and cameras is towards the end of the game when your supplies are low; or, maybe earlier, if you find safe passage to an area where several animals are located. When you're out of film, it's best to return to base camp as soon as possible, so your supplies won't be wasted.

One possibility is to shoot your film in a given region, leave the location, and immediately return to film again (for fifty or thirty points). However, while you're wasting time and supplies in one region, the other players may be exploring distant areas containing several animals. Since the point value is increased by ten for each day's journey from base camp, a filming region several days distance away has significantly higher point potential. It might be better to keep on searching after you get the eighty or more points, then on your way back to camp travel through that region again. These strategies will vary depending on whether your base camp is adjacent to regions containing several animals, or whether you have to search for several days before you find and film them.

Your turn ends when you don't have the minimum amount of supplies needed to equip a new safari party: two cameramen, one camera, three bearers, and two hundred pounds of supplies at base camp. Also, if your last camera is destroyed while on safari, your turn at play will end.

Since the winner is the player with the most contract points, it's possible you could be eliminated from the game before the others and still end up as the winner. The game ends and final scores are displayed when every player has either lost all his cameras or has insufficient supplies to begin another safari.

TAKE A PART:

SAFARI!

Take A Part is a new feature in **SoftSide**. One of the best ways to learn new methods is to look at programs that others have written. In this series, we'll take one feature of a program in our current issue and explain how it works.

When playing games (like **Safari** or **X-Wing Fighter**) that call for moving objects around on the screen, it's awkward to remember which particular letters mean to go up, down, left or right. One solution to this problem is to use the arrows on the keyboard to indicate motion.

At first glance this seems difficult, for the arrows already have specific functions. Without a shift, (and in fast action we don't want to press the SHIFT key) the **up arrow** prints an up arrow, the **down arrow** gives us a line feed, the **right arrow** functions as a TAB key, and the **left arrow** is a back space. Of the four, only the up arrow gives us a visually recognizable symbol in an input statement. We can't print a down arrow, or a right or left arrow directly from the keyboard. However, we can print them indirectly, using the CHR\$ function (See line 702 of **Safari**) Here are the codes, from page C/2 of the Level II Manual:

CHR\$ (91)	Up Arrow
CHR\$ (92)	Down Arrow
CHR\$ (93)	Left Arrow
CHR\$ (94)	Right Arrow

The reason we can't use these directly is that the down, left and right arrows are dedicated to other ASCII codes in lower case, as follows:

Down Arrow	ASC (10)	Linefeed
Left Arrow	ASC (8)	Backspace Cursor
Right Arrow	ASC (9)	Advance Cursor

If we use these keys in an INPUT statement, the line feeds and spaces are printed. If, instead, we use them with the INKEY\$ function, we can translate them into printed arrows before we print them, and even use them to set up a variable to control movement on the screen, as is done with Line 510 and the subroutine at 450 to 454 in **Safari**.

The Programming of the FUTURE is here NOW

BIZ-80 offers you the first element of its revolutionary business software project:

INVENTORY SYSTEM II

Proper inventory management is the backbone of a profitable business, yet it's very difficult to keep current on price increases, shrinkage, low-on-stock items and profitable items versus losers, without an efficient and prompt method of surveying your inventory levels at any given time. **INVENTORY SYSTEM II** can help you to achieve optimal management — it can handle up to 1,000 items on one mini-floppy disk. Each additional disk can handle another 1,000 items.

The system is menu-driven to aid you in its use:

MENU CHOICES:

1. Activity Report
2. Minimum Quantity Report
3. Inventory List
4. Class Code List
5. Vendor Code List
6. Update or Video Display Inventory

DATA FIELDS AVAILABLE FOR EACH ITEM

- # On Hand
- # Sold This Period
- Date of Last Sale
- Cost \$
- Selling Price \$
- Description (25 char.)
- Vendor #
- Class #
- Location #

A comprehensive 32-page manual guides you step by step during your first-time run of the system (dummy data is supplied with all BIZ-80 systems). Your conversion of data from a manual system to the computer system, regular run procedures throughout the year — update the file, add or delete items, keep track of activity month by month or week by week, check for low-on-stock items, run inventory control reports for management.

Requires a minimum system configuration of 32K Level II TRS-80 microcomputer with at least one mini-disk and line printer. Two disks are recommended.

EXAMPLES OF REPORTS AVAILABLE:

SERIES CIRCUITS

by Philip Brown

One of the nicest things about a computer is that it never complains about having to figure the same math problems over and over again. We find it a nuisance to have to keep doing problems with different data, as we would in examining the behavior of a series circuit over a range of operating voltages. When you enter the information for this one, the initial voltage must be lower than the final voltage, and you may not have more than one step per volt.

Within those limitations, this is a lot easier than breadboarding the circuit and measuring all the voltage drops and the current while increasing a variable voltage power supply. •
