## MORE THAN JUST ANOTHER PRETTY FACE.

Says who? Says ANSI.

Specifically, subcommittee X3B8 of the American National Standards Institute (ANSI) says so. The fact is all Elephant<sup>™</sup> floppies meet or exceed the specs required to meet or exceed all their standards.

But just who is "subcommittee X3B8" to issue such pronouncements?

They're a group of people representing a large, well-balanced cross section of disciplines—from academia, government agencies, and the computer industry. People from places like IBM, Hewlett-Packard, 3M, Lawrence Livermore Labs, The U.S. Department of Defense, Honeywell and The Association of Computer Programmers and Analysts. In short, it's a bunch of high-caliber nitpickers whose mission, it seems, in order to make better disks for consumers, is also to make life miserable for everyone in the disk-making business.

How? By gathering together periodically (often, one suspects, under the full moon) to concoct more and more rules to increase the quality of flexible disks. Their most recent rule book runs over 20 singlespaced pages—listing, and insisting upon—hundreds upon hundreds of standards a disk must meet in order to be blessed by ANSI. (And thereby be taken seriously by people who take disks seriously.)

In fact, if you'd like a copy of this formidable document, for free, just let us know and we'll send you one. Because once you know what it takes to make an Elephant for ANSI...

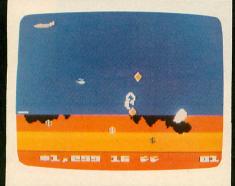

We think you'll want us to make some Elephants for you.

## THE EXPLOSIVE NEW GAME FROM ANALOG SOFTVARE

So you think you're good, huh?

Getting a little harder, isn't it?

OH NO! WIPEOUT!!!

While flying your helicopter over a high mountain plateau in Tibet, your magnetic detector chatters wildly — you have discovered the treasure of a long-lost Sherpa kingdom!

Quickly equipping your 'copter with explosives, you fly over the plateau and attempt to blast the treasure out, intending to split the profits with the Sherpa natives.

But, flying over you in his World War II bomber, the evil Dr. Muta has other plans — he intends for the treasure to remain buried — along with you!

Buried Bucks is a fast action "dare devil" game written entirely in machine language for 1 or 2 players. 16K cassette or diskette.

**Buried Bucks** — the newest game for the ATARI, with **great** graphics, brilliant colors, dynamite sound effects — guaranteed fast action!! **99 levels** of play assure long lasting challenge. Will the evil Dr. Muta defeat you? Will the bucks remain buried forever? Don't go for broke — go for the bucks — **BURIED BUCKS!**

## **EDITORIAL**

#### by Jon Bell

This issue's editorial deals with bits and pieces. A lot has occurred since A.N.A.L.O.G. No. 9, so I want to mention a number of things concerning this issue, as well as what you're likely to see in our pages in the near future.

#### Whither ATARI Follow-up

The response to the editorial in the last issue has been overwhelming. "Whither ATARI?" seemed to have touched a nerve among many ATARI owners, as well as from companies manufacturing ATARI software (see Reader Comment, page eight). Not surprisingly (to us), there was no response from anyone at ATARI, even though dozens of people at ATARI receive A.N.A.L.O.G. If we receive any word from the creators of our favorite home computers, we'll be sure to let you know.

There is a point that I'd like to clear up concerning the origins of "Whither ATARI?" The gentleman who wrote the editorial wrote it in conjunction with the editors of the Portland ATARI Club newsletter of Portland, Oregon. The editorial originally appeared in the October, 1982 edition of the P. A.C. newsletter. Due to a mutual misunderstanding, the credit for the article reprint was not given. For this I would like to apologize. The author's name was withheld at his request. I hope that the increased exposure of our thoughts, so well expressed in "Whither ATARI?", will in some manner influence the way ATARI sees its products — and the people who buy them.

#### The Reader's Poll

At the time of this writing, it's still too early to announce the winners of our free cassette and disk subscriptions, or the winner of the Favorite Program/Article Contest. By the time you read this, however, we will have picked the winners of both, and will have contacted them. The Reader's Poll cards have been pouring in at the rate of hundreds per week, and the preliminary results have been very interesting. The final results of all cards received will be given in the next issue, but I can mention the changes that we will be implementing in **A.N.A.L.O.G.**, starting in this issue. In other words, you asked for it, you got it! Generally, our readers would like to see: ...more reviews of both hardware and software, with plenty of pictures. Our readers have indicated that they want to read tough, no-holds-barred reviews of ATARI products before spending their money.

...more beginner's programs in both BASIC and Assembly language.

...an increased emphasis on educational and business software.

...how to access bulletin board systems.

...and, not surprisingly, at least two games per issue.

Well, if you scan this issue, you can see that we have a great deal of reviews with pictures, a beginner's player/missile graphics article, an article on how to access bulletin board systems, and three games, including a super Assembly-language game from Tom Hudson, author of "Graphic Violence!", **A.N.A.L.O.G. No. 8**. Fans of a certain coin-op arcade game should get plenty of kicks from it.

#### The A.N.A.L.O.G. Compendium

First, the bad news. We have a very limited number of back issues still available. The only issues available are no.'s 2, 7, and 8. When these are gone, that's it. No back issue of A.N.A.L.O.G. will be reprinted, so those of you who have all the back issues should consider them collector's items. Now, the good news. We are going to be publishing, sometime in spring, The A.N.A.L.O.G. Compendium, a large-format book which will contain the best articles and programs from the first 10 issues of A.N.A.L.O.G. Computing. The Compendium will contain utilities, games, tutorials and demo programs. It will be available in your local computer store, or you can order it direct from us. However, please do not call us until we have announced shipment in the magazine. We are not accepting advance orders now, so please be patient. I think you'll like it. □

The staff of A.N.A.L.O.G. would like to thank the staff of The Higgins Armory Museum for allowing us the use of their facilities for the production of this issue.

### ADD A FLOPPY DISK TO YOUR ATARI\* FOR LESS THAN \$450

Now Atari\* users can upgrade to 5" or 8" floppy disks at an affordable price with **MICRO MAIN-FRAME.** 

Micro Mainframe, the premier manufacturer of low cost add on peripherals for the TRS-80 computer, is proud to announce our lineup of products for the Atari\* computer. Micro Mainframe is not a newcomer to the computer marketplace, as we have been supplying quality disk drives for the TRS-80\* for three years. We now bring our expertise to the Atari\* market and pledge to provide the highest quality peripherals at the lowest price.

Our floppy disk drive is designed to sell for under \$450, and check out the features:

- · Low initial cost includes one disk drive and controller
- Single and Double Density operation STANDARD
- Additional drives available for under \$200
- · Controller features a proprietary digital phase lock loop data separator for unparalleled reliability
- Operates 8" disk drives with our MaxiDos A operating system (AVAILABLE MID-1983)
- Intermix 5" and 8" disk drives with MaxiDos A
- Includes a parallel printer port to allow the use of low cost printers
- Expandable to include hard disk operation (requires expansion chassis and host adapter)
- Includes a SWITCHING POWER SUPPLY that is capable of running two disk drives
- · Can be used in conjunction with other Micro Mainframe peripherals

The expensive Atari\* 810 disk drive includes a costly disk controller and power supply for each drive. This is wasteful as one controller can easily control up to four disk drives. With a **MICRO MAINFRAME** drive, you pay only once for the disk controller. To add a second disk drive, you merely purchase a disk drive and case. The power supply in your first drive will power an additional disk drive. Other manufacturers use cheap linear power supplies which generate considerable heat that can shorten the life of your electronic equipment.

#### ADD A DISK DRIVE TO YOUR ATARI\* FOR LESS THAN \$90

If you already own a TRS-80 Model-III\*, you can use your Model-III\* as an intelligent disk controller with the addition of our **CONNECTION A™**. This peripheral connects between the 50 pin expansion bus on the Model-III\* computer and the Atari\* 400 or 800 computer. After loading the supplied software package, your Model-III\* computer thinks that it is an Atari\* disk drive and you can read and write Atari\* diskettes on your Model-III\* for less than \$90.

**Dealer Inquiries are Solicited** 

MICRO MAINFRAME

11325 Sunrise Gold Circle Building E Rancho Cordova, CA 95670 (916) 635-3997

## READER COMMENT

Due to the response from "Whither ATARI?" this issue's Reader Comment section has been considerably expanded, so our readers can voice their opinions unedited.

#### Dear Editor:

In response to your request for comment the following is submitted. I happen to be one of the many who bought an ATARI during the July-August 1981 crest. Your comments are right on the button. It has amazed me at the apparent lack of marketing for what I think is the most versatile system available to the home market. Having been in the computer field since 1963, using the ATARI 800 is a real pleasure even after coming home from working on Univacs, DEC's, Harris and Honeywell systems.

When telling someone you have a computer at home the first problem you experience as you say "ATARI" is the game syndrome. ATARI's image as a game machine is fixed in most peoples' minds because this is all they see advertised.

One of the comments I have heard dealer's make who carried ATARI but were dropping the line is lack of support or slow delivery of orders. One dealer here in Charleston said he thought that if you carried several other competitive systems you did not get the support from ATARI. Again the image problem appears. ATARI is not an Apple nor a TRS-80. The personal computer market is now flooding with choices. I believe ATARI is missing the chance to grab the bull by the horns and become identified as the "Home Computer". Most of the current systems are really personal computers designed to be sold first as a aid to business with home applications being secondary. The new Commodore and the Zenith (among) others) are truly small business systems being sold as personal computers. Witness IBM PC, the "Cadillac," is not advertised as an entertainment system. The answer lies with ATARI. We as owner's can brag, show off our system and have the best of each world, but if the image problem is not reversed the rest of the industry will leave ATARI behind.

Thank goodness for the third party software. I have watched ATARI drop what I thought would have been a good product line not to mention the software which is really where profit comes from.

I believe ATARI needs to correct an image problem and then market the "Home Computer" as an answer to those out there who don't want a business system. Comparison of the cost alone for the true home user should sell ATARI if it were marketed properly.

Thanks for listening. Sincerely, Martin T. Foley Moncks Corner, South Carolina

Editor:

Your "Whither ATARI?" editorial in issue #9 was an act of courage. You risked advertising revenues and support from ATARI's parent, Warner Communications, by asking the important question: "Why is ATARI trying to sell and support their wonderful 400/800 home computers like throwaway toys?" That's a question troubling most all of us faithful ATARI computer users.

Early in December, Wall Street investors revolted against Warner's stock when news leaked that ATARI had lost its sales lead in the home computer market and was in danger of losing its neartotal domination of the home video game market as well. While Warner pointed its finger to its errant ATARI Division as the culprit for a disappointing earnings statement, the true focus of both Warner's overall and ATARI's specific problems should have been aimed at the boardroom of Warner itself.

When Warner Communications purchased ATARI a few years ago, Warner had no real experience in marketing high technology products. Warner's holdings in the movie, TV and recording industries naturally make them entertainment specialists, and with ATARI producing the hottest new wave in entertainment, video games, it seemed a natural fit as another cog in their corporate wheel. But since the merger, ATARI has grown so fast and so large that it has become too complex for Warner's show-biz moguls to handle. Warner's control of ATARI is analogous to an old Douglas DC-3 pilot being given command of a Concorde.

Warner's installation of the Harvard Business School type of corporate political structure at ATARI marked the beginning of their problems with the division. Creative design and software engineers who were weaned on Nolan Bushnell's entrepreneurial spirit at the old ATARI chafed under the new Warnerinstalled regimen of MBA executives, committee decisions and anything-for-the-bottom-line philosophy at the new ATARI. Many of them departed to form new companies or joined competitors. Some of the better engineer-businessmen from ATARI went on to form formidible competitors to their former employer such as Activision and Imagic.

Warner's answer to the burning question, "How do you market a home computer or video game to Mr. & Mrs. Average?", was in the form of mass marketing. And to implement this mass marketing program, ATARI replaced their key marketing executives with men from the toy and cosmetic industries rather than those who were experienced in selling consumer electronics. These "new brooms" quickly landed deals with major retailers like Sears, Toys-R-Us and K-Mart during the Summer. But to make these deals, ATARI had to give contract pricing to the big retailers that was well below the costs offered to ATARI's computer specialty dealers. Naturally, when Toys-R-Us can sell an ATARI 400 for less than XYZ Computer Center can buy it, XYZ would have to drop the ATARI line or go out of business. Thanks to ATARI's mass market programs, dealers from coast to coast dropped the ATARI line and began to bad-mouth it due to the bitterness of being cut out by ATARI. What ATARI's market managers didn't figure, however, was that while they were signing up the big retailers, so were their competitors, Commodore and Texas Instruments. Since Commodore and TI are both vertically integrated, they had no problem bombing the ATARI prices. ATARI, meanwhile had to sit back and attempt to sell the 400 home computer with a \$50 handicap against their key competitors due to the video game groups' insistence that the toolate and over-priced 5200 Super Video Game System needed to

occupy the \$200 price slot. The fruits of this mass market effort have been bitter for ATARI. Before the Fall of 1982, ATARI led the home computer market, but today, (December 21, 1982), ELECTRONIC NEWS reported that ATARI had fallen into third place and even that position was in danger with Radio Shack coming up strong recently. For their efforts, the marketing executives and president of ATARI were recently terminated. The damage those executives did to ATARI's sales and support network still will require much effort to correct, however.

"Warner's control of ATARI is analogous to an old Douglas DC-3 pilot being given command of a Concorde."

For all of its faults, however, ATARI has the best supported home computer on the market. ATARI's APEX program is unique in that it allows the 400/800 users an opportunity to provide software support for their systems without having to go in business for themselves to do so. TI, Radio Shack and Commodore have no current program such as APEX. ATARI has done a good job of setting up service centers at most major cities, important support that the other companies are lagging in. ATARI has also cooperated with the third party suppliers of software, accessories and books for their computers in a manner similar to marketleader, Apple. Third party support is just in its infancy for ATARI's competitors, however.

On the marketing scene, ATARI will be dropping prices on all of their current home computer models and offering new models, such as the 1200XL, to boot. ATARI is also going to try to re-woo the specialty computer dealers with fairer margins and better support in 1983.

From appearances, ATARI and parent Warner have learned a hard lesson in the high-tech consumer electronics business: computers are not toys. Let us hope that they will return to being a technologically-driven, rather than a market-driven company in the future and that ATARI will graduate their excellent home computers from a stormy adolescence to a stable maturity. With over 750,000 users of the ATARI 400/800 among us and excellent magazines like A.N.A.L.O.G. to act as sounding boards, I'm certain that Warner and ATARI will get the message and give us the support and products we want and need in the future. Sincerely, J.T. Irby

Dear Editor:

Orlando, Florida

Your editorial in issue #9 was straight to the point and ironic in view of current events. The New York Times of 12/19 reported that ATARI is plagued by management turnover, disappointing game cartridge sales and an unprofitable computer division. It seems that ATARI really doesn't understand the home computers it is trying to create and is unprepared to compete now that they aren't the only GAME in town. The December issue of Datamation magazine related an interesting picture of R & D at ATARI with a budget between sixty and one-hundred million dollars, an innovative chief scientist, an educational research institute, a lab to work on LOGO research and even a consultant in AI. I don't know about you but I think that this kind of effort should pay off with something more than just game software. Something is wrong.

Your points were well taken especially about education, user support and marketing. I do some part-time work for a local computer sales company and we no longer carry ATARI. Why? Because of the discounting of local video stores and mail order, it is not profitable to sell ATARI and provide support. ATARI seems to think user groups are the total answer but they aren't. Unfortunately people go for the low price and then realize too late that they need support in the form of advice and information. Everyone I have talked to wants a computer for their children. They are interested in education for their children as a very high priority and not only in games.

A particularly annoying indication, at least to me, that ATARI does not take computer software seriously is the Macroassembler. It costs almost \$100 and yet there is no way to buy a backup diskette and it doesn't even come with a center hole reinforcement. Games costing \$30 always have the reinforcements and sometimes the backup availability. It may sound like a small point until you accidentally spill milk or something on your disk and have to pay full price for a "backup" of expensive software.

ATARI's forte (for the VCS) has thus far been games but Activision, Mattel et al have produced game cartridges with much better graphics for the 2600 than ATARI has and as I have said ATARI is hurting because of it. It seems that cartridge sales account for the bulk of game machine profits. ATARI is heading for the same situation in serious computer software. Perhaps if A.N.A.L.O.G. surveyed its subscribers and made the results known to ATARI the problems would be brought to their attention and improvements would follow.

Sincerely, Jordan Powell Carmel, New York Dear Sirs,

This article was long overdue. I agree with it 100%, but I'm not sure who's to blame. We, the user, guide ATARI by our buying habits. If we show that we will buy more games than Educational or Utility programs then that will be the direction ATARI will take.

When the first Home Computer hit the market the best way to show it off and get the public's attention was with a game, such as Star Raiders, and it did the trick. After Star Raiders came Space Invaders and so on, but soon after playing these games the hobbyist found the real purpose of the computer, and started to write his own programs.

"With ATARI putting out more games and limited types of utility programs, ATARI went from Home Computer to Game Computer."

The problem is ATARI saw the money in games and started to redirect their thinking and leave the utility programs to third parties. With ATARI putting out more games, and limited types of Utility programs, ATARI went from Home Computer to game Computer.

We now have to correct this error and your article "Whither ATARI" is the first step, but it can't stop there. We have to let ATARI know by writing to their Marketing Dept., telling them what we want to see from them. We, the buyer, have to guide them. Now is the time to get our act together. Maybe you could get the correct name and address of ATARI for your readers to write to with their ideas. If we don't let them know then we have nobody to blame but ourselves.

Sincerely yours, Philip Diedeman Phoenix, Maryland

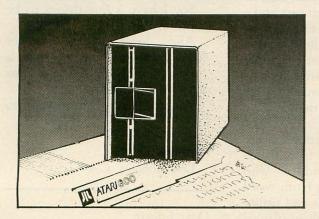

#### Dear Sir:

Your editorial in issue #9 expressed my long-felt opinions very well. After purchasing an ATARI 800 over a year ago for use in my home, I've agonized awaiting ATARI to release nongame software but was relieved when they finally released hardware information to third party developers. Now all ATARI users must wait for these firms to develop software that fills the gaps in Educational, Word Processing, Personal Finance, DB Management and Telecommunications. The efforts made by ATARI in these fields is less than first class and thus many users feel this reflects on ATARI hardware as well.

You question the marketing strategy and I'd like to share some questions and possible actions with you. ATARI has many resources, not the least of which is name recognition. We're seeing the retail price of hardware falling to under \$600 for the ATARI 800. As ATARI struggles for market share, I wish they'd consider package enhancement instead of reduced prices.

As "Computers for People" enter more homes, I believe many will refrain from purchasing today as prices will be lower later. Many remember the calculator price shake out. Now that these households see little quality software outside of games, they have little motivation to buy today. Developers of non-game software also feel less urgency in positioning their products. The ATARI name recognition will keep the public very aware of these price changes.

#### Access Drives for the Atari®—Why settle for less! GET THE MOST OUT OF YOUR ATARI®COMPUTER. GET AN ACCESS UNLIMITED MINI-DISK DRIVE.

#### Store twice as much information

With an Access Unlimited drive, you can store almost twice as much information on a diskette as you can with an Atari 810™

Our system has double-density storage. Which lets you store system and application programs on one diskette and still have room for data files.

#### You save \$\$

You save on the cost of diskettes—because you don't need as many. You may also need fewer disk drives because our Access drives are double-density and, unlike the Atari 810, our controller can handle up to 4 drives.

Furthermore, our add-on drives do not require their own controllers. They're less complicated. They cost less. And they're more reliable.

#### **Now Available!**

Access single density drives. 102k storage but much cooler, quieter and more efficient than the 810!

#### **Enjoy more flexibility**

Our flexible drives let you cable your first-drive system directly into your computer. Or go through an 810 drive.

And our Access controllers automatically handle single- and doubledensity drives in the same system.

#### Order today. Satisfaction guaranteed.

What could be done? Prices are lowered due to decreased costs. Less resistance would occur had ATARI included more "optional" hardware with the ATARI 800 package. Suggested items would be: Pilot Home Package, Entertainer Kit, Educator Kit or 850 Interface. By adding any of these items to product would be enhanced and the selling price would not need to drop. The customer would not see successive price reductions and thus would purchase more readily based on desire to satisfy need.

What could be done to allow home users to upgrade? Why not give \$75 credit toward the purchase of a 1200XL or 800 from a dealer with the trade-in of a 400? Then ATARI, via Warner, could place them in cable households in the vein of the Qube experiment in Columbus, Ohio. Or the tradein units could be donated to schools at a break even expense to ATARI considering tax benefits and the "cost" of the trade-ins. This would place more units in front of more users and help enhance the "education" image for ATARI - not at the expense of the "game" image.

Regardless of the marketing strategy eventually chosen, I hope ATARI soon develops superior non-game software to compliment their machines and game software. Many households already have ATARI VCS game systems and more purchase them every day. Does ATARI really feel a household will pay \$600 for a second game machine? Isn't there enough competition in the home arcade industry without ATARI competing with itself?

Robin Lynch Mundelein, Illinois

#### Dear Sirs:

I couldn't help but grin when reading your editorial in **A.N.A.L.O.G. #9**.

Slightly over two years ago, I purchased a TRS-80 Color Computer from Radio Shack. I quickly learned BASIC, Extended BASIC, and updated the memory to 32K. I waited and waited for the software to come out, only to be rewarded with Dinowars and a whole list of second-rate games. Tandy's marketing policy targeted the computer as a game machine, but the users knew differently they knew it was a machine far more capable than its makers gave it credit for.

Eventually, frustrations were eased by the products from thirdparty software vendors who developed everything from word processors, data bases and utility packages, to much-improved high-resolution action games. It was finally becoming a worthwhile investment, but no thanks to Tandy.

Although the machine improved in its capabilities, I never could resist the lure of the ATARI 800. In December, I plucked down a lot of money for the system with disk drive, and was thrilled that there was so much software to choose from. I gave the TRS-80 to my parents with their new-found interest in home computers.

The irony, of course, is that the **A.N.A.L.O.G.** editorial speaks of the same problem. Different computer, different corporation, same problem. The solution is simple: don't look to ATARI for the answers. The good software will result from two things, namely third-party software companies and *user demand*. Furthermore, the scenario is typical of many home computer products. We are not alone.

The fact is, any business application, peripheral device or expansion capability that can be conceived of will most likely be done, especially if there is a demand for it. I imagine there will be numeric keypads, Z-80's, CP/M systems and who-knowswhat available for our favorite computer before too long.

As a matter of fact, I'm writing this letter on a system utilizing Bit 3's 80-column board, a green phosphor monitor and Letter Perfect word processor. It's enough to make many Apple users a little bit envious.

So, I have a few things to be grinning about.

And don't worry whether ATARI thinks they've got a "machine in a box." The serious software *is* out there.

You just have to know where to look.

Sincerely, Bob Safir Los Angeles, CA

Dear Editor:

We note the reference in your editorial in Issue 9 to the ATARI "Talk & Teach" system. Dorsett Educational Systems, Inc., developed this system in 1975, patented it, and in 1977 licensed ATARI to use it. We later developed 1024 half-hour tutorial program titles, contained in 64 courses of 16 audiovisual programs each, far in excess of the number for any other computer. It is perhaps more tutorial programs, (exclusive of drills, tests, games and simulations) than exist for all other computers, combined.

ATARI released only 256 of our titles, contained in 16 courses (Algebra, Spelling, Psychology, Sociology, Economics, Accounting, Electricity, U.S. History, World History, U.S. Government, Supervision, Writing, Physics, Counseling and Classics). We now sell these courses, plus Electronics (48 programs), First Aid and Safety, Spanish, Health Services, Office Careers, Philosophy, Auto Mechanics, Construction, Carpentry, Shop, Statistics, and hundreds of Reading Comprehension, Reading Development, Vocabulary Building, ESL, Phonics, and Math programs, each of which runs up to a half hour, and has full-time professional, high-quality recorded narration. We are unable to agree that for the ATARI computers, as you claim,

"quality educational software is in short supply."

ATARI apparently agreed with you that the "Talk and Teach" programs "didn't sell", since they sold the rights for them back to us nearly two years ago. But their royalty statement to me discloses that they had already sold more than 600,000 program copies packaged in 38,000 series. Not bad for something that "didn't sell" and which was returned at a time when 80% of the ATARI's now being used did not exist. We hope to supply courseware in increasing quantity.

But there are problems with "Talk and Teach" programs. They are first-generation, so graphics are simple, although often clever and colorful. Special visual efforts are infrequent, although all text is in upper and lower case. Particularly important is the fact that computer hobbyists will miss complex branching and string responses. Responses are all multiple-choice, and branching, when used, is simple. It is not easy to make illegal copies.

Most important, the tutorial mode actually attempts to teach, which means that after going through programs two or three times you are through with them, as compared to games or simulations, which can provide more extended interest to those who already know the subject. Many educators prefer to introduce information by noncomputer means and use the computer as reinforcement. Tutorial programs may have more appeal for home self-study.

Sincerely, Loyd G. Dorsett President Dorsett Educational Systems Inc. Norman, OK

Gentlemen:

Here I sit at the console of my ATARI 400, having just finished a productive and (through no choice of mine) lengthy programming session. I have decided to announce the big error.

This letter is being sent to four major magazines for personal computers in the hope that we can avoid any more BASIC cartridgesized holes in the wall.

A "lock-up" is a painful experience, as it prevents any communication with the computer whatsoever. There are many ways to produce a lock-up, such as Print A = Not B. Try it. Then enter from tape or disk (after rebooting) a long BASIC program. Now the tricky part: type a line number near the beginning of your file. With your finger on BREAK, push RETURN immediately followed by depression of the BREAK Key. 4 out of 5 times, odds enhanced by long sessions of unsaved programming, the machine will allow entry of input but not respond.

Great fun, eh?

If this ever happens to you, don't get mad, just take it in stride (while sweeping cartridge pieces away). It's happened before, it will happen again and until 300,000 rude letters to Warner Communications cause them to correct the defect, will continue to happen throughout eternity.

Sean Puckett Homestead, Florida

Dear A.N.A.L.O.G.,

Game programming can be rewarding, but moving the players up and down in BASIC is too slow. Since I do not know how to program in Assembly language, would you produce a machine language subroutine that I can call up from BASIC to move players up and down fast?

Thank you very much for your attention.

Yours truly, Long Mai Salt Lake City, UT No problem. Check out ''Moving Players in BASIC,'' page 73. —Ed. Sirs,

Is it possible to CLOAD or CSAVE a program, but not have that shrill beep?

The cassette (or disk) Input-output beeping can be turned on or off at any time. To turn the sounds off, use the command POKE 65,0. To turn them on again, POKE 65,3. —TH

## **NEW PRODUCTS**

#### by The Program Doctors

The ATARI home computer market continues its explosion as almost every "home" computer software company is now either converting or designing new software for the 400/800. With all the outside competition, ATARI is finally realizing that it must begin to meet the challenge head-on both in price decreases and an increase in the frequency of software releases. With the recent announcement of a \$499 full retail 48K 800 (minus a BASIC cartridge), ATARI is clashing directly with the Commodore 64. Along with this our sources indicate that 810 drives will also be dropping in cost probably to combat the challenge from both Percom and Micro-Mainframe drives which retail for much less than the 810. ATARI rushed out DEFENDER and GALAXIAN for Christmas and neither match up to their arcade counterparts. DEFENDER (a true 16K cartridge) lacks the superb graphics of the original Williams classic. Although the game is a lot of fun to play it lacks that arcade "feel." GALAXIAN does not even come close to the Midway classic in either playability or screen display (and is really not that much fun to play.) The ATARI consumers are constantly upgrading their 400's; more and more people are also adding drives and playing such outstanding computer games as CHOPLIFTER, BANDITS and POOL 1.5. These people are not satisfied by "licensed arcade releases" in ROM packs. To satisfy the evergrowing "purist", ATARI should take a hint from the third party vendors and begin releasing these titles in both a ROM version and a more enhanced disk version (ala Roklan).

GALAXIAN

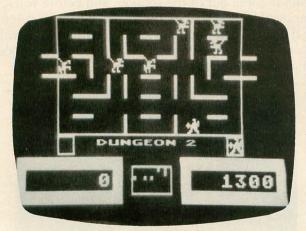

Back in the early days of A.N.A.L.O.G. there was an original program entitled "Maze Rider". Essentially this was a three-dimensional maze game and definitely an A.N.A.L.O.G. "classic." This idea was expounded upon by P.D.I. in CAPTIVITY and EPYX with MONSTER MAZE. The 3-D concept has been taken to the ultimate experience by Sirius in WAYOUT. This 48K game consists of 26 different mazes which provide hours of fun and frustration and demonstrates the superb graphics and animation which can be programmed into this marvelous machine. As you attempt to find the WAYOUT you see and feel the depth in the maze as you travel about with your compass and map maker. As in all games there is a villain and in WAYOUT it is "Cleptangle," a mischievous pirate that steals your exploration equipment and leads you astray. This game has a great scoring system which allows for many replays within the same maze, since it is based on the distance traveled through the maze. A floppy record is provided to maintain high or in this case low scores on the disk for each of the 26 mazes. On a lower note from Sirius is its release of all the VCS cartridges for the 400/800, FAST EDDIE, TURMOIL, DEADLY DUCKS, WORM WAR and BEANY BOPPER. To say that these are 4K cartridges should be enough to the average A.N.A.L.O.G. reader, but to be more specific, let your VCS buddies buy these cartridges.

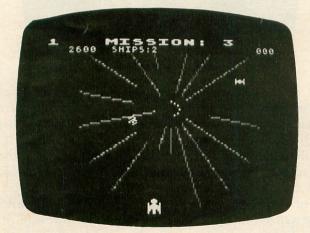

Everybody likes to say that they own real arcade titles like FROGGER and MISSILE COMMAND, but sometimes these translations are not true to the originals. One company that is attempting to reproduce authenic arcade games is Roklan Software. Its first release was DELUXE INVADERS, an excellent translation from the Midway classic. Now comes WIZARD OF WOR and GORF, also licensed from Midway in both disk versions and ROM packs. WIZARD OF WOR, a personal favorite of the Program Doctors, is complete with hi-res graphics, arcade-like sounds, and interactive play. As you enter the "Dungeons of Wor", your mission is to rid the Dungeon of all the evil "Worlings", destroy the speedy "Worluk", and meet the mighty "Wizard" himself. Some of the "Wizard's Worlings" have the ability to disappear and therefore to aid in your search a radar screen is provided for tracking purposes. When you successfully survive a "dungeon" you are confronted with a better-protected one. Also, the time before the "Wizard's" cronies speed up their

PAGE 15

defense of their "lair" is decreased and there are more enemies to destroy. In the interactive twoplayer version, both players compete at the same time either as partners or opponents. This really is the best feature of the game. WIZARD OF WOR is an arcader's delight and definitely a must for the game enthusiast. The disk version has more sprucedup sounds and a fine high-score save feature. GORF, the most popular of Midway's trio released by Roklan, does not excite as much as their previous two games. This could be due to the tremendous amount of quality arcade games on the computer market already. Although it was unique in its original issue as a multi-screen arcade game, GORF is not as well-received as it might have been had it been released a year ago.

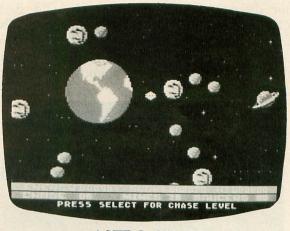

WIZARD OF WOR

#### GORF

Many software purchasers are influenced by full page 4-color advertisements in computer magazines. Often times the best thing about these programs is the cover art. A program that does live up to its 4 month media hype is First Star's ASTRO CHASE. From the time you see the title page and the onevoice opening theme (this was to preserve memory) you can tell this is something special. Currently available on 32K disk and tape, the scenario is a SYPFAD (for the new readers "SAVE YOUR PLANET FROM ABSOLUTE DESTRUCTION.") Graphically speaking this game has everything, and the periodic sideshows are well done and quite humorous. "THERE IS NO ESCAPE" to this game but it sure is a lot of fun trying.

ASTRO CHASE

Adventure International has been writing for the 400/800 from its conception in 1979 and is quickly climbing to the top of the ATARI computer software industry. AI has followed its largest selling software program written for any computer, PREPPIE, with three new arcade titles. SEA DRAGON (written by Russ Wetmore, author of PREPPIE), is a multiscreened underwater game which not only requires skill but also patience as you navigate your submarine through a plethora of obstacles in an attempt to destroy the "Master Mine." This game receives the Program Doctors first "Seal of Approval" awarded only to computer games which contain everything a great arcade game should have:

- 1. Multi-level option
- 2. Great graphics, sounds, and game logic
- 3. Real-time playability
- 4. A save Hi-score to disk option (32K disk version only)
- 5. Multi-screens
- 6. An attainable ending (nobody says it has to be easy)
- 7. A repeatability factor (or lack of boredom factor)
- 8. An availability on both disk or cassette (16K in this case) so all of us can enjoy the game

Obviously we like this game very much and highly recommend it, and suggest when you play it to try to use the joystick in as many ways as possible; you may find some hidden surprises.

AI has not stopped here. They have released two other arcade titles, STRATOS, a nice extension to the MISSILE COMMAND genre; and BUG OFF, a frantic game for you people who love to kill bugs instead of spaceships. For the adventurer both ADVENTURELAND and PIRATE ADVENTURE are now available in 48K graphic versions and are unique both in animation and perspective, and the S.A.G.A. Series shows great promise. This company is not only offering support in these two areas but also in utility packages with DISKEY, a disk editor that allows you to do everything you wanted to do to your disks but were afraid to try, and BASIC ROUTINES FOR THE ATARI, by Jerry White, containing 24 basic programs to aid in programming in such areas as paddles, joysticks, timer, common subroutines, p/m graphics, sounds, disk utilities, etc..

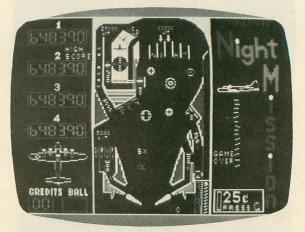

SEADRAGON

S.A.G.A. #1

Pinball simulations are big sellers for home computers and SubLogic has finally converted NIGHT MISSION for the ATARI. With its first ATARI arcade release SubLogic has attempted to recreate the actual feeling of playing pinball. From the time you insert your first quarter you begin to feel that this is different from other pinball simulations. NIGHT MISSION is user-adjustable, and therefore if you do not like the SubLogic version you can redesign it to suit your taste. Although you cannot modify the playfield itself you can adjust such things as ball speed, friction, inclination, bumper sensitivity, free game match probability, and free game score. These adjustable parameters allow you to customize NIGHT MISSION just the way you like it. The only drawback to this game is that the sounds come out of the speaker, and before you get annoyed, this was done for memory considerations and that old computer proverb "you don't mess with success", since the original was written for our good

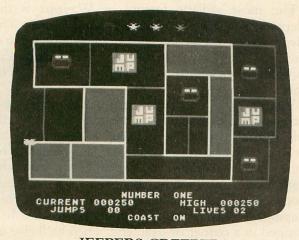

micro-buddy, the (burp) Apple.

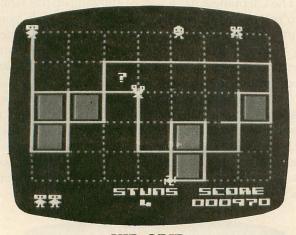

#### NIGHT MISSION

As the software companies pulled out all the stops for Christmas a multitude of new titles were released, including two games which will satisfy that QIX fix until the original is released by ATARI. KID GRID and JEEPERS CREEPERS are based on the "surround-the-box-before-they-get-you premise". Both are fun arcade games with addictive qualities. For all you "Forth Funatics", JEEPERS CREEPERS is written in QS FORTH by Quality Software on both disk and cassette. On the other hand Tronix (a new kid on the block) developed KID GRID, a real sleeper on both 16K tape and disk.

Just when we were about to write off Gebelli and give it the "Crystalware Award of the Year" prize, CANDY FACTORY, a 32K disk, comes to the rescue. Those of you who have been "burned" by this company in the past can be confident when you get this good climbing game. Unlike CANYON CLIMBER this game has "staying power". It has 10 different screens that will definitely bring out the Spiderman in you. Unfortunately we must warn you to stay away from their two cartridges, the 4K FIREBIRD and EMBARGO; your software dollar can be much better spent.

#### JEEPERS CREEPERS

**KID GRID** 

Before we close, the Program Doctors have one other new program to talk to you about. It is rather hard to do since a definite conflict of interest is apparent. We do not work in the offices of A.N.A.L.O.G. and have never even personally met one of our two editors, nor do we need the income derived from writing this bimonthly column. Our job is only to inform you, the software purchaser, of the products on the market. Therefore, hoping we have maintained our editorial integrity, we must tell you that A.N.A.L.O.G. Software has a definite winner with its latest release, BURIED BUCKS by Tom Hudson. Providing 99 levels of play, this original game requires speed and skill. The player uses a helicopter to dive-bomb holes into the earth and then delve inside these same deep caverns to pick up the money and run (or in this case fly) to safety. The nemesis in the action is a plane that keeps on coming to refill the earth channels your chopper has made. Available on both 16K tape and disk, for one or two players, this game is done rather well.

By next issue, we should have new, massive amounts of information for you, so until then, keep those cards and letters coming.  $\Box$ 

#### Software Review: Wayout by Paul Edelstein SIRIUS SOFTWARE Sacramento, CA 95827 48K Disk \$39.95

#### by Brian Moriarty

A few weeks ago, I came strolling into the offices of **A.N.A.L.O.G.** to ask my favorite annoying question, "What's new?"

Editor Lee Pappas immediately began tearing his desk apart, looking for the latest marvel from Sirius Software. As his frantic search continued, his eyes began to redden, his breath heaving in quick, short jerks like a junkie going cold turkey. Just as I began to think it might be better to visit some other day, Charles Bachand had the bad luck to walk through the door. Lee grabbed Charlie by the throat (*not an easy task; Charlie stands 6'4"*) and hissed, "Where's **Wayout**?"

"Out in my car," poor Charlie croaked helplessly. "Get it — now!"

The precious pre-release copy of the disk was quickly booted, and I became another fan mesmerized by one of the best microcomputer games since **Star Raiders**. **Wayout** is really that good.

The idea of the game is simple. You've been dropped into the middle of a complicated maze which has exactly **one** exit. Armed only with a compass and a map-making tool, you must find your way out of the maze by the shortest possible route.

As you "walk" through the maze (using either the keyboard, a joystick or a paddle), you see a full-color image of the maze as experienced from the **inside**. The solid blue walls slip past with startling realism and perspective. Both Charlie and Tom Hudson (no strangers to assembly-language game programming) were astonished by this nifty example of real-time animation. The rest of us were dumbfounded.

#### 26 ways to get hopelessly lost.

It wouldn't take very long to memorize the layout of a single maze, even a big one, so Sirius provides no less than 26 different mazes on the **Wayout** disk. You can save a game-in-progress, record your best score for each maze and even mark up to nine locations in a given maze and return to any one of them in a moment. This latter feature is essential to mastering the game — but more on that later.

While admiring the graphics, you may notice little dots of light flitting around the picture area. These "bugs" in the program are actually fireflies, moving around on the breeze that sometimes blows in from the exit. You're supposed to let the fireflies help you determine the location of the exit. After hours of play, I can't say they've been very helpful.

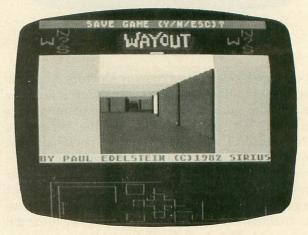

#### Introducing...the Cleptangle!

The most sadistic feature of **Wayout** is the Cleptangle (CLEPTomaniac RectANGLE). The Cleptangle is the geometric equivalent of a purse snatcher. He's also one of the most diabolical computer personalities to emerge since the Thief in **Zork**.

Visually, the Cleptangle appears as a spinning rectangle, red on one side and white on the other. His sole purpose in life is to make you miserable by stealing your compass and/or mapmaker. The compass is somewhat expendable, but the mapmaker is absolutely essential to your success. Consequently, if the Cleptangle runs off with your mapmaker you must chase him down until he's trapped in a corner or dead end. Then he'll give up his prizes and go away — for a while.

The Cleptangle has a way of showing up just when you're starting to make progress. He'll grab your stuff and head straight for the area you just finished exploring. Unless you use the save-position feature mentioned earlier, you will go mad re-tracing your steps after you catch up with the fiend.

A warbling tone indicates the presence (or blessed absence) of the Cleptangle. A different sound is heard when you come close to the exit, represented by a rapidly flashing hole in the maze. In some mazes, the wind coming out of the exit is so violent that you can't get near it without blowing away. You'll have to find some alternate path of approach.

Wayout is one of those rarities in ATARI games: a good-looking product that actually manages to hold your interest. Since I received my rare personal copy, I've made my way through about a dozen of the mazes. My scores have been pretty awful, but I'll be going back to improve them after I finish numbers 13-26. In the meantime, we can hope that Sirius will release additional Wayout mazes.

Paul Edelstein deserves stardom for his masterful programming effort. When I'm showing off my ATARI to friends, I don't automatically reach for **Star Raiders** any more. □

#### by Richard A. Benson

What does someone who is 33 years old and still a kid at heart ask Santa Claus for Christmas? What else — a new keyboard for his computer! Of course I thought that my chances of actually getting one were slim to none, being that my wife hates the stupid thing that sits on the desk in the bedroom and occupies most of my waking hours. (When I am not playing with my IBM 3081 at work, that is). Well, Christmas morning I woke up to find shirts, ties, and last but not least, a B. KEY 400 keyboard for my ATARI 400. (Yes Virginia, there really is a Santa Claus).

I did my best to hold myself back from doing any more than just looking at it (or should I say drooling over it) until the kids had settled down after unwrapping their presents and totally destroying the house. After what seemed like years (actually an hour and a half), I grabbed my ATARI 400 and settled down at the kitchen table with a cup of coffee for what I expected would be at least an hour of tearing my hair (what little there is left) out while trying to install it. You see, I might be able to program, but when it comes to anything mechanical, forget it.

Inhome Software's advertisement read, "the B. Key 400 can be installed in 2 minutes." Well, I said to myself, here goes nothing. I opened up the instruction manual and read the first sentence. "TOOLS NEEDED: 1 PHILLIPS SCREW-DRIVER." Hey, this isn't going to be as tough as I thought! I removed the 4 screws on the bottom of my computer, lifted off the top cover, and disconnected the factory installed keyboard. There were no additional screws to worry about and the ribbon cable simply pulled out to disconnect it from the computer. Next, I snapped in the B. KEY 400 and proceeded to plug the new ribbon cable into the computer. This was the only tricky part, as the new ribbon cable had no plastic reinforcement on the end to allow you to apply the even pressure needed to make the correct contacts. Back went the four screws and I was looking at my new keyboard after only 5 minutes installation. (Well, so the ad exaggerated slightly. Actually if it hadn't been for the ribbon cable, I could have easily done it in 2 minutes.)

Next came the tough chore of putting the keys on. I was actually going to have my 4 year old do it, but I knew if I wanted to have the key that I pressed be what it was supposed to be I had better do it myself. Another 5 minutes and the installation was complete. My coffee wasn't even cold yet.

For those of you who have done any serious editing on the ATARI 400, you will be pleased to know that I no longer had to wonder if I was actually pressing the CTRL key when moving the cursor around on the screen. The feel of the keyboard is great, as good as the 800, in fact. The only problem that I have found is that some of the special function keys have been moved around a little. This is because the size of the ATARI 400 keyboard is smaller than the ATARI 800 keyboard and in order to accomodate the larger size keys some adjustment had to be made. But I am happy to say that it took only a short time to make the adjustment and I find myself using the computer more than ever.

In short the B. KEY 400 is the ATARI 400 owner's dream come true. It is so good in fact that I just got a 48K memory board installed so that I could do everything that a 800 can do.

Congratulations to Inhome Software on a quality product with excellent installation instructions that even an amateur like myself could understand.

Let's see, what should I ask for next Christmas?...  $\Box$

## UTILITY#4: DISK DIRECTORY DUMP

#### 16K disk

#### by Tony Messina

This issue's utility is rather simple in nature but can prove quite helpful when trying to remember what program is on which diskette. In order for this utility to work you need the following items. 1) A disk drive 2) a printer (40 or 80 column) 3) an ATARI computer with a least 16k of memory. The utility itself will give you a neat, formatted hardcopy of your disk directory (I told you it was simple!). The following article should also give you a general idea about IOCB's and the OPEN/CLOSE statements which are part of the BASIC repertoire.

#### **IOCB's**

Many programs appearing in A.N.A.L.O.G. use OPEN and CLOSE statements to perform a particular function. I'm sure such questions as (What is being opened/closed, How/Why is it being opened/closed and How can I open/close my own things?) has crossed your mind, so now would be a good time to find out what it's all about!!

One of the most difficult things to do on any computer is INPUT/OUTPUT or I/O for short. Would you like to write the program (commonly called a driver) to print to the printer or list to the disk or input a character from the keyboard?? It really isn't all that fun. Thanks to those great ATARI folks who designed our systems, (the operating system in particular), we don't have to worry too much about the above-mentioned items. We can control our I/O through an IOCB or Input Output Control Block. The operating system has eight IOCBs. Each IOCB contains information as to the nature of the device we want to communicate with, where the driver for the device is located, where the buffer for the device is located, length of the buffer, the command we are trying to execute on the device (OPEN, CLOSE, PUT CHARACTER, GET CHARACTER etc), Timeout values (i.e. how long do we try to execute a command before we decide to give up) etc. This information is used by the Central Input/Output (CIO) portion of the operating system when communicating with the device on the IOCB specified. Now that we know about IOCBs, lets look at how we set them up.

#### OPEN/CLOSE

The OPEN command allows us to communicate with a device using the CIO facility. We don't have to know maching language to access a device...we can use BASIC instead! OPEN just dedicates an IOCB to perform our command. We can think of it as opening a hotline to our device. The line will stay open until we hang up or CLOSE it. The form of the OPEN command is as follows:

OPEN #IOCB,I/O CODE, SPECIAL, DEVICE

Parameters can take on the following values:

IOCB - Any number from 0-7, Usually only 1-5 is best since the operating system uses IOCB 0 for the screen/editor, 6 for any graphics window (I'm sure you all have used a PRINT #6 statement), and 7 for LPRINT and Cassette I/O.

I/O CODE - 4=INPUT, 8=OUTPUT, 12=INPUT and OUTPUT, 6=DISK DIRECTORY INPUT, and 9=OUTPUT (APPEND TO END OF FILE)

SPECIAL - Is usually 0 but can be filled in based on the device you are using. If you are opening a screen mode other then GR.0, you would need to put the GR. mode number in the SPECIAL parameter. If you have a sideways printing printer (say that 10 times quickly), you could get it to print sideways by putting 83 as the SPECIAL parameter. When in doubt, use 0.

DEVICE - Devices which we can control and which BASIC knows about are the KEYBOARD "K:", GRAPHICS WINDOW "S:", PRINTER "(P:'', CASSETTE ''C:'', DISK FILE "D:filename.ext", SCREEN EDITOR "E:", and RS232 PORTS "R:"

When opening a device we must make sure that the parameters make sense. We wouldn't want to open a printer for INPUT and OUTPUT since most printers only allow OUTPUT. It also wouldn't make sense to open the graphics window for DISK DIRECTORY INPUT. See...it's not all that complicated now is it??

#### **NOW WHAT HAPPENS?**

Once we have opened a device there are many things which can be done. Commands such as PUT #, GET #, PRINT #, etc can be executed by BASIC directly to the device we have opened. The only thing we have to remember is not to use an invalid command for the I/O CODE selected. If we opened the GRAPHICS WINDOW for OUTPUT for example, then we could not use the GET command. Experiment using OPEN with its associated commands and you'll soon become proficient in the mysterious world of ATARI I/O.

#### WE NOW RETURN TO EARTH OR HOW UTILITY #4 USES THIS STUFF

This issue's utility opens 2 IOCBs. IOCB 1 is opened for output to the printer LINE 220 and IOCB 2 is opened for disk directory input LINE 230. The filename to get has been set to "D:\*,\*" since we want them all. DEV\$ is simply set to "P:" for the printer, I set all my codes to constants for easier reading. The values can be found in LINES 115-125. With these two IOCBs open the rest of the utility is a snap. We input a file name in LINE 380 and output it to the printer. A nice thing about the directory input command is that it also returns the number of FREE SECTORS after the last filename has been input. Line 385 checks for this and routes us to LINE 420 when we are done. Another item to note is that the printer now recognizes; and, so that we can format our output. LPRINT under certain circumstances will recognize these two characters but it's best to open a channel to the printer and do a PRINT # instead. This way we can be sure of obtaining the desired results. The remainder of the utility performs error checks and issues prompts for the user. All of the major sections have been block commented and should present no major problems when you try and figure out what is being done.

#### **HOW TO USE UTILITY #4**

Type in the listing and save it to your disk. You can now run the program. If you forget to turn on your printer or disk you will be razzed until you do. Just follow the prompts and you'll soon have a listing of all your directories. You can even print a title (18 characters max) for each of your directories to help jog your memory. One last note. If your printer doesn't support the expanded print mode then you must change LINE 305 by deleting the ESC ESC CNTL N sequence and also deleting the \*2) from the centering calculation. If you have an EPSON printer just change the code for expanded print to your appropriate code.

That wraps it up for this issue. Have fun and I hope I have provided you with another useful aid. Keep those ideas, questions, and comments rolling in. Till next issue HAPPY COMPUTING!!

## **D: CHECK II**

#### 16K disk

D:CHECK by Istvan Mohos Revision 2 changes by Tom Hudson

In issue #8 of A.N.A.L.O.G. we introduced a program called D:CHECK, written by Istvan Mohos. D:CHECK's purpose was noble enough: help disk users to find typographical errors in the programs they typed in from the magazine. Unfortunately, D:CHECK has a minor flaw that can cause some confusion. This article will present a set of modifications to D:CHECK that will correct the problems.

#### The Changes

For those who already use D:CHECK, there are only a few changes. The lines affected are 105, 125, 130, 140, 150, 360 and 365. For those who do not use D:CHECK yet, the entire program with changes is listed at the end of this article.

The main problem with D:CHECK shows up if (1) an entire line is missing or (2) a line is missyped with a different number of characters than the original. Either of these problems may confuse the checksum routine in D:CHECK, giving incorrect checksum values for the rest of the program.

Since the new checksum routine will only work with programs starting with issue #10, D:CHECK2 will ask for the issue number. If the program being checked is from an earlier issue, D:CHECK2 will use the old checksum routine, and so will match the D:CHECK DATA from that issue. This was done so that readers who order back issues will be able to check those programs with the new CHECK program.

The last modification allows the user to simply enter the filename (D:filename) to be CHECKed.  $\Box$ 

#### Description of Changes

- LINE DESCRIPTION
- 105 Revision 2 credit.
- 125 Set up a string for the filename.
- 130 Accept the filename via INPUT statement. (Remember to use the "D:" prefix!)
- 140 Find out what issue the program is from.
- 150 OPEN the requested file (LIST format).
- 360- Adjust checksum routine if program is from 365 issue #10 or later.

#### **Abbreviated Instructions**

For those who have not used D:CHECK, here is a step-by-step explanation of how to use D:CHECK2:

1. Type in the program listing from the magazine. (DO NOT type in the "D:CHECK2 DATA"!)

- 2. LIST your program out to the disk (i.e. LIST "D:yourprog").
- 3. RUN D:CHECK2.
- 4. D:CHECK2 will ask for filename. Respond "D: yourprog".
- 5. D:CHECK2 will ask for the issue number. If the program you are checking is from issue 10, type "10".
- 6. D:CHECK2 will execute and display final instructions. At this time you can check the D: CHECK2 DATA from the magazine against the results D:CHECK2 put out to the file called "BUG".
- If your BUG data does not match the D:CHECK2 DATA, check the line that corresponds to the DATA value that is incorrect. For example: 100 DATA 234, 34, 120, 254, 23, 78, 34, 198, 202, 134, 233, 102, 97, 134, 33, 1910

In the above line of BUG, if the value 254 is incorrect, then the third line after line 100 in your program is incorrect. Note all errors and then EN-TER your program in order to correct it.  $\Box$

## MAGIC KEYPAD

A Program that writes Data Statements for your ATARI

#### 16K disk

#### by Greg Peck

I'm sure that you will agree that one of the most tedious activities on your computer is typing in DATA statements. Whether it's from a listing in your favorite magazine or a piece of music to dress up your program, it tends to be more work than it's worth.

Well, your worries are over. MAGIC KEYPAD will take care of the work for you. All you do is type in the data and MAGIC KEYPAD will take care of line numbers, the command, commas, how much will fit on each logical line and LIST the file to your disk. And that's not all! You also have the option of a numeric keypad.

The program checks keyboard input and changes U,I,O into 4,5,6; J,K,L into 1,2,3 and M into O. Presto! You've got a numeric keypad. Granted, it's not perfect, but for the price it will do quite well. I got the idea from an ad for that little Epson computer.

To use the program, begin by answering the prompts. First, you select to either pack (fill to capacity) the DATA statements or have from 1 to 9 separate elements in each DATA statement. Then choose whether you want the keypad or not. After that, type in the first line number to be used in the DATA statements. The lowest line number available is 500 to prevent the DATA statements from writing over part of the program. The last prompt to answer is the file name. Your DATA statements will be LISTed under this name, so be sure it hasn't been used before. Later, you can ENTER the DATA statements into your program.

You will then be told the line number and the current number of the "data element" you are working on. Just type in whatever you want in the DATA statement and press RETURN. Everything will be taken care of. Type "1E9" if you want to move to the next line number. When you're done just type "END" as your response to the prompt. The screen will go blank while the program is erased and the data statements are LISTed to the disk drive. The READY prompt will then appear on the screen. If you type LIST you will see the DATA statements that the program wrote. □

- Lines 10-100 set up the strings and prompts the user. Each input is trapped so that an error will not stop the program.
- Lines 110-120 establishes the file name to be listed later and sets LL (Line Length) to 10 to cover the line number and command.
- Lines 130-240 contains the loop that controls data input. It loops once for each element in the DATA statement. NOE is the variable for the Number Of Elements. Then, it checks FLAG to see if the user wants to use the keypad. Lines 170 & 180 check for flags to jump out of the loop. Lines 190 & 200 check the line length. Line 210 adds a comma if needed. Line 220 takes care of the first element in the DATA statement. Line 230 adds the most recent input to LINE\$.
- Lines 250-290 clear the screen, print the DATA statement, turns on the FORCED READ, stops the program, turns off the FORCED READ and returns to the main program loop.
- Lines 300-390 create the numeric keypad. If the RETURN key is pressed, K will equal 155 and the program will return to the main loop.
- Lines 400-470 deletes the program and LIST the DATA statements to the disk drive under the name input at the beginning of the program. Line 470 ends the program and returns the computer to the normal operating mode.

Variable Table for MAGIC KEYPAD. E\$ - holds user input LINE\$ - the content of the DATA statement C\$ - a comma "," CO\$ - the command "DATA" NAME\$ - name of file NM\$ - "D: (added to NAME\$ for disk operation) K - number of character from Keyboard NOE - Number Of Elements FLAG - 1=keypad input 1=normal input

LN - current Line Number

I - counter in main program loop

LL - Line Length

X - first line number and counter in keypad

## **IT'S HERE!**

## THE ATARI 1200XL HOME COMPUTER.

#### by Lee Pappas

"We at ATARI believe that the model 1200XL is a new generation in home computing, a culmination of our experience in hardware design." These words come from Raymond Kassar, ATARI's chairman and chief executive.

ATARI has just pulled the post-Christmas wrapping off of its latest personal computer — the 1200XL. New design. New features. New questions as to ATARI's place in the computing world. Last issue's editorial covered many of the problems ATARI has been experiencing of late, and although hardware wasn't the main problem we were concerned with, suddenly the 1200XL has been thrown upon us. Just what is the 1200; and what does it do that the 800 (and, for that matter, the 400) does not?

#### The 1200XL Differences

The 1200XL comes with 64K of RAM. As with the 800, once the BASIC cartridge is used, you are down to 37902 bytes of free RAM. However, there the similarities end. The 1200 has a 16K ROM pack compared to the 10K unit of its predecessors. The 16K ROM can be completely bypassed, and — with no ROM cartridge in the slot — it allows 64K. However, the computer will now be incapable of doing anything until the user puts in some sort of operating system. The expanded ROM operating system capabilities will be explained later on.

The most important feature of the 1200 however, is that it is **ALMOST** fully software compatible with the 400 and 800. Read ALMOST. We didn't have enough time to try all the software available, but we do know that Letter Perfect and several other programs will not operate on the 1200. LJK, for instance, has announced they will have a revised version for the 1200. Cartridges now go in the left hand side of the new computer. There is no door to open and close, and the power is automatically triggered to "reboot" any new cartridge inserted (no need to turn power on and off by hand — the computer knows how). Because of some physical differences, many third party cartridges will **NOT** fit in the 1200XL.

On the left panel is the on/off switch, and near the front, angled at about 30° are only two controller ports, not four. There are no openings of any kind on the front or right hand side; no cables dangling out all over the place. The channel selector switch, monitor jack, TV cable plug, and serial port are all on the rear panel. The television cable has RCA type connectors and is removable so that all cables can be disconnected from the computer. The serial port is identical to that on the 400/800 and will take all the peripherals of its predecessors, although a new version of the 410 and 810 are on the way. The newer disk drive is rumored to have 180K of disk storage.

The 1200XL cabinet is a cream and dark brown high impact plastic, with a new brushed metal strip, where the new keys lie. Just above that is a clear plastic strip covering the 3 LEDs and key labels.

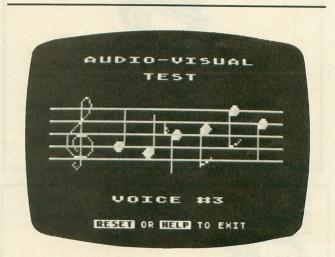

#### **Special Features**

The most radical difference in the 1200XL is the strip of metal keys residing just above the slightly rearranged keyboard. The 11 metal pushbuttons consist of the System Reset key, remotely located to the left of the 1200XL logo. This key is more difficult to press, making programming "accidents" less likely. To the right of the logo are the newlypositioned START, SELECT, and OPTION keys, followed by 4 new function keys, the HELP button, inverse video key (no more ATARI logo key on the keyboard), and the BREAK key.

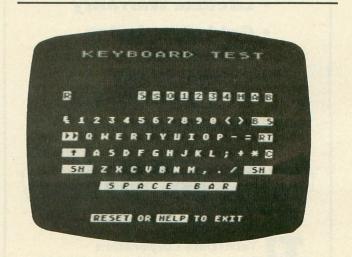

The HELP key will work with selected new programs, to aid the user in the use of that piece of software. When pressed with no cartridge in place, for instance, the computer displays the self-diagnostic mode. From here you can check for ROM errors, bad memory locations, the sound channels, and all the keys on the keyboard. All this is a little gimmicky, but it does work. The new function keys allow the user to move the cursor up, down, left, or right (these replicate those also found on the keyboard, but are one touch and don't require the use of the CONTROL key). If pressed with the SHIFT key, F1 will bring the cursor to the top left (HOME) position without clearing the screen. F2+SHIFT will bring the cursor to the bottom left corner. Function key F3+SHIFT will cause the cursor to move to the far left of a logical line, and F4+SHIFT moves the cursor to the far right of a line.

6	MEMORY TEST
	ROM
	RAM
	RESED OR DENT

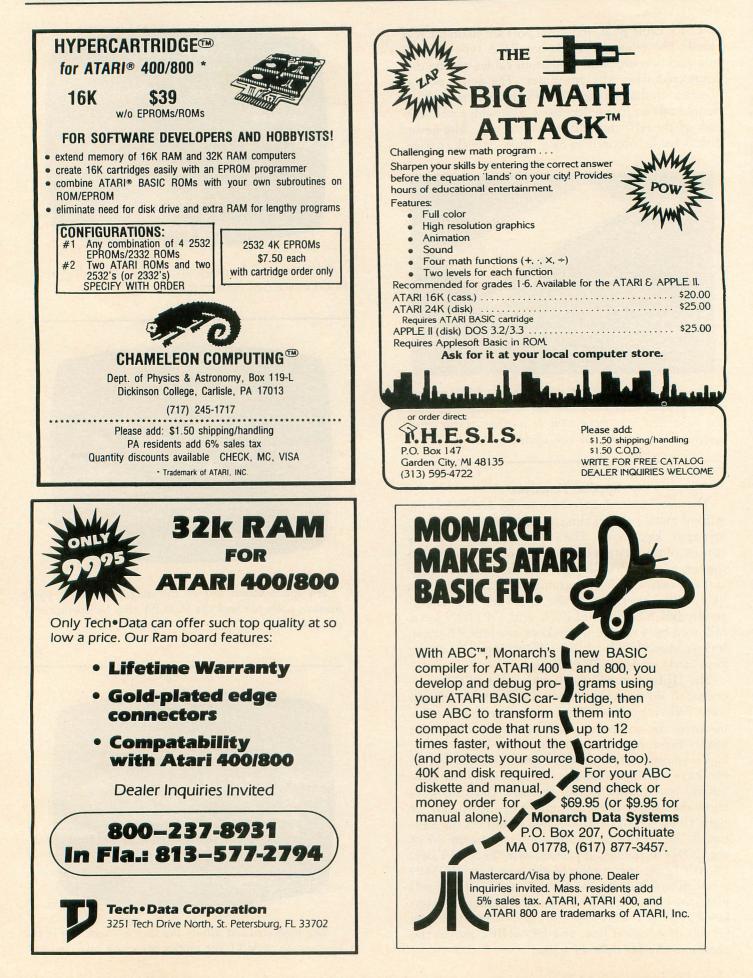

Selection 1 of the diagnostic HELP screen displays a ROM and RAM memory test.

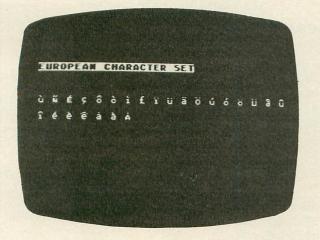

An audio-visual test in the diagnostic mode plays musical notes to check the POKEY chip for operation of all 4 voices.

The keyboard test allows the user to check any of the keys on the 1200XL for proper operation and contact.

When used with the CONTROL key, F1 will now disable the keyboard ("locking" it up so no one can type), and when pressed again will free it up. F2+ CNTRL shuts off the screen DMA: when DMA (Direct Memory Access) is disabled, the screen goes black, and the processing of the computer is increased, as now it doesn't have to waste time putting information on the screen. Math calculations can be speeded up by as much as 35% by using this feature. At any time during a program, you can enable the screen to check what's going on, then shut the screen off again to speed things up. Function F3+CNTRL will shut off the keyboard "click". The 1200XL has no internal speaker — the keyboard clicking sound now comes from the TV or monitor. F4+CNTRL will give you the European character set.

Function key F4, when pressed with the CONTROL key, will provide the European Character set.

#### Also...

The inverse video key replaces (or rather duplicates) what the ATARI logo button on the 400/800 accomplished. There are also three LEDs, just above the 1200XL logo. One is for power ON; the others show various functions, such as European character set in use, etc.

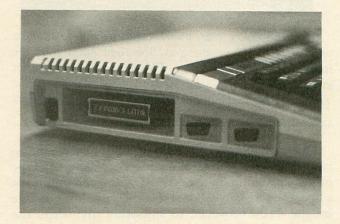

Some of the software features of the 1200 include user programming of the function keys (even the HELP key). Also, most of the keys on the 1200 keyboard are redefinable. The keyboard is of the QWERTY type found on most typewriters, but through software you can change the keyboard format to Dvorak or alphabetical (see Issue 9, page 105).

The new operating system allows you to alter the rate of the auto-repeat. Through software you can have the characters put on the screen at either faster or slower rates, while holding down one character key.

Of course, the most visible attribute to the 1200XL is its sleek, low cabinet. I always thought of

the 400/800 as quite futuristic, but next to the 1200XL, they do look rather "clunky." The inside of the 1200 is also sleek, as nearly all of the components are on a single board, thus reducing problems in reliability.

To quote ATARI, "with its user aids and beautiful packaging, the model 1200XL is one of the 'friend-liest' computers ever built...it will be a handsome and useful addition to any home." I quite agree.

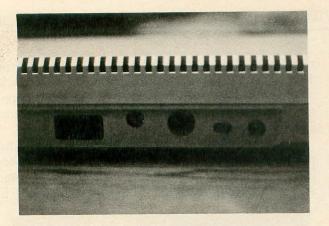

The power switch, single cartridge slot, and **two** controller ports now reside on the left side. ATARI responded to user comments that the joystick/paddle wires were always in the way on the computer's front. They also, apparently, feel that only two controller ports are necessary.

#### FEATURES OF THE 1200XL OPERATING SYSTEM

The operating system of the 1200XL has been altered as much as possible to give it additional features, but at the same time, increase its computing power. Compatibility between this model and the 400/800 was of prime concern to ATARI, thus technical material on the two previous models applies to the 1200 as well. Here I will attempt to cover some of the additional functions of the 1200.

As mentioned in the overview of the 1200XL, many new features are implemented, such as onetouch cursor control, the HELP key, DMA enable/ disable, and the additional European character set. All of the keys can be user defined with the exception of the BREAK, SHIFT, CONTROL, SYSTEM RE-SET, and CONTROL+FUNCTION KEYS. In addition, the HELP, START, OPTION, and SELECT keys must be handled somewhat differently.

Some important features on the 1200XL are the additional graphic modes that were previously unavailable to the 400/800, except through machine language. What we at A.N.A.L.O.G call graphic modes  $6\frac{1}{2}$  and  $7\frac{1}{2}$ , plus the multi-color character sets, are now readily accessible, even through BASIC. Of course, to utilize the 4-color character set, you must still redefine the characters.

The 1200XL's rear panel contains the I/O ports previously found on the 400/800 right hand side: the standard ATARI serial port, TV connector jack, monitor jack, channel 2/3 selector, and power socket. The 1200XL uses the same power transformer as the 400/800.

One nice feature, not used up until now on micro computers, is a fine scrolling screen. When you type or list a program on the ATARI, and reach the end of a line, the screen will "coarse scroll" up. It is possible on the 1200 however, to smoothly fine scroll the screen; an impressive feature.

A more serious feature is the added disk handling system. One setback on the 400/800 was the limited string length of 128 bytes. The 1200XL can read and write sectors on the disk from between 1 and 65536 bytes. The default, as in the 400/800, is set at 128 bytes, however under software control you can reset that value. The 1200 also has the capability to ignore the read-after-write verification on disk I/O operations.

We will cover the how-to-get-all-of-these-neatthings-to-work in a later issue, once there are 1200XLs out on the market. As you may have noticed, the 1200 attempts to take the idea set forth by the 400 and 800 just one more step towards human engineering.

The 1200XL in all of its glory. This prototype (one of only 5 in the US!) lacks the white lettering that will appear just above the strip of metal keys, making their functions clearly marked to the user.

# WE'RE WRITING

At the rate we're going, we'll have these pages filled by 2083. And by 2084, people will be clamoring for the next Infocom creation.

We hate to disappoint our public. So we keep you waiting. Because while the software factories are cranking out arcade game after arcade game, pulpy adventure after trite fantasy, we're writing and rewriting, honing and perfecting. Before a single person enters one of Infocom's worlds, it must be crafted into a living, riveting, definitive experience. Judging from the public's reaction, it's worth the wait. For instance, *Creative Computing* welcomed DEADLINE<sup>™</sup> as "thoroughly engrossing and realistic," while a *Softalk* readers' poll recently voted ZORK<sup>™</sup> I and ZORK II the most popular adventures of 1981.

SFAS

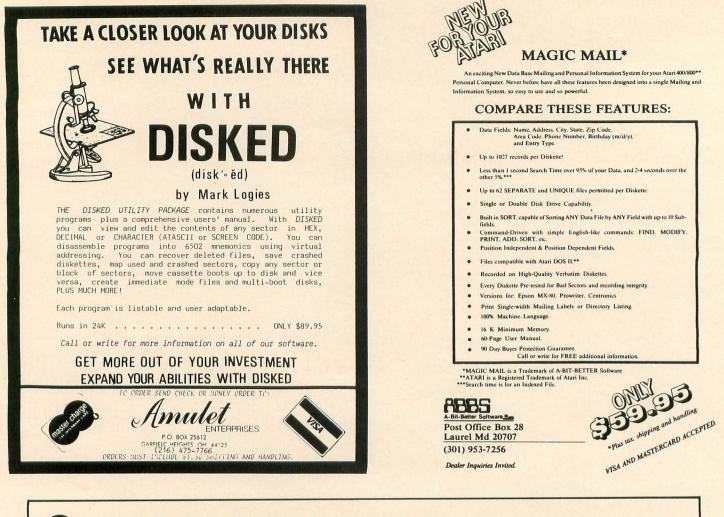

And now, for the moment, your wait is over. ZORK III, your final

step in the underground trilogy, and STARCROSS,<sup>™</sup> an exploration of a new dimension in science fiction, are ready for you. Look at them up there,

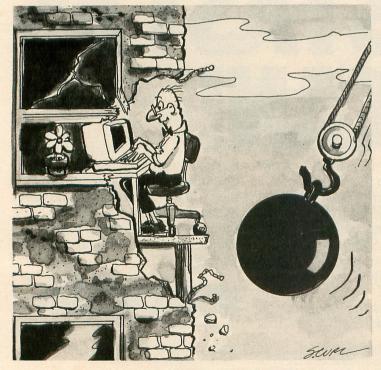

the little worlds of Infocom. As our universe expands, companions will come to help fill that vast expanse of white space. Till then, they'll continue to stand alone as the best of all possible worlds.

Infocom's worlds are available for Apple," Atari," IBM, TRS-80," Commodore, NEC, Osborne, CP/M," and DEC.™ Apple is a registered trademark of Apple Computer, Inc. Atari is a registered trademark of Atari, Inc. TRS-80 is a registered trademark of Tandy Corporation. CP/M is a registered trademark of Digital Research, Inc. DEC is a trademark of Digital Equipment Corporation.

### **Q:** What is the hardest thing in the world? **A:** Tearing yourself away from an EPYX game.

Nobody but nobody builds more lasting playing value into their computer games than EPYX.

EPYX—computer games thinkers play. EPYX—producers of award-winning games (including "Crush, Crumble and Chomp"; "Dragon's Eye"; "Temple of Apshai"...and dozens of other thinking games.) For Atari," Apple," Commodore," Radio Shack," and IBM\* personal computers. EPYX—the leader in computer game quality, creativity, innovation.

#### You will love them all.

Write or phone for our latest catalog; it's absolutely free...we even pay the postage. Or stop in at your favorite computer dealer. He should have a supply of catalogs and he can also show you some of those marvelous EPYX games in action.

\*The trademarks, respectively, of Atari, Inc.; Apple Computer, Inc.; Commodore International; Tandy Corp.; International Business Machines. And EPYX is the trademark of Automated Simulations, Inc., just so you don't forget.

## Experience the Now On Cassette! MicroProse Challenge!!!

#### **CHOPPER RESCUE**

Zip up your flying suit and strap yourself into your sleek assault chopper: CHOPPER RESCUE challenges your skill and daring. Pilot your nimble craft through the treacherous underground labyrinth. Search out and rescue the captives trapped inside. Danger approaches from all sides as defenders fire winged missiles and sparkling energy bursts at your fragile craft. But you are not defenseless, your explosive tipped rapid-fire missiles dart out to blast a path through the dense minefields. Thread your bomb directly into the heart of their pulsating nuclear furnace. And just when you think the path is clear, a swift patrol drone appears from behind a ledge, spitting missles as you scramble for a firing position! CHOPPER RESCUE features three scenarios, multiple skill levels, and competition in solo or team configurations for 1 to 4 players. Immerse yourself in the non-stop excitement of CHOPPER RESCUE. You'll keep coming back for more!

Requires ATARI® 32K, Disk or Cassette . . . \$29.95

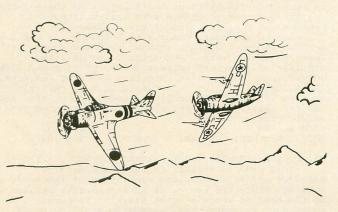

#### **HELLCAT ACE**

HELLCAT ACE is a superbly realistic re-creation of WWII Air-to-Air combat in the Pacific using a fully three-dimensional airspace. HELLCAT ACE puts you in the fighter cockpit with its unique pilot's eye view. To escape and destroy the tenacious enemy fighters, HELLCAT ACE allows you a full range of high-performance aerobatics; including loops, stalls, rolls, immellman turns, and spins. The fifteen well documented scenarios include combat air patrol, night action, and kamikazes --- and, if things get out of hand, you can bail out or attempt a water landing in your damaged fighter! HELLCAT ACE includes multiple skill levels and options for up to four players. Can you avoid being shot down and win five victories to become a HELLCAT ACE?

Requires ATARI® 40K, Disk or 32K Cassette . . . \$29.95

For aerial combat challenge and excitement over Europe in WWII fly the SPITFIRE ACE!

Requires ATARI® 40K Disk or 32K Cassette . . . \$29.95

#### **FLOYD OF THE JUNGLE**

Looking for a fun game you can play with your family and friends? FLOYD OF THE JUNGLE is a great game up to four people can play simultaneously! Can you be the first to guide Floyd through the jungle perils to save the lovely Janice? It isn't easy! Floyd must leap the poisonous snakes, climb the slippery vines, ride the elephants, and cross the raging rivers. FLOYD OF THE JUNGLE includes fully-animated wild animals, music, sound effects, and five different multi-color jungle adventures. Requires ATARI® 32K, Disk or Cassette ... \$29.95

MicroProse Software is dedicated to bring you games that will challenge you far beyond the first few plays. We promise you hours of excitement and pleasure. Our games are created using "MicroProse", our own proprietary assembly language gaming system, and are available at select computer stores.

RAMROD MMOS - ATARI 800 ONLY \$159.95 (less memory) RAMROD is a new operating system board that replaces the existing board. It gives the user the flexibility of using either the existing operating system roms or it is switch selectable to use EPROMS. This allows the user to change the operating system to meet any needs that might arise.

RAMROD also addresses the 4K of memory not currently accessible in the system. It also is switch selectable and may be used as RAM, ROM, or a combination. This ram is usable by software such as SPREADSHEETS, WORD PROCESSORS, and certain LANGUAGES to mention a few, without modification to the existing operating system. Complete with instructions and recommended modifications. 1 year warranty.

PLUS, every board comes with SUPERMON<sup>1</sup>, a resident machine language monitor written by David Young. It features many powerful debugging commands like display/ alter memory, disassembler, printer and disk interface, etc. The disk interface has many features, including the ability to access single or multiple sectors in sequential or linked mode, S/D or D/D. And you can call it up at any time. A sophisticated yet simple program to use. WITH 4K RAM \$169.95

WITH 12K MEMORY (4K RAM, 8K EPROM) \$189.95

PRO BOWLING VERSION THREE - ATARI 400/800 \$24.95 This game is written in Basic and machine language and is an accurate simulation of the sport of bowling. There are ten skill levels to give challenge to the best of computer game players. Features redesigned character set, automatic scoring, sound, and P.M. graphics. REQUIRED ACCESSORIES: DISK DRIVE

# ADVENTURE GAME

#### 16K cassette 24K disk by Michael Duboy

n Adventure is designed for joystick input only. Move the joystick right for a yes answer or left for a no answer. Use north (top of joystick) and south directions to increase or decrease the amount of food and water being purchased by you. At other times these joystick posi-

tions will input the direction of travel. When you have the desired amount of food and water, press the fire button to acknowledge purchase.

The hero in the game starts out with only enough food and water to last one day. Three moves are a day's journey in game time. Abdul the loan shark is always ready to loan a hero enough gold to provision a short journey. He can be found at the "c" in "city."

There is a limit of 100 weight units that can be carried by the hero. This should be taken into account when buying food and water. These provisions can be obtained at the "i." Water is cheap, but food is not. You buy these in amounts used in one day's travel.

The journey to the lost city is long and perilous; having a psychic companion along is always an advantage. A companion doubles the amount of weight that can be carried. You can only have one companion at a time, but if he dies you can always hire

another companion. Remember though, that debts must be paid. Companions can be found at the "t;" but be prepared to pay their price or go alone. The more a companion's asking price, the stronger he'll be. Don't forget food and water for your companion!

Beware of the sea, as you're likely to drown. The forest is swarming with bandits. The trail is longer but safer than the forest, and — of course — there is also a storm that can flood the trail.

When you arrive at the lost city you will notice strange symbols on the ground. You must guess the number these symbols represent. Here a psychic companion will prove invaluable. His hints will reduce the number of guesses necessary to open the stones. (Hint: Don't guess a number over 26.) Evil spirits roam the ancient city. The longer you stay in one place, the likelier it will be that they will appear to steal food and water from you. When you tire of adventuring, you can end the game and obtain a rating by occupying the "y" in "city." You'll find leaving the lost city a lot harder than entering it.

The following variable descriptions should give the reader the opportunity for modifying the game. For example, islands and a sea adventure can be added to the game; also a trading post or another city.  $\Box$

We have over 1000 Educational Programs for use on your Atari 400/800 Computers!

You and your family will enjoy learning in your home when you

## Stop Playing with Your Atari

All along you've heard there isn't much of a selection of low cost microcomputer courseware. Well, do you want to learn Physics, Psychology, or Philosophy? Accounting or Auto Mechanics? Sociology, Supervision or Statistics? Economics or Electronics? How about English as a Second Language? Would you like to teach your children Math or Reading? If you do, then we have the educational programs for you—and at affordable prices.

-

It's true there aren't many companies that offer full-length courses in subjects other than reading and arithmetic, and what is offered seems to be drills, tests, games, or simulations. What you really want is a course that covers the subject with, say, 16 full-length lessons called tutorial programs, where you interact with an expert programmer backed by a staff of experts. That's exactly what we have.

#### **ASK THESE QUESTIONS**

Why haven't you heard of us before? We're a public company that's been trading over the counter for 16 years. We've been developing interactive learning systems since 1957. We sell hardware and software for interactive film, slide, video and computer learning to the educational field, vo-techs, industries, military, and several state and federal agencies. Our programs are used in all 50 states and even in some foreign countries! In 1975, we started to convert to the Talk & Teach Computer-Assisted Instruction (CAI) System, licensed Atari to use it in 1977, and in 1981 licensed Radio Shack to use our Talk/Tutor System. So, why haven't you heard of us? Frankly, we've kept a low profile. Until now.

Is there something wrong with our software? Well, we don't ask you to enter your name so we can drop it into some later text. We don't ask you to type in your answer and refuse to accept it if it's not spelled just right. And, we don't branch around a lot when you make an error. Our programs simply let you know if you're wrong by proceeding only when you select the right multiple-choice answer.

This proven learning-by-positive-reinforcement method lets you proceed quickly and smoothly through the programs, without a lot of cute tricks. But, if you're a devoted computerist or game freak you may be disappointed at the lack of motion in most of the pictures, or our special visual effects. We have some dandies, like the mushroom cloud that rises over Hiroshima in our History series, but your learning is not distracted by needless special effects.

#### **OVER 1000 PROGRAMS**

We have 64 courses of 16 half-hour programs: 1024 programs! All are easy-reading, upper-and-lower-case. All are in Atari color. All are illustrated by frequent graphics, composed of special and regular characters. And, best of all, every frame of every program is accompanied by high-quality, full-time audio narration by professional voice talent. David Stanton, James Mathers, Pam Barrymore. Recorded and played back, not synthesized or digitized!

- If your child is having trouble with Reading or Math, or if he or she is exceptional, and could benefit from professionally programmed lessons or courses, then you need our educational programs for your Atari 400 or 800 to help your child.
- If you want to build your math skills, we have programs on Numbers and their meanings, Addition, Subtraction, Multiplication, Division, Fractions, Decimals, Percents, Angles, Graphs, Word Problems, Algebra, Statistics. There are ten series in all, 160 math programs. Again, all with color, pictures, and a friendly tutor's voice—all the time.
- If your verbal skills need polishing, try our Talk & Teach programs on the alphabet, spelling skills, and every level of vocabulary; Sight Words or Learn by Phonics; develop Reading Comprehension skills from stories and articles. There's even a series on the Great Classics.
- For self-development, try a 16-program course in Economics or Psychology. Or Supervision, Sociology, Counseling (Personal, School, or Employee), Writing, Business, Philosophy, Government, World History, U.S. History, or Accounting.
- For vocational skills, study our 16-program courses in Electronics, Fluid Power, Auto Mechanics, Shop, Carpentry, Construction, Meat Processing, Military Skills (64 programs), and there are many more.

#### YOU HAVE WHAT IT TAKES

You'll need your Atari 400 or 800, and the Atari Cassette recorder. And to present the Talk & Teach programs you need the Educational System Master cartridge: it's **\$25** from us, if you don't have one.

We say these courses, which are recorded one program per side of C20 to C30 (half hour) cassettes, are the equivalent of a chapter, or perhaps an hours lecture. We've been told that by studying our Economics or Psychology course, a student could pass a secondary or college test for credit. Many who have such credits never learned all that's in these courses. And while some of our courses have 1980 copyrights, most are 1981 and 1982. In U.S. History, for example, you'll learn about America's foreign policy during the Falklands crisis as well as that in the Mideast in 1982. And we're putting this information at your fingertips.

Not sure whether you agree more with Rationalists or Existentialists? Do you commit logical fallacies? Try our Philosophy course. If you're not sure about neurosis or psychosis, classical or instrumental conditioning, then you need our Psychology course. Just how independent is the Federal Reserve? Get Economics, Program 12. Confused about the changes in traditional roles of political parties? It's Government 5. And let our tutor tell you patiently and clearly about measures of dispersion and central tendency. Our Statistics goes through F tests. We even have 16 full-length audio-computer programs with Spanish words and phrases.

Remember, these are all for your Atari! Yes, we've done programs for TRS80 Model I, III, Color, for the Apple and T. I. But that's another story.

Would you like to do something more than play games on your Atari? Tired of squeaks and robotics and want to hear a human voice? Do you want to further your education or help your children along in theirs? Now you can. For just \$9.90, we'll send you one cassette with 2 programs from the course of your choice, 100% guaranteed to work in your Atari, and you can try us out. Better yet, get one full course of 16 programs on 8 cassettes for only \$59.90. For full documentation, 32 pre-post tests, fancy binder, 8 cassettes with 16 programs of the course you want, send \$79.00. That's less than books and tuition for most college classes. And we offer a 10 day, 100% exchange allowance. Does your alma mater? Send us your check, or call us at (405) 288-2301 with your Visa/Master Card number. We'll send your educational software pre-paid. Please allow 15 days delivery. Or see your Atari dealer. He may have some of our courses in stock. You've got nothing to lose but your games!

P.O. Box 1226, Norman, OK 73070 (405) 288-2301

## Four smart ways to make your Atari 400/800, TRS-80 COLOR, VIC-20 and Commodore 64 much more intelligent.

The Color Accountant pays for itself. This *complete* personal financial package is designed to make your money easier to manage. Included are:

- 1. Checkbook Maintenance
- 2. Chart of Accounts
- 3. Check Search
- *4. Income/Expense Statement 5. Net Worth Statement*
- 6. Color Graph Design Package
- 7. Home Budget Analysis
- 8. Color Payments Calendar
- 9. Mailing List
- 10. Decision Maker

This unique menu-driven package requires less than one hour data input per month. The Color Accountant has over 60 pages of documentation including examples and step-by-step instructions. TRS-80 COLOR requires Ext. Basic and 16K for cassette, 32K for diskette; Atari 400/800 requires 24K for cassette, 32K for diskette; VIC-20 requires 16K Expander. Now available for Commodore 64.

#### \$74.95 cassette; \$79.95 diskette

The Tax Handler makes April 15th just another day. This is the perfect complement to our Color Accountant. The Tax Handler will help prepare your tax returns and probably save you money. Included are:

- 1. Form 1040 (Long Form)—filing status, exemptions, income, income adjustments, computation of tax, tax credits and payments or balance/ refund due.
- Schedule A (Itemized Deductions)—medical and dental deductions, taxes, interest expenses, contributions, casualty/theft losses, miscellaneous deductions and summary.
- Schedule G (Income Averaging)—base period income and adjustments, computation of averageable income and computation of tax.

Additional schedules or alterations to the tax codes will be available separately in our monthly magnetic magazines. Atari 400/800 requires 24K for cassette, 32K for diskette. VIC-20 requires 16K Expander. Now available for Commodore 64.

\$34.95 cassette; \$39.95 diskette 5

You'll love your computer with The Magnetic Magazine. Our magnetic magazines will entertain, inform, educate, challenge and delight you. Each issue contains 4 to 7 ready-touse quality programs, all fully listable. Every issue includes a newsletter containing instructions, tips on programming techniques and a line-by-line examination of the feature program. And starting with issue number 8, the first in a series of tutorials on machine language programming, Database I with a new application every following issue and a new utility in our Utility-of-The-Month section. And word processing is coming soon!

A full year's subscription consists of 10 issues—over 50 programs a year at a mere fraction of their cost. Available for TRS-80 COLOR Ext. Basic, Atari 400/800; all require 16K. Back issues available.

One year subscription: \$50.00 cassette; \$75.00 diskette Half year subscription: \$30.00 cassette; \$45.00 diskette Sample issue: \$10.00 cassette; \$15.00 diskette VIK VIDE0 issue 1 available for VIC-20; \$12.95 cassette

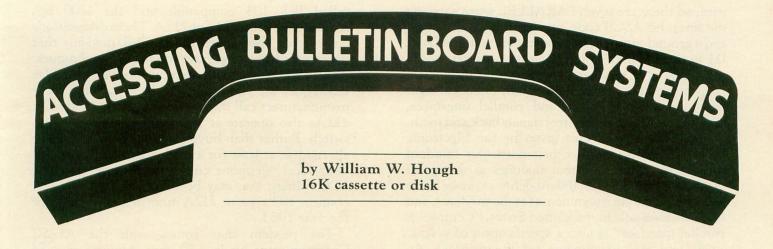

**The Learning Center** teaches and enlightens children. Our exceptional educational programs are classroom designed and tested. These unique packages have been invented to introduce 3 to 9 year olds to the ease of computer learning. Through the use of basic concepts such as colors, shapes, numbers and letters, children understand counting, math and language skills. Each program is designed to develop a specific skill, rewarding each correct answer with music and a happy face. Most are compatible with our new Edumate Light Pen \$34.95.

Available for Atari 400/800, VIC-20 and Commodore 64; all require 8K for cassette, 16K for diskette. Also available for Timex/Sinclair 1000 and TI-99.

Please ask about programs available and their prices for Pre-School, Kindergarten and Grades 1 & 2. Prices range from \$8.95 for a single cassette to \$79.95 for a complete set on diskette.

Order now! See your local dealer or order direct. New catalog \$2.00. Visa and MasterCard accepted please add \$2.00 for postage and handling. Call toll free!

1-800-334-SOFT DEALER INQUIRIES INVITED DEALER INQUIRIES INVITED a division of FUTURE HOUSE – dept. al p.o. box 3470, chapel hill, north carolina 27514, 919-967-0861

Computer bulletin boards are systems that are accessed over the telephone network and offer file space for messages, questions, answers, want ads, phone numbers for other bulletin boards, and public domain software. They are provided by hobbyists, user groups, or dealers, and once your ATARI is equipped with a modem and terminal software, the cost of using a bulletin board service can be limited to telephone charges. Some boards do limit general use to portions of their files by requiring passwords. For example, a user's group might give the password for their best programs only to paying club members. The major services, Dow Jones, CompuServe, and the Source, are the largest bulletin boards, and these services bill for usage.

This article presents information about smaller bulletin board systems, particularly those catering to ATARI users, and details on how to get a novice started with the ATARI Communicator package or equivalent pieces. First, a bit of background on the capabilities of the ATARI and the functions of the pieces in the Communicator kit is in order.

The ATARI offers significant advantages over other home computers in its own (and higher) price classes when called upon to double as a remote terminal. When shopping for a home computer, my list of requirements included two very specific items only the ATARI could deliver!

- 1) Full ASCII character set from the keyboard. and:
- 2) Minimum of 40 characters per line on a TV display.

I intended to use the micro-computer at home to access a mini at the office, and the full ASCII character set (particularly lower case) was necessary for work-related purposes. While you will not find all of the 128 ASCII codes pictured on the keyboard, they are there when the TELELINK I cartridge is installed. Table 1 gives the keystroke sequences that, when used with the TELELINK cartridge, will produce the non-obvious ASCII codes.

#### TABLE 1

ASI CHAR.	CII CODE*	NAME	KEY-SEQUENCE
( ) DEL	96 Gra 123 Ope 125 Clo 126 127 Rub	NUL ve Accent ning Brace sing Brace Tilde put (line) BREAK	CONTROL-SPACE CONTROL-; (semicolon) CONTROL-, (comma) CONTROL (period) CONTROL-+ (plus) SHIFT-DELETE SHIFT-BREAK

My ATARI Communicator kit was ordered the same day as the computer, and within an hour after opening the boxes, I was conversing perfectly with the mini 20 miles away. (It would have taken less time, but my son naturally insisted on a few Star Raider missions before I linked up.)

The Communicator kit includes the interface module, an acoustic coupled modem, the TELELINK I terminal program cartridge, and appropriate power supplies and connecting cables. There are also instructions on introductory access to three of the great big bulletin boards that charge for usage after your free hour is gone. The kit is a bargain when compared to ATARI's individual prices, but there are alternatives to most of the pieces which may reduce the overall cost, or increase the capabilities. I'll treat each piece separately:

#### INTERFACE MODULE

The function of the IM is to "interface" the ATARI peripheral port to an RS-232 serial interface port (it has four) and a single Centronics parallel interface port. Serial ports? Parallel port? Really quite simple. A serial interface or port puts the bits that represent a character, 7 bits for ASCII, 8 bits for ATASCII, a parity bit with ASCII, and control bits (called start and stop bits) in SERIES on one wire for each direction of transmission, plus a ground return. A series of bits, in time, is necessary when a data signal is to be carried over the telephone network. A parallel interface or port puts each bit on a separate

wire, so there are seven PARALLEL wires carrying the seven bit ASCII code, an eighth wire for parity, and a ground return. The parallel port on the ATARI IM is intended for connection to a printer, and a printer only receives characters. Since data transmission is one-way, there is only one set of eight wires. In both the serial and parallel interfaces, additional wires carry control signals back and forth.

"RS-232" is the name given by the Electronic Industries Association to their particular standard for the serial interface that operates at the speed range of interest. This standard defines voltage levels and connector pin assignments (at the modem), and is used universally in the United States. "Centronics parallel interface" is also a specification of voltage levels and pin assignments (at the printer). An American printer manufacturer, Centronics, defined this interface years ago, and it has been adopted by the printer industry as a standard. The ATARI 825 dot matrix impact printer is in fact a Centronics 737 parallel printer.

You can get into telecommunications without buying the ATARI interface module. At least one manufacturer (Microbits) offers a modem that plugs into a joystick port. However, should you want to add a parallel "Centronics type" printer, or upgrade your modem capabilities (higher speed or autodialing) later on, you will be out of luck. This type of modem does not have the standard RS-232 interface, and requires special software to drive it. Therefore, all the great public-domain smart terminal software described later on in this article won't work. While you would be saving about 35% on hardware cost, my personal opinion is that, for future flexibility, you would be better off sticking to the RS-232 standard.

#### MODEM

The next item in the Communicator kit is a modem. "Modem" is a contraction of modulator/ demodulator, and its function is to transform the low-voltage, serial digital signal on the RS-232 interface wire to an analog signal that can be transmitted over telephone lines, and vice-versa. Modems come in two basic varieties: acousticcoupled and direct-connect. A third variety, which the manufacturer calls direct-connect, but which is really a hybrid, is also available. There are modems capable of operating at several different speeds, which actually means different analog (telephone line) modulation techniques that increase in sophistication (and cost) as the speed increases. However, only two are of interest in bulletin board applications. These are: 300 bits per second (bps), where the modulation technique is simply two standard audio tones that represent the state (0 or 1) of the bit; and 1200 bps, where the modulation technique is somewhat more complex.

Both modulation techniques are based on Bell System standards; the 300 bps technique is often called Bell 103 compatible and the 1200 bps technique is called 212 or 212A. These designations come from the names of the Bell modems that operate with the respective modulation techniques. As all 1200 bps modems that operate with the 212A technique are built under Bell patents, most manufacturers call these modems 212As. And most 212As also operate at 300 bps with the flick of a switch. Rather than buying a modem, you have the alternative, at least for a while, of leasing one from your local telephone company. Because of recent FCC rulings, you may be able to buy a Bell direct connect 103 type or 212A modem after the first of the year 1983.

The modem that comes with the ATARI Communicator kit is a 300 bps, acoustic coupled unit that is a Novation Cat in ATARI clothing. An acoustic coupled modem has two cups in which you place a standard telephone handset after establishing a call to the other computer. As used here, "standard" means plain-old-ordinary; dial-inhandset and designer models won't fit.

The hybrid modem installs between the base and handset of a standard phone (which has a plug-ended handset cord.) For other reasons, dial-in-handset model phones will likewise not work with the hybrid modem.

As the telephone instrument is doing part of the work with acoustic-coupled and hybrid modems, these modems are less expensive than true directconnect modems. But there are none in these categories that are capable of greater than the 300 bps speed. The acoustic-coupled modems are less reliable because they are subject to interference from room noise, TV speakers, computer buzzers, etc. True direct-connect modems are more reliable, more expensive, and often offer some added features, such as automatic answering and automatic dialing.

A word of caution. If you subscribe to two or more party telephone service, it is against FCC rules to use a true direct-connect modem. Such use could in fact cause you and the other party(s) difficulty and embarrassment at billing time. Further, another party trying to initiate a phone call when you are transmitting or receiving data will surely mess up your data (even with a legal acoustic-coupled or hybrid modem). If you are a party line subscriber, you will want to convert to individual line service before trying data communications.

Finally, not all (probably "few" is more accurate) of the small bulletin boards devoted to ATARI are presently capable of 1200 bps. After all, they would have to buy the more expensive modem too. But the higher speed cuts their phone bills, so we can expect that more and more will be offering the higher speed in the future. All that are capable of 1200 bps are also capable of 300 bps. Your decision on 300 vs. 1200 should be based on the capability of boards you want to access and a trade-off between phone bills and modem cost, which of course depends on your contemplated use.

#### TERMINAL SOFTWARE

The next piece of the Communicator kit is the TELELINK 1 cartridge. Its function is to provide the software to turn your ATARI into a remote terminal. It automatically sets some interface module options — specifically 300 bps, ATASCII/ASCII conversion which ATARI calls light translation, no parity, and a few other control functions. Once you have dialed the host computer (bulletin board), your ATARI becomes what is known as a "dumb" terminal.

TELELINK I is convenient to use, but has no capability to capture files in memory. It does have a dump-to-printer option, but if you are after a new BASIC game on the bulletin board, dumping it to the printer only means you have to type it all in to play the game. You might as well have typed it in from the magazine. TELELINK I not only sends and receives a full ASCII character set (per Table 1), but it also displays grave accents, curly braces, and carets properly on the screen. Not all terminal programs have such a character set.

So how do you turn your ATARI into a smarter terminal, one which can capture that program in memory or a magnetic media (cassette tape or disk)? Well, you can buy one of several smart terminal programs, or you can save some money and get a copy of one of the very fine smart terminal programs that are in the public domain. But, you say, you don't know anybody who has one. The answer should be obvious — you download if from a bulletin board. Later on in this article, we will discuss several of the public domain smart terminal programs, and show you step-by-step how to download one from a bulletin board using the TELELINK I cartridge and a short basic program. First, however, there is one more item in the Communicator kit which deserves discussion.

#### CONNECTING CABLES

The cable that connects the computer to the interface module is no problem; it comes with the IM which you buy separately or as part of the Communicator kit, (If you choose the direct-connect modem that plugs into a joystick port, you don't need it at all.)

If you buy the ATARI modem, either separately or as part of the kit, you will also get the IM to modem cable. However, if you choose another modem, you may have to buy or build a cable. The IM end of the cable is not a standard RS-232 connector, but a smaller one that I presume ATARI chose so they could fit four serial ports on one edge of the IM. ATARI supplies a cable that will work with any standard RS-232 modem, but bought by itself, it is quite expensive. If you have a wire stripper and a small soldering iron, building a cable is straightforward. You will need a DB-9 male plug for the IM end and a DB-25 male plug for the modem end. You'll also need a short piece of cable with at least eight individual conductors, and the following table of pin-to-pin connections.

		TABLE	2		
		MODEM C	ABLE		
1 2 3 4	DTR CRX XMT RCV	20 8 2 3	56789	GROUND DSR RTS CTS no IM connection	7 6 4 5 11

#### ESTABLISHING A CONNECTION

Now that you have all the pieces you need — the interface module, a modem, and terminal software — it's time to explore a bulletin board. You must turn on the interface module before you turn on the computer. If you are using TELELINK or a terminal program on cassette, the RS-232 handler will boot from the interface module when you turn the computer on. If your terminal program is on a disk, the diskette must also have a copy of the AUTORUN.SYS file that came with the ATARI DOS 2.0S master diskette. When the computer is turned on, AUTORUN.SYS boots the RS-232 handler. The instructions that come with the interface module are quite clear on the proper order for powering-on the different pieces.

Set your modem for call-originate and full-duplex, and make sure it is also turned on. Now, load and run your terminal program. (TELELINK I, being a cartridge, will automatically gain control.) If the terminal program asks for options (TELELINK doesn't), pick these: download, light-translation, no-parity, full-duplex. Also make sure your modem is set for the right speed as determined by your terminal program (300 bps for TELELINK and most other programs if unmodified to run at the higher rate). If things don't go quite right, you might have to try a different parity setting (try even first) or translation option.

Call the bulletin board as though you were placing a voice telephone call. If the bulletin board system is on-line, it will automatically answer after one or two rings and return a high-pitched tone. This is your signal to switch to the data mode. If you have an acoustic coupler, this means placing the telephone handset into the cups on the modem. With a directconnect modem, there is probably a switch that says "talk/data". Turn it to "data".

On your modem, a lamp is lit that indicates it too can hear the high-pitched tone. If nothing else happens, press RETURN a few times; the bulletin board should wake up and announce itself on your screen. Many bulletin boards first ask how many "nulls" you need. Your ATARI needs none, so type "O" (zero). It will also ask for your name, (probably) location, and possibly some other questions; for instance, can you support lower case (Yes). After it is satisfied that you haven't dialed a wrong number, it will tell you about itself and how to access the message file and the program files available for downloading. Pay close attention to the commands it needs to pause (usually CONTROL-S), to resume (usually CONTROL-Q or any character), to abort a file listing (usually CONTROL-C), and to disconnect (usually CONTROL-D or "BYE"). It may or may not understand a BREAK, and your terminal program may or may not send one. (TELELINK I does if you type a SHIFT-BREAK, and CONTROL-TAB seems to work with some other programs.)

The reason for the differences in commands and responses is that different bulletin board programs are used by the host computers. By far the most popular for bulletin boards in general is a CP/M program, but this is not true of boards devoted to ATARI users. Naturally, most ATARI boards are ATARIs, and ATARIS don't run CP/M. There are at least three fine bulletin board programs for ATARI: AMIS, ARMUDIC, and TARI-BOARD. What you need to do is explore the board, following its instructions, until you are comfortable using it. **CAPTURING A FILE** 

I promised that I would explain how to capture a listed file on magnetic media if you are starting with TELELINK I dumb terminal software. You need a short BASIC program like the following one. I call it QD (quick and dirty) DUMP. It is customized for CP/M. I chose CP/M simply because CP/M needs some extra translation not required with the ATARI programs, but this extra translation won't (except as noted) bother AMIS, ARMUDIC or TARI-BOARD. If you use it with one of the ATARI programs, there are some changes that will have to be made to incorporate their different commands. The statements needing attention are identified by remarks. None of the interface module's default options are changed, which makes QDDUMP the same as TELELINK (300 bps, light-translation, noparity). QDDUMP also assumes your magnetic media is a cassette tape. If you have a disk drive, change line 210 appropriately.

You will need a loadable copy of QDDUMP on cassette or disk before you use it. Using TELELINK, log onto the bulletin board system and get to the point where the board is ready to send you the listed file. With CP/M, this will follow your command "TYPE" followed by a space and the filename. With other systems, it may be as simple as picking a number from a menu. You will have to tell CP/M to stop after its initial response by sending a CONTROL-S. Other systems may wait for you to type RETURN before sending the file. The point is that either it must stop or you must stop it, because you've some fast work to do.

Replace the TELELINK I cartridge with your BASIC cartridge and load and run QDDUMP. The first thing it does is dimension a string called INLINE\$, which we will use to download a line at a time, and a string called QUIT\$, which is the string that the board sends when it is finished outputting a file. With CP/M and a TELELINK in your ATARI, this string appears to be "DONE". However, CP/M speaks pure ASCII, and pure ASCII uses two characters to delimit lines, a carriage-return (decimal 13) followed by a line-feed (decimal 10). The lighttranslation option we picked changes the carriagereturn into an ATASCII EOL (end of line character decimal 155), but leaves the line-feed intact, and it will appear at the beginning of the next line. TELELINK throws the line-feed away, and we will do that too when we record the file. The reason we don't throw it away when we get it is that we would have to look for it and, in BASIC, that takes time. We want the part of the BASIC program that is accepting lines to be as fast as possible so we won't miss anything. Line 20 of QDDUMP defines the CP/M end-of-file as it appears to the ATARI, without TELELINK. If you are talking to one of the ATARI bulletin board programs, and you have told it you don't need line-feeds, then omit the CHR\$ (10) from the end-of-file definition.

Lines 30-50 find the maximum free memory that can be used for a string and dimension it accordingly. The more memory you have, the longer the file that can be downloaded, as we will be adding each line we download to the string, TXT\$.

#### Line 80 starts CP/M; CHR\$ (17) is CONTROL-

Q. This line should start any system, as it automatically ends with a return. Lines 90 through 140 are the loop for receiving downloaded lines, printing them on the screen, and adding them to the string in memory. On an error, or when it sees the string the board sends when it is done downloading. QUIT\$, we go to line 150 which waits blindly for a prompt from the board and signs off. The "BYE" in line 160 is the string CP/M recognizes as a signoff. Having the program do this is to save phone time. You've got to save the file you've captured on magnetic media before you turn off the computer, so you can't put TELELINK back in just yet.

Watch the light on the modem which lit when the board responded with its high-pitched tone. It will go out when the board recognizes your signoff, or when it gets tired of waiting for another instruction. (This is the dirty part of quick and dirty.) Hang up your end of the phone connection, and return your attention to your ATARI.

The TV screen should say "STOPPED AT LINE 190". At this point, you can type "PRINT TXT\$" to see what you've captured. If there are funny triangles at the beginning of each line except the first, those characters are the line-feeds we will get rid of in the next part. If there are no triangles, you don't need line 250, but it does no harm, other than to waste a bit of time, to leave it there. After you have installed a blank cassette in your 410, or changed line 210 to "D:filename" if you are using a disk drive, type "GOTO 200" or "CONT" and an enterable copy of the downloaded file will be written to your magnetic media.

Type "NEW" and ENTER the listed BASIC file. You might get a couple of error messages if it finds some statements that it doesn't understand, but you don't want those anyway. Now you can RUN the program, SAVE it, or anything else you could do if you had typed it in.

#### PUBLIC-DOMAIN **TERMINAL SYSTEMS**

If you have followed the admittedly cumbersome technique outlined above, then you don't already have a smart terminal program. When you have one, you can throw QDDUMP away, because never again will you need it. Don't throw TELELINK away, however, because none of the public-domain terminal programs have the full ASCII capability from the keyboard that TELELINK does. Some programming languages, notably 'C', make extensive use of these characters.

There are several public-domain smart terminal programs available. A version of one can usually be found on any bulletin board catering to ATARI users. I have used three, and while they all do a fine job, each has unique properties. All three are written in BASIC, but have machine-language routines to handle character transfers at high speed.

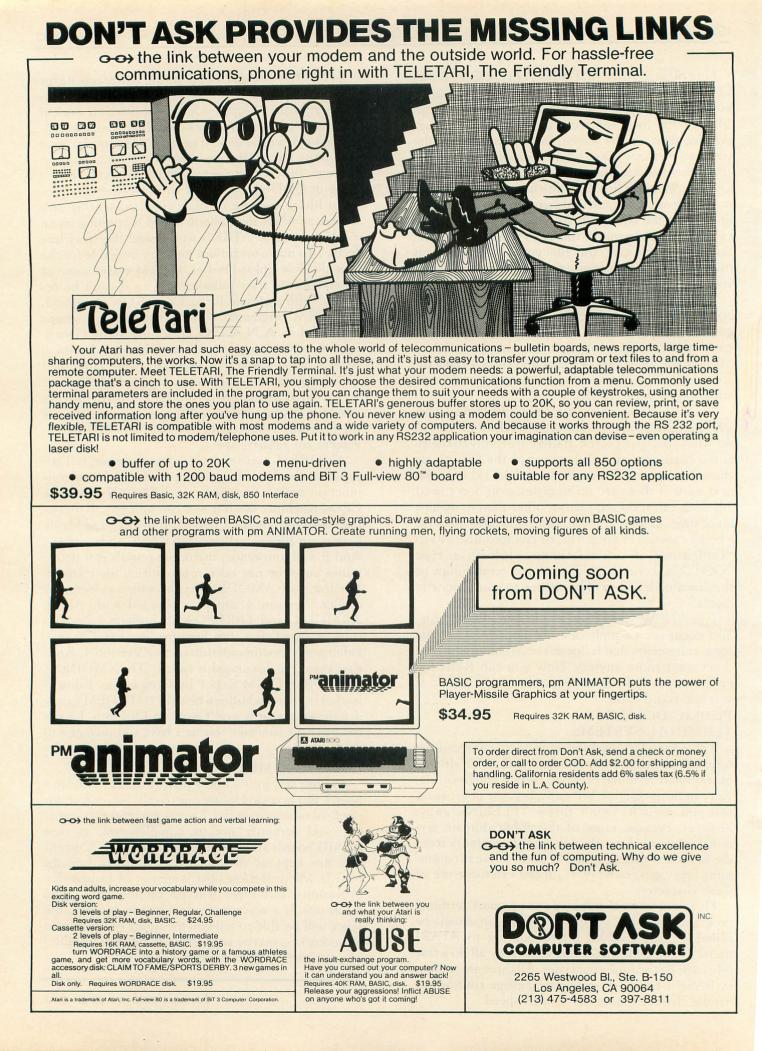

JTERM, written by Frank Jones, is my favorite for AMIS, ARMUDIC and TARI-BOARD applications, primarily because a few additions let it work at 1200 bps. It is the only one of the three that does. Although written for disk, it is easily converted to read and write listed files on cassette. With a little bit more modification to get rid of line feeds (such as is done in QDDUMP), it will write an enterable program file to cassette or disk. (Of course, this isn't necessary when the bulletin board is running on an ATARI, because ATARIs won't send the stray line feeds.) To make maximum memory available for the download or upload buffer, JTERM erases some of its statements after initialization, so it can't be restarted with a simple RESET and RUN command.

ATERM originated with two modem programs published in A.N.A.L.O.G. Computing (Download Terminal, issue no. 2, and Upload Terminal, issue no. 3). These two programs were combined and extended by Bob House and Marshall Abrams. ATERM has the unique advantage of a help (instruction) file that should be written on the same disk as the program. As it comes in three parts, it is inconvenient for cassette users.

AMODEM, written by Jim Steinbrecher, is THE program for CP/M applications. It works in conjunction with a program called XMODEM on the CP/M machine. With it you can upload and download machine language, tokenized BASIC, and Music Composer files as well as listed BASIC and text files. And it's all automatic, including retrials if it determines an error has been made during file transfer. Version 4 of AMODEM works with a cassette recorder. Version 4 can also be used with AMIS, ARMUDIC and TARI-BOARD bulletin boards to transfer listed files. Jim Steinbrecher has also provided a nice documentation file for Version 4. Another very nice document is called "The XMODEM, AMODEM, CP/M Saga," by Greg Leslie. I downloaded both from bulletin boards. AMODEM's only deficiency is that it won't work at 1200 bps. I guess the machine language routines have so much else to do.

#### PHONE NUMBERS

So, you say, now I know how to access a bulletin board. But how do I locate one to call? Never fear, for the final table gives a list. I won't guarantee its accuracy, and certainly not its completeness, as new ATARI boards are cropping up all the time. Current lists are kept as files on many of these bulletin boards. Many of these boards are not 24-hour-a-day operations, but most will be on-line nights and weekends. If a voice instead of a tone answers, the voice will be able to tell you the hours of operation. Who knows, maybe soon you will be the "SYSOP" of your own ATARI bulletin board.

AMIS

#### THE MONKEY WRENCH<sup>™</sup> FOR ATARI

\$49.95

(See the many

reviews.)

A BASIC and machine language programmers aid for 800 users. Plugs into right slot and works with ATARI BASIC. Adds 9 new direct mode commands including auto line numbering, delete lines, change margins, memory test, renumber BASIC, hex/dec conversion, cursor exchange, and machine language monitor.

The monitor contains 15 commands used to interact with the 6502. Some are display memory/registers, disassemble, hunt, compare, hex/dec convert, transfer memory. Uses screen editing.

#### MACHINE LANGUAGE MONITOR FOR ATARI USERS

A must for anyone interested in machine language and wanting to know more about how the computer works. Provides 21 easy to use commands. Uses screen editing. Cassette - \$24.95 Diskette - \$29.95

#### **TYPING EXERCISE**

A great educational program. Consists of typing drills and timed typing tests. Diskette - \$12.95

#### **ATARI AND PET EPROM PROGRAMMER**

Programs 2716 and 2532 EPROMs. Includes hardware and software. PET = \$75.00 -ATARI (includes sophisticated machine language monitor) = \$119.95

#### **EPROM BOARD FOR ATARI**

The EPROM board plug into the cartridge slots. Uses 2716, 2532, and other EPROMs. May contain up to 8K. A must for making your own machine language programs. \$19.95

#### EPROMS - HIGH QUALITY, NOT JUNK

Use with PET, APPLE, ATARI, SYM, AIM, etc. 450 ns. \$6.50 for 2716, \$12.50 for 2532. We sell EPROM programmers for PET and ATARI - see above.

**5% INCH SOFT** 

SECTORED DISKETTES

Highest quality. We use them on our PETs, APPLEs, ATARIs, and other computers.

• ()

It's a Professionally Designed Software Development System

Blast off with the software used on the space shuttle project!

MAE SOFTWARE DEVELOPMENT SYSTEM

More than just an Assembler/Editor!

- Designed to improve Programmer Productivity Similar syntax and commands – No need to relearn peculiar syntaxes and commands when you go from PET to APPLE to ATARI
- · Coresident Assembler/Editor No need to load the Editor then the Assembler then the Editor, etc
- · Also includes Word Processor, Relocating Loader, and much more.
- Options: EPROM Programmer, unimplemented opcode circuitry
   STILL NOT CONVINCED: Send for free spec sheet!

#### **MEMORY TEST**

Avoid problems with ATARI RAM cartridges. Don't let your guarantee run out without a test. Cassette - \$6.95, Disk - \$9.95

3239 Linda Dr. Winston-Salem, N.C. 27106 (919) 924-2889 (919) 748-8446 Send for free catalog!

## The Challenge of the Quest

#### by Brad Griffin

In a remote part of Angola, the fair maiden, Glanoa, shivers with fear and disgust as the evil Captain Moonglug approaches. Her skin crawls as the vile scientist, caressing the silken strands of her hair, whispers in her ear, "You are mine now. No one can save you." As the foul stench of his breath causes our lady to recoil, a gust of fresh air with a hint of honeysuckle pervades the dark room of her imprisonment. Could this be an omen of hope? Or is it something too perverse to imagine? Far away, in the outer reaches of the desert known as Gala No, a lonely figure wanders aimlessly from dust to dune. Alan Og, a soldier of fortune, about to give up all hope of surviving, catches the faint hint of honeysuckle in the wind. A mystifying force surges through the sinewy body, as the wanderer feels a sense of purpose. He knows that the fairest maiden of all is a captive of the dreaded one, and he, Alan Og, is her only salvation. He begins the search anxious to encounter the one known as "pond scum", the villainous Captain Moonglug.

So begins your adventure into lands unknown, against never-before-dreamed-of foes. Among the scores of games in the burgeoning software market, the computer adventure is a genre of its own. What is an adventure? How does one play it? Who plays adventures? Are they all the same? We shall explore the computer adventure with all of its variations and review representative simulations from the different groups.

Deciding what games should be included in the category of adventure is becoming increasingly difficult. As programmers search for original ideas and games to attract the public, combinations of arcade and adventure games further cloud the issue. An adventure has been defined as a bold undertaking, in which hazards are to be met and the issue hangs upon unforeseen events. Using this definition as a guideline, we shall explore computer adventures.

There is stark contrast between the adventure game and the arcade game. Frequently, this same contrast exists in people. Arcade addicts with their lightning quick reflexes and unparalleled persistence must eventually succumb. They may achieve a higher score, but the invaders (centipedes, et al) always prevail, and losing is inevitable. The adventurer knows there is always hope, and, if one is clever and possesses dogged determination, The Quest will be accomplished. It is the possibility, even the probability, of success, that truly differentiates the adventure from other simulations. An arcade game is like shooting basketball; the more one does it, the better one becomes. A variety of obstacles may prevent one from reaching perfection or totality. Distance from the hoop, angle of the shot, fatigue, and the ever present, "in your face!", all enhance the game, but deny perfection. An adventure is like reading a book. The story line exists and the resolution is sought. The adventure game differs from the book in that one must be an active participant instead of an omniscient observer or reader. There is jeopardy in a computer adventure. The ever-present risk of being wasted in an encounter with a monster of low degree always exists; however, the true peril is failing to solve the puzzle and never achieving the final goal. This is like reading a mystery and never having the opportunity to finish the final chapter. The exhilaration of discovering the clue which finally enables one to get the key from the ogre by tickling its froboosh is not found in any other game. The exasperation of being unable to cross the ravine, beyond which is a buried treasure, is unmatched. The sense of accomplishment and pride when success is at hand is universal. The desire to complete the quest, and the anxiety in mastering the final obstacle give way to the feeling that a friend has been lost. Much the same feeling one has when a book is finished. The only way to rid oneself of this depression is to begin a new adventure. Quite a hardy lot these adventurers. Some of the newer adventures have random features assuring one of a different adventure with each new game.

The basic scheme in an adventure is to advance through a series of mazes to reach a final goal. Each section of the maze may be depicted as a room, a forest, or even the inside of a tourbillion? Traveling from one section to the next may simply require a command, such as, "GO DOOR." Certain items may be needed to allow progress. E.g., one must use the stick to knock the apple from the tree to throw at the fire-breathing Galumph, who, being terrified of apples (specifically, Golden Delicious), runs away, dropping the key to the secret door. Most objects have a purpose, but not one that is always apparent. There is usually a limit to the number of items one is permitted to carry, requiring discrimination in the load carried. Drawing a map is essential for most adventures. Dropping objects as one explores the maze, ala Hansel und Gretel, avoids traveling in blind loops, and the search for the way in or out is simplified.

The basic concept in computer adventure games is to reach an ultimate goal, whether it be to accumulate a certain number of \*TREASURES\*, rescue the princess, or discover the guilty culprit. However, adventures are not all the same. The most fundamental difference is the format of the adventure. These have been described by others, but the use of generalized terms has made these distinctions confusing. The most commonly abused term is "graphic adventure." Every adventure games uses graphics to some degree. How does one discern the difference between a game with a static graphic display of what the adventurer sees and one with a scrolling graphic map, where the adventurer is seen as a figure within the representation? Both are described in advertisements as graphic adventures. The following categorization may remove some of this confusion. There are two basic types of computer adventure games; the text adventure and the action adventure.

#### **TEXT ADVENTURES**

Here the adventure scenario and progress through it are conveyed with the written word. There are three kinds of text adventures. The Pure Text Adventure uses only written text. Usually, the adventurer sees through the eyes of a "puppet" and communicates using two word commands, a noun and a verb. The surroundings are described in some detail and the objects in view are listed. Objects are used by typing specific commands, such as, "TAKE AXE", or "USE AXE". The program responds with "OK" if it is an appropriate command, or with "I DON'T KNOW HOW TO USE AN AXE." At times, one may feel compelled to "USE AN AXE" on the computer. The possible routes of exit from each location are displayed. Movement is accomplished using directional commands. Most adventures permit use of abbreviations, so instead of typing "GO NORTH", using "N" is sufficient. Other directions are abbreviated as S,E,W,U (up), and D (down). An inventory (I or INV) command displays the objects one possesses at that moment. Hints to aid the novice may suggest the correct word to use in a certain situation. Hints may also provide a classic straight man setup, as Scott Adams demonstrates when he suggests using the command "WEIGH ANCHOR". The more advanced adventure games do not contain hints within the program itself, although many hint books are available separately. (The Zork Users Group superbly complements Infocom's series of adventures with maps, blueprints, posters, hint books, T-shirts, etc.). Scott Adams' Adventures fall into this category, as do most of the APX adventures. Infocom's adventures allow the input of full sentences with multiple commands, successfully

simulating actual conversation.

Slightly different is the Enhanced Text Adventure in which something extra is added to the basic text format. This may be done using sound or a simplified illustrated panel to embellish the overall effect. LABYRINTHS from P. C.A. is an example of an enhanced text adventure. Commands are selected from a menu, while sound effects for combat and changes in the background color for different locations are used.

The third type is the Illustrated Text Adventure where every location (room, panel, portion of the maze) is a picture of what the adventurer would be seeing. The static graphic display is accompanied by text in the lower window. Keyboard commands, as with other text adventurers, are used. If an object is picked up, or an action taken that would alter the scene depicted, e.g. cutting down a tree, the pictorial display is redrawn to show the changes. Although challenging in their own right, these adventures may be limited in scope, since an illustrated, and hopefully recognizable, object must appear on the screen. WIZARD AND THE PRINCESS, an Sierra-Online Systems Inc. Hi-Res Adventure, is an example of an exciting adventure scenario with high quality graphic illustrations that does not sacrifice the challenge of pure text adventures.

#### **ACTION ADVENTURES**

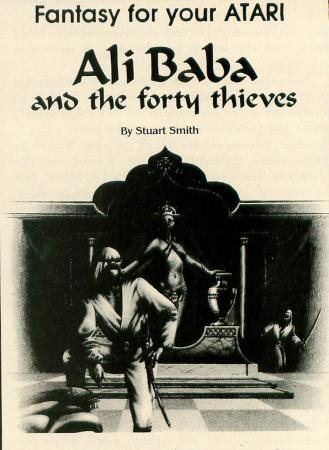

There are two sub-groups in this category. The Personified Adventure is a group that is most varied and difficult to classify. They are often referred to as graphic adventures, mapped adventures, or roleplaying fantasy adventures. The adventurer is usually represented by a symbolic human figure (ergo, personification) which is able to be moved about the screen from one location to another. As the edge of the screen is approached, it scrolls to the adjacent area. Control is through a combination of keyboard commands and joystick manipulation. The commands are most often in menu form and are quite limited. Consequently, the commands are known to the player and the challenge (or frustration) of discovering the game's special vocabulary is missing. Random encounters with danger highlight the quest, and combat is frequent. After achieving the final goal, the random nature of these games allows them to be played repeatedly. ALI BABA AND THE FORTY THIEVES by Quality Software is an example of this type of adventure.

Arcade Action Adventures are unique in that they require use of motor skills to facilitate interaction with the game. Features of the other adventure formats are incorporated, but quick responses to invading aliens, etc. are necessary. The display may be similar to the illustrated text, and animation added by having foes appear periodically. Unlike other adventures, the goal may be to attain a high score, rather than achieve a final success, although both goals are usually embodied in the arcade action adventure. The cerebral challenge of decifering clues and the mental images created by the text-based adventures are replaced with the reflex response to the droid which just appeared and blasting it to Cleveland where it will never be heard from again. STAR WARRIOR from Automated Simulations is a personified adventure with arcade action.

There are adventure players who consider themselves purists and only play the text adventures. They are involved in the challenge of the word game aspects and solving the mystery. The illustrated text and action adventures provide an enjoyable variety. There may be major differences between adventures with the same format. Documentation, game-save feature, real-time element, completion time, and originality of the scenario are a few areas where these differences occur.

The only way to find out if you will enjoy adventure gaming is to try it. For the beginner, Scott Adams' PIRATE ADVENTURE or Online's MISSION ASTEROID provides a good introduction. They are both available in illustrated text versions (PIRATE ADVENTURE is also available as pure text and on cassette for less money). Both are challenging, but not impossible, and will give hours of pleasure. If you want greater challenges after whetting your appetite, a bounty of adventures await you - many reviewed in this issue. Naming the best adventures is difficult because of wide variation in individual preferences. All of Scott Adams' Adventures are well done and original. WIZARD AND THE PRINCESS (Online Systems Inc.) was the first high quality illustrated text adventure available for the ATARI. This Hi-Res Adventure by Ken and Roberts Williams is still the standard of excellence in its field. ALI BABA (Quality Software) is without peer in the personified adventure arena. Stuart Smith has created a role-playing fantasy with many special features that no other adventure of this type has even remotely approached. ALI BABA's originality, playability, and use of ATARI's unique sound and graphics capabilities are unparalleled. Though not considered here as a true adventure game, CRUSH, CRUMBLE, AND CHOMP (Epyx Simulations) is a role-playing fantasy with the player starring as one of many available movie monsters attempting to destroy any of four major world cities. It is great fun. SNOOPER TROOPS (Spinnaker) offers an excellent combination of all the above formats, and though its advertisements seem to be aimed at children, it is challenging and fun for all ages.

No article on adventures would be complete without mentioning the creators of the first adventure, Don Woods and Willy Crowther. Their original trek through Colossal Cave has been recreated by many. A version of this classic adventure game should be part of every serious adventurer's collection. Let The Quest begin. □

#### A fantasy role-playing adventure for Atari Personal Computers.

Encounter sultans, thieves, fierce and friendly creatures as you guide your alter ego, Ali Baba, through the thieve's mountain den in an attempt to rescue the beautiful princess. Treasure, magic, and great danger await you! One or more human players can guide up to seventeen friendly characters through the many rooms, halls, and caves. Some characters wander around randomly, making each adventure a little different.

ALI BABA AND THE FORTY THIEVES is written in high resolution color graphics and includes music and sound effects. Adventures can be saved to disk and resumed at a later time. *Atari 800 32K*.

On diskette only - \$32.95

 FORMAT
 Text = Pure Text; Text+ = Enhanced Text; Illustrated = Static Graphics; Person = Personified Graphic or Mapped; Arcade = Mobile Enemy, Motor Skills needed; Mixed = Unique Combination, animated/personified, motor skills.

 SKILL LEVEL
 Level of expertise or experience needed to successfully interact or complete adventure.

 INTERFACE
 K = Keyboard alone; J = Joystick; JK = Joystick and Keyboard used together; K/J = Either utilized

 EXTRA FEATURES
 1) Random variations; 2) Printer output; 3) Voice synthesizer; 4) Two or more players possible.

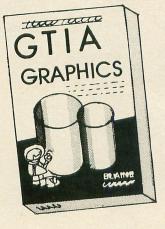

## EDUCATIONAL SOFTWARE

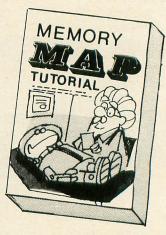

**PROUDLY PRESENTS** 

TRICKY TUTORIALS<sup>™</sup> 8 Thru 11 FOR ATARI<sup>®</sup> COMPUTERS

#8 - Create and animate your own character sets using the same methods used in many of your favorite games. Includes a great editor, utilities, examples, and a complete Space Invaders look-alike, all explained in detail.

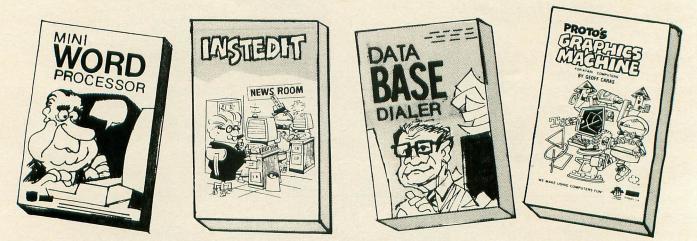

#### 16K TAPE OR 32K DISK ONLY \$29.95 EACH!

#9 - Learn to use Graphics modes 9, 10 & 11 giving you 16 shades or 9 colors, all from BASIC. Create programs never before possible such as three dimentional shapes and digitized pictures, all explained in great detail. #10 - Find that perfect sound effect for your games and programs. Includes over 50 effects ready to use and explains how they were written. Special utilities are included to allow you to develop your own sound effects. #11 - Our famous Memory Map now COMES ALIVE in this TUTORIAL. Included are thirty of the most useful POKE locations within the ATARI, each fully explained with interactive examples. See the tricks you have always heard about.

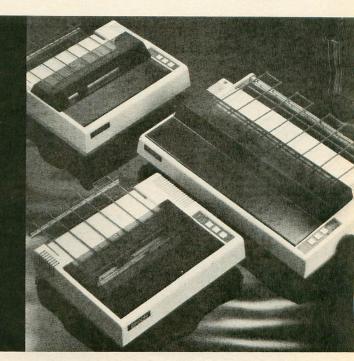

## **OUR NEW PROGRAM EXCHANGE**

FEATURING THE FINEST PROGRAMS FROM AUTHORS AROUND THE WORLD:

THE ESI PROGRAM EXCHANGE OFFERS A \$24.95 WORD PROCESSOR (TAPE OR DISK), A \$19.95 GRAPHICS TOOL THAT USES SINGLE WORD COMMANDS, A FAMOUS CHARACTER EDITOR FOR ONLY \$19.95, A DATABLE PROGRAM (\$24.95) THAT ACTUALLY DIALS YOUR PHONE AS WELL AS KEEP YOUR RECORDS, AND OVER 20 MORE!

## EPSON PRINTING MODES SIMPLIFIED

#### by Thomas M. Krischan

Tired of coding all those CHR\$(xx) statements to generate an EPSON printing mode? The User's Manual uses the Model I TRS-80 as its teaching system. Consequently, ATARI computer owners find, that many of the well documented examples don't work. At first glance, the EPSON printing modes seem strangely and lengthily encoded. For illustration, say we wish to print a line of double strike compressed expanded mode. We would have to type in this:

#### LPRINT CHR\$(27); CHR\$(71); CHR\$(27); C HR\$(70); "text"; CHR\$(27); CHR\$(72); C HR\$(27); CHR\$(69)

That accounts for 72 keystrokes dedicated for control codes. Half to enable the mode and half to disable it back. Rejoice, there is a simpler way. GRAFTRAX-80 and the ATARI computer are a great combination.

CHR\$(27) is an escape code CHR\$(69), CHR\$(70), CHR\$(71), and CHR(72) set printing modes. Each of these express a single ASCII value which just so happens to also represent a single printable screen character. Try typing this:

#### ? CHR\$(27); CHR\$(27); CHR\$(69); CHR\$(7 0); CHR\$(71); CHR\$(72)

Aha! **E**FGH. Note that **E** corresponds to the ESC key and that only one **E** is printed. The first **E** is used by the computer, but that's another story. Back to the printing modes. Try typing this little gem:

#### LPRINT "EGENtextEHEE"

(Remember to use the ESC key twice for each symbol).

Hey, that's the same print mode as our first illustration. And this uses only 8 keystrokes for control codes, or 12 if you're a purist and consider double presses. In either case it's much less than 72.

Before you go racing off to your printers, let's explore more about character codes. There are only 5 true character control codes (Table 1).

	TABLE 1.			
ON CODE	OFF	FUNCTION		
E	F	Emphasized		
G	H	Double Strike		
P	Q	Compressed		
R	055	Expanded		
4	5	Italics		

We must include the necessary preceeding escape code before each of these. By specifying all possible combinations we obtain 32 character modes  $(2^{**5} = 32)$ . These are displayed in Table 2. Note that only 24 character modes are unique. The Emphasized code (E) nullifies the Compress code (P). The first line in Table 2 was generated by:

#### LPRINT "EFEHERESES00000FHR55"

... where "LFLHLOL5L5" are the necessary control codes and "00000FHQ55" is the printed text.

By the way, if you use escape codes in a program it becomes non-listable on the printer, but will list to the screen. TABLE 2

occorhoss occ2ffgs/ OCOLOFHORS 00011FHQR4 00100FHPS5 00101FHPS4 00110FHPR5 00111FHP84 O1 COOF BOSE 0200278888 01010FGQR5 01011FBQR4 01100FGPS5 01101FGPS4 01110FGPR5 01111FSPR4 10000EHQS5 10001EHQS4 10010EHQR5 10011EHQR4 10100EHPS5 10101EHPS4 10110EHPR5 10111EHPR4 11000EGQS5 11001EGQS4 11010EG0R5 11011EGQR4 11100EGPS5 11101EGPS4 11110EGPR5 11111EGPR4

Now we will explore spacing codes. If you have tried the underlining example in the EPSON User's Manual you found that it doesn't space correctly with the ATARI computer. Try typing in this example:

	LPRINT "&ATUNDERLINE" LPRINT "&A"
20	LPRINT "
30	LPRINT "IS FAKED! 4"
	LPRINT "NORMAL LINE." and RUN
NO	ER ESC ESC 1=CTRL E SCTRL G

Let's explain how it works. Standard (i.e. default) spacing consists of 12 vertical dots or 1/6 inch. Upper case letters use the top seven dots (dots 1-7), leaving the bottom five dots blank (dots 8-12). Vertical line spacing can be changed using an ecA control code. The number following the control code signifies the number of vertical dots in a line, from 1 to 85. The ATARI keystroke which corresponds to 1 is "ctrl A", 2 is "ctrl B", etc. In our illustration we do not specify a type of vertical line spacing. The default is twelve vertical dots. The top of our line is dot #1 and the base of our line is dot #12. Statement (10) activates the top seven pins in our printer head and we print "UNDERLINE" on dots #1 through #7. We then change our line spacing to a five dot vertical line. In statement (20) we skip to the next printer line. Our top is now dot #6 and base is dot #17. We activate pin number four and print several dashes. Pin number four is located on dot #9. We again readjust our line spacing to a seven dot vertical line. Then, in statement (30) we skip another printer line. Our top is now dot #13 and base is dot #24. We are positioned on a standard spacing base line (i.e. 24 is divisible by 12). We then print "IS FAKED!" and reset the vertical spacing to a standard 12 dot line. Statement (40) shows us that we're back to normal.

Table 3. illustrates the five spacing codes.

	TABLE 3
ATARI Code	DESCRIPTION
40 41	Sets 9 dot vertical line Sets 7 dot vertical line
42 43 n	Sets 12 dot vertical line Sets n/3 dot vertical line
ta n	Sets n dot vertical line

Why are there so many spacing codes? Well, the first three are intended as quick and easy spacing for normal text printing. The last two codes concern more specialized text printing, like underlining and graphics.

Unfortunately, once you activate any of these spacing codes, except ec2, the printer forgets where the top of the form is. The form feed counts the number of whole lines, not dots. You could readjust for this by manipulating with fewer or greater dots in successive print statements.

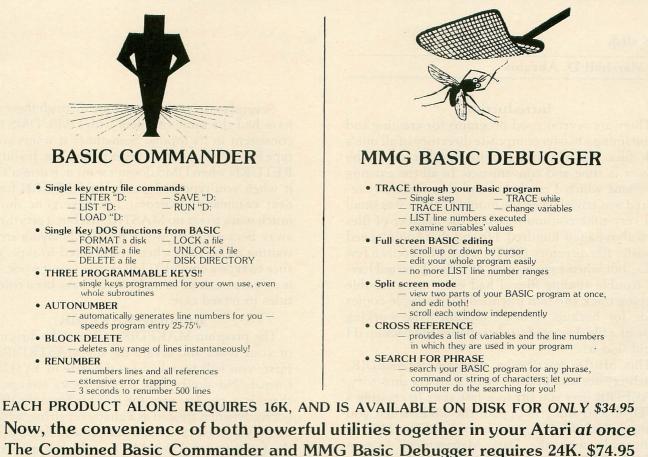

For example, in our illustration we use four LPRINT statements. But, it appears that we've only printed three lines. One of our LPRINT's is the underline. We are actually one whole line, 12 dots, behind the form feed counter. To catch up we simply add one 24 dot line, like this:

#### 50 LPRINT "EA" (-CTRL X)

With this information in hand, EPSON printer users can write programs with much more efficient operation, not to mention the savings on keystrokes when entering programs.

## NEW FOR ATARI FROM MMG MICRO SOFTWARE

#### NOW - THE TWO MOST POWERFUL AIDS FOR ATARI BASIC!!

#### **ADDITIONAL PRODUCTS**

#### NECESSITIES

RAM TEST II - The fastest and most thorough memory test available for the ATARI has now been further improved! Tests not only all locations, but also tests the memory addressing system. This all machine language program takes 4 minutes to test 48K. It's the only program that tests the cartridge area of RAM. Good for new 400/800 computer owners, for testing new RAM boards and for use in computer stores to test and pinpoint bad memory locations. Bad memory locations are pinpointed so repair is as simple as replacing a chip!

Requires 8K, Disk or Cassette ..... \$29.95

DISK COMMANDER II - Just save this program on your BASIC disks and it will autoboat and automatically list all programs for the disk into your screen. Simply run any program by typing a single number.

Requires 16K, Disk Only...... \$29.95

#### **TUTORIALS**

ASTEROID MINERS This 50 page book and program provides for a unique intermediate to advanced tutorial. A 32K BASIC game utilizing over 25 players in player-missle graphics, machine language subroutines, a redefined character set, multiprocessing utilizing the vertical blank interrupt interval, and much more! The 50 page book included with the program documents each part of the entire program and contains the fully documented source code for both the BASIC and assembly language parts of the program. Use these routines in your own programs. These examples make it easy!

Requires 32K, Disk or Cassette ...... \$34.95

#### GAMES

CHOMPER - An all machine language arcade style game with intelligent monsters. Requires 16K Ram, 1 Joystick and nerves of steel.

Available on Disk or Cassette ..... ..... \$29.95

#### **BUSINESS/HOME**

MAILING LIST - Extremely fast BASIC and machine language program. Each data disk holds over 500 files. Sort on any of 6 fields at machine language speed or search on any fragment of a field! Use any size labels or envelopes.

Require 40K, Disk Only ..... \$39.95

#### NEW

MMG DATA MANAGER - If you frequently find yourself looking for something, only to find it eventually right under your nose, then MMG DATA MANAGER is for you. Organize virtually anything into a computer-searchable format, and let your ATARI do the hunting for you. MMG DATA MANAGER is the first of a series of business applications from MMG MICRO SOFTWARE, all of which will share the ability to access files created by any of them. This flexible database manager will allow many fields, with machine language sorting, on any field. In addition, you have total control of the structure of your data, allowing you to design a database which you feel most comfortable. A special feature of MMG DATA MANAGER is its ability to select for a given value of any single field, or any combination of values from many fields. You could, for instance, determine who lived in Las Vegas, Nevada, and bought item #3145 from you, and whose last name began with SM, and whose telephone number began with (702) 873-4. You'll never lose track of information again! Multiple print options add to the versatility of MMG DATA MANAGER. Requires 40K, Disk Only ....

Available At Your Favorite Computer Store OR Send a Check or Money Order to:

## A MASTER FILE DIRECTORY USING DMS

16K disk

#### by Marshall D. Abrams

#### Introduction

There are several good programs for creating and maintaining a master composite directory of all one's disk files. So why did I write another one? The answer is time and convenience. In all the existing programs which I tried, I found that the effort required was trivial when the number of files was small and very time consuming when the number of files grew above a few hundred. I found that I didn't need a master file directory (MFD) when I had only a few disks, but when I got to over 40 sides, I started having trouble finding files. I had even more trouble keeping track (no pun intended) of multiple copies made for backup. When I modified the working copy of a file, I wanted to also change the backup if I could find it!

This article describes a program, MAKEDIR, which creates and updates such a master directory. MAKEDIR gets you off to a fast start in creating a MFD. It also lets you update the MFD when you change which files are on which disk. The MFD is compatible with the Data Management System (DMS) which appeared in COMPUTE! November 1981 and the improved ATARI Program Exchange (APX-20059) version. As described below, DMS may be used to sort, edit, and print the MFD.

#### Design criteria

MAKEDIR was designed to interface with DMS. It creates and edits a file named MASTRDIR.DB which is completely compatible with DMS. MASTR DIR.DB is also designed for listing on the TV screen and 40-column printers. Accordingly, the total column count is restricted to 38. Fields are defined with an extra column so that they are separated and readable when directly copied to the screen or printer. If this feature is not important to you, but the limit of five columns to identify a file type is too confining, you may easily change the field widths.

#### **Getting Started**

Run DMS and create the database file MASTRDIR. The extension .DB will be automatically added by DMS. The following fields should be created:

Name	Width	Editing
1 FILE.EXT	13	none
2 Sec	4	numeric
3 Disk	7	none
4 Date	7	numeric
5 Type	5	none

Several people who have gone through these steps have had the same problem with DMS. DMS is inconsistent in its inputs. Sometimes it wants you to type RETURN; at other times it does not. If you type RETURN when DMS doesn't want it, it doesn't read it when you type it. It reads the RETURN for the next command! Horrors! You have gone through much work to set up MASTRDIR, but it gets thrown away because there was a RETURN laying around waiting to be read when you wanted to type Y. Be sure to type a capital Y; lower case won't work. This is an easy mistake to make if you have been entering titles in mixed case.

#### **Running MAKEDIR**

The program MAKEDIR will read the directories of your disks and create the file MASTRDIR.DB. First, you will be asked for the date in YYMMDD format. No doubt this format looks strange, but there is a good reason for it. This format will sort correctly when treated as a character string, which is the way that DMS's sort works. It would also work if the format were YY-MM-DD, which is more readable but takes more columns. To be more general, the format should be YYYYMMDD, but YY will correctly sort this century.

MAKEDIR will attempt to read the disk id (see below for disk id format); if it fails, it will ask you to type in "diskid". The program assumes that all files on each disk are of the same type, or purpose, and asks you for this information. If you have organized your disks this way, with games on one disk and utilities on another, MAKEDIR will save you lots of time. If a few files are of a different type, you can use DMS to change their types. Common types are GAME, GRAPH, WORDP, and UTIL. MAKEDIR will ask you to load new disks as necessary. When creating a new MASTRDIR, MAKEDIR fills up all of available memory before requesting that you load the disk onto which it will write MASTRDIR.DB. Generally you will be able to catalog all your disks before this.

#### Recataloging a disk

If you have made many additions or deletions to the files on a disk you may want to recatalog that disk using the Update command in MAKEDIR. After reading your disk, MAKEDIR will search MASTR DIR for all entries previously made for that disk and mark them as deleted. It will then append the new entries.

#### Adding non-directory files using DMS

Many boot disks do not have directories. Some way is needed to make MFD entries for such disks. In addition, you may wish to make an entry for an AUTORUN.SYS that identifies the content of the file (GAMENAME.ATO, for example). One way to do this is with the DMS update command. If you run DMS and select the update option, you will be prompted into creating as many entries as you like. The editing tests will even prevent you from entering alphas in numeric fields.

#### **Editing MASTRDIR**

Since MASTRDIR.DB is a text file, it can be edited with a text editor, such as the Program-Text Editor (APX-20075). Using an editor is often more convenient than DMS for a small change. Similarly, searching MASTRDIR.DB for a specific file may be done with the editor's search command. An alternative way to add records to MASTRDIR.DB is to use an editor. In general, an editor will let you see a screenful of records, so it will be easy to create new records by lining up the fields above and below. Further, an editor lets you insert the new record anywhere you want. For a few additions it is probably more convenient to insert that in the right place in a sorted list rather than have to resort after insertion.

#### Disk Name

MAKEDIR assumes that a file DISKNAME.TXT exists containing a single record in the format

(...title... diskid).

Diskid may be any string, preceded by at least one blank and followed by a greater-than character. If MAKEDIR discovers that DISKNAME.TXT does not exist, if offers to write it for you. So even if you hadn't previously numbered your disks, you can number them at the same time that you catalog them. Since MAKEDIR is written in BASIC, it may easily be changed to work with other disk identifiers.

#### **Other Features**

MASTRDIR.DB records occupy 38 columns, making it very convenient to list them to the screen or a 40-column printer. From DOS, type C (for copy). Then specify

#### MASTRDIR.DB,E:

to have the MFD scroll on the screen. Typing CTRL +1 will stop and restart the scrolling at will. To print the MFD, type

#### MASTRDIR.DB,P:

To avoid multiple entries which would convey little information, MAKEDIR excludes files with extension .SYS and MINIDOS. However, since each AUTORUN.SYS may have a different purpose, I manually enter progname.ATO (where progname is the name/purpose of the AUTORUN) in the directory.

#### Program description

Lines 10 to 90 set up the program variables and color the screen. I like to have a unique color identifying each program or program type. Lines 100 to 120 get the date. Lines 200 to 460 constitute the main menu. The disk type is input in lines 540 to 588, with all 5 characters padded with blanks as necessary. If you want to allow more characters for type identification, change the count here as well as the DIM on line 30. The disk name is read and padded in lines 600 to 720. If one doesn't exist, lines 800 to 860 allow you to identify the disk and to optionally write the DISKNAME.TXT file. Line 890 pads the diskid to 6 characters if necessary.

The disk directory is read in lines 900 to 1020 and written to the internal buffer, the record being terminated with an asterisk and an EOL. If the buffer is full, line 1060 sends us off to 1500 to empty it. If we are updating MASTRDIR by recataloging a disk, lines 1040 and 1100 to 1420 mark the previous entries for this disk for deletion by changing the asterisk to a D. The entire buffer contents are appended to MASTRDIR.DB in lines 1520 to 1580. If you have two disk drives, this section could be easily changed to eliminate diskette changing.

Error checking is handled in lines 1560 to 1580, calling on a subroutine at 2200 to 2280. The menu at 1600 to 1800 allows another copy of MASTRDIR to be written, another disk to be read, or program termination.

## **TRAPPING YOUR ATARI**

#### 16K cassette or disk

#### by Donald B. Wilcox

It is often frustrating to be forced to restart a software program because an inadvertent error caused the program to crash. ATARI BASIC provides a special word —TRAP— that often can be used to prevent a program from ending before intended. Many errors are subject to automatic correction or compensation through a little extra effort on the part of the programmer.

If you are not yet familiar with the TRAP statement, the following example shows how to use it to detect INPUT errors. These occur when the user of a program types invalid numeric values into a numeric variable.

10 INPUT X

20 PRINT X

30 GOTO 10

In the above listing, typing a non-numeric response to the INPUT statement in line 10 (such as accidentally pressing return with no number entered) will result in an "ERROR-8 AT LINE 10" message. By adding a TRAP statement, this problem will be avoided completely.

10 TRAP 10: INPUT X

20 PRINT X

30 GOTO 10

In the slightly modified example above, if an input error occurs, the TRAP statement will catch the error and go back to line 10 to try the INPUT again.

This short article presents some common errors that can be prevented with a few extra lines of code. After perusal of these five examples, you should be able to understand how to make your programs less vulnerable to errors that prematurely end your program.

PROGRAM ONE - If you mistakenly create a new file using a file name that already exists, you will destroy the already existing file. No error message will warn you of the impending disaster. Program ONE will prevent this.

PROGRAM TWO - If you try to OPEN a nonexistent file, you will get error message — 170 and your program will crash. This can be prevented by using Program TWO.

PROGRAM THREE - If you try to input data from a disk file beyond the end-of-file, you will get error message — 136 and your program will terminate. You may not always know beforehand where the file data ends, so an automatic end-of-file trap can be programmed easily to prevent error — 136. Program THREE will solve this problem. PROGRAM FOUR - You forgot to turn on your printer or interface unit and get error message — 138. If you attempt to use the CONTINUE command after you turn on the correct unit, your program will continue beginning at the line number that follows the line that caused the error. Often this can create erroneous results (not always detected) because the instructions on the line that caused the error may not have been executed correctly before the error.

PROGRAM FIVE - You are reading in data with a READ statement and you do not want to use an endof-data dummy value as a flag nor do you want to count the entries to determine when all the data has been read. Program FIVE demonstrates a simple method to prevent error #6 (out of data) from prematurely terminating your program.

Finally, for those of you who are relatively new to ATARI BASIC, there are several locations (addresses) that you may PEEK to find out which error occured and which line caused the error. Location 195 contains the error number. Locations 186 and 187 contain the line number where the error occured, low byte, high byte respectively. To display this information on your screen, use the following statements as one method.

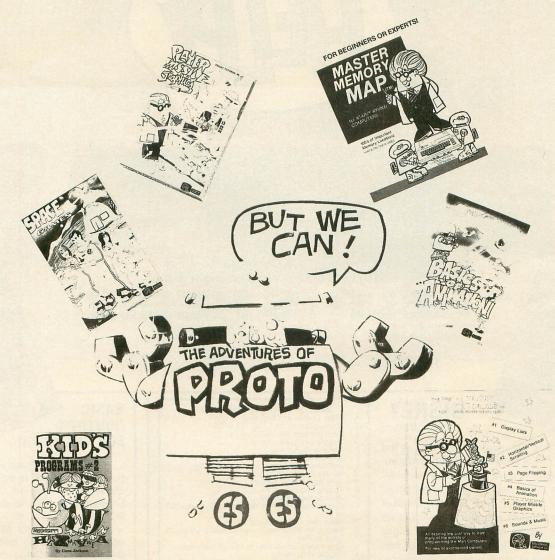

#### 10 REM DISPLAY ERROR NUMBER 20 REM AND LINE NUMBER OF ERROR 30 ? PEEK(195);" AT LINE ";PEEK(186)+P EEK(187)\*256

Happy trapping in your future programs. □

## NOT EVERYONE CAN TEACH THEIR ATARI™NEW TRICKS...

### WE MAKE USING AND LEARNING ABOUT COMPUTERS FUN!

PROGRAMMING GUIDE FOR BEGINNERS OR EXPERTS — MASTER MEMORY MAP.<sup>™</sup> A 32 page book with hundreds of hints on how to use your computer. Over 500 memory locations! \$6.95.

LEARN SOUND AND GRAPHICS with our exciting lessons called TRICKY TUTORIALS.<sup>™</sup> Each comes with a tape or disk full of examples, and a 12 to 64 page manual written in an easy to understand manner. #1 DISPLAY LISTS - Put several graphics modes on your screen at once. #2 SCROLLING - Move text or graphics smoothly up, down, sideways, or diagonally. #3 PAGE FLIPPING - Change TV screens as quickly as flipping pages in a book. #4 BASICS OF ANIMATION - A beginner's lesson in animation using PLOT, PRINT, and a surprise game. #5 PLAYER MISSILE GRAPHICS - Learn the basics of writing your own arcade games. #6 SOUND & MUSIC - Simple methods to play complete songs, with graphics. Includes PLAYER PIANO free! #7 DISK UTILITIES - 7 programs to help you use your disk drive. 32K. #8 CHARACTER GRAPHICS — The best editor available with examples using special characters YOU CREATE and ANIMATE. #9 GTIA, GRAPHICS 9 to 11 - New tricks you can do with these 16 color modes. #10 SOUND EFFECTS - Many examples, from rainfall to laser blasts,

with ample explanation. **#11 MEMORY MAP TUTORIAL** — 30 colorful examples of tricks your computer can do.

TUTORIALS 1 to 4 are \$19.95 each. Numbers 5 to 11 are \$29.95 each. 16K Tape or 24K disk. SPECIAL: Tutorials 1 through 6 for \$119.95. SAVE \$20.00!

DISKEY by Sparky Starks

ATARI 80

Potential into practical reality. This is the core of DISKEY - a remarkable utility program that gives ATARI disk drive owners the flexibility to accomplish tasks that other utilities either ignored or only hinted at. With DISKEY, the user will be able to actually examine a disk and its directory, and repair some files that might otherwise have been lost. DISKEY also performs a multitude of other practical functions, including the following:

- \* Automatically lists any unreadable or destroyed sectors
- \* Sends contents of disk to printer selectively
- \* Up to four separate drives may be addressed
- \* Can be used to backup some of those "unbackupable" disks
- \* Allows direct examination of any file
- ★ Over 50 separate key functions available

As an ATARI 400 or 800 owner, you have extraordinary power and versatility at your disposal. Tap into those resources effectively with DISKEY - new from Adventure International.

ATARI 400/800 32K DISK 052-0158 \$49.95 (Note: Some features will require 40K)

#### BASIC ROUTINES FOR THE ATARI

SHIFT

bv Jerry White

Finally, a self-help system that cuts through the stuffy technical jargon and allows the user to learn effective programming techniques fast! BASIC ROUTINES FOR THE ATARI has been written especially for ATARI 400 or 800 users who wish to write programs in BASIC. This package comes complete with an extensive manual and your choice of a tape or disk which contains all of the routines from the manual which means you'll be able to actually see each of them in action on your ATARI. Some of the BASIC routines include joystick, sound, player missile strings and much more - and presented in a way that you'll quickly be able to learn and apply to your own programs.

If your programming ability lies somewhere between beginning and advanced, then look no further - BASIC ROUTINES FOR THE ATARI is the system for you.

#### ABOUT THE COVER...

Yes, there really was someone in that suit of armor, and that someone was none other than editor Mike DesChenes, revealed here for the first time. The suit of armor he was wearing was a replica, but the suit in the background is an original — German ceremonial armor for a young man, fashioned after combat armor, circa 1540-1550. The armor was provided by the Higgins Armory Museum. The Higgins Armory Museum houses the largest collection of medieval armor, tapestries and weaponry in the entire Western Hemisphere, and the Museum was kind enough to let us photograph our cover there. Unlike our last five covers, there were no double-exposed elements in the shot - only colored gels over the lights were used.

We invite all of our readers in the New England area to visit the Higgins Armory Museum, located at 1CO Barber Avenue, Worcester MA 01606. Phone (617) 853-6015. The Museum is open Tuesday through Friday 9 a.m. to 5 p.m.; weekends and holidays 12 to 5 p.m. The Museum is located just off I-90 and West Boylston Street at the corner of Barber Avenue and Randolph Road. Please visit the Higgins Armory Museum - we guarantee you a fascinating experience.

Mere words fail to convey the excitement that is truly LEGIONNAIRE.

Designed & Programmed by Chris Crawford for Avalon Hill

LEGIONNAIRE is a realtime game of combat between the Roman Legions of Juilus Caesar (you) and the Gaulish barbarian hordes (the computer). High resolution scrolling graphics and sound brings you the live action. You have up to ten legions to command, each with different strengths and weaknesses, and a choice of any two of sixteen different barbarian tribes to fight. As Caesar did two thousand years ago, you must meet the Gauls and defeat them. They outnumber you at least two to one, so you must use the terrain and the disorganization of the barbarians to counter your disadvantage in numbers. Above all, you must be able to react quickly to the changing battlefield situation, or the

battle depicted above could happen to you! Caesar managed to conquer all of Gaul-can you do as well, or will the barbarian hordes defeat your legions?

A. KIGYA (A

LEGIONNAIRE is ready to run on your Atari<sup>®</sup> 400 or 800 with 16K cassette or 32K diskette and one joystick. Available at finer computer and hobby stores everywhere. To order by phone, dial TOLL FREE: 1-800-638-9292

and ask for Operator A, or write: Avalon Hill Microcomputer Games, Dept. 81, 4517 Harford Road, Baltimore, MD 21214. Please add 10% for postage and handling.

# **MOVING PLAYERS IN BASIC**

# 16K cassette or disk

# by Tom Hudson

Just before issue #9 of A.N.A.L.O.G. went to press, I was handed a letter from Long Mai of Salt Lake City, Utah (see the Reader Comment section of this issue). Like many BASIC programmers, he was frustrated by BASIC's snail-like pace, and asked for a machine-language subroutine that could be used with BASIC to move player-missile graphics around on the screen.

Unfortunately, it was too late to write such an article for issue #9, but here it is, along with fully documented assembly-language code.

# THE PROBLEM

Player-missile graphics are one of the most powerful graphic features of the ATARI 400/800 computer systems. Unlike traditional graphics, players and missiles can be moved around on the screen without disturbing the existing display.

In order to use players and missiles, one must first reserve a portion of memory. Once this is done, the user can begin designing and displaying the players and missiles.

The problems begin when the user wants to move a player or missile around on the screen. Horizontal movement is done easily. A POKE to the appropriate horizontal position memory location will move the desired player to any horizontal location on the screen. If the user wants to move a player or missile vertically, he or she must copy the P/M bit image to another location in memory. BASIC is too slow to do this, but it can call a machine-language subroutine to do the "dirty work."

# THE PROGRAM

The BASIC program listed here will allow the user to move any player around on the screen. It calls the P/M movement subroutine, shown in the Assembly language listing.

As listed, the program will move a shape around on the screen at random. The shape of the player is stored as a series of bytes in the string ''PO\$''. By altering the data in line 420, you can change the shape that appears on the screen. There are currently 7 bytes in line 420, but this can be changed by altering lines 130, 290 and 420.

Lines 110-180 set up the subroutine and turn on the P/M graphics. Lines 220-310 are for demonstration purposes only. You can put your program code in this section.

Line 110-Loads the string PMMOV\$ with the

P/M movement subroutine.

Line 130 - Places the data that defines the graphics shape into the string PO\$.

Line 140 - Tell the system where the P/M memory starts.

Line 150 - Saves the P/M base address.

Line 160 - Saves the graphics data string address.

Line 170 - Turns on P/M direct memory access.

Line 180 - Sets the color of player 0 to light blue.

Line 220 - Initialize the X and Y coordinates of the player.

Line 230-280 - Alter the X and Y coordinates to move the player.

Line 290 - This USR call moves the player to the desired X and Y location. This statement has 7 parameters inside the USR parentheses:

# A=USR (MOVE, 0, PMB, PMD, X, Y, 7)

"MOVE" is set up in line 110. Do not change this variable. It is the address of the P/M mover subroutine.

"O" means that we want to move player zero. This value can range from 0 to 3, moving players 0 through 3.

"PMB" is the P/M base address. Do not change this value.

"PMD" is the address of the string that holds the player image data. This should be set to the address of the string you are using to hold your player shape data. If your player shape data is in a string called "PL\$," you could replace "PMD" with "ADR(PL\$)".

An "X" and "Y" are the horizontal and vertical coordinates when you want to place your player. X ranges from 0-255, and Y ranges from 0-127.

"7" in this case indicates that our player is 7 bytes long (see line 130 and the player image data in line 420). If your player is 10 bytes long, place a "10" here.

# SUMMARY

This program should help out anyone who wants to use player-missile graphics from BASIC. If there are any questions, write me care of A.N.A.L.O.G. (please include a pre-addressed, stamped envelope). If there is a specific application you would like to see appear in a future issue, just ask. You never know there may be hundreds of other readers who would like the same information. □

# LIFETIME WARRANTY GOLD PLATED CONTACTS

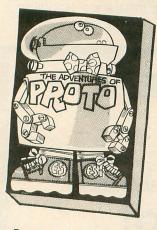

BONTEK MPO Box 547 Niagara Falls, NY 14302 Call: (416) 245-9758

Add \$5 Shipping, Insurance, Handling

Diggerbonk! contains the following ingredients: Orange Whirlers, Pulsing Greenies, Twinklers, Bombs, Fog, Purple Gurples, Yellow Blinkers, Aqua Chasers (watch out), and of course the PANIC BUTTON.

Prototype the Robot needs the help of your child, 4 or older. His busy day includes catching marshmallows being dropped by friendly Aliens, Coloring pictures, and Playing tunes on his piano. \$24.95

AN ADVANCED ARCADE GAME ig dig dig **ONLY \$29.95** 

Diggerbonk! is the first arcade style game with a continuously scrolling maze that never repeats. You must guide your Digger upward before it goes off the bottom of your screen. There are, however, a few problems you must BONK! along the way (see ingredients). To add to the complication, you need to BONK! the creatures in a specific order. Playable by all ages, but be prepared to end up with a NEGATIVE SCORE.

AVAILABLE FROM DEALERS WORLDWIDE. WRITE FOR A CATALOG OR CALL FOR ORDERING INFORMATION VISA/MC/COD: (800) 692-9520 OR (408) 476-4901 4565 Cherryvale Ave., Soquel, Ca. 95073

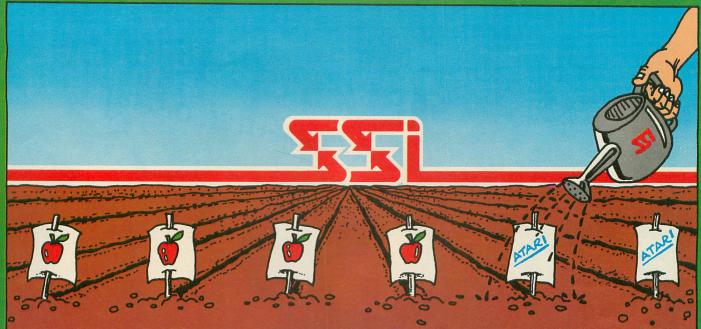

For those of you who always wanted a pet snake, this game is for you. What do you feed a guest like this? An ample supply of insects, of course, but be aware that snakes often wind up biting themselves or getting electrocuted on their cage walls if not properly trained. Difficulty levels for all ages. \$24.95.

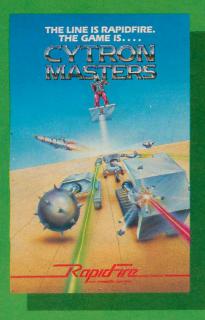

Do you like to challenge your mental powers? Try to solve this color matching puzzle in less than 11 moves. Play it against the computer or a human. Easy you say? SURE ..... \$16.95

# AT SSI, WE GROW MORE THAN APPLES.

# INTRODUCING SOME NEW FRUITS OF OUR LABOR...FOR THE ATARI.

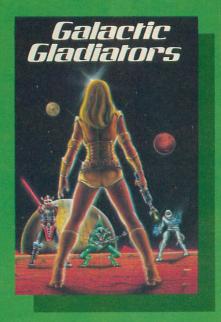

At SSI, we cultivated our fine reputation in the computer gaming world by producing some of the best Apple<sup>®</sup> games around. But to paraphrase an old saying, "Man does not live by Apples alone."

So we bent our backs to the task of converting some of our Apple crops to the ATARI<sup>®</sup> 400/800. The three games you see above are the new fruits of our labor.

As part of our exciting *RapidFire* series, they contain all the ingredients needed to make the perfect strategy simulations for your Atari. Rooted in popular sciencefiction and fantasy themes, they are challenging and sophisticated – yet fast and full of fun!

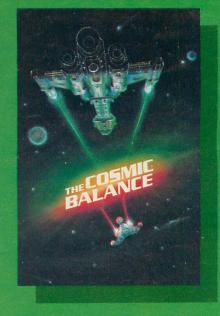

Best of all, they're'ripe for the picking at your local computer/game store today!

■ CYTRON MASTERS<sup>™</sup> puts you in charge of a small army of *Cybernetic Electronic Devices*. Your forces consist of laser-blasting shooter units, kamikaze-like mine cytrons, mobile bunker cytrons, guided missiles and antimissiles. Use these mindless but deadly machines to crush your hapless foes, and you will someday become a...*Cytron Master*! On 48K disc for \$39.95; 32K cassette for \$34.95.

■ GALACTIC GLADIATORS<sup>™</sup> takes you to a remote corner of our vast universe to participate in a wild and crazy cosmic shootout. We're talking about four-armed Froglodytes with phasor rifles, Viking-like Wodanites wielding laser swords, and ugly Mutants whose only socially redeeming feature is their Death Touch. And these are the *nice* folks! On 48K disc for \$39.95.

®ATARI is a registered trademark of Atari Inc.

■ THE COSMIC BALANCE<sup>™</sup> is a tactical space game that not only lets you wage magnificent starship battles, it gives you the chance to *design and build* your ships from the ground up! With a host of variable parameters to choose from, you can equip your fleet with ships optimally designed to suit your style of space warfare. On 48K disk for #39.95.

Coming soon – **COSMIC BALANCE II** – the strategic-level adjunct to *The Cosmic Balance*.

If there are no convenient stores near you, VISA and M/C holders can order direct by calling 800-227-1617, x335 (toll free). In California, call 800-772-3545, x335.

To order by mail, send your check to: *Strategic Simulations Inc*, 465 Fairchild Drive, Suite 108, Mountain View, CA 94043. California residents, add 6½% sales tax.

WRITE FOR A FREE COLOR CATALOG OF ALL OUR ATARI GAMES TODAY!

# 

And guess who stars as the movie monster. You! As any of six different monsters. More if you have the disk version.

You can terrorize and destroy four of the world's largest and most densely populated cities in over 100 possible scenarios. From Tokyo to the Golden Gate, you are the deadliest creature in the air, on the land, or in the sea.

You can be the deadly amphibian who simultaneously smashes street cars, lunches on helpless humans and radiates a ray of death.

If you were a giant winged creature, think of the aerial attacks you could make on the terrified but tasty tidbits beneath you.

But as in all the best monster movies, you're up against everything the human race can throw at you—even nuclear warheads and a strange concoction developed by a team of mad scientists.

For only \$29.95 you get 6 stupendous monsters, each with its own monstrous summary card, 4 teeming metropoli displayed in graphic detail on your computer display and mapped in the accompanying 48-page illustrated book, the awesome sounds of monsterly mayhem, and spinetingling, real-time, edge-of-yourseat excitement. ilable sorre ilabl

**GET CRUSH, CRUMBLE & CHOMP** now at your local dealer for your APPLE, ATARI, or TRS-80 ... **before it's too late.**

# A.N.A.L.O.G. COMPUTING

# The Halls of the Leprechaun King

# 16K cassette 24K disk

# by Keith Evans and Ted Adkinson

Alas! The Leprechaun King has awakened from his long slumber, and he has taken all of the world's gold. Every nation is bankrupt. The world's only chance is Smiley, the famous gold miner. With his dexterity and wit Smiley just might be able to recapture all of the gold, pick up the magic key, and put the gold in a sanctuary. But unless he's careful, the Leprechaun King will give him the Midas touch, turning him into a 24-carat gold tombstone.

The halls of the Leprechaun King is a maze-type game which runs on an ATARI 400 or 800 with a minimum of 16K (Cassette based) or 24K (Disk based) and one joystick. When the game begins take some time to notice where everything is positioned. Smiley is in the upper middle of the screen and the Leprechaun King is in the upper right hand corner. Throughout the maze there are pots of gold. To collect one, just touch it. If you look in the lower right corner, you will see the key surrounded by walls. Collect about half of the gold and the key will move to the center of the maze. After Smiley gets the key and all of the gold, he goes to the sanctuary chamber at the far lower right corner directly to the left of the cross. Push the trigger button and a section of the wall will disappear. This is the entrance to the sanctuary where Smiley has to store the gold. Deposit gold by simply touching the cross.

Some other important parts of this game are gold tombstones. When Smiley loses a life, a tombstone appears as a resting place for all of the gold he was carrying. A new Smiley has to touch the tombstone to collect the gold that the old Smiley was carrying.

In this game, you start with three lives. The game is over when you use them all up. To see how many lives you have left, look in the upper right or left hand corner of the screen where vertical bars indicate lives remaining (including the one currently in use.)

An expert player might get to the third maze and find it is totally different. Two clues about this maze three: the key appears in the lower middle of the screen, and the section of disappearing wall lies directly below the cross.  $\Box$ 

Here is the documentation of the program. Line # Description 1-10 Variable Initialization, title 120-372 Character set redefinition 395-507 Maze drawing, placing of the gold 510-624 Joystick reading, movement of Smiley 630-999 The Leprechaun's logic 1000-1120 Maze and character set data 1150-1154 Men left indicator 1500-1510 "Midas Touch" sound effects 2000-2020 Counts bags of gold taken, places key in the maze if enough has been taken 2500 Draws tombstone, checks men left 2510-2570 Erases Smiley's trail 2575 Start's game over when all men are used up 2610-2700 Puts the gold Smiley was carrying in a tombstone when he is killed 3000-3050 Subroutine to flash maze 4000-4350 Actually moves monster 5000 Plays "Oh, when the saints...", clears screen 6000-6007 Displays score at end of game 6010 Clears screen 7000-8030 Data for "Oh, when the saints..." 9000-9130 Subroutine to play "Oh, when the saints..." 9150-9260 Plays "Good night, ladies..." 9270-9290 Data for "Good night, ladies..." 9300 Sound effects of gold being cashed in 10000-Color rotation subroutine 10020

For those interested, here are some of the techniques used in this program. First is "redefined character sets", which when carefully laid out can simulate a high resolution graphics screen, but requiring much less memory. They are fairly easy to design. Each character can be one of four different colors. Step one is to design some characters. Here's Smiley as an example:

128	64	4 32	2 10	5	8	4	2	1																								
									4	+	8	+	1	6	+	3	2	H	6	0	2.8							3	1			1
185									2	+	4	+	8	+	1	6	+	3	2	+	6	4	=	1	2	6						
- tes								-	1	+	2	+	8	+	1	6	+	6	4	+	1	2	8	=	2	1	9	18	2			1
		1000							1	+	2	+	4	+	8	+	1	6	+	3	2	+	6	4	+	1	2	8	=	2	5	5
							RG.		1	+	4	+	8	+	1	6	+	3	2	+	1	2	8	11	1	8	9					
				T					1	+	2	+	6	4	+	1	2	8	п	1	9	5				1	101					
									2	+	4	+	8	+	1	6	+	3	2	+	6	4		1	2	6						
									4	+	8	+	1	6	+	3	2	=	6	0			-									

Make an 8 by 8 grid; mark the blocks to be filled in, then add up the corresponding numbers to determine its POKE value.

Following is a program which defines a space, and a Smiley character and then prints out a picture of Smiley on the screen. The number used after the COLOR statement in line 100 is explained later.

```
10 GRAPHICS 2+16:REM START OUT WITH A
GRAPHICS STATEMENT
20 POKE 106,PEEK(106)-2:REM SET ASIDE
2 PAGES OF MEMORY FOR THE CHARACTER SE
30 CHBASE=PEEK(106)*256:REM THIS
ERE THE CHARACTER SET WILL BE POKED IN
TO MEMORY
```

40 SET=PEEK(106); REM THIS IS WHERE THE
CHARACTERS WILL GO IN TERMS OF PAGES
OF MEMORY
50 READ VALUE: IF VALUE=-1 THEN 95: REM
READ IN PART OF A CHARACTER
60 POKE CHBASE+C, VALUE: REM PUT THE NUM
BER IN MEMORY
70 C=C+1:GOTO 50
75 REM DATA FOR SPACE
80 DATA 0.0.0.0.0.0.0.0
85 REM DATA FOR SMILEY
90 DATA 60,126,219,255,189,195,126,60,
-1
95 POKE 756, SET:REM TELL THE COMPUTER
WHERE THE NEW CHARACTER SET IS LOCATED
100 COLOR 1: PLOT 5,5: REM PUTS SMILEY O
N SCREEN AT 5,5
110 GOTO 110:REM ENDLESS LOOP FOR DISP
LAY PURPOSES
A REAL PROPERTY OF THE PARTY OF THE PARTY OF THE

To determine the number for the COLOR statement in line 100: First, Smiley is to be green. Color register number 1 normally contains green so it is used. Smiley has been defined in the program above as the second character in the redefined set. (The space was the first.)

With these pieces of information I looked up the number in a chart, like the following one:

COLOR REGISTER 0 = 32, 33 through 95 COLOR REGISTER 1 = 0, 1 through 124, (125\*), 126, 127 COLOR REGISTER 2 = 160, 161 through 223 COLOR REGISTER 3 = 128, 129 through 154, (155\*), 156 through 255

\* 155 selects the same thing as 32. 125 has no effect.

Smiley's color is set by color register 1 so look in the second row. Since he is the second character use the 2nd number in the 2nd row, which is 1. As another example, if Smiley were to be controlled by color register 2 the correct number would be 161. Try 161 in the example program above and see what happens.

Before you get too carried away, remember that the example program will not allow text to be displayed on the screen. To switch back to text only POKE 756, 224.

If you are really interested in redefining a complete character set there are several software packages out which make it easier.

Another section of the Halls of the Leprechaun King which is interesting is its color rotation subroutine (10000-10020). Adding this to a program's title makes it very colorful. Here is how it works. Memory locations 708-711 contain the numbers which determine the colors which will be displayed from each color register. The subroutine rotates the colors from one register to another so that everything on the screen is flashes through each color. Try it in one of your programs.

Good Luck! And keep on coding! □

# **A LISP TUTORIAL**

# by Ken Litkowski

LISP is an old language, dating to the dark ages of computers (pre 1960), still hardly standardized, yet still making a contribution to the evolution of new languages. Its influence will continue to be felt in the years to come. And now it is emerging from the hallowed halls of academe and made available to us lesser mortals. It is a language or research; its availability on personal computers will allow anyone so inclined to participate in the future.

LISP is primarily a symbol manipulation language used today in many areas of the ever-expanding field of artificial intelligence. Programs in LISP can do calculus problems (on a level equivalent to college freshmen), prove mathematical theorems, solve geometric analogy problems, provide natural language interfaces to data base systems for limited domains such as moon rocks and inventory systems, and have been used for word processing, symbolic mathematics, and writing operating systems, utility programs, compilers, and interpreters for personal computers. These applications have been developed on large computers, but there is no reason why LISP's capabilities cannot be harnessed on a personal computer. (See the review of a LISP implementation for the ATARI in A.N.A.L.O.G. #8, particularly noting its limitations, which effect the speed of flexibility of LISP programs.) In this tutorial, I will attempt to convey the power, beauty, and sophistication of this language, while trying to demystify the aura which surrounds artificial intelligence.

# The Basics

LISP is essentially a functional language, meaning that its capabilities are implemented through functions (comparable to the functions in FORTRAN and analogous to the subroutines in BASIC). A function in LISP is always enclosed in parentheses, with the function name given first, followed by its arguments (or values to be given to the function, if any). For example, (+2 5) will return the value 7. This prefix notation is important, since it ensures that the system always knows where to look for a function name. Other functions can also be used as arguments, nested to any depth. Listing 1 shows several examples of mathematical functions. Arguments for the more complex examples are discernible by balancing the parentheses.

As is evident from the examples in Listing 1, parentheses proliferate in LISP. This brings us to another main characteristic of LISP, namely, that it is

a list processing language. The fundamental entities in LISP are called **atoms** (roughly corresponding to veriable names in most other languages). Atoms may be symbolic, such as +, SQRT, x, or 3x@H#, or numeric, such as 4 or 5.2374. Some symbolic atoms are given special meaning when they are used as function names (recognized as such either by the system or through user definition). Other symbolic atoms may be given values or properties. Atoms may be grouped together into lists, which can then be grouped into higher-level lists, and so on. Lists are always enclosed in parentheses. The functions in Listing 1 are nothing more than lists, some containing sublists, and all of them distinguished in that their first elements are symbolic atoms recognized as function names which cause a computation to be performed.

LISTING 1.	
(+ 3.14 1.27) 4.41 (* 4.13 3) 12.39 (/ 327 200) 1.635 (* (+ 3 4 ) (SUB 13 5)) 56 (SQRT 1.4641) 1.21	User input LISP response User input LISP response User input LISP response User input LISP response User input LISP response User input

Atoms and lists collectively are called symbolic expressions, or s-expressions. Their manipulation is the essence of LISP. As mentioned above, symbolic atoms may be given values; these values do not have to be numbers; they can be other symbolic atoms, lists, and even lists which are also functions. This makes LISP a symbolic language in addition to being a functional and list processing language.

#### **EVAL and QUOTE**

The ability to give atoms values which are other atoms, lists, or functions is what gives LISP its power. Understanding how this is done is therefore of primary importance. There is a simple function called SETQ which gives a symbolic atom its value. Thus, we can write (SETQ X 3); this is equivalent to the BASIC or FORTRAN assignment statement X=3. We can also write (SETQ X 'Y) or (SETQ X '(A B C) ). These give X the value Y or (A B C), respectively, but they do so in a peculiar manner. First note that these values were preceded by a quote mark. This quote mark inhibited what is known in LISP as evaluation.

Whenever LISP encounters an atom or list, it attempts to evaluate it. That is, it will substitute the value of the atom or the list for the atom or list itself. In the case of the Y above, LISP would substitute the value of Y and make that value the value of X, if we had not inhibited evaluation with the quote mark or with the equivalent QUOTE function. In the case of the list (A B C), LISP would have attempted to determine its value by assuming that it is a function with name A and arguments B and C. Not finding a function with such a name would have caused an error. The quote mark inhibits such evaluation. In both cases, the QUOTE function returns the literal expression which follows it. This enables X to be given the literal values intended.

In the examples of Listing 1, where a function was given as an argument to another function, the absence of a quote mark permitted the evaluation of the function. The value of the function thus became the value of the first function's argument. Sometimes, however, it is necessary to use the opposite of the QUOTE function and let a symbolic atom go through two (or more) stages of evaluation. This is accomplished with the EVAL function. Listing 2 shows an example of this, where the atom A is given the value B and the atom B is given the value C. When A is entered, LISP returns its value B: similarly, B returns the value C. But, typing (EVAL A) returns the value C. In creating the listings for this article, I set a variable to the lines marked "User input" and then EVALuated that variable to get the LISP response. In most of the listings, this resulted in the evaluation of a function.

LISTING 2.

(Setq B (Quot C A B B C C (EVAL A) C	E C))	illser	response input response input response input response input response	

# List Processing Functions

Since LISP is a list processing language, it has special functions for manipulating them. The most basic functions are CAR (for Contents of Address Register) and CDR (for Contents of Decrement Register), where both acronyms were taken from the structure of the IBM 7090. CAR returns as its value the first s-expression of the list, while CDR returns the list that remains after the first element is removed. Listing 3 contains some examples of these functions; note again that the QUOTE function was used to inhibit evaluation.

	the second s
LISTING 3.	
(CAR (QUOTE (A B C))) A (CDR (QUOTE (A B C))) (B C) (CAR (CDR (QUOTE (A B C)))) B (CDR (CDR (QUOTE (A B C)))) (C) (CAR (QUOTE ((A B) C))) (A B)	User input LISP response User input LISP response User input LISP response User input LISP response User input LISP response

Three other basic functions are APPEND, LIST, and CONS. APPEND merges all the elements of each of its argument lists into one list, while LIST simply forms its arguments into a single list. CONS takes its first argument, any s-expression, and makes it the first element of the list which is its second argument. Listing 4 shows several examples of their use; in these cases, X has been given a value before use by the demonstrated function; no quote mark has been used in order to show what happens when an atom is evaluated prior to its use by a function. Several other list processing functions are usually available in any implementation of LISP.

# LISTING 4.

(A B) (LIS (APPEND X X) (Use (A B A B) (LIS (LIST X X) (Use ((A B) (A B)) (LIS (CONS X X) (Use	r input P response r input P response r input P response r input P response P response
---	--

Lists may have any degree of complexity; by giving some lists a certain degree of regularity, they can be used in special ways by using system or user defined functions. Listing 5 shows one type of list I have created for analyzing the semantic structure of dictionary definitions. I have developed special functions to access particular parts of such lists when I wish to perform specific analyses. This list is known as a property list, in this case associated with the atom IF. An atom may have any number of properties, each of which in turn may have values.

# **Predicate Functions**

LISP is a logical language in addition to being a functional, symbolic, and list processing language. LISP has two special atoms, T and NIL, roughly corresponding to 'true' and 'false', respectively. If one were to enter an atom, thus requesting its value, and it had none, the system would respond NIL. If it had a value, that value would be returned. LISP has several functions which ask questions which demand an answer of T or NIL. Among these are ATOM (which asks whether its argument is an atom), EQUAL (which asks whether its two arguments are equal in value), NULL (which asks whether its argument is the null set), MEMBER (which asks whether its first argument, an s-expression, is an element of the second argument, a list), and the logical connectives AND, OR and NOT (which act in the usual way). Several other predicate functions are usually available, and others are easily created. **Defining Functions** 

Each LISP implementation has a special function for defining new functions. In the system which I use, this function is called DEFINEQ. The arguments of this function are the function name, the parameters of the function being defined, and the body of the function which articulates what the function is to do when it is called. The body of a function is much easier to comprehend for anyone with programming experience. Usually, the body of a function will contain a series of s-expressions combined in the form desired. After the function is defined, it can be used by itself or as part of another function. When used, the function always returns a value (which may be just about anything).

One important type of s-expression which is frequently used in functions is the COND function, which makes use of the predicate functions. COND can have any number of arguments, each of which is a conditional expression called a clause. In each clause, the first s-expression is a predicate function; if this function has the value T (for true), then any expressions which follow are executed (or evaluated, to be a purist). The last such expression is returned as the value of COND. LISP examines each clause of a COND in turn, until it finds one whose first expression evaluates to T (actually, to anything that is nonNIL), and then evaluates everything else in the clause. Listing 6 is a function like CONS, except that it will add an item to a list only if it is not already a member of the list. The first clause of the COND asks whether the item is already in the list and, if so, returns the list without the item being added. If the item is not on the list, COND will bypass the first clause, going to the second. Since we have made the first element of the second clause T, we have guaranteed that the consequents of this clause will always be executed if the first clause is not successful. In this case, the item not on the list will be added. The two examples in the listing show what happens to the list L when using this function.

ila	LISTING 6.
	(DEFINEQ UNIQUECONS (LAMBDA (ATM LST) (COND ((MEMBER ATM LST) LST) (T (CONS ATM LST)))))
	(SETQ L (QUOTE (A B))) (A B) (UNIQUECONS (QUOTE D) L) (D A B) (UNIQUECONS (QUOTE A) L) (A B) (UNIQUECONS (QUOTE A) L) (A B) (LISP response (USER input (LISP response) (USER input (LISP response) (USER input) (LISP response)

Conceivably, a function can be written in only one line, but typically several steps are performed. This requires the use of the function PROG which can have an indefinite number of arguments, each of which is an s-expression. Each argument is evaluated in turn and the last such argument is the value of the function. The first argument of PROG is a list of the variables to be used in the remainder of the arguments; when this function is entered, all such variables are initially given the value NIL. When one of the arguments in PROG is a symbolic atom, it is construed as a label which marks a place in the sexpressions to which a transfer can be made. This is done using the GO function. Listing 7 is a function to compute the factorial of the number N. This function also shows another example of how the COND function can be used. In this example, COND has only one clause; as long as the first expression is not T, the second expression (the function RETURN, used to exit and return a value from the PROG function) will not be evaluated.

LISTING 7.

(DEFINEQ FACTORIAL-1 (LAMBDA (N) (PROG (I J) (SETQ I N) (SETQ J 1) (SETQ J 1) LOOP (COND ((EQ I 0)

(RETURN (SETQ J (* J I (SETQ I (SUB I (GO LOOP)))	))
(FACTORIAL-1 6)	;User input
720	;LISP response

The factorial function can also be defined recursively, since LISP is also a recursive language, meaning that essential aspects of the language can be defined in terms of themselves. Thus, an sexpression can be defined as either an atom or as a left parenthesis followed by a sequence of sexpressions separated by blanks and followed by a right parenthesis. To define a function recursively means to use the function as part of the body of the function itself. Such a function written recursively. Note that every use of this function terminates when N equals 0, and returns the number 1, the second expression of the first clause of the COND function.

LISTING 8.

(DEFINEQ FACTORIAL-2
(LAMBDA (N)
(COND ((EQ N 0)
(T (* N (FACTORIAL-2 (SUB N 1)))))
(FACTORIAL-2 6) :User input
(FACTORIAL-2 6) ;User input 720 ;LISP response
)

# Functions with Function Arguments

An important capability in LISP is the ability to use functions as arguments of other functions. For example, in developing a parser for analyzing English sentences, one first defines a series of functions known as an interpreter to handle the analysis. These functions in effect constitute an entire new programming language, defined by the user and then used to write the actual parsing programs. In LISP the ability to create such special programming languages arises from functions which can take function arguments. EVAL and QUOTE are two such functions; APPLY (or APPLY\* in my system) is another such function.

APPLY takes two arguments, a function name and a list; the list contains the arguments necessary for the given function. APPLY then applies the function to the list and returns the value as if the function had been executed directly with its list of arguments. The significance of this function is that it allows "computed" function calls. At first glance, the value of this function may seem obscure, but it provides an ability to write programs which can write programs and then execute them.

One way APPLY can be used is in what called

"mapping functions", with which a function is applied iteratively to a list of arguments. Listing 9 contains a definition of the function MAPCAR, which applies its function argument to the CAR of a list. As can be seen, this function is also written recursively. It builds a list, one element at a time (using the CONS function), starting at the last element. This is done by recursive calls to MAPCAR until its second argument is the empty list (the first clause of the COND function). The function is primed to perform the CONSing operation for each element of the list, but makes sure it has reached the end of the list before it actually begins to form the list which will be the output. The second part of Listing 9 shows an example of this function's use; in this case, the first argument is the function ATOM (which takes a single argument and asks if it is an atom or a list, returning T if it is an atom). The second argument of MAPCAR is the list of elements we wish to test. The value returned by this example is a list showing which elements of the list are atoms and which are not.

LISTING 9.
(DEFINEQ MAPCAR (LAMBDA (FN X) (COND ((EQ X) NIL) (T (CONS (APPLY* FN (CAR X)) (MAPCAR FN (CDR X))))))
(MAPCAR (QUOTE ATOM) (QUOTE (A B (A B) C (D E))));User i nput (T T NIL T NIL) ;LISP r esponse

# Pattern Matching

Using the material described thus far, it is now possible to present an example of a very powerful LISP function. Listing 10 contains a function which will determine if a list contains a pattern of a specified form. Despite its apparent simplicity, it can be used in quite imaginative ways to search for patterns in an input stream. I will describe one such way below after I have explained the function and one example of its use.

LISTING 10.

```
(DEFINEQ MATCH
(LAMBDA (P D)
(COND ((AND (EQ P)
(EQ D))
T)
((OR (EQ P)
(EQ D))
NIL)
((OR (EQ (CAR P) (QUOTE )))
(EQ (CAR P) (CAR D)))
(MATCH (CDR P) (CDR D)))
```

((AND (EQ (ATOMCAR (CAR P)) (QUOTE )))
(MATCH (CDR P) (CDR D)))
(SET (ATOMCDR (CAR P)) (CAR D)) T)
((EQ (CAR P) (QUOTE +))
(COND ((MATCH (CDR P) (CDR D))
T)
(T (MATCH P (CDR D)))))
((EQ (ATOMCAR (CAR P)) (QUOTE +))
(COND ((MATCH (CDR P) (CDR D))
(SET (ATOMCDR (CAR P)) (LIST (CAR D)))
I) a service date and the service of
((MATCH P (CDR D))
(SET (ATOMCDR (CAR P)) (CONS (CAR D) (E
JAL (ATOMCDR (CAR P)))))
T)))))

The arguments of the function, P and D, are both generally assumed to be lists, the first argument defining the pattern we wish to test for and the second argument the input we wish to test. The function consists of one condition, containing several clauses, and returns T if the pattern has been matched and NIL if the pattern has not been matched. The function is written recursively, so that it calls itself many times; the final call returns a value from one of the first two clauses in the condition statement. The expression (EQ P) asks if P is the empty set; if so, its value is T. The test in the first clause asks whether the lists P and D are both empty, i.e., have been exhausted at the same time, thus indicating a successful match, causing T to be returned. If they are not both empty, but one is, the test in the second clause will be T and cause NIL to be returned, since there is not total agreement between the pattern and the input being tested.

There are two tests in the third clause (indicated by the OR), the second of which asks if the first elements of both lists are the same. The fist test asks if the first element of the pattern is the symbol which is a privileged special atom which can match any atom. In other words, if the pattern has a , it does not matter what the input has; it will always yield a successful match. If either of these two conditions is met, the function says OK for the first two elements and asks if the rest of the two lists match (hence the call (MATCH (CDR P) (CDR D)). The fifth clause of the condition involves another privileged symbol +, which allows the pattern to match an arbitrary number of atoms in the input. It does this as follows: If the first element of the pattern is +, another COND statement is posed, in which one of two tests can be successful in order to return an overall value of T. Either the remainders of P and D match or P matches the remainder of D. The second possibility is kind of tricky. Notice that we keep the list P, which we know begins with the special symbol + (since that was the test that got us into this situation); by keeping the same list, when the call (MATCH P (CDR D)) is made, we will end up at this same test on the next pass through the function. In effect, we have ignored the first element of the input in

matching against the pattern. This will be made clearer in the example below.

In the fourth and sixth clauses of the condition, we are again testing for the presence of the special symbols + and , but with a twist. In these cases, we are testing to see if the symbols are actually part of the atoms. For example, we could have the symbol +L as part of the pattern. The function ATOMCAR unpacks the symbol into the list (+L) and returns the + as its CAR. If the test of an atom shows that it has one of these special symbols as its leading character, the remainder of the clause then sets the value of the following atom to the element or elements in the input which matches the special symbols. This allows the unspecified part of the input to be used as the value of a variable, which can be used in any desired manner. The example will demonstrate this.

LISTING 11.

(G0 LOOP)))
)

The example using the matching function is shown in Listing 11, which is a much simplified version of the notorious ELIZA program written by Joseph Weizenbaum in the early 1960s. It is notorious because it simulates conversation between a computer and a human that can be very beguiling. It was so beguiling to Dr. Weizenbaum's secretary that she asked him to leave because she felt she was having an intimate conversation with a psychologist. This incident, stemming from a simple program, set him against many of the initiatives of artificial intelligence. (See his book, *Computer Thought and Human Reason*.)

The program in Listing 11 begins by asking the human to initiate the conversation and sets this input to the variable S. The main condition statement of the function DOCTOR then attempts to match key phrases against the input and then prints output based on the particular match. The second and third clauses of the condition look for instances of the words MOTHER and COMPUTERS, using the privileged symbol + to ignore any of the surrounding input. Not that when MOTHER is found in the input stream, the consequent part of the condition clause sets the atom MOTHER to T, so that if the rest of the conversation becomes repetitive, the response returns to this earlier reference in the fifth clause of the condition. (A value for MOTHER of T will activate the fifth clause.)

The first clause of the condition makes use of the facility to set the value of a variable to part of the input stream. If the input begins with the phrase "I AM WORRIED", one can expect that the following part of the input will begin with the word "about" and then contain the object of the worry. The program is designed to catch this regularity by setting the variable L to the phrase beginning with "about" and using it in responding to the human, thus giving the illusion of intelligence. Finally, the last clause of the condition, having exhausted its repertoire, finishes its conversation. Since any number of clauses may be added to a COND expression, the sample program can be extended to cover a wide range of apparent coversational complexity.

# Extensions

The simplicity with which the pattern matching function was written should give some idea of the power of LISP. With such a function alone, it is possible to write simple programs like DOCTOR to accomplish such things as theorem proving, solving algebra word problems, differentiating complex mathematical functions, accessing a data base with a relatively free form input, developing chess playing programs, and examining data (e.g., astronomical data) for patterns. The power in LISP comes from being able to write ever more complex functions in terms of simpler functions, so that the user is operating on a high level with all the details hidden at a very deep level within the machine. In effect, LISP allows one to create a high level language to handle particular problem domains. A user can operate on the problem domain without being concerned with the details.

My particular interest lies in determining the semantic relationships between the different meanings of words, with the hope of eventually incorporating semantic properties in English language parsers. LISP enables me to conceptualize the problems at a higher level. My first problem is to analyze the regularities of dictionary definitions. To do this, I must develop a parser which will handle the peculiarities of dictionary definitions. I can build such a parser by identifying patterns at the lowest level, such as nouns, adjectives, and verbs. By ascertaining the existence of patterns of particular parts of speech, I can build more and more complex parsers which will look for particular types of noun or verb phrases. With a pattern matcher, I can first determine if a particular definition fits an existing pattern, and, if not, hypothesize a new pattern, which I can easily add to the set of patterns for which I test.

When I wish to add a pattern to an existing parser, I have to built program statements which can be inserted into an existing program. Here again, LISP comes with a ready-made capability. A program is nothing more than a list, so to alter the program it is only necessary to alter the list. This is simplified in LISP since a program can be treated as a list. In fact, to print the functions accompanying this article, their definitions were given as arguments to another function which printed them out in a pretty form, so that the plethora of parentheses would not be confusing. (This is know as prettyprinting.)

It is therefore possible in LISP to create a program based on another program. I can use a pattern matching program to look for particular patterns. Using the COND expression, I can then build a list which consists of program-like words. Using the EVAL function, such a list can be transformed into a program and executed. This is the power of LISP. □

# EXPLORE A NEW DIMENSION IN SOFTWARE

When you reach the stage where you need more sophisticated software to help you with business and other applications, explore the programming power and flexibility available to you with systems software from OSS.

# BASIC A+ Will Rate an A+

BASIC A + is what you'd expect from the authors of Atari BASIC! It's the only logical upgrade available to the Atari BASIC programmer, and it adds statements and features that enhance the Atari's real power, flexibility and ease of use. While retaining all the features which make Atari BASIC so easy to use, BASIC A + also offers features that place it at the forefront of modern interpretive languages.

BASIC A + is designed to support any business programmer or Atari user. Its enhancements include structured programming, more powerful input/output, helpful program development and debugging aids, and several business-oriented features, including a very comprehensive PRINT USING command. And, exclusively for the Atari computer, there is an amazing array of PLAYER/MISSILE GRAPHICS commands and functions.

No other BASIC for Atari can match BASIC A+ when it comes to features, compatibility, and ease of use ... \$80.00

#### A Strong Software Family

Other major systems software products from OSS include:

MAC/65	the finest and fastest complete 6502 macro assembler/editor package you can buy\$80.00
C/65	the first native mode "small c" compiler for Atari and Apple computers\$80.00
TINY C	for structured programming, an easy-to-use inter- preter, a learning tool\$99.95
BUG/65	a powerful, self-relocatable debugger. FREE with MAC/65\$34.95

#### And More ...

OS/A+, the first and finest operating system for BOTH Atari and Apple II computers, is NOW included FREE as a part of every OSS systems software package. OS/A+ features a keyboard-driven, easy-to-use command processor, several simple resident commands, and logical and readable requests for even the most sophisticated utility commands. Versions of OS/A+ for some higher capacity drives are available at extra cost.

NOTE: Unless otherwise noted, all OSS products require 48K and at least one disk drive.

ASK YOUR DEALER, or call or write for our brochure.

ATARI, APPLE II, and TINY C are trademarks of Atari, Inc., Apple Computer, Inc., and Tiny C Associates, respectively. MAC/65, C/65, BASIC A+, BUG/65, and OS/A+ are trademarks of Optimized Systems Software, Inc.

# Using the PERCOM Drive with Double-Sided Disks

# by Kevin Lever

I recently purchased a Percom Disk Drive as a first disk drive for my ATARI 800. I was quite impressed with the double density storage capacity when, in transferring my cassette-based BASIC games to disk, I found I was able to put all of the games on one disk! So, of course, I went out and bought a disk-based adventure game to find out what random-access files were all about. Here I found my first major obstacle: The adventure game consisted of three double-sided disks, six sides in all, but the disk drive is single sided. No problem on the 810 drive, true, but with Percom it's another story.

It seems that the 810 by ATARI uses a timing sector, recorded at format time, to let the drive know where the disk is. However, most other systems use the little hole in the lower-right side of the disk, together with a properly oriented LED and sensor in the drive itself, to keep the system informed of disk position. Such is the case with the Percom disk drive. So, when a program is recorded on both sides of a disk, the ATARI 810 drive cares nothing of the timing hole in the disk. It has no trouble locating side-two data. But now consider the Percom unit: It always expects to find the timing hole in the lower right corner when the disk is inserted into the drive. Now, if we flip the disk over to read side two, the timing hole will be on the lower left. The LED and sensor in the disk drive sees only cardboard on the lower right, and can't read the disk!

An industry-standard drive equipped to read either side of a disk should have **two** sensors, one positioned to read the timing hole at the lower right, and the other located at the lower left. The user flips a toggle switch on the front panel to inform the drive which side of the disk it will be reading. The Percom single-sided drive is not so equipped. So what do we do with commercial software recorded on both sides of a diskette? We make an extra hole in the disk jacket! Now, either way the disk is inserted, the sensor will be able to locate **one** of the timing holes.

The procedure is very simple, but care must be exercised to avoid damaging the diskette or getting fingerprints on the magnetic surface. If this happens, you might as well throw that disk away. (Not so fast. See Charles Bachand's "Burp" program in Issue No. 9.) However, if you are careful and methodical, you should have no problems. As a precautionary step, first wash your hands and then find a clean, uncluttered work surface. The first step is to obtain a "crashed" diskette, either from your own misadventures or from your local computer store. Odds are, if the store demonstrates programs for its customers, they will have a few disks in the wastebasket. You are going to make a template. Take the "crashed" disk and carefully slit open one edge of the disk jacket with a sharp knife. Remove the disk itself and throw it away. Save the jacket, and put a label on it reading "TEMPLATE" and add it to your library.

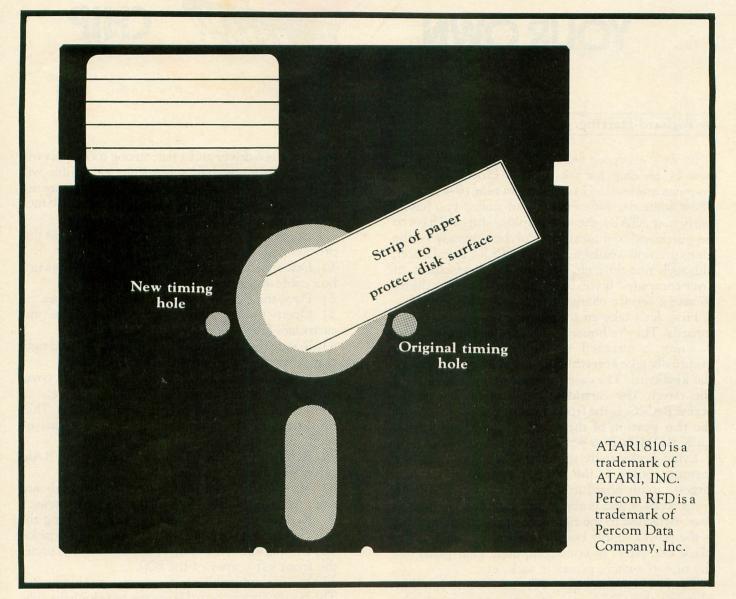

Now it's fairly easy to modify your disks for use on the Percom drive. Retire to your handy work area with the template, the disk you're going to modify, a pencil, a hole punch, and a strip of paper. Refer to the diagram as your proceed. Place the disk to be modified, flat on the table, label side up. The timing hole should be on the lower right. Now place the template over the disk, but with the timing hole on the lower left. Carefully match up the edges accuracy is important — and mark the perimeter of the timing hole onto the disk jacket of the subject disk. Press very gently with the pencil. Now flip over the subject disk and repeat the procedure to make a mark on the lower right, directly behind the mark on the other side. This is where you will punch the new hole.

The idea is to punch a hole through the disk jacket, but not through the disk itself. That is the only tricky part, and you might try it once on a disk you don't care too much about. You are going to have a insert one part of the hand punch between the disk jacket and the disk itself, once on each side. I recommend slipping a strip of paper inside the disk jacket to protect the disk surface. Again, refer to the diagram. (You might also make sure your punch isn't magnetized!) If you damage the disk surface or warp the disk, it will be ruined, so don't blame me if you fail to heed this warning. Now slip the punch inside the disk jacket and punch a hole where you made the mark. Again, punch the jacket only. Repeat the procedure on the other side. You can now read both sides of the disk!

The procedure I have described will enable you to use commercial software which is recorded on two sides of a disk. It will also enable you to use both sides of your own disks. It will almost definitely void the warranty on your commercial software, so check with the retailer and be advised. When writing to both sides of your own disks, remember that side two was not certified, so you're on your own. I have had no problems at all.

I guess there is some advantage to owning an 810

drive. But for me, the capacity to use double density far outweighs the few minutes it takes to do the modification. Good luck!

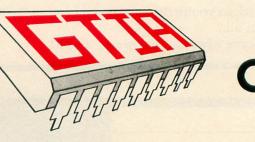

# **ATTENTION PROGRAMMERS!**

A.N.A.L.O.G. Computing is interested in programs, articles, and software review submissions dealing with the ATARI 400 and 800 home computers. If you feel that you can write as well as you can program, then submit those articles and reviews that have been floating around in your head, awaiting publication. This is your opportunity to share your knowledge with the growing family of ATARI computer owners. A.N.A.L.O.G.'s rate of pay is comparable to many other computer magazines. All submissions for publication must be typed, upper and lower case with double spacing. Program listings should be provided in printed form, and on cassette or disk. By submitting articles to A.N.A.L.O.G. Computing, authors acknowledge that such materials, upon acceptance for publication, become the exclusive property of A.N.A.L.O.G. If not accepted for publication, the articles and/or programs will remain the property of the author. If submissions are to be returned, please supply a self-addressed, stamped envelope. All submissions of any kind must be accompanied by the author's full address and telephone number. Send programs to: Editor, A.N.A.L.O.G. Computing, P.O. Box 23, Worcester, MA 01603.

**ISSUE 10** 

# INSTALLING YOUR OWN

by Richard Herring

By now everyone has heard of the glories of the new GTIA chip for the ATARI. Providing twelve graphics modes (0-11) rather than nine (0-8), it will allow some dramatic effects. But unless you have a fairly new ATARI, the new graphics chip will have to be purchased and installed. Purchase is easy — the chips are now available for \$25 to \$30. Installation, although not difficult, will require disassembly of your computer. If you have the nerve (and the desire to save a service charge) here's how to do it.

First, let's take an imaginary tour of your 800's innards. They're housed in a two-piece plastic case. Nothing is attached to the case bottom. We'll eventually take everything out of the case top except the keyboard. The case top has a removable ribbed top cover. The cartridge door, which you use to access BASIC, is the front third of this cover. Under the rear portion of the cover is the memory bank (10K ROM & 8 to 48K RAM).

Lying horizontally under the keyboard and the memory board is the mother board. This is the largest circuit board in the computer. It runs from front to back and is about half as wide as the 800's case. Attached to the right side of the mother board is the power supply board, one side of which is the black side panel of your computer. That panel has the on/off switch, power in jack, etc.

The last board in your 800, and the one you'll be plugging the GTIA into in a few minutes, is the personality board. It plugs vertically into the mother board and stands behind the memory board. Among the several chips it holds are three 40 pin chips which appear quite similar. They are the 6502 CPU, in socket A303; Antic, in A302; and CTIA, in A301.

Before you start doing anything inside your computer, make sure you have a good working environment. You need a clean work area at least 5 to 6 times the size of your 800. You should avoid static charges by working in an uncarpeted area, not wearing clothes that create static, not walking around during the installation process and grounding yourself before you begin.

You should read through these steps completely before you begin. Do not handle the pins of chips or the connectors of boards unnecessarily since the oil on your skin does not help make good connections. The only tools you will need are a medium size Phillips screwdriver and a flat, strong tool to pry out the chip — a standard screwdriver or nailfile will work. Make sure that any metal tools you use are not magnetized. You will remove a total of eight 5/8 inch and twelve 3/8 inch Phillips screws.

Last, before you do anything remember that this process will void your warranty.

1) Disconnect the power supply cable, TV switch box cable and peripheral cable.

2) Place the 800 in your cleared working area.

3) Open the cartridge door and remove any cartridges (BASIC, etc.).

4) Rotate the two black clamps, at the left and right rear corners of the cartridge slots, outward.

5) Lift the front edge of the ribbed top cover slightly and slide it toward you. Place it aside.

6) Turn the black clamps in as far as possible. They must be in this position when the circuit boards are removed from the 800 case top.

7) Remove the 10K ROM cartridge and all RAM cartridges. Place them aside.

8) Turn the 800 over and, supporting the keyboard side, remove the five (5/8 inch) recessed screws.

9) Remove the plastic case bottom by lifting the rear first so that the front will clear the joystick jacks.10) Unplug and remove the speaker which lies under the front left corner of the 800.

11) You see a metal bottom over the mother board. The power supply board is uncovered along the side. Remove the (5/8 inch) screw from the power supply board. The screw lies approximately under the START key.

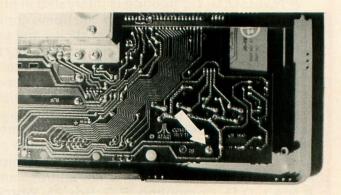

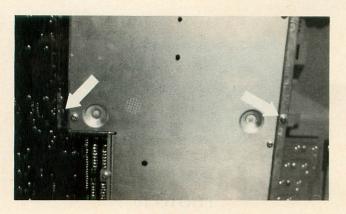

PHOTO 1

12)Remove two (5/8 inch) screws from the outer lip of the metal case — one on the left, one on the right. Do not remove the nine screws which hold the metal bottom yet.

# **РНОТО 2**

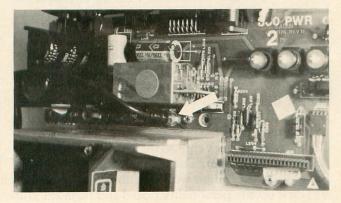

13) The 800 should still be upside down. Move it so the keyboard is facing you and 12 inches in from the edge of your table. Slowly lift the metal case (covering the mother board and attached to the power supply board on the left) and flip it over toward you. NOTE the six inch ribbon cable which attaches the mother board to the case top roughly between the second and third joystick controller jacks. Do not bend it. It is stuck in place with padded tape which can pull loose.

14) If the mother board and its metal case will not come out check the 2 black clamps which held the ribbed top cover over the memory bank.

15) Set the metal case down on its bottom cover.

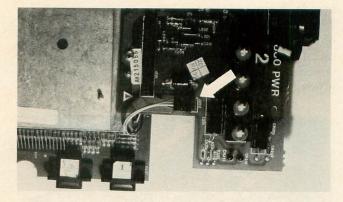

16) Unplug the ribbon cable from the mother board. 17) Place the 800's case top (with the keyboard and ribbon cable) aside.

18) Follow the cable from the TV switch box to the point where it plugs (RCA) into the power supply board. Unplug it from socket J203.

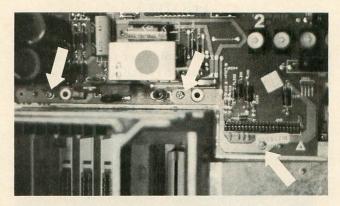

**РНОТО 3** 

19) Unplug the rust colored connector (at J202 on the power supply board) near the fourth joystick jack.

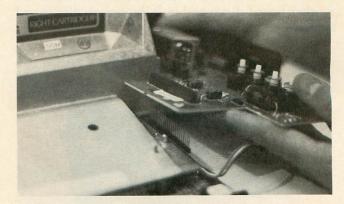

**PHOTO 4** 

20) Supporting the power supply board, remove three (3/8 inch) screws which attach it to the metal case.

**РНОТО 5** 

21) NOTE the power supply board is still attached to the mother board by a 22 pin connector at socket J201. Find this connection near the fourth joystick jack. Gently and evenly lift the power supply board being careful not to bend any of the pins. Pressure will be needed only at the 22 pin connector.

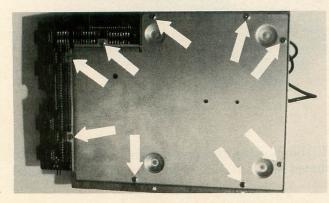

**PHOTO 6** 

22) Place the power supply board aside.23) Turn the metal case (covering the mother board)

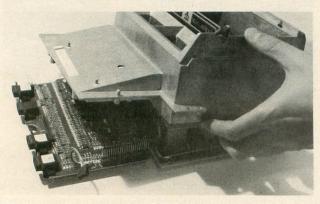

# upside down.

24) Supporting the side with the joystick jacks, remove the nine (3/8 inch) screws from the sheet metal bottom of the metal case. The mother board is attached to the metal bottom. The metal case top is now disconnected.

# **РНОТО 7**

25) Holding the metal case top securely to the mother board, turn the unit over (right side up).26) Lift the metal case top STRAIGHT UP and place it aside.

# **PHOTO 8**

27) The personality board is now accessible standing behind the memory board. Carefully, hold the mother board down and pull the personality board straight up and out of its socket.

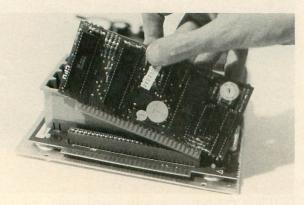

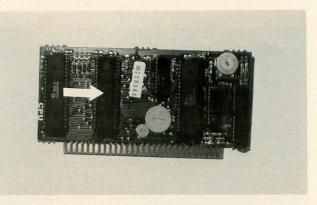

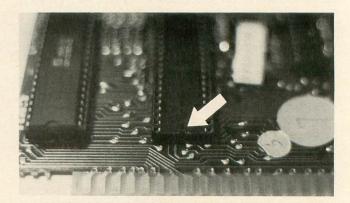

PHOTO 9

28) Lay the personality board flat with the chips up. Locate the CTIA chip in socket A301. It is the middle of the three large chips.

# **РНОТО 10**

29) Carefully remove the CTIA chip. You can pry it from the ends with a strong flat tool — a standard screwdriver or nailfile will work. Alternate prying each and only a little so the chip comes straight out. 30) Note that the lower end of socket A301 (toward the personality board's gold connectors) has a round notch. This notch MUST align with a similar round notch in the end of the GTIA chip when it is installed.

# **РНОТО 11**

31) Set the new chip in its socket. The two rows of pins may be flared too wide. If so, place the chip on its side on a hard surface. Carefully rotate it down against the pin ends to bend them closer together. Seen from the end, the pins should be perpendicular to the body of the chip.

32) Align the GTIA chip so that all pins are correctly placed in the socket. The round notch in the end of the chip MUST align with the notch in the socket. 33) Pick up the personality board and push the chip straight in. You may need a soft clean cloth to put against the bottom of the board to protect it (and your fingers). When the chip is all the way in (it may snap into place!) it MUST be seated as close to its socket as the other chips are to theirs. Compare to make sure the GTIA is fully seated. 34) Plug the personality board back into the mother board. The chips face the rear of the computer (away from the memory bank). You may need to rock it slightly from end to end to make sure it is in all the way.

# (SEE PHOTO 9)

35)Place the metal case top back over the personality board and on the mother board.

# (SEE PHOTO 8)

36) Holding the mother board and its metal case top securely together, turn them upside down.37) Supporting the side with the joystick jacks, reinstall the nine (3/8 inch) screws.

# (SEE PHOTO 7)

38) Turn the mother board over (right side up). 39) Reposition the power supply board. Note the two alignment pins on the lip of the metal cover. Making sure all pins on the 22 pin connector at socket J201 are aligned, push it gently, evenly back together.

# (SEE PHOTO 6)

40)Reinstall three (3/8 inch) screws which hold the power supply board to the lip of the metal case. There are two holes toward the back of the board. Do not put a screw in the rear hole.

# (SEE PHOTO 5)

41)Replug the RCA plug (from the TV switch box cable) to the power supply board at socket J203.

# (SEE PHOTO 3)

42) Replug the rust colored connector at socket J202 (near the fourth joystick jack). The red wire goes toward the joystick jack, the orange wire toward the rear of the 800.

# (SEE PHOTO 4)

43) Position the mother board right-side up, with the joystick jacks away from you. Position the plastic computer case top upside down, with the keyboard side near the joystick jacks.

44) Making sure all pins are aligned, replug the ribbon cable.

45) Make sure the two black clamps which hold the ribbed top cover are turned in as far as possible (locked position).

46) Turn the mother board assembly over into the plastic case top. Be careful not to damage the ribbon cable and to align the contact switches in the four yellow keys (START to RESET).

47) Reinstall the (5/8 inch) screw which holds the power supply board to the top of the 800's case just

below the START switch.

# (SEE PHOTO 1)

48) Reinstall two (5/8 inch) screws which hold the lip of the metal case to the 800's plastic case top. These screws go on the right and left side holes nearest the center. The rear holes are for the screws in the plastic case bottom.

# (SEE PHOTO 2)

49) Replace the speaker in its hole and plug it in. The number on the plug goes toward the 800's bottom. 50) Replace the plastic case bottom. Align the front first so the joystick jacks fit in their slots. Watch, as you lower the rear of the case bottom, that the speaker remains positioned properly. When the case bottom is in position, check that the TV switch box wires goes through the hole in the rear of the case. 51) Supporting the front (keyboard) side, replace five (5/8 inch) screws into the plastic case bottom. 52) Turn your 800 right-side up and reinsert the 10K ROM cartridge and 8K or 16K RAM cartridges. (If your boards do not have covers, be sure the chips face the rear of the computer.)

53) Turn the black clamps out and replace the ribbed top cover. Turn the clamps in to lock the cover in place.

54) Reinstall BASIC (or other cartridge) and close the cartridge door.

55)Reconnect the cable to the TV switch box, the power cable and the peripheral cable.

You are now ready to try graphics modes 9, 10 and 11. If you have any trouble, check first that all external connections are good, that the channel 2-3 switch is correctly set and that your television is properly tuned. If you still have problems, check that ROM and RAM cartridges are properly seated. If all else fails, walk through the installation process again to make sure that all internal connections are good and that the GTIA chip is properly seated.

Although the GTIA is downward compatible (all software designed for the CTIA will still run) you may have a few nice surprises. Check the new gold color of the mazes in Jawbreaker or Mouskattack for examples.  $\Box$ 

If you are unable to obtain a GTIA chip from your local dealer or repair shop, you may order them directly from A.N.A.L.O.G. at \$25.00 each. To order send check or money order to:

> GTIA P.O. Box 23 Worcester, MA 01603

SCOTT ADAMS' ADVENTURES 1-12 Adventure International A Division of Scott Adams, Inc. Box 3435 Longwood, FL 32750 24K Tape \$19.95

1.1.0

# by Brad Griffin

X

The twelve original Scott Adams' Adventures are a collection of superb and entertaining text adventures. The style of writing is the same throughout, filled with clever puns and exceptional puzzles. With the change in scenarios, each adventure maintains its uniqueness, much like a collection of Jack London stories. Though the difficulty varies, the quality is always high. If one enjoys any of the adventures, the others will not be a disappointment. Each of the twelve adventures will be briefly reviewed.

# **#1 ADVENTURELAND**

A journey through a strange land filled with dangers, ranging from a fire-breathing dragon to deadly chiggers. Deadly chiggers? There is a way to avoid the peril of infection from their bites, but can you find it in time? Clues abound in this adventure that challenges you to find thirteen \*TREASURES\* and store them in the correct location. Considered a moderate level adventure in difficulty, fitting the pieces of this puzzle together will not be accomplished overnight. The game-save feature (as with the other eleven) comes in handy when you are just about to try a potentially dangerous move. After several hours of trial and error, you begin to think like Scott Adams, — perversely. You find your way into an elaborate maze and, without too much difficulty, discover the treasures that it hides. You seem to be catching on to this game fairly easily. Then, (uh-oh), you cannot get out of the maze! You should have saved the game before you entered it. No wonder it seemed so easy; it was a trap. You will be much more careful the next time. Come on ADVENTURELAND, this time the challenge will be met.

# **#2 PIRATE ADVENTURE**

The easiest of the twelve adventures, this is an ideal introduction to the text adventure. The liberal use of hints enables the first time adventurer to proceed without too much frustration. By the end, you are ready for greater challenges. If you are stoic, or masochistic, the hints need not be requested. Starting in a London flat, a magic excursion takes you to far away places in search of Long John Silver's treasures. There are no mazes, but danger exists just ahead. Alligators, deadly mamba snakes, a mongoose, and a parrot are but a few of the obstacles

that block your way. "Aye matey. Ye must use your 'ead if me treasures Ye 'opes to find. Yo-Ho-Ho and a bot'le of..."

# **#3 MISSION IMPOSSIBLE**

"Good morning Mr. Phelps. Your mission (should you decide to accept it) is to prevent this automated nuclear reactor from being destroyed by a saboteur's TIME BOMB!" Attention all honorary IMF members. This adventure is for you. There are no tricks involved here; no magic either. Just a clear head and a keen eye are required to solve this one. Everything you need is in a manila envelope. Or is it? A strong heart is mandatory as the tension mounts. With each move, the reactor comes one step closer to oblivion. Unlike many of the other adventures, the solution here is arrived at using logic and common sense. Sounds simple, huh? Click... Did you just push the wrong button?

# **#4 VOODOO CASTLE**

Written by Alexis Adams, this adventure is eerily authentic. Count Cristo has been cursed. You must remove the curse and foil the worshippers of the dead. West African artifacts and modern-day laboratory chemicals paradoxically weave their magic in your attempt to reverse the spell. No mazes here, but magic is everywhere to help and to hinder your undertaking. A medium named Maegen may be helpful. Maegen? Maegen Adams? Written by Alexis Adams? For Scott Adams? Is this the Adams Family? No, it couldn't be. That was Addams. Walking through this castle with its dusty corners, mysteriously slamming windows, and animal heads makes you wonder if it is not more than a coincidence. Be careful, doors may close behind you and you will have a devilish time getting free. "Double, bubble...Toil and Trouble..."

# **#5 THE COUNT**

You awaken in a strange bed. There is a heaviness in the air. Exploring the adjacent rooms, you find a watch (keep close track of the time), a clove of garlic (Huh?), Nodoz pills, ... what is all this? A coat of arms...a closer look...it is the family crest of Dracula! A surly mob outside makes you soon realize that you must destroy the evil Count Dracula. Where is he? Further searching reveals a bathroom... go ahead (tsk,tsk). Talk about your realism (excuse me for a minute). Yawn. Tired? Take a nap; you will feel much better. Hmmmm. Didn't sleep that well? You sure look pale, and what are those marks on your neck, as if I didn't know. Time is of the essence (so is the garlic). Find the vampire and destroy him, but you do not have all day...or night. Better play this adventure during the daylight hours, if you are the nervous type. You cannot afford to bat an eye, or is that supposed to be "eye a bat?"

# **#6 STRANGE ODYSSEY**

This outer space adventure places you at the outer

edge of the galaxy. Your goal is to gather a fantastic collection of treasures and return to Earth. SF nuts will thoroughly enjoy the challenge. Just getting out of the space ship is quite an undertaking, and that is only the beginning of an exciting expedition; an expedition that takes you through a Jovian mining colony to an intergalactic zoo with bizarre inhabitants. The hazards of a methane snow storm may not deter you, but do not get too close to the centurion slime trees. Persistence is rewarded in this adventure. Clever solutions again, but with the proper mindset, you will solve this puzzle in just a few hours. However, hours at the edge of the galaxy may really be days here on Earth. Blast off!!

# **#7 MYSTERY FUN HOUSE**

The idea of being trapped in a fun house is usually not terrifying, but it is here. First, you have to get in, and you have no money. Do not give up; you will find some. This adventure does not match the others in excitement or challenge. Mazes, the time factor, and buttons to be pushed are much the same. If this were one's first encounter with these adventures, it might be interesting. It offers the typical dilemmas expected, and the solutions are predictable. The best reason to play MYSTERY FUN HOUSE is to complete the set. Even Jack London slipped once in a while.

# **#8 PYRAMID OF DOOM**

Lost in the desert, you see a pyramid. Entry is forbidden, and a curse will fall upon you if you defile the ancient resting place of the pharoahs. A collection of \*TREASURES\* await you within the stone edifice. Discovering the location of all of them is quite difficult. The obstacles preventing you from reaching your final goal are formidable. Several hours (to days) will be necessary to find them all. While you are away from the adventure physically, your mind will constantly return, trying to figure out how to get past the Giant Oyster, or how to dispose of the dreaded Purple Worm. PYRAMID OF DOOM is one of the best text adventures written. The combination of easily-found treasures and seemingly impossible clues to others gives it a mixture that keeps the adventurer coming back until it is finished. Some magic is involved, but no mazes here. It must be magic if one dies of dengue fever without being bitten by the mosquito, Aedes aegypti, which transmits this viral disease. Well, other than that, it is very realistic and entertaining.

# **#9 GHOST TOWN**

The search for thirteen treasures in a deserted ghost town is going to be a long one. The most clever of all the Scott Adams' Adventures, GHOST TOWN requires all of your brain power to solve. One may go for days without progress (it often helps to put it away for a time, in order to let new thoughts ferment). How long has it been since you used Morse Code? Do you have an old Boy Scout Handbook close by? Finally, you can get that (expletive deleted) Purple Worm. Remember the way to make gunpowder (a noble gesture)? A special bonus scoring system is offered as a part of this adventure, but it is really of little consequence to the true adventurer. Completion of this adventure is satisfying enough. "Smile when ya' say that, pardn'r."

# #10 & 11 SAVAGE ISLAND - PART I & II

A challenge for the expert adventurer, this twopart adventure offers everything you could hope to find in this or any other world. This surrealistic journey begins on a small island and takes you to undreamed-of places in search of a secret. You must survive Hurricane Alexis, volcanoes, a Tyrannosaurus, and many, many more dangers, just to discover the password enabling you to play PART II. You must be ready for anything as your journey continues. If you are not ready for anything as your journey continues. If you are not ready, your soul will never rest easy. Mazes, dangers, and puns are all here in a mammoth adventure that will not be finished without investing a great deal of time. It is well worthwhile. Where else can you be a part of psychotransfiguration?

# **#12 GOLDEN VOYAGE**

The final adventure in the series has you searching for the secret to make an aging king young. You only have three days to accomplish your mission, and you must learn how to sail a ship to the correct location. Though a bit of a letdown after SAVAGE ISLAND, all the elements of a good adventure are present. If you have completed the other eleven adventures, this one is not too difficult. A word of warning: keep your eye on the Cyclops. He has his on you! □

# by Tom Hudson

When looking over the reader survey cards sent in from A.N.A.L.O.G. #9, one quickly notices a common request: more assembly-language game programs. In an effort to satisfy those avid videogamers out there, I have written "Fill 'Er Up," a public-domain assembly-language game.

# **PROGRAM LISTINGS**

This article contains two program listings. Listing #1 is a BASIC program which, when run, will build the machine-language game in memory and execute it. Listing #2 is the assembly-language source code for "Fill 'Er Up!," for those who are interested in assembly-language programming.

To play the game, type listing #1 into your computer. I realize that those DATA statements aren't fun to type in, but they are a necessary evil. This game differs from previous **A.N.A.L.O.G.** games in that this data is listed in hexadecimal (base 16). If I had listed it in decimal, "Fill 'Er Up!" would

have required 24K memory on cassette. If you want to play the game, you have to pay the piper...

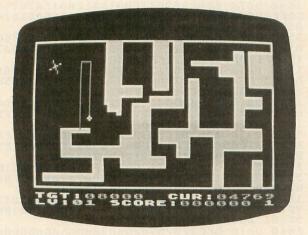

After typing the BASIC program into your computer, SAVE it. When the program is RUN, it will transfer control to the "Fill 'Er Up!" machine code, which will wipe out the BASIC program. If this happens, you'll have to re-type the BASIC program. The program will warn you before it blows itself away.

After SAVEing the BASIC program, RUN it. The program will READ the data and check it to make sure it was typed in correctly. Two types of error messages may be displayed. A BAD DATA error means that the line indicated was mistyped. A MISSING LINE message indicates that you left a line out completely. It takes roughly 2 minutes for the program to check the DATA.

If the program is typed in correctly, it will warn you to SAVE it before it starts the game. Type "YES" to this message to continue.

# GAME DESCRIPTION

You have been assigned to build a series of water reservoirs in uncharted territory. Unfortunately, an electrified starfish (don't boggle; read on) is patrolling the area. Using your joystick, you must maneuver yourself around on the screen, building walls to hold the water, while avoiding the starfish.

You start out on the white border surrounding the planned reservoir area. You may move around on these white walls by moving your joystick in the desired direction. You can build a reservoir wall by moving into the black "uncharted" area while pressing your joystick button. The walls you make can be any length, and must be terminated at a white wall. When you finish a wall by hitting a white wall, the area you have enclosed will fill with water. Do NOT run into the wall you are building or you will be destroyed. If the starfish hits you or any part of the wall you are building before you complete it, you will be destroyed. On levels 1,2,4,7,12 and 13 you wil be safe from attack when standing on a white wall, but on other levels the starfish can destroy you on contact at any time!

At the bottom of the screen are several information displays. "TGT" indicates the TARGET area you must fill with water before you complete the level. "CUR" indicates the CURRENT area you have filled. Once CUR reaches TGT, you have completed the level and are awarded points. SCORE indicates the number of points you have gained. At the end of each level, the computer will give you 2 points for each unit over the target you have filled. If the TARGET amount is 8000 and you fill 9000 units, you receive 2000 points. "Fill 'Er Up' may be paused at any time by pressing the space bar.

This game contains 16 levels of difficulty. The level number is shown in the lower left corner of the screen.

You have 3 lives, shown in the lower right corner of the screen. Good luck!  $\Box$

# WORD SQUARE

### 16K cassette or disk

### by Sol Guber

The computer can be used as a very good teaching tool. The uses for teaching of mathematics are endless, from simple addition to calculus. Concepts are easily represented through the arithmetic algorithms that are common to computer-assisted instruction (CAI). The teaching of other subjects like geography and history can lend themselves to CAI, either through quizzes or games with the computer either scoring or asking a series of predetermined questions and monitoring the answers. The use of CAI in teaching English and spelling is weak since these subjects lend themselves to repetitive drilling of the concepts. The following is a game that can be used to teach spelling.

The game is called MAGIC SQUARE, and the concept comes from a book called Puzzelment by Kohl. The computer makes a square of letters in a random order. The player moves a joystick over the square and forms the letters into words. The letters have to be one of the letters around the previous letter. There is a two-minute time limit, and the only skills needed are in moving the joystick; no typing is needed. There are two levels of difficulty, a six-bysix square containing 11 extra vowels and the standard five-by-five square containing all the letters except Q. The game is non-scoring, in that there is no internal scoring of the game for the number of words or the number of letters used, so that any rules can be made up. The computer also does not check to see if the letters make up a real word.

The following is a quick description of the game. A question is asked if extra vowels are wanted. If a "Y" is pressed, then a six-by-six square is formed. The square is made up in the left corner of the screen. Every time the joystick is moved, it highlights a letter. If the trigger is pressed, the letter is put on the screen below the square. When the word is completed, then the Start button is pushed. When the trigger is pressed for the next letter, another part of the screen shows the next word. The system is set up for a maximum of eight letters in a word. In the upper right corner is a real-time clock that is set for two minutes of time. After the two minutes are up, hitting another key will start the system with a new word square and another two minutes.

The following is a line by line description of the program. Line 10 dimensions the various variables that will be needed. Line 15 puts the subroutine lines into variables. Line 20 determines if extra vowels are desired. Line 30 determines if FLG is set to 1 or 0. In

Line 20, a logical IF is performed, and the question X\$(1,1)="Y" (1) or does not equal "Y" (0) is answered. This answer is placed into the variable FLG. Line 40 puts the alphabet into A\$ and the extra vowels into B\$ and determines the values for the size of the square. Line 50 determines if FLG has been set and extra vowels are wanted.

The Line 55 goes into Graphics 2 without a text window and changes the color registers from the default to other colors. Line 60 starts a FOR-NEXT loop that puts the square on the screen. Lines 70-80 determine the position of the next letter. Line 90 determines a random number between 1 and the number of letters still needed. Line 100 puts the letter on the screen in the proper position. Lines 105 and 110 shorten the variable A\$ so that fewer letters are needed for the next choice. By decreasing both the size of the variable I and moving the unused letters internal to the variable A\$, there is no need to check if the letters have been used yet. This also increases the randomization of the square.

Line 125 goes to a subroutine that puts the possible values of the joystick into a look-up table for quicker translation from numbers to direction. This eliminates many IF tests. Line 130 puts 0 into the two low bits of the real time internal clock in the ATARI. Locations 18, 19, 20 are the real time clock. The value of 20 is changed every 1/60 of a second. When the value reaches 255 in location 20, then the next number is 0 and location 19 is updated by one. When location 19 is 255, the next update is to 0 and location 18 is updated by one. Thus, location 20 is accurate to 1/60 of a second, location 19 is accurate to about 4 seconds, and location 18 is accurate to about 17 seconds. Every 77 hours, the clock starts itself again. Line 140 starts printing the clock on the screen.

Lines 150 and 160 initialize several variables. Line 170 determines the address of the screen memory. Line 175 determines the address in ROM of the position of the joystick, and lines 178 and 190 change the color of that letter. Line 210 determines if the trigger has been pressed, and if it has, then it goes to subroutine line. Lines 212 and 214 determine if the START button has been pressed and if it is the first or the second time in the line. Line 218 is a delay to make the joystick less responsive to movement. Line 220 determines the position of the joystick. If it is 15, it is in the neutral position, then GOSUB clock and go check the trigger again. If it is not in neutral, then change the color of the letter in line 228, add the appropriate value of the X and Y direction in line 230. Check the movement to see if it is not off the square in lines 240 and 250. If it is, then do not make the movement. Go change the clock in line 300 and then go to change the color of the letter and check the trigger again.

Lines 1000-1090 are the standard subroutine to make a look-up table for the joystick. The various numbers returned by the joystick controller are translated into an X and Y direction which corresponds to the way the joystick is oriented. This greatly speeds up the use of the joystick.

Lines 2000-2060 are subroutine clock. Line 2000 determines how many 1/60's of a second have elapsed since the clock was turned on. Line 2010 determines the minutes, and lines 2020-2030 determine the seconds. Lines 2045 and 2050 print the minutes and seconds that have elapsed. If the number of seconds is less than ten, then a blank is printed after the colon mark. Line 2055 determines if 2 minutes have elapsed, and if they have, then the program goes to line 4000 where it is stopped.

Lines 3000-3070 are subroutine LINE. Line 3000 determines the letter under the joystick. Line 3005 determines if the position is the same as the last time the trigger has been pressed. If it is, then the program is returned. The program is fast and it is hard to press the trigger for a short enough interval to signal the system and not long enough to signal the system twice. As a compromise, no letter is allowed to be used as a double letter, and, to have a letter be printed on the screen, it must not be the same as the last letter. In other words, the position of the joystick must have been changed. Line 3007 updates the position. Line 3010 determines the color of the letter. Line 3020 determines the spot to put the letter and lines 3030-3040 put the letter on the screen and updates the position. Lines 3050-3060 make a random sound, and the subroutine returns to the program.

Lines 4000-4040 put a message in the right hand corner that the game is over. Lines 4042 make a sound to signify the same thing if the person was not paying attention. Line 4050 determines if a key has been pressed to start the next game. If it has, then the system goes to line 20, and a new game is started.  $\Box$

# **BEGINNER'S PILOT**

### by Thomas M. Krischan

Recently I attended a convention which introduced computers to the novice user. The most popular demonstration there was a simple graphics program written in ATARI Pilot. The program would ask the user to type in the answer to four questions about a pattern to be drawn. The computer would then sketch the pattern on the screen, play a little tune and repeat the questions for the next user. At times fifteen to twenty people would gather around the machine to try their hand at this computerized spirograph. The number of viewers grew even larger when I began to explain how the Pilot language worked. The language consists of only a handful of commands and special characters. Figure 1 lists the most fundamental of these.

T:	TYPE
A:	ACCEPT
M:	MATCH
JM:	JUMP ON MATCH
U:	USE
J:	JUMP
E:	END
GR	GRAPHICS
SO:	SOUND
PA:	PAUSE
*	LABEL
#	NUMERIC VARIABLE

The commands of ATARI Pilot consist of one to two key letters followed by a full colon or a special character (eg. #). Each command is directly followed by a subcommand. The subcommand may be an instruction, label, numeric variable, character string or some other statement depending upon the nature of the original command. We will describe the nature of each of the commands that are listed in Figure 1.

The TYPE command (T:) is roughly equivalent to the PRINT command of ATARI BASIC. The character string that you wish to display on the screen is typed after the command. However, the character string does not need to be enclosed by quotation marks. If quotation marks are included they will also be displayed on the screen. The ACCEPT command (A:) is similar to the INPUT command of BASIC, with two major exceptions. Character string variables do not have to be dimensioned nor do variables have to be included at all. In the event that no subcommand follows the ACCEPT command, Pilot will automatically place the character string in a special test register. In the event that the user wishes to type in a number then a numeric variable should follow the command. NUMERIC VARIABLEs consist of a pound sign (ie. #) followed by a single letter; A through Z. Consequently, there are a maximum of 26 numeric variables.

The MATCH command (M:) compares the character string of the special test register against the character strings in the subcommand. Character strings in the subcommand are separated from each other by commas. If a match occurs, Pilot notes which subcommand was the successful one (ie. first, second, third...). The JUMP ON MATCH command (JM:) recalls this notation and executes the corresponding subcommand. Subcommands are in the form of LABELs which are denoted by an asterisk (i.e. \*) followed by one to several letters. Again, commas separate the subcommands. In the event that a match has occurred, Pilot will search the entire program for a LABEL that corresponds to the appropriate subcommand of the JUMP ON MATCH. Execution is then transferred to this point.

The USE command (U:) causes Pilot to once again search the entire program for a LABEL that matches the subcommand. Execution is as well transferred to this point. However, upon reaching an END command execution is returned back to the line directly below the originating USE command. The USE command is similar to the GOSUB command of BASIC. It calls subprograms, executes them and returns back to the main program. The JUMP command (J:) is equivalent to a GOTO command in BASIC. It causes Pilot to search the entire program for a LABEL that matches the subcommand and transfers execution to that point. The END command (E:) indicates the terminating point of a program or subprogram.

The GRAPHICS command (GR:) causes the computer to enter the graphics mode. The subcommand instructs Pilot on how to draw, fill, turn, change color, clear the screen or to quit the graphics mode and return to the text mode. The graphic techniques of Pilot are quite different from those of ATARI BASIC and further explanation will be necessary. The two major differences lie in how the languages reference points and how they issue line drawing instructions. In BASIC the point (0,0)lies in the upper left hand corner of the screen. In Pilot the point (0,0) lies in the direct center of the screen. This conforms to the popular Cartesian coordinate system which is taught in geometry class. The visible portion of this grid accounts for 160 points horizontally by 80 points vertically. This is equivalent to the visible number of points in BASIC's GRAPHIC MODE 6 and 7. However, nonvisible points may be addressed in Pilot without causing an error statement. The second difference is how the languages issue drawing instructions. Instructions in BASIC are an absolute reference system, (ie. PLOT x, y and DRAWTO x, y). In Pilot the only absolute reference point is the initial one (ie. GR:GOTO -20,5) after that all references are relative to the last point. The last point is referred to as the "turtle", hence the nickname "turtle graphics". The subcommand TURN redirects the turtle. A positive value after the subcommand turns the turtle so many degrees clockwise. A negative value turns the turtle counterclockwise. The subcommand DRAW sketches a line. The value after the subcommand determines the length of the line. In ATARI BASIC every line length and turn requires a separate calculation. In the case of the latter, calculation could be quite complex.

The SOUND command (SO:) allows you to create musical tones. Up to four subcommands, separated by commas, can be assigned. The subcommands are in the form of integer values from 0 through 31. These values correspond to musical tones, where 1 represents low C and 31 represents high F. Zero turns the sound off. Four subcommands allow for four separate tones to be played at the same time. The PAUSE command (PA:) determines the length of play for the preceding tone. The subcommand is in the form of a positive value. Tones may be played in 1/60th second intervals; 60 pauses one second, 120 pauses two seconds, and so on.

There are several other commands and special characters. We have described the ones essential to understanding the Pilot program referred to in the opening paragraph and have listed it in Figure 2. We will now go through this example step by step.

### Figure 2.

Line 12 types the question, "WHAT COLOR (RED, BLUE, YELLOW)". Line 13 accepts the user's reponse. Line 14 matches this response to the character strings, "RE", "BLU", and "YE". If a match exists, it notes which character string caused the match. Line 16 transfers execution to the corresponding label. Lines 20 and 30 type the question, "NUMBER OF SIDES" and accept the user's response as numeric variable #S. Lines 32 and 34 and 40 to 50 behave in a similar fashion. Lines 85 and 86 use two subprograms labeled "\*DRAW" and "\*SOUND". Line 90 causes Pilot to jump back to a statement labeled "\*LOOP" on line 10. Line 99 indicates the end of the main program.

The main program illustrates two techniques of calling subprograms. The first technique is the JUMP ON MATCH method; line 16. The second technique is the USE method; lines 85 and 86. The first method causes the program to jump from line 16 to one of three labeled statements, depending upon the preceding match; line 14. If the user's response was "RED" then Pilot will find a match in the first character string. This will cause execution to jump from line 16 to the labeled statement "\*RED" on line 300. Line 310 causes the turtle to select a red colored "PEN". Line 320 causes the execution to jump back to line 18 which is labeled "\*CONTINUE". This just so happens to be the very next line after the JUMP ON MATCH command. Had the user responded "BLUE" or "YELLOW" then the turtle would have selected that corresponding "PEN" color.

The second method of calling a subprogram is the USE command. Line 85 causes Pilot to transfer execution to the statement labeled "\*DRAW" on line 100. Line 130 clears the screen while line 140

positions the turtle on coordinates (-20,5). Line 150 tells the turtle to draw a line of length #L, then turn #D degrees and repeat this pattern for #S number of times. The color of the pattern will depend upon which color "PEN" the turtle has selected. Line 160 indicates the end of the subprogram and Pilot transfers execution back to the very next line after the USE command.

The next command happens to be another USE command. This command causes the program to transfer execution to the statement labeled "\*SOUND" on line 200. Line 210 causes three musical tones to be played. The values 13, 17, and 20 correspond with the musical notes of middle C, middle E, and middle G, respectively. Line 220 causes the tones to be played for one second. Line 230 through 280 are similar in fasion. Line 290 turns the sound off. Line 294 indicates the end of this subprogram. Pilot transfers execution back to the very next line after the second USE command. This line is a JUMP command which causes the entire process to repeat.

For those of you that are not duly impressed with the Pilot language after reading this article. I have a little exercise for you. Part one of the exercise requires you to write a program similar to this one using ATARI BASIC. Sounds simple, doesn't it? The rules for writing the BASIC program limit you to 42 lines with one statement per line; just like the Pilot program. Part two of the exercise requires you to enter into a small race. In this race there will be a turtle (me) and a hare (you). Our programs will do the actual running. For judges we need to find two novice programmers. The race begins when you hand my turtle article over to one judge and you then start to explain your harebrained program to the other judge. The race is over when either judge completely understands the entire program and finishes the explanation by saying "Ah ha!" Who will you bet on, the turtle or the hare?  $\Box$

# We've Got More Than A Fond Attachment For Your ATARI

We've Got A Disk Drive For \$488.

Percom Data Corporation believes your Atari\* home computer is more than just fun and games. We believe you should be able to get a single-density, floppy-disk-system for your Atari 400 or 800 at a price that will take you into the future without knocking you into the next galaxy.

Percom Data has been manufacturing disk-drive systems, and other accessories for personal computers since the mid-1970's and is the industry standard to follow when it comes to data separation and system compatibility.

The Percom Data AT-88 combines Percom Data quality and reliability at a price that is not a budget-buster.

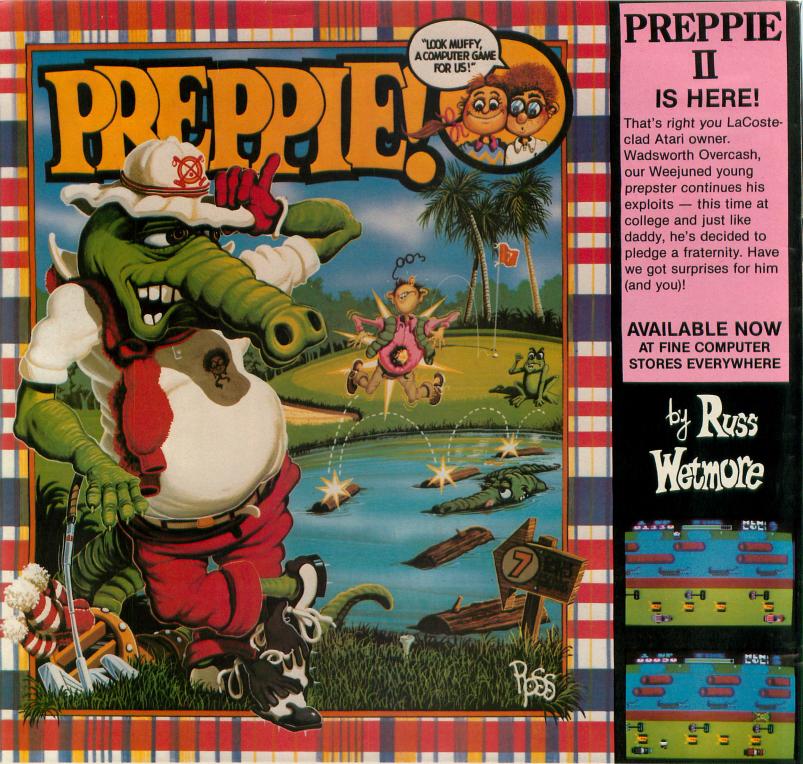

The Percom Data AT-88 offers 88 Kbytes (formatted) in single-density, with plug-in ease of attachment to your Atari. The AT-88 has integral power supply, "no-patch" to Atari DOS and critical constant speed regulation.

Take advantage of this low introductory price of \$488 by calling Percom Data now to get more information, or the name of an authorized dealer nearby. Call toll-free **1-800-527-1222**

# **Good Golly! What A GAME!**

The original arcade game **PREPPIE!** will give you hours of toe-tickling fun. **You** take the controls, moving your young prepster about on the golf course. And what a golf course! It's unlike any you have ever played on before. There are dangers **everywhere**, and only you can keep the little lvy Leaguer from a fate worse then Penn State!

**PREPPIE!** is written in state-of-the-art machine language, is joystick compatible and fully utilizes the Atari's sound and graphics capabilities. Quite frankly, it will give you the most fun you can have on an Atari microcomputer.

PREPPIE! is available at fine computer, book, and hobby stores everywhere.

An exclusive game from

### THE CURSE OF CROWLEY MANOR

by Jyym Pearson

You've sensed it before: nameless, unreasoning fear. Fear of the unseen of things that scurry and scrabble through the shadows when the lights have been put out. How then will you fare when you face the Ultimate Evil; how will you possibly survive — THE CURSE OF CROWLEY MANOR?

Jyym Pearson, author of ESCAPE FROM TRAAM and many other fine programs, explores a new dimension in fright with a macabre tale of things that go bump in the night. THE CURSE OF CROWLEY MANOR is an excursion into mindwrenching terror as you enter the dreaded Crowley Estate in search of answers to some pretty grisly questions. Fear fans take note: This is the stuff that nightmares are made of, so think twice before you approach...

THE CURSE OF CROWLEY MANOR features Adventuring the way YOU like it, with plenty of clever plot twists, and a scenario that'll roll your socks up and down your legs! If Adventuring has become a bit tame for you lately, this is one sure-fire cure! THE CURSE OF CROWLEY MANOR will run on any ATARI 400 or 800 with ample memory. We supply the software; you supply the atmosphere. (A well-lit room is optional, but recommended!)

ATARI 16K TAPE ...... 050-0108 \$24.95

### **ESCAPE FROM TRAAM**

by Jyym Pearson

As soon as your small space cruiser began losing altitude, you knew you were in for serious trouble. You somehow walked away from a fiery landing that would've spelled certain death for a less fortunate man, but as one may quickly learn, there are fates far worse than a rapid death...

You've managed to walk away intact from the awesome Curse of Crowley Manor. So far, so good. But will even your finely tuned Adventuring skills give you the necessary edge to ... ESCAPE FROM TRAAM?

ESCAPE FROM TRAAM is a detailed Adventure for the ATARI 400 or 800 computer that defies the player to successfully search a bizarre alien world for a means of escape. The perils are many and the opportunities for survival are few. But for the clever Adventurer, a single opportunity is all that might be needed for a speedy exit from this hellish world. Are you up to the challenge?

All of the traditional Adventure elements are In ESCAPE FROM TRAAM, including two-world command input, game save feature, and an extensive vocabulary. Add to this the impact of a dynamic storyline that'll give even the most experienced Adventurer a real workout! ESCAPE FROM TRAAM — a fine addition to any Adventure collection.

### WHEN YOU SIT DOWN TO A SCOTT ADAMS' GRAPHIC ADVENTURE

# . ANYTHING

That's right — anything can happen, and it usually does! Because with a Scott Adams Graphic Adventure, the fantastic is as close as your computer — and your own fertile imagination. Each S.A.G.A. features the finest in hiresolution graphics — graphics which compliment and enhance the classic text — and, they can be toggled on or off with a single keystroke, too. Plus, optional Votrax Type 'N Talk<sup>™</sup> and printer compatibility give you the flexibility to add new dimensions to your Adventuring — when you're ready.

KOW LOADINT:

ready. The incomparable S.A.G.A. Series — experience the magic yourself. But be prepared for anything.

Also, look for the Scott Adams Text Adventure Series on these fine computers: TRS-80 • COMMODORE VIC • NEC PC-8001 TEXAS INSTRUMENTS 99/4 • CP/M Z-80
