CHIPS ALIVE!....12

The next generation of super-fast microprocessors is upon us - the 1040 and the 3040. For instance. Beyond that, there's the 'living processor' - just imagine, in 10 years time the machine you own could have a living man-made brain inside it.

DANCE WITH A STRANGER.....42

You're not restricted solely to traditional keyboard synthesizers. There's a wealth of MIDI instruments that can be attached to your computer: drums kits, digital horns, microphones, guitars and much more. Your indispensable guide to the more exotic musical instruments plus the software needed to use them.

MONTEIRO'S MONTH

What motivation causes us to be the Review this month - and why not? The features starting on page 60 raises some thoughts concerning spectrum though. For instance, should we games - Hollywood Peter Pan, Leather Goddesses of Phobos, Tempest Quest, Encounters, Leisure Soft, Larry, et al - be available to under 16's? Some sort of certification code to the Amiga industry's system is definitely needed.

I'm not a prude - far from it. In fact, I quite enjoy scary software. The Leisure Soft Larry series include some of the funniest - albeit gory - scenes of any software. As the strip poker games - and everyone is allowed to indulge their ideas to them. However, I can sympathise with parents' jitters at some little Adonis should be exposed so much as possible from the coarse world during his formative years. But there's little chance of that with such lax regulation. Something must be done!

Assuming over 16's visitors to leisure soft are the right ones, what will presumably need to stand down their too blustery to make way for the rest. Now that would be interesting!

Windows themes, available from several BBS's. Windows visited around the country, and another thing all together. The enhanced variety recently breaks the Windows Recognition Act. How long will it be before someone decides enough is enough?

That's enough of my thoughts on the matter, what are yours? You know the address, so get writing!

US GOLD HERALD GAMES PRICE WAR

US Gold have announced that they are dropping the price of all their computer games to £14.95. Forgotten Worlds is the only remaining license to be pitched at the old £19.95 price level. US Gold's PR executive, Danielle Woodbury, stated: "This does not apply to games programmed outside this country, but hopefully every title will change."

Other major software houses appear reluctant to follow the lead, but a host of budget labels have made an appearance over the last few months. Software Horizon have been the first to announce a budget label, going under the title of Rapid Software Games, and set at £9.95 - the same price as those popping out of the left Media stable Andromeda and Super Grid Runner, for instance.

Below I present a quick-head campaign to bring down the prices in games software. We would welcome your views and comments on current prices in the games section to pass on to the software houses. Send your views to **FORMAT**, 87 Ampleforth Rd, St Leonards-on-Sea, East Sussex TN3 0EU.

Rapid Software have a number of products lined up for release on their budget label including Rick and Monkey's Delight. Their original budget price was £9.95, but Andrew Wright, product manager, is currently discussing price points as Rapid Software aren't getting the volume sales they want at £9.95.

US Gold are currently in the process of setting up their own budget label, announced at a recent promotional bash in London. The label, entitled Klaxon, will be the start of a cam-

aign to re-release US Gold classic titles such as Quake and Descent at £9.95. Danielle Woodbury commented: "We hope other software houses will follow our lead and reduce their prices." As yet other software houses' reactions have been neutral. Grandsoft's Duncan Lonsdale summed up the situation: "We appreciate that cheaper games are the way forward, but we are reluctant to make any moves at this stage at the moment".

Everyone is waiting to see the outcome of US Gold's brave attempt.

HiSoft BASIC to be given away with ST

After last month's news story that Alan is introducing a new ST bundle later in the year, HiSoft have confirmed that a colour version of their popular version of the BASIC programming language is to be included in the deal. The 5000STFM Superspack also contains 20 games, - Laser, Double Dragon, Ninja, Encounters, Outrun, Gauntlet II, Super Hexx, Afterburner, St Fyre, Predator, Super Hong Oh, Black Lagoon, Starship, Space Ranger, Street Jack, Superlander, Pacmania, StarGunner, Star Key,

and Bomberman, as well as Micro-Maker which is of the same as the Basic Construction Kit and Organiser software.

Fox BASIC, as HiSoft's colour-based BASIC is to be called, is to be modelled on Power BASIC. The major differences will be a lack of a compatible disk format and fewer features. Fox BASIC will work just like an interpreted language even though it compiles to memory. Virtually all ST BASIC programs should run under Fox BASIC - albeit much faster - without modification.

HiSoft's MD, David Lusk, said: "Fox BASIC will be included with Power BASIC allowing users to hand off to a hefty manual. The price will be around £14. There will also be a very attractive upgrade option in Power BASIC or HiSoft BASIC".

"We took a lot of work over ST BASIC," confessed Bob Cox of Alan, "which is why we looked at what other was possible. HiSoft's BASIC seems to be the ideal choice. Although Power BASIC will only be available with the Super-pack bundle at first, there is the possibility that we might include some more complete versions in the future."

■ ST hard disk backup problems have been solved with the introduction of FA-ST Tape Backup from Third Coast (£257.42540). It's a tape drive unit that comes in either a standard case or fitted in the same box as one of Third Coast's hard drives. It's compatible with the Centaur, Third Coast, 2000, Megabyte and Super ranges of hard drives. A 20MB/40MB hard disk drive which has such a socket is included. Data densities of various capacity are available: 1.44MB, 2.88MB, 4.32MB and 8.64MB. Prices: 1025, 2050, 3050, Spectre 125 and Super ST hard drives.

■ Amiga 2000 owners can now upgrade to Amiga 62000 models by trading in their old machines. The new-for-old offer comes from **Pentech**, **Proprietary of Rosemont House, 289-291 Holloway Lane, Finsbury, London, N10 1BP** (01-446 8421). Pentech will accept any ST 6000 in part exchange for the latest Amiga model from pentech in the UK or overseas. The deal enables users to upgrade their computer along with payment of £399.95 to Pentech. In return they'll receive a 62000 with Pentech and Workbench 1.3.

■ The **Foxwell Plus Accessories Pack**, which lets you grab a selection of images of horses and tennis balls to use with Foxwell, has been released by the ST Club. It costs £4.99 (£5.99) to registered Foxwell Plus users, while from the ST Club is the Foxwell Series - a set of four CDs. Each disc costs £2.99. Details from 9 Station Place, 49 Stoney Street, Nottingham NG1 1LA (0602 400041).

■ Amiga owners can output colour to a separate colour monitor via the **Sierra Software's Scanwriter**. The kit comes with two 20MHz drivers, a monitor and a video adapter which gets its power from the Amiga. Five fixed planes are being given away with the package. Scanwriter costs £29.99 and is available from 5486 Princess Street, Manchester M1 9AG (061 238 1011).

■ Hard Drive Toolkit Kit from Microdriv provides ST hard drive users with a set of handy utilities for optimising work speeds, providing a file cache and, that old chestnut, backing up data onto floppy. Price is £29.95. Further details from PD Box 687 25 000820.

HARD TIMES COMING

Suddenly everyone is releasing compatibility. Current hard disk drives or reducing prices of existing models. This is no bad thing, and is well received. Originally manufacturers blamed low sales and expensive components at high retail prices. If anything those days are over. Andrew Bennett, Foster's managing director, raised the concern of many: "Retail losses, volume sales and better deals from parts manufacturers mean prices are tumbling". This also explains Foster's 20% reduction on their 30MB Super ST hard drives.

STC of Swindon, Wiltshire, have come up with a 20MB drive for the ST for £299. Although the drive doesn't have a read/write clock or auto-booting facilities, its price is remarkable. The next model up, the 40MB drive, goes for £399. Provision for auto-booting is expected later in the month. Upgrading should cost around £200. According to Martin Delaney of STC an Amiga 2000 version of their hard disk drives will be available at the Commodore show. His firm retail price yet, but Martin hopes for a price of £2000. The Amiga drive is more expensive than the ST 6000 because it features an SCSI interface, auto-boot, DMA port and space for installing 2Mb of RAM.

Applied Systems and Proprietary (PSI) of Gloucester, formed by the budget packard dealer

Wingers, have finished work on an Amiga hard drive for under £400. The 40MB Amiga is available in two models - an external 40MB version with power supply and fan, and an internal 42000 version.

Currently only the 42000 model offers auto-booting with Kickstart 1.3. Chris Hargreaves at ASPI hope to have an auto-booting 40MB model ready in a few months time. 4000 units will be able to be made in the existing version of the hard drive for the new model. Price for the upgrade hasn't been finalized, but is expected to be between £40 and £50. Auto-booting is only possible with the Kickstart 1.3 ROMs - ASPI will replace the ROMs and upgrade the drive for around £75.

Amstrad's £399 price is extraordinary when compared to Commodore's £600 hard drive system for the Amiga (no official price yet, however, sources at Commodore reckon it will come in at between £800 and £850) and the £6000 hard drive for 2000s, £1510. Both of Commodore's drives offer 20MB storage and auto-booting.

TOP ATARI MAN JOINS GFA

Les Player, Atari's technical manager, has been appointed to head GFA Systems' technical operation in the UK. Les had been instrumental in ensuring the development of the Plan 9 transport and Pocket PC word processing.

He joins GFA to help it to release GFA BASIC 3.0.02 and GFA Compiler for the ST. Looking further ahead, Benji's GFA Compiler for the Amiga plus BASIC are being given away with the package. Sourcebooks cost £29.99 and is available from 5486 Princess Street, Manchester M1 9AG (061 238 1011).

■ Hard Drive Toolkit Kit from Microdriv provides ST hard drive users with a set of handy utilities for optimising work speeds, providing a file cache and, that old chestnut, backing up data onto floppy. Price is £29.95. Further details from PD Box 687 25 000820.

SIGNALS FROM SPACE

It's now possible to receive free weather satellite pictures beamed down from space using the latest Amiga Telesat Adapter from Microdriv. The pictures originate from satcoms like Meteosat which circle high above the equator. The Amiga Telesat Adapter captures the signal and processes the picture to make the view appear to be of continental Britain. As well as being able to receive satellite pictures over Meteosat, the Microdriv adapter enables normal television to be displayed on the Amiga screen. The adapter even enables the user to take stills and make movies to pick up TV signals. The Microdriv Telesat Adapter costs £19.99 and is available from T. Binding O'Brien, Marlowe, Marlowe (01628 666664).

LIGHT BRIGADE ARRIVES

While having all that storage space sounds ideal, the price £44.99 means that only large companies will be able to afford the device. One use for the drive would be as a file server in a network - it would have to be a large network to justify the expense though.

Now then! Third Coast is a

floppy drive for around £79. This uses removable 440k disks which cost £1.25 each. The Second drive has a 40MB storage time which is on a par with fast hard drives.

AMIGA HELPS AT LOCKERBIE

Dumfries and Galloway police have installed an Amiga 2000 computer system to help process the many hundreds of hours of videotape taken during the aftermath of the Lockerbie disaster.

The Amiga system is being used to reconstruct the site of the crash so that police can work out what happened prior to the incident. The system will allow experts to produce stills from video material on a digital frame store. The graphics capabilities of the Amiga are being used to enhance the recorded pictures before they are sent to a Polaroid

processing film recorder.

Sgt Bob Evans of the Dumfries and Galloway police force: "The Amiga 2000 system obviously gives us the potential for crime detection by using its excellent graphics and the ability to grab stills images - so we can submit them as photographs and videos."

To help with the analysis of other disasters, the Amiga system is being used to produce enhanced transparencies for demonstration purposes, as a video tape, and to make annotations of incidents.

Blunders from last month

Microplay's Drives - It would, but not at the time. Now, most of the machine will get the response.

MTI Musical Keyboard - In Figure 1, pins 2 and 8 of the ADC (IC2) should be connected. Also, the parts list failed to mention the type of diode necessary. Two general-purpose signal diodes (1N4148, etc).

MacLab Sound
Graphics are offering digitising cameras using their custom-built real-time frame grabber. You send them the photographs, slides or videos with the images on them and Graphics will transfer them to disk. Graphics will consider travelling to you and videotaping any objects that are too large to post. Each shot costs £5 - except for the first which costs £15. A quality printout, like the one on the right, is available at extra cost. Graphics' publishing handbook, which includes a simple graphics device, is available for £15. Commodore and Atari shows set for June with launches galore in store

SHOW OFFS

Software and hardware manufacturers are promising major launches at next month's Amstrad and Commodore shows.

The Commodore show takes place from Friday June 2 to Sunday June 4; the venue is the Novotel Exhibition Complex in Hammersmith, London.

Companies known to be attending the Commodore exhibition include Wibbit, who plan to have the developer version of *Invader*, an Extended Library for the ST (BBC), and something new on the C front; George Thompson Services will be there with their range of ST expansion and external drives; Power Computing are to demonstrate Mac Magix and several hard drives; Arrow will have the latest version of Protext and its 2MB floppy logo; Intron a £395 2MB internal RAM expansion and SAT Master Professional.

There will be over 100 exhibitors attending the show which will feature presentations, advice stands and special events.

You can enter tickets - £4 for adults and £2.50 for under 16s - on 081-5573960 and make a saving of £1 on the door price. Show times are from 10am to 6pm except for Sunday when the show closes at 4pm.

ATARI AT ALLY PALLY

The Atari show is later in the month - taking hold at Alexandra Palace in Wood Green, London - from Friday 23rd to Sunday 25th. Tickets are available on 081-3572981, and cost the same as the Commodore show.

Don't forget that the STOS Games Writer of the Year competition will be judged at the Atari

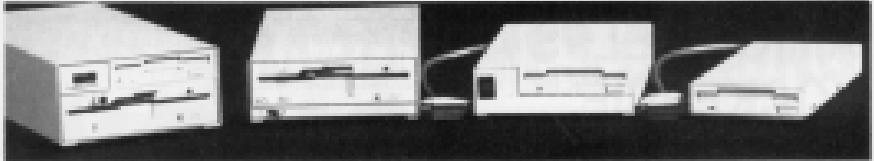

show. You've still got time to send your games to Mandarin Software, Europa House, Wellington Park, Ashton-under-Lyne, Greater Manchester, SK10 9EP. First prize is having your game marketed by Mandarin and £5,000 in advance royalties. Mandarin have already selected four games that they consider to be the best so far. These are *Star Strike Battle Command*, *Mouth Trap* and *Arthur of the Britons*.

BIG PRIZES

Three fabulous holidays - worth £2,000 in total - have been put up by SSI and Database for the most innovative use of the ST. Winners to be announced at the shows.

First prize, £1,500 from SSI, in the form of President's Cheques (which can be cashed in for a library (MFP) or a single volume); plus the cash equivalent from Database; plus the winner to take another person. Second prize is £1,000 in cheques plus the cash equivalent for a second person. Third prize is £500 in cheques plus the cash equivalent for the another. Sounds confusing - but basically the three winners get prizes allowing them to take themselves and a partner on an exotic holiday.

All you need to do is enter to write a 1000-word description of the innovative way you use the ST and send the brief - along with any support material on disk - to ST Amiga Format, 4 Queen Street, Bath, BA1 1EL. The innovative user could fall into any category: anything from the bottle who has achieved a major breakthrough using the computer to the housewife who plans gourmet meals on the ST.

TRADE SECRETS

The European Computer Trade Show, held last month in Islington, was the launch pad for various new ST and Amiga products. RICHARD MONTEIRO reports.

Leading computer traders from all over Europe lined up in Islington on a sunny April day to show off their wares. In the assembled computer dealers, importers and the occasional journalist at the European Computer Trade Show, some interesting Amiga and ST products came to light during the course of the show.

Power Computing displayed an enviable number of new items including a wealth of hard drives. Offered in 20, 40, 80 and 120MB versions for both machines, the ST drives start at £450 while the

Amiga drives are available - one running at 100MB and the other at 250MB. Up to 2MB of high speed, 32bit, RAM can be added via an optional daughterboard. Software and hardware revisions of 640000 or 68000 is possible. There's a card for an optional 68881 or 68882 floating point coprocessor. Impact cards start at £199. PC emulation on the ST will take a few forward with Power Computing's announcement that they are to distribute Acorn's PC Emu II. The update is

cheaper Amiga model is £2524. The Amiga version costs more as it has room inside the case for an optional 2MB RAM board. An A2000 version is available with extra memory.

The performance of the A2000 can be boosted to that of a workstation with Power Computing's 68030 accelerator

a £1799 hardware/software combination that boasts a Norton 30 card - the industry accepted PC based rating - of 3. The computer favours the system by the name of the range IBM PC's rating of 1. The new list shows IBM PC/2 Model 30V 1.8, and the Zenith E320+ 2.6. Full use of the ST's 16 ports can be made, the mouse can be

used, and either mono or colour screens are supported. Only eight-colour low-resolution CGA graphics can be used in colour - highest CGA compatibility is planned later in the year. Only 640K of the ST's memory can be used for running programs - even with machines containing more than 1MB. This is a limit of 880K. Power Computing are on 081 338 27300.

Amon presented Project VLSI 20 for both the ST and the Amiga. Both include a completely revised and integrated manual, data and line insertion direct to a document, a more positionable cursor, a better procedure for installing printer drivers, a faster COMMPORT program, provision for accessing Greek characters, small font and status bar check, "big changes".

From Amon, Mark Day, 'will only appear in 84/85' Project VLSI 20 is available at £299.95, upgrading from VLSI 10 costs £30, upgrading from VLSI 10 costs £50 and upgrading from VLSI 10 and VLSI 10 costs £75. More from Amon on 071 868 9705.

Microf's new distribution Tempo 2 - the follow on to the speedy text editor Tempo - for £199.95. Tempo 2 is faster, includes facilities for editing up to ten files simultaneously, three

disk drives with either Winchester or floppy, Power Computing announced a selection of floppy drives, some of which are pictured above. The Rocking-Hights division, Microf's disk drives which feature an acoustic particulate track erasure, has come up with a general 80/120MB drive called Amiga 1000, retailing for £314.95. The price difference is attributed to the fact that the 80MB version comes with a power supply (floppy drives draw power from the computer). For the Amiga 1000 also the Amiga 1000 which consists of two 40MB and one 120MB drives. It weighs in at 1.6kg.

cursor modes, password search and replace functions, bidirectional editing, keyboard macros, undoable undo and auto-line save.

Also new from Microf is the J4910 C interpreter. It's a package designed to take the hard work out of learning to program C. Rather than having to go through the tedium of compiling your programs, you can run it in real time. It's ideal for beginners.

Although Microsoft seem to have had the lion's share taken over by Microgen, they made an appearance at the show. The follow up to Bubble, Bubble, Fantasy Islands, looks as addictive as the original. Also to look forward to are Quartz, Sausage, Wizard Dreams and Hemisphere.

■ Photon Paint II - the Amiga 1000 art package - was demonstrated at the Euroshow, but not on the exhibition stand as expected. Instead Microfloss, creators of Photon Paint, owners of the software's copyright, Microfloss, are thinking of distributing the package to the 100 manufacturers which would leave the current shareholders, Microf, in an awkward situation. Microf have a 10 month contract to supply Microfloss' software which, says Microf's Tim Jones, "would be honoured if necessary."

Release: Future Works, Coffey Park, California, United States - 10/10/1992

A Motorola's 68040, shown here, used in 1989's Macintosh II computer, the workstation. This 32-bit microprocessor had 2.8 million transistors, 16-bit data paths, 32-bit address buses, 32-bit floating-point arithmetic, and a maximum clock rate of 20 MHz. Motorola's next chip, due in the fourth quarter of 1990, promises to push the limits of 32-bit processing by offering a 32-bit floating-point processor.

Motorola's 68040, the world's most powerful 32-bit processor. It can execute two floating-point multiplications in one clock cycle and double that speed for 3D graphics support. At 20 MHz, it costs about \$1,000. Motorola's next chip, due in the fourth quarter of 1990, promises to push the limits of 32-bit processing by offering a 32-bit floating-point processor.

PROCESSING PROGRESS

We've come a long way from the humble eight-bit microprocessor, but there's a lot more potential yet. JEFF LAWSON has been listening to the Silicon Valley boffins' pipe dreams

Sixteen years ago there were no microprocessors. The rate of progress in the intervening years has been phenomenal. Although the techniques used to make them are truly awesome to contemplate, the underlying ideas are actually quite easy to understand.

All computers consist of three basic parts: the central processing unit, main memory (RAM or ROM) and input and output I/O devices such as disk drives, display units, and keyboards. Central processing units move data around in memory, and between memory and I/O devices, and perform arithmetic and logic operations on that data. In a microcomputer the CPU is a single integrated circuit called a microprocessor.

There are many microprocessors in use today, classified by a dazzling array of letters and numbers: Z80, 6502, 68000, 64020, 80386, 80486, 7032, Amiga, 68000C, 68020... the list goes on.

When improving microprocessors, developers attack on four fronts: increasing the amount of data that can be processed at once; increasing the memory the chip can use; spending on the data processing; and improving data manipulation facilities.

ON THE BUSES

The microprocessor is connected to the memory by two groups of wires on a printed circuit board, each known as a bus. One group is responsible for holding the data and is called the data bus. The other group specifies where in memory the data was read from or is to be written to and is called the address bus.

The size of the single piece of data a processor can hold on its data bus is called a word. The Z80 (used in the Spectrum) and 6502 (the BBC micro's chip have eight-bit data buses so their word length is eight bits). The 68000 - present inside 32 and Amiga - and 80386 have 32-bit data buses and are therefore known as 32-bit chips. The

60386, 80486, ARM and TRIO address 32-bit words and the 6803 is a 32-bit processor. It is not the amount of data that can be handled at any instant, each bit being dealt with simultaneously. Clearly data throughput, and therefore processor performance, improves with increasing word length.

REMEMBER, REMEMBER...

The Z80 and 6502 eight-bit microprocessors have 16-bit address buses and so can use 65,536 bytes - 64K of memory. The 68000 has a 24-bit address bus and can therefore use 16,776K of memory. However, in the ST and Amiga much of this space has been reserved or assigned for memory mapped I/O and for access to devices such as drives.

With the coming of 32-bit microprocessors the limit on addressable memory has changed to an enormous 4GB (4,294,960K of RAM) for the 80386, 64020 and 80486. 4GB of memory space would cost nearly a quarter of a million pounds at today's prices.

Because modern software often needs vast amounts of memory (the PC's new operating system, OS/2, needs around 8MB to be comfortable but gigabytes stretch the pocket a little), 32-bit microprocessors usually have virtual memory addressing. This is a hard-wired scheme to make the different parts of a system share the same bus and have access to a large amount of memory. In reality chunks of data are saved out to disk and other blocks loaded from disk when necessary. In this way the 80386 can map each of up to 16,384 tasks believe they have access to 4GB. This is a virtual address space of 64Kbytes (that's 64,713,664,736K).

SPRING KING

All processors rely upon a clock signal to synchronise their actions. The faster the clock signal pulses the faster the processor runs. Clock speeds are measured in MHz (megahertz), and at one

JUST A SWEET TRANSISTOR

Over the years more powerful microprocessors have been developed as new manufacturing techniques have allowed more transistors to be crammed onto a piece of silicon. This very large scale integration chips contain more than 100,000 transistors. This is how the transistor count has increased.

Processor	Transistors
Z80	~14,000
6502	~14,000
68000	~43,000 (~)
64020	~102,000
80386	~23,000
80486	~100,000
ST	~1,000,000

RISCV BUSINESS

Up until now, or for 16 years, most microprocessor designs adhered to the von Neumann architecture. Designers produced their processor very differently to the units that previously had been more computer manufacturers. This methodology is exemplified by the manner in which a program is stored in memory. The Z80 can execute every instruction like ADDI #10, ADDI #11, ADDI #12... which means that the address of stored in the address memory is added together with the contents of register R0 and the contents of R1 in memory. Then the results computed add to give the next address from which to read more bits of data called an I/O pointer. From the code base this one-line code sequence can be put into place to set another in register R0, and something is added to the number you first thought only.

In the mid-Eighties it was realised that if instructions were more compact after a few - though a deceptively small - iterations, special purpose machines could make the required computation much faster. And so, starting in mid-Eighties, work began on reduced instruction sets.

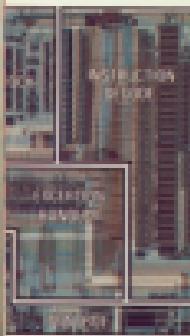

This technique of reducing the length of each instruction set compute throughput much. The most, 68000, 64020 and Amiga's 7032 are all RISC microprocessors.

RISC technology is a wide area. As soon as complicated instructions can be executed in one clock cycle RISC will happen.

IT'S A PLANT

Many thanks to Michael Soto for providing the picture of a cross-section of a young oil palm tree infected with a fungal pathogen. The image in the *Comments* shows tissue inside the infected wood produced by neighbouring cells to counteract infection. The shot on this page portrays fungal deposits in the system roots.

ADDITION DIVIDED

All general purpose microprocessors perform simple addition and subtraction of integers. The 64-bit and 128-bit devices can multiply and divide as well.

Computer arithmetic performance has improved the 327 and 329 chips from 1.6MHz speeds that can execute a 16-bit by 16-bit integer multiply in an average of 16 clock cycles to 1.7MHz 64-bit multiplication in 16 clock cycles. The 64-bit processor can execute two floating point multiplies in effectively one clock cycle at 1.6MHz.

cycle per second, so 32MHz is a million cycles per second. The 68000 in the 27 is clocked at 8MHz and then in the Amiga at 1.16MHz. The fastest machine code instructions that a 68000 can perform execute in four clock cycles. Hence, a 68000 can run two million of its fastest instructions per second (2MHz). However, many 68000 instructions take much more than four clock cycles to complete; for example, can take up to 70 clocked to the base rating of an 8MHz 68000 is much less than 2MHz.

Motorola have produced several versions of the 68000 including versions running at 1.6MHz. The 32-bit processors such as 68020, 68030 and 68040 can run at 20MHz and more. PC compatibles are available with 30MHz 386 processors. The new Intel 486 64-bit microprocessor is expected to run at 40MHz.

TURN BACK THE CLOCK

Surprisingly, the short history of ever increasing clock rates looks at, it is good news for the future; there's one big problem though. High-speed RAM chips are very expensive and, in general, dozens of these chips are used with every microprocessor chip. Over the past 10 years or so microprocessor speeds have increased by an order of magnitude while RAM speeds have only doubled. RAM capacity has increased dramatically but not its speed. This means that although a microprocessor is capable of running fast it may have to pause in order to let the RAM catch up. These pauses are called wait states.

Many PC chip manufacturers alleviate the waiting problem by constructing a 'cache' of fast but expensive SRAM (static RAM) between the microprocessor and slower and cheaper DRAM (dynamic RAM).

The cache holds addresses and data of recently accessed memory. Whenever the microprocessor accesses locations or data the memory management hardware checks to see whether the data is in the cache. If it is then fast access occurs. If not then the DRAM must be accessed which is slower. Because programs tend to repeat instructions in loops and access a small amount of data frequently the actual total

TEAMWORK

Specialist chips have been developed to act as co-processors - chips that run alongside the microprocessor to help it out with specific tasks. The Motorola 68882 and now 68883, for instance, provide trigonometric functions, powers, roots and logs.

Other graphics co-processors can draw lines and polygons, even produce shaded polygons and perform 3D calculations.

In more recent years it has become possible to fit more circuits onto semi-conductors and today that had previously been assigned to microprocessors are beginning to appear on microprocessor chips. The 68040 chip announced last month by Intel, for example, has its own onboard media coprocessor.

PARALLEL LINES

Faster and faster microprocessors run up against the brick wall of memory speed.

Improving instruction execution time would help, but the real leap forward is in parallel processing where several processors can be linked together.

The art and science involved in the field of parallelism is the Inmos Transputer. This processor family was designed from the outset to run in parallel, large arrays of Transputers all communicating together. The Micro Transputer Association is currently the lead company to use Transputers. One 32K can hold up to 17 32K's thus giving 17x32K. Many ATX's can be connected together providing an enormous processing facility. Inmos were recently recycling personnel for the development of a 128MB transputer.

You may be surprised to know that we, think you and I used to own Inmos. The company which brought to market the world's most innovative microprocessor, the 1802, was set up by the last Labour government. The current Conservative government sold it off - it's now owned by the French and Belgian Peugeot car company. Unfortunately they seem to forget that most of the time that's enough politics - Ed.

AMIGA 1084S

The Commodore MPS 1200 printer presents the state of the art in dot matrix printers. With all the features of a printer that wouldn't look out of place in the Amiga's processor board. It can produce intelligent print pages, as well as the fly of a minute, mean average line or MPS Graphics Printer with IBM Graphic 12 characters or 16 Blank/Postscript characters support. Because of the printer's compatibility with the Amiga in the Amiga configuration. The printer is capable of all the printing functions programmed except, as well as some additional features you may not expect.

... . . . AND MORE BESIDES!

The hot item from Commodore US is that Man. The president of Commodore's US operations, has resigned. The official line is that he has left to pursue "other interests" - which is the usual line when the company doesn't want anyone to know what's going on.

Tom's replacement is a chap called Heribert Copperman, a 42-year-old entrepreneur of Apple Computer's Eastern US region. Before joining Apple in September 1982, Copperman served with IBM for 20 years, so it looks as though he has some experience under his belt.

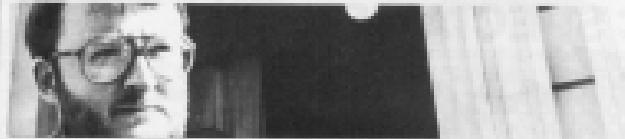

In his inaugural speech that pleased many US Commodore-watchers, Copperman said that he intends to concentrate on pushing the Amiga hard into US educational establishments. In addition, he aims to concentrate on areas that Atari seems to have left behind - dealer distribution. What does this mean for the Amiga? In the short term, very little. Copperman will oversee only Commodore's Central US operations, leaving Commodore Europe - headed by Christian Hirschec - to run affairs over here.

Copperman will, however, report directly to Jerry Gould, Commodore's chairman, so it's a fair bet that most of Copperman's strategies will succeed in the US will find their way over to this side of the Atlantic. Furthermore, if Copperman's plan to establish the Amiga in US schools and educational establishments, we should see some good software appearing in about six months' time.

PIRATES ALERT

The other side of the coin than good software is bad software. Even some old or pirated software that is corrupted with viruses.

GOLD DUST

You don't have to take a Greyhound bus to see America and discover what's new at Atari and Commodore - let STEVE GOLD do that.

programs. In the US, someone somewhere has cracked Dennis Covert Software's Quarterdeck disk boot loading package for the Amiga. The cracked version is called Quarterdeck v2.0.

Quarterdeck v2.0 has been sighted on a BBS in Detroit. The best news is that it is illegal and carries a number of viruses in it. Central Coast Software is currently in the process of tracking down the source of the cracked version (check serial numbers to have a look), and has confirmed that Quarterdeck v2.0 is the latest official version.

So, if you do per a public-domain version of Quarterdeck on your local Amiga BBS or online system, you have been warned. If you don't think that software piracy is a bad thing, fire up Quarterdeck v2.0 and watch what happens...

Many software houses in the US are responding to the problem of piracy by producing their packages - usually by taking advantage of some of the quirks of the Amiga's operating system. The

problem is many of the ready-madeware protection systems on the Amiga are not at all happy with the latest Kickstart ROMs.

Now, an Oberon-based company has come up with a clever solution to the problem - a Kickstart module. The \$49.95 module fits inside the Amiga 1000 and 2000 series, and allows the sets of Amiga Kickstart ROMs to be fitted. Switching between the ROMs is simply a matter of flicking a switch. Further details from: The ROM Company, P.O. Box 165-AT, West Milton, Ohio 45380.

There are a number of utility packages coming on to the market that allow users to modify the Amiga icon system. The problem (although packages are in the £75 to £120 price range) is the cost of the Amiga.

In response to a number of requests, Andy Karttusko, in Florida has upgraded his Amiga icon package. The latest version is V1.20 - which adds a very reasonable £20 - has all of the features of the expensive packages, including the ability to split, cut, save and manipulate icons. It's even possible to work with eight-colour icon pictures. Most interesting of all, the package allows the icon data to be modified. Further details from: A. G. Karttusko, 8524 Calderon Island Drive, Simple Session, Florida 33631-7300.

Finally this month, there's just room to mention that the World of Commodore show takes place from 27th to 29th in the City of May in Los Angeles.

POCKET PORTFOLIO

Over in the States, meanwhile, even the most diehard Amiga fans cannot have helped but notice Atari at Comdex in April. The reason? Why, the

Pocket Portfolio, of course. The Xanta were shown by the Pocket Memory 1024 portable, which will retail for £299.95 in the US. As mentioned in last month's column, rumour has it that Atari now contacted Sharp in to produce a second version of the Pocket Portfolio. These Xantas were unveiled at the Portfolio's US launch at Comdex. The Sharp 2 machine is now reported to be £329.95 microprocessor-based featuring a PC/AT compatibility and speed, and will feature an optional two-inch hard disk drive. Two such drives have recently been produced by several Japanese firms, the most notable of which is Citizen.

The Citizen unit is capable of being fitted inside the Pocket Portfolio case, but it could add around £200 to the unit's price. This should translate into a £320 price supplement on the side of the Amiga, but it's been said that a Macintosh-based Portfolio, with hard disk, will retail for around £800 pounds.

The good news, the Xanta fans of Comdex is that, although both the laptop ST and the above-mentioned Pocket Portfolio were only shown in cube cases to the public, they have now performed the specifications of the machine.

The good news, the Xanta fans of Comdex is that, although both the laptop ST and the above-mentioned Pocket Portfolio were only shown in cube cases to the public, they have now performed the specifications of the machine.

Finally this month, there's just room to mention that the World of Commodore show takes place from 27th to 29th in the City of May in Los Angeles.

Speculations on the entry-level Sharp will be set the 1040SX with 256k of RAM, and single 520k drive. Some comment on the Sharp suggested that Atari are planning to use up all the 1040 components in the Sharp, now that most of the 1030 ST's demand seems to be heading to the public.

PASSING THE PORT

One of the (few) advantages of using a PC instead of an ST is that the PC has multiple serial ports. Double Disk Networks have released a module (Xport) for the ST-based PC Port.

PC Port is a serial expansion cartridge that plugs into any of the ST's serial cartridges slots. The port can still draw its power from the cartridge slot, so there are no messy wires hanging around. Furthermore, the unit is completely interrupt-driven, and can thus be interrupted from within software.

If that's got you drooling, then just listen to this: the serial port on PC Port, which can be addressed concurrently alongside the ST's existing serial port, can handle 38,400 baud full duplex, with 16-bit bidirectional resolution, resulting in 16,000bytes/sec. The days of 38,400 bauds are now well and truly over.

Double Disk is distributing the PC Port system via mail order in the US, and also via Mailorder, so as should see the unit on sale on this side of the Atlantic quite soon. If you can't wait, write to Double Disk Software, PO Box 700-260, Houston, Texas 77094-0700, or call their 800-line (409) 713-9444-2000.

DIGITISED DAYDREAMS

You have some artwork or photographs that you want reproduced on your machine's screen; how do you go about it if you haven't the time, hardware or know-how? Call Photoshot! RICHARD MONTEIRO reports on the firm's activities.

A: The image above is the same helmet as in part 1 of a 12-part colour series taken from an ST. The pictures were originally produced on an Amiga and then transferred to the ST via floppies. The picture above, Photoshot's first artwork taken from their Amiga, shows

Pat two machines side by side – for argument's sake, an ST and an Amiga – hook a colour video digitiser to one of them and add a program that will let you read and write both ST and Amiga format discs. Supply a black and white or colour picture and get digitised. That, as a nutshell, is what PhotoArt does for us. You feed them photographs and in return you get a disc containing the digitised images – up to 4,096 glorious colours. So how's it done?

For digitising pictures, Carl Young of PhotoArt uses Digitizer on a Z80-Amiga A500. The extra 1.5MHz are provided by an internal Speed RAM expansion board. Because none of the ST video grabbers on the market offer true-colour image capturing, PhotoArt decided to use the Amiga to do the digitising. That and the fact that the Amiga has a 4.096-colour mode as standard.

Digitiser uses three scan speeds fast, normal and slow. The slower the scan rate the more accurate and therefore the picture. All pictures are scanned in raw mode regardless of whether they are colour or black and white. This process can take as long as five minutes for a high resolution interlaced colour picture. Such a picture demands several MBs of memory. A standard A500 or A2000 will allow you back into PhotoArt's with a 'not enough memory' error if you try to grab pictures in anything more than interleaved

PhotoArt's lightning creature at its best. The original artwork was produced by Paul at PhotoArt using Amiga 4.096-colour digitiser. This picture was a Windows from Windows 3.1 image. The larger picture here was produced by the Amiga in RGB mode – no resampling inside a point package was done. Notice carefully on the ST it's possible where PhotoArt's 4,096-colour mode is used.

HM format

A special type of bulb is used by PhotoArt which simulates daylight and casts out red light emitted by normal bulbs. The red light causes a pulsing in what are supposed to be white areas of good images.

Amiga pictures can be digitised at any resolution – and in either PAL or NTSC standard. ST pictures are digitised in 16 (or fewer) colours in 320 by 256 for the education PEGC mode. This mode is common to both machines.

STs – or rather several ST point packages – can read ST files, but they can't read AmigaDOS disks. To get round this, Carl uses DOS 3.30 on the Amiga to make an ST formatted disk.

The next stage involves using an IT-to-ST file conversion utility on a 1040 ST. PAL images (the file extension used in Extensis 4.096-colour ST point packages Quantum Paint) – are now in a format the same way except they are saved as 320 by 256 HAM pictures on the Amiga and after being transferred are loaded into Quantum Paint which, incidentally, recognises HDM format.

Power Computing have given PhotoArt permission to distribute the SuperMJPEG software utility – this enables the 4,096-colour PAL pictures to be displayed without the need of Quantum Paint. Of course, you need Quantum Paint if you wish to edit the images.

If you're interested in PhotoArt's services you can contact Steve at PO Box 2198, Wellington 6011 0800 260007 261000. Single digitised pictures can be used in most media. Multiple digitised pictures cost \$100 each grade (and \$1.17 for formats). Services include PAL, NTSC, RGB, HAM, and PEG. ST photos are discounted enough for PAL formats when costs \$2. A limited point price May 25. PhotoArt visitors will get a free picture digitised for every file they send.

GRAB 'EM YOUNG

This is Carl Young, PhotoArt's 26-year-old production manager. Originally PhotoArt provided an Amiga-only digitising service; a 1040 and have stayed that way as Carl explained, "When we first started to expand that service to include the ST, we tested the more popular ST digitisers and discovered they were all producing pictures speed apart than answers. I mean, everything, though, was the fact that no ST digitiser offered true-colour problems, the more commonly discussed with the require from those digitisers, we are forced into the possibility of picking pictures from the Amiga to the ST. At first we thought that ST would have to convert the two images together via an interface. Then we discovered the number of 4,096 in DOS."

PhotoArt's best shot! The picture above (printed from PAL) is a 16-colour ST digitise image.

Free software? Surely you jest – but no, the public domain holds a vast array of quality programs. JASON HOLBORN takes a look at some of the range of Amiga utilities this month – ST owners will have to wait until next month for their installment.

All the disks in this month's Amiga PD Update were taken from the Fred Fish collection of public domain disks. Fred's disks are available from George Thomson Services.

All disk numbers quoted below refer to that particular library although most can also be found in the other Amiga public domain libraries.

PROGRAM DISK 1000

Jumping by the vast number of computer letters and phone calls we received about the Scenery program on issue disk #8, you'll certainly agree by now that the generation game. We are of course speaking about the Amiga government game and not Larry Grayson's 'Did that Door关?'.

Freedom is another in the ever popular breed of Lucas graphic generators that seem to be the current flavor of the month in the PC market. This particular program is most certainly one of the easiest of these to use and the results can often be nothing short of astounding.

If you already know that both the ST and Amiga PCD libraries are great for picking up quality utility and games software as well as fonts, but what else is available?

Dig deep and you'll find a large number of programs that could quite rightly be deemed useless but are kept because of their aesthetic value. We are of course talking about the highly under-rated range of demo programs available for both the ST and Amiga.

What are demos? Put simply, demos are programs written to show off one or more aspects of the power of the machine they were written for.

Probably the most famous examples of the genre are the Amiga Bouncing Ball and the Juggler demo on the Amiga, and the BBC demo and

■ The starship Enterprise moves directly toward the viewer.

DEMONS CORNER

The unknown on the ST.

Each month, we'll be going through all the latest and greatest demos on both the ST and Amiga and picking one or each machine that we think best shows off the ST or Amiga. Here will we judge each demo? Well, it makes the editor's personal taste go "Wow!" and tell their readers, then it's a winner. Other criteria will include originality and how much of the ST or Amiga's capabilities are exploited.

The place featured this month was supplied by VHS Software who can be contacted on 0813 268862. The disk number quoted therefore refers to that particular collection.

STAR TREK DEMO

Animation has always been one of the Amiga's strongest points, and this demo certainly shows the amazing hardware of the ST. The demo shows a scene from the Star Trek TV series in which the Enterprise moves slowly from out of the sky above the white clouds. The four different views of the action give an impressive quality to this excellent demo.

Star Trek costs at least £100.

So far it's not possible to achieve the kinds of complex animation on the ST and Amiga which result with the Super Machines. The French company MicroAge produce software capable of broadcast quality animation on the PC, although there are distinct areas in the right direction on the ST and Amiga market. Despite that packages offer the kinds of colour schemes to make animation easier and this is reflected by the emergence of sophisticated CAD packages on the Amiga. Evolution CAD software is out in the shape of Cyber CAD.

THE CASE FOR CAD

CAD offers exciting opportunities in the complex field of animation. We look at packages specifically aimed at ST and Amiga owners. MARK HIGHAM delves into the CAD caverns.

The progression of professional CAD from the likes of the Clay Animation down to the ST and Amiga has not been an especially easy one. Limitations in hardware have made the high end of the market inaccessible to even the Amiga, which needs enough clever hardware to make it the most likely candidate for various game/animation packages. However, that is not to say that associate CAD programs cannot be found on either machine.

CALCULATING CAD

Entry-level packages on the ST and Amiga are hard to come by. The requirements of even the simplest CAD software make dedicated and ultimately expensive packages the only real option, and even these lack the kind of professionalism which might be expected.

Intro-CAD on the Amiga comes from IBI Marketing and, at £149.95, is perhaps the nearest thing to an entry-level package. It's simple enough to use and is designed to produce everything from illustrations for reports to floor plans and circuit diagrams.

Where Intro-CAD performs best is in its extensive library of pieces which permit parts to be grouped together so that an image may be designed using these different sections. This technique is not, however, nearly as extensive as that employed in Electro Design's Cyber Studio.

The package boasts a standard design style which is also reflected in Design 3D, a Gold Disk CAD product for the Amiga.

When Cyber Studio was first conceived it was intended to play the role of an entry-level package which could be

equated with the sort of all sorts of mini packages to become a top of the range piece of software. This has been achieved to a fault.

Cyber Studio contains the usual range ST CAD package - Cyber CAD as well as Cyber Moto, an animation program. But in addition, Electro have recently distributed Cyber Draft - probably one of the best design programs on the market for the ST - as well as a range of animation programs. These include the Carbon Design studio and the Modeler Design studio released in version 1.11 which contain basic Modeler designs of the relevant sets and pieces of characters and robots which may be imported into Cyber CAD and combined, shaped and coloured. Hence, an enormous library of sections may be created.

GOOD DESIGN

The equivalent Amiga package in this range is Design 3D from Gold Disk (IBI Marketing). It offers a superior 3D environment and allows the extensive colouring routines available on the Amiga so that all sorts of Mac II effects can be obtained and rotated at speed. This has also been accommodated in this package, a feature sadly lacking from Cyber Studio.

Cyber Studio is a OEM-based system with standard drop-down menus and double click icons - the same technique as that employed in Design 3D; therefore economy can be assessed in the user key although they must not take up too much space on the amateur computer machine.

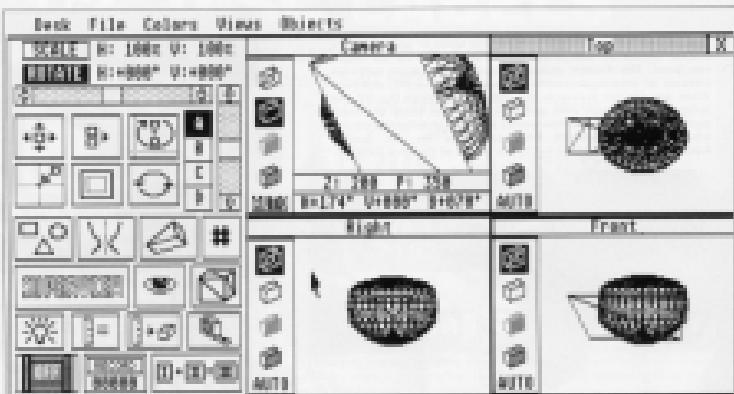

Both CAD can run on a 480x320 although at least a 1MHz 68000 is recommended for serious use. Design 3D

requires at least 1Mb of memory to run it properly.

FIRST DRAFT

CGD can be divided into two specific sections: drafting and 3D imaging. Cyber Studio and the Amiga's Design 3D fall into the latter category which reflects far more interest in the amateur side of CGD.

The basic design system is split into four windows which provide a view of the 3D image from several different angles. You only work on one design but the changes are reflected in all windows whenever they are updated.

The first step in creating any 3D image is to set up some basic planes. CGD images tend to be in a very blocky style with harsh, angular lines

scattered everywhere. This is because most designs must be constructed using polygons which can then be further manipulated.

The best way to go about getting your design into the machine is to draw a rough approximation of the size and split it up into 3D blocks. So, for example, a house can be neatly converted into a set of block structures. These can then be very easily created using a CGD package and merged in together so that you can end up with the design that you originally planned. Any type of polygon can be created very easily using these techniques. Facilities to split these lines will usually add an acceptable curve to simple shapes.

All sorts of features may be added to these lines depending on the pack-

age used. It is this area which is dominated by the sophisticated Cyber Sculpt package, boasting all sorts of features including revolving user-created lines around any axis as well as chopping sections of a design and pulling them out. (See issue 10 for full review.)

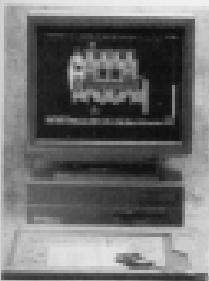

With both Cyber Studio and Design 3D the real deal in the design is usually to set lighting sources and intensities as well as creating colour shades for specific appearances.

Both packages offer the facility to view the design as a single 3D wireframed image and then resolve it through all manner of angles and perspectives. A special super-view supplies the perfect 3D picture of your design, boasting all kinds of colour shades from any selected viewpoint.

One of the most obvious essentials in the box of packages is to provide a hard copy output of the designs. The Allegro Design 3D is far more suited to professional use in this area with output to plotter being an integral part of the software. Both packages do, however, offer output to Epson printers at the very least.

The ability to save screens is another important aspect and both offer the chance to save the design complete with colour palettes and lighting shades. The format that Cyber Studio saves its picture data into is acceptable by all

■ KACAD is, without doubt, the most powerful system for 3D design to date. This provides a wide range of features unique to the world of mechanical design and to fit the needs of the total engineer - Albeit, basic drafting, graphics, hatching and plotting - and you're unlikely to make mistakes with Micrographix.

Other Cyber products including their parent package, Cyber Fast.

These two packages make up the base of the CAD scene on the PC and Allegro is on the list advanced systems are concerned. However, the wealth of facilities on the Allegro makes it a likely candidate for more intense professional competition. KACAD from

■ Allegro starts in a drawing package mode. There are three windows, at the top, to choose one of the three expensive options for enhanced CAD. Below, at 3D/feature appearance, it allows for the use of solids, wire frame and surfaces. A feature mode is developed to store more than 200 images in a similar way to a paint package but with far more attention paid to the working area. All parts of the working environment can be made up to taste or colour but the most sensible option is to maximise hatching and rotation as well as a range of dimensioning features. Input can be via keyboard, mouse or digitising tablet and output can be via standard Windows-compatible printers. The short basic problem need no range of plotters.

Baron expands enormously on these basic principles offering the type of professional CAD system required by those with specific interest in the business applications market.

The hatching and of KACAD is reflected in the hardware which is required. The basic program needs little of memory and a hard disk to make it a viable proposition, and a graphics tablet and plotter can both be added for easier input and output more accessible. The graphics tablet is the input device used by the vast majority of professional CAD systems so it easily takes part in KACAD as the home user needs.

The KACAD range is split into two packages - KACAD Designer and KACAD Professional. Both expand on the advanced techniques of the predecessors by including a range of additional features including, everybody's favourite, grids which can be used as a basis in the creation of less traditional designs.

Marketing on the KACAD package is one of its best assets while it is harder than on professional PC 3D machines, even on very complex designs. The higher screen resolutions on its design make such designs a possibility and with

colour implemented as well the results can be far superior to any other ST or Allegro CAD software.

FIGHTING IT OUT

CAD on the ST and Allegro is usually aimed at the home enthusiast where animation is often the only option, and with these interests being so non-specific it's not surprising that such CAD packages have found a home among this users. For ST users there are a host of smaller CAD packages but Cyber Studio is certainly one of the best, besides being extremely well supported by animation disks and the whole range of Cyber products. Studio offers a very user friendly environment particularly for the basic CAD function. Design 3D is the equivalent Allegro package which has, without doubt, one of the clearest manuals with superb tutorial sections.

The pricing and hardware requirements of KACAD really put it out of the scope of all but the most serious user. However, if you must reason for buying your machine in CAD then the KACAD and KACAD is certainly worth the money. Commodity market both and are currently offering special discounts.

FLAIR PAINT

Has a look at the art package that's making more than a few heads turn in the world of ST art. Flair contains the kind of features that previously you could only dream about.

SUPER

Again remember the Amiga disk editor we featured on our Cover disk in issue one of Format? Of course you did. But here's a problem: it was for the Amiga only. Now! It's time the ST has its frustrated users sorted.

TOPPER

Has ST got your hairy skills? If, like the Format team, your talents are restricted to the apply-and-paste technique, then Topper will free you. Topper, drawing to a new beat in no time at all.

SPRITE ST

Designing and creating graphics is a task that every would-be games programmer has to learn sooner or later. With SpriteST, this process is made considerably easier.

TRADE IT

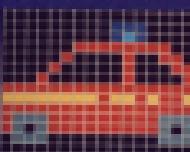

Are you having problems trying to track down that elusive disk editor that hides when you get out your trusty disk editor? With TradeIt, these disks won't have nowhere to hide.

FLAIR PAINT

Bring your own artistic resources with Flair Paint, by far the most advanced paint package on the ST.

SPRITE ST

Sprite editors are a vital part of many games software systems, and SpritedIt is one of the best you can get.

COLOSSUS CHESS

Do you think of yourself as bit of a klutz when chess is concerned? Well you can't beat Colossus Chess unless laser cannons, throwing stars and fireballs when you've got a game that is as utterly addictive as chess.

ROOT INTO

Add that little bit of extra sparkle to your work disks with this handy little program. Root Into allows you to put your own little friendly messages onto the front of your disk.

VIRUS 3.16

Format, champion of the cause to completely eradicate all known viruses, presents the latest release of the program that is generally regarded as the longest virus file.

DISK CONTROL

The Amiga's multi-tasking system is not exactly the most stable of working environments. With Disk Control, you can make those rogue tasks better before they get a chance to get help from the guru.

TUNNEL

Fun and friendly is what Format is all about (particularly when the Editor isn't about) and so we present our latest offering: a program that is guaranteed to send you tunneling for your dark glasses!

COLOSSUS CHESS

Games don't come any more addictive than this combination of real space and chess... Colossus makes it easy to play.

WIN WIN WIN...

All you have to do is become available to write the most superb program ever seen since... well... since... well...

AMIGA COLOSSUS CHESS

PROGRAM: BY COOS
MACHINE: ALL AMIGAS
PRICE: £19.95

Do you rate yourself as bit of a Kasparov beater? Then why not try your hand at the latest, and most certainly the greatest chess program to appear on the Amiga. We at Format certainly tried our best to beat Colossus but our pathetic attempts were miserably crushed in no time at all. Can you beat what is quite simply the ultimate chess program?

The demo version on this month's disk is cut down version of the full game. Our demo gives you 10 moves in which to either beat the computer or to baffle yourself (as far, the latter has been more successful).

To move a piece, just click on it and then click on the square you wish to be moved to. Alternatively, you can keep the mouse button depressed and then drag the

piece across the board yourself.

One of the nice features of Colossus is the extent to which you can customise the chess board and all the different pieces. Even in our cut down version, you can change the appearance of all the pieces into any one of four different styles, ranging from ornate to futuristic.

You can also change the orientation of the screen, either from 2D or (awful) 3D. When in 3D mode, you can even change the angle at which the screen is viewed by clicking on the base of the board, and, while keeping the left mouse button depressed, moving it around with the mouse.

GETTING GOING

You can load the Colossus Chess demo in two ways. The first, and simplest method is to insert our demo disk at the 'Insert Workbench' prompt and Colossus will automatically boot up.

Alternatively, you can load Colossus by double clicking on the CH32 icon on the Workbench. From Workbench, the computer will ask you to swap disks several times as the game loads; just follow the on-screen prompts and everything should load OK.

last, and certainly the most dangerous of Amiga viruses is the dreaded W32. Who can save us from this insidious file of disk? W32X 3.32 of course.

W32X 3.32 is the latest, and most powerful release of the popular virus destruktiv. But it is generally regarded as the least malignant. As well as the more mundane viruses such as the SCA and Light Guard viruses, W32X will also trap and kill the more obscure viruses such as the Byte Karron, North Star, System and even the Action W32 virus.

Once loaded, W32X sits in a little window in the Workbench file bar and monitors every disk that is inserted into the machine there after for any potential viruses.

When a virus is found, W32X will instantly inform you of its presence and then give you the

option of eliminating the file straight.

You can load W32X by double clicking on the W32X icon on the Workbench. Full instructions on using the program are included in the W32X manual.

TASK CONTROLLER

PROGRAM: PUBLIC DOMAIN

MACHINE: ALL AMIGAS

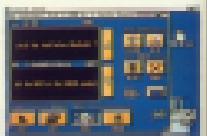

FILES: TASKCONTROL.DOC

When the Amiga was originally released, the machine was held up as a breakthrough in terms of price and performance. One particular area that received more than a fair share of abuse was the Amiga's advanced message passing, multitasking operating system. The Amiga was the first personal computer to offer true multitasking at any price.

Unfortunately, Amiga multitasking reviews soon turned to bewilderment as the Amiga operating system proved to be, unreliable, colour blind multitasking operating systems have two major fail points: the Amiga operating system badly lacks memory management and task priority. These two features are designed to stop a task that goes haywire from bringing the entire system down as well.

So what do you do when a task decides it wants to go ad infinitum? Use TaskController naturally.

TaskController is a very nicely presented tool that allows you to immediately kill rogue tasks before they can do any harm whatsoever. Used in conjunction with a game killer such as the CompuGuru based on cover disk #5,

■ Killing a task in the Tasker

LOADING THE OTHER ST PROGRAMS

This month's demo of Flair Paint is set up so that it will automatically load when you reboot with our cover disk in drive A. To access the other programs in the disk, either reboot your ST with a disk that allows you access to the Startup in drive A or load your ST with the Amiga cover disk in drive A while keeping the CONTROL key depressed and the Chequered will appear.

TaskControl will provide you with a graphical operating environment. Other features offered by TaskControl include:

- **SIM Task To Start**: just select and click on a particular task, then select sleep and the task will be sent into immediate status.
- **ALL TASK**: for those tasks before it gets a chance to awake its sequence on the Amiga, just click on the task to be halted and then select the kill option.
- **NOT PRIORITY**: tasks change any task by changing its execution priority; the higher the priority, the faster your task will run.

GETTING STARTED

You can run TaskControl by either double-clicking on the **TaskControl.DSK** on the **Workbench**. Full instructions are available within the **TaskControl.DOC**, please. This is a fairly basic program and therefore should be used with some caution.

SPIRIT OF ST

MACHINE: ALL COLOUR STS

Just take a look around at the way number of games can look ST and Amiga and by far the most widely used graphic technique used is the animated sprite. The quality of animated sprites can often make or break a game and if both the animation and definition of a sprite is right, the results can be very impressive indeed; just take a look at games such as *(Blood Money* for a very good example.

As you've probably already guessed, the cover disk program **Spirits ST** is a very powerful tool designed to enable you to easily produce animated sprites to incorporate into your games and other

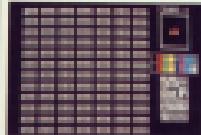

applications offered by Sprites1 include:

- **Sprite editor.** Sprites of up to 32 by 32 pixels can be easily created which utilise the full 16 colours available in the ST's low resolution mode.
- **Sprite image animation.** With **Spirits ST**, you can design several sprite images that are made up of up to 128 frames, and then string them together into a sequence of over 140 events.
- **Sprite in all languages.** Sprite designers for ST BASIC are all very cool, but what happens if you're an assembly programme? Luckily, the **Spirits ST** format is explained in considerable depth and therefore incorporating sprites into your programs is very simply indeed.

The current version of **Spirits ST** will only save and load its files from the top directory of a disk HD or LS, even if you try

**TRACK IT**

**PROGRAM: BY A FOUR-MATE
MACHINED: ALL 64%**

FILE: TRACKIT.PRG, TRACKIT.DSK

If you've seen any of the latest edition disk drives for the 64 and Amiga, you may have noticed that the latest 'feature' is memory for every trackwise disk driver to an LED display that shows the current track being read. All very nice indeed, but what happens if you've already bought a second drive or just can't afford the relatively high cost of such learned toys? That's of course

TrackIt is a very handy little program that displays the current track, sector and side being addressed every time the machine reads or writes a file to a disk in the 64's internal drive (A:). Just load the program and that's it, every disk access thereafter will be displayed by TrackIt.

GETTING STARTED

There are two versions of TrackIt included on the cover disk, one for colour users and another for those of you with monochrome vision. To load TrackIt just double click on the appropriate version of TrackIt for your machine (TRACKIT.PRG for colour and TRACKITPRO for monochrome) and instructions are available within the TRACKIT files.

HOW TO USE YOUR DISK

The ST Amiga Format cover disk is in a special format which can be read by both the ST and Amiga. Even if you are a seasoned computer user, please read these instructions carefully or you could damage your copy of it.

The first thing you must do is make a backup copy of the disk. Because of the special format, the normal disk-to-disk copying methods, as recommended in both the ST and Amiga manuals, won't work. Instead you will need to format a disk and copy the files individually. Don't panic, this isn't at all difficult.

ON THE ST

Instructions for a single drive machine.

1. Take a blank disk and format it in the usual way.
2. With the blank disk still in the drive, double click on the A icon to open up the (Blank) contents window.
3. Now drag the icon for drive B into the open window of disk A. This will copy all the files over to one off of the master disk onto your new disk. Make sure that the master ST Amiga Format disk is write-protected (the sliding tab should be back so the hole is open) and put it in the disk slot when you plug the drive in.
4. You will now be prompted of various times to insert disk A and disk B while copying, later place. There will be a lot of waiting to do on a single drive ST!

Note that our special space disk contains 2000 more files than will fit on a standard single-sided ST disk. If you run an ST at 320, you'll have to be selective and copy only the files you want.

ON THE AMIGA

Instructions for a single drive A2000.

1. Start your Amiga up with your normal Workbench disk.
2. Take a blank disk and initialize it in the usual way.
3. Now enter the CLI by double clicking on the CLI icon that is in your System drawer on a standard Workbench disk. Once the CLI window pops up, stretch it to full size using the window sizing gadgets at the bottom right-hand corner of the CLI window.
4. Now enter the following CLI commands to set up our writing environment (remember to press <Shift> after each):

```
FORMAT BASIC
COPY D: COPYFILE.DSK RELOCATE HIDDEN.DSK
BASIC C:
COPY D: CANCELFILE.FATFILE.DSK
FORMAT BASIC C:
PROTECT BASIC C: FDD
```

Now remove our cover disk and insert your destination disk and enter the following:

```
MOUNT D: /DISKFORMAT/FORMAT.DSK
COPY BASIC ALL /DISKFORMAT/FORMAT.DSK
```

```
FORMAT BASIC C: ALL /DISKFORMAT/FORMAT.DSK
```

Now repeat stage 8 for every directory on your cover disk master. On the CLI command above, replace each instance of the word FDD with the name of the directory to be copied. Once all directories are copied, our ST Amiga Format cover disk will have been successfully copied!

10. The final step is backing up your cover disk so you can use the same media as our cover disk and make it directly bootable using the following command:

```
FORMAT BASIC DSK /DISKFORMAT/FORMAT.DSK
FORMAT BASIC DSK /DISKFORMAT/FORMAT.DSK
```

USING THE PROGRAMS

All the programs on the cover disk have been set up so that they are as easy to use as possible. If you do have problems with a program, full instructions on loading and running the program are included in the disk pages and these should get you up and running. If you still have problems, read the documentation file (DOC) that is included with every program.

ON THE ST

To display the contents of a program's documentation file, double click on its icon and a dialog box will pop up which includes an option to allow you to display the file's contents on the screen. Select 'SCROLL' and the file will be displayed.

ON THE AMIGA

To display a documentation file on the Amiga, just double click on the appropriate DOC file to be viewed and a window will open and the file's contents will be displayed. Pressing the space bar will advance a page at a time.

COPYING THE DISK

Unless specifically stated the programs on the cover disk are not public domain and the copyright owners will be obeyed. Using these programs without the authors' permission is against the laws of copyright and offenders will be dealt with by law.

HAVING TROUBLE WITH THE DISK?

We have done our best to check that the programs on this month's disk are complete to use, error free and have no known glitches. However, we cannot answer telephone queries on using the software, and we cannot accept liability for any consequences of using the programs.

If your ST Amiga Format disk is faulty - and out of lots of thousands digitized home users found to be - you should send it back by June 15 for a free replacement to:

INSTRUMENTAL CHANGES

WHAT'S THIS CRAZY THING?

The potential for computer MIDI control of musical instruments is almost unlimited, so much so that many musicians have had difficulties controlling instruments for them.

Last May - perhaps the most famous example of this may played by Bernard Tapie and used by Jean Michel Jarre at the infamous "Revolutions with Beethoven" bicentenary concert last year. This works by translating the point at which a beam beam is broken by the hand, into digital graph data. It's not too practical, but looks great.

However here's a more practical instrument designed by German New Age musician Robert Baginsky. It has one sensor, and uses six control reference points for the instrument. The user need to define six reference points between the sensors, which defines the position and velocity of your hands and translates into MIDI data to drive a Synthesizer. The tool has been used on stage in Russia, and may well appear in a performance of Baginsky's (With Chip Chodos) in his country next year.

Autum - manufactured by Pohledex, the Autum consists of a pair of hand-held tubes containing motion detectors. A special panel converts movements into MIDI notes and velocity messages. As you just connect them to a drum machine and

shout him about the robotics performance sounds. Kowalski... Soundbeam - first developed in the Soviet Union, from 1985, the soundbeam is a computing instrument for the classic VHS video format and recorders. The Soundbeam is a motion-sensor device; the idea is to move around inside the ultraviolet lamp and generate MIDI signals, it can work three input ports - Jean Michel Jarre brought this... You will see Baginsky over there won't?

Synthesizers aren't the only things that you can connect to the computer via MIDI; there are lots of MIDI controllers - guitars, wind instruments, drums, microphones, even completely new types of instruments with which you can program your computer via MIDI systems.

MIDI is the digital information standard, introduced almost ten years ago, which lets you treat music like a word-processed document. Using a suitable MIDI software package and a MIDI controller - usually, but not always, a keyboard - you can record musical 'events' with the computer, edit them in your usual words, and have the computer replay them precisely. There are dozens of MIDI music packages for the ST and Amiga; some of them, like Syntrax Pro24, Cubist Creator and Bigfoot Arts AMIDirect, are used in top studios all over the world. Less expensive packages like Dr T's ACS, Syntrax Jupiter and Bigfoot Arts Disk Doctor are within the budget of most home musicians.

Excalibur Soundboards, on 0793 800239, can send you out with a copy of Pro24 or Pro24, MIDI 101 (£19.99), etc., etc. You'll be able to supply with any of the other products mentioned.

The ST, of course, comes with MIDI sockets built-in. The Amiga requires an additional MIDI interface. Probably the best buy in the market is Dataflow's £199.95 MIDI/FD1 (MIDI Master), which offers one IN, three OUTs and a THRU socket, and a high degree of software compatibility for CP/M-DOS. It's available in different versions for the 4000, A1000 and A2000.

But that's enough about MIDI.

NOT AIR

The Bigfoot MIDI-Mic - imported by major manufacturer Farfisa - is a hand-held pickup/MIDI controller which allows singers (or for that matter players of any monophonic instrument) to control MIDI equipment. Black, sleek and futuristic, the MIDI-Mic incorporates a small condenser microphone which picks up the

sound of your voice and attempts to convert it into a MIDI patch signal. The soft-touch controls on the head allow you to set the MIDI channel, patch, note attack, velocity response, volume and so on. Then it's your job to sing as cleanly as possible. £199 buys you the instrument.

GOING MENTAL

A mind-to-MIDI converter has been the subject of *Software News* page April. Good news, but would nevertheless be an unusual device for an average person to buy. Just plug into your brain and think your tunes? Amazing, but... where is probably working on it right now...

Goldberg recently, the only practical wind synthesizer was the Syntron. The advent of MIDI has changed all that; now you can get real wind synthesis for less than £100.

Excali 04000/800 - The 04000 and 04000S horns may look like toys, but they've been used by bands such as Status quo both on stage and in the studio. The 04000 horns are played like recorders - you blow via the mouthpiece and finger the keys as you would a recorder. Although

you can't breath and do away with the need for any breath, both horns have a number of woodwind-style electronic keys such as flute, oboe, and clarinet. These can be heard through the built-in speaker or through an external amplifier. You can also plug them into an external MIDI module for amazingly realistic wind-synthesizers. By using sample and loop techniques, Excali have managed to create a number of different

instruments on the mouthpiece, you can create effects impossible to play on a keyboard - and, of course, your ST or Amiga-based MIDI sequencer package can record all this data for later use.

Namica 900T - This wind-sounding implement is now available at a discount price of around £299, though it doesn't make any sound itself, the instrument works by connecting its MIDI output with the

breath-controlled signals recognised by most Namica synths since the 031. The 900T is played like a saxophone, and has a unique transportation range using thumb-holes.

The similar mouthpiece has a plastic head; the key-layout is unlike the 031. The response can be tailored to your individual playing style by adjusting switchable modes, the bassoon. There's a very sophisticated MIDI spec which is particularly suited to Yamaha's T01/12 multi-timbral FM tone module.

SOUND YOUR FUNKY HORN

Excali 04000/800 - The most unusual synthesizer, such as Yves Charles of Status quo puts it best, "it's a toy, it's a toy, it's a toy". It's a genuine wind-sound synthesizer made purely from compressed air. The 04000 is a traditional single horn that looks like a mouthpiece, which has a treble and bass end, allowing you to create a natural range of instruments. An electrically powered pump creates enough air pressure to move the valves which divide this into different sounds. It's a very simple device, but it does require some initial learning, this including aspects of the mechanics. It's always important to change filter pitch you have to, set the mode switch to a fixed position, then play a note, which determines the new pitch of the note. This system is fairly simple, but by connecting an LSI display or memory sequencer it makes it easier for police down to a synthesizer room.

The mouth has an air-tight polypropylene valve, including connection and mouthpiece guides, bags, transport and cases. These can be found through the Authorised distributor or used in a complete. Some of these have built-in switches, records and sequencing software added. In addition, the 04000 has a digital synthesizer with twelve programmable voices, rhythm patterns, patch memory and more. There's also three drum pads which trigger them, noise, bass and control sounds.

The 04000 can connect into your sequencing units, patch changes, leading the rhythm layers, solo stacks and performances. Within a multi-timbral module you can assign a different synth voice to each track. By using your computer's software sequencer it is even easier to record six different tracks at once - much as a different keyboard! One of the main is a sequencer track.

MIDI FACT SHEET

DIGITAL DRUM SETS

There's nothing quite so satisfying as a good beat at a drum set - unfortunately, real sets are big, noisy and expensive to set up. MIDI can help with the last two.

Drumset DP1-MIDI - Oberheim's DP1 Powerset Kit costs £159.95, and consists of five full-size electronic drum pads and a strong tubular steel frame. As they stand, the pads don't make any sound - hitting them just produces a microsensitive trigger which can activate sounds from drum modules such as those manufactured by Tascam.

A triggered-MIDI converter - for instance, Casio's CT1 - will let the Oberheim DP1 drive any MIDI module like the Roland MT-2 or ST-10.

You can connect the DP1 to an interface box or interface with Oberheim's own digital drum machine. At £149.95 this is the cheapest on the market; it offers eight sampled sounds which can be rearranged using special data tapes.

Rhythmix DP5 - another excellent budget MIDI drum module is the £380 DP5 from Yamaha. This is marketed by the home keyboard division, but has a lot to offer professional musicians - so much so that it was used by production team Cocomat on hits like *Stop This Deep Thing*, *The Only Way Is Up* and *People Hold On*.

The DP5 features four velocity-sensitive MIDI pads, which are designed to fit 10 with sticks rather than fingers. There are 127 ROM sampled drum sounds available here, snare, hi-hat open and closed, toms and cymbal. Any sound can be assigned to any pad, and when played through the internal speaker or output to an amplifier.

The DP5 also has 30 built-in preset patterns, covering all sorts of styles including rock, disco, Hippie, bluesy metal, brassworks and world.

The DP5 really comes into its own when you use it as a MIDI controller for creating your own patterns. Looked through its MIDI OUT socket to a polyphonic sequencer running on your ST or Amiga, it can be used to build up complex rhythm patterns which can then be downloaded to your synthesiser, sampler or drum machine. Just, unfortunately, on the ST, which lacks a MIDI IN. As usual, though, it makes the £450 Roland Soundset - which has eight pads and a much more complex MIDI spec, but no built-in sounds - look a bit silly.

KEYS PLEASE

Even if you plan to use a MIDI guitar, keys, drums or whatever as your main controller, you probably need a keyboard at some stage. In the same way that you can save money by buying keyboard synth modules, you can also save by buying standard MIDI master keyboards.

There are two main types: 'mother' keyboards designed largely for plastic

and 'remote' keyboards for stage use.

Chester MKIV - this is the clear budget winner in the 'mother' keyboard market. It offers seven octaves of velocity, aftertouch and release-sensitive full-size keys, four key-assignable piano-style pads each with its own MIDI OUT portlet, MIDI IN and THROUGH, LCB display,

pitch bend and programmable modulator wheel, and eight performance parameter buttons. All this for an unbelievable £199.

Casio AX1 - loads of appearance in one voice, and demand from musicians, have prompted Casio to revise it at a reasonable £275. Inside stocks last! The heart of the remote keyboards, the AX1 has buttons on many transmitter pages, and is styled in eye-catching white with a guitar-style neck and head. It's slung over the shoulder on a guitar strap and played with one hand, while the other hand operates the performance controls.

There are three-and-a-half octaves of full-sized keys, two control wheels, parameters and button buttons, a programmable pitchbend slider and a bank of pitch change buttons. It's velocity and aftertouch sensitive, and can send out MIDI signals on two programmable channels simultaneously. A great toy for style-conscious musicians. ■

■ This month we're showing Oberheim's new digital drum machine, the DP1. The instrument is a bit of a oddball, but which is probably around you will need to connect the kit to Oberheim's own drum machine, called the EPIC-1000. It's a multiplay synthesizer, which means it can play several different instruments simultaneously. There are also two programmable channels.

LEARNING TO COUNT AGAIN

This month's episode in the teach-yourself-assembly saga looks at subroutines, negative numbers and simple arithmetic. Your personal microprocessing guide is TURBY FOSTER

Last month we looked at how the Z80A, DMOV and DMOV+ instructions can be used to move a portion of code in a single loop. Often, however, we need to move a section of code repeatedly. For instance, when you're screen clearing routines might be required in several different places within a larger program. You don't have to start having to repeat the code by moving it into three, as in Figure 1.

No, additions to the code make it a subroutine. The label 'Clear_Screen' identifies not to identify it when it is run with an instruction like 'LDH (Clear_Screen)'. The Z80 'Clear_Screen' and the Z80A 'DMOV' instructions then indicate the end of the subroutine. Z80 is short for Branch to Label and R7 is short for Return from Subroutine. A program may then go to call the subroutine at any time simply by using 'LDH' label.

In fact, subroutines may even call itself. This is called 'recursion', and frankly it only rarely does!

Subroutines are normally placed after the main program. Always, add comments to give a brief description of what the routine does, details of any variables (parameters) which need to be passed to the routine, a list of registers whose contents are corrupted and details of any parameters returned to the main program, either in registers or RAM. This information will be valuable when, long after the code was originally

written, you want to reuse a routine.

PARAMETER PASSING

To pass parameters to a subroutine you have to make sure that any variables that the routine expects to be in the stack, within a table of variables or in the stack are indeed present and correct. For example, 'Clear_Screen' expects R5 to point to the base address of the screen, if it didn't then 32,000 bytes of memory would be cleared from wherever R5 happened to be pointing at the time – possibly elsewhere. Some subroutines don't need any parameters.

It's worth considering more closely what goes on during a subroutine call because it should help you understand what the stack is and how it works.

STACK TIME OUT

The stack is a section of memory which the computer uses as a kind of 'holding' place to put on the stack ('pushed') in the program and can be referenced later. The memory which is used for the stack is pointed to by register R7, longer, logically enough, as the stack pointer. In fact you can use 'SP' instead of R7 in instructions if you wish.

When a subroutine is called the address of the instruction following 'LDH label' is written onto the stack so that the processor knows where to return to at the end of the call. The return address is

* According to clear the screen pointed to by R5. *
LDH CLEAR

MOVE R0, R5

CLEAR: LDH R5,-R1,_SCREEN_0:

used to be 'on the top' of the stack. At the end of a subroutine R5 reads the address from the top of the stack (in practice, factory cell bypassing). Whatever information is pushed onto the stack the stack pointer is pre-decremented making it point to a lower memory location before writing the data. Popping information off the stack is accompanied by 'post-incrementing' R5, increasing the pointer after the information has been removed.

Registers R0, D1 and R0 are smashed by 'Clear_Screen'. If those registers held important information from the main program their contents could be preserved by putting them on the stack, then repositioning them after the subroutine has finished, as in Figure 2.

It's important to use pre-increment and post-increment addressing, otherwise you'll end up overwriting information on the stack.

Register D0 is the first register to be pushed onto the stack if used for the last register to be popped off. Clearly the stack pointer R7 must be used with care. By the way, whenever an ST or LDMG program is run, R7 is set up by

DOCUMENTARY EVIDENCE

What happens in whilst programs are documented varies enormously. It is usual in academic or corporate environments to produce books of documentation to enable anyone to understand, and therefore update, the code when the originalists are long gone. This consists of paragraphs to tell the first part of using the code. More often than not, it's the next bit of using the code that's often 'a good assembly language programmer can only produce eight lines of disassembled code per day'.

In contrast, many games programmers provide virtually no documentation – this is understandable as throwing code away since it's hard to reuse code when you've forgotten what it does!

I don't pretend to be perfect but here's how I document code and, of course, I recommend that you do the same when you are writing code (if the ideas are present in your mind), you know what's going on. Or at least you know what should be going on. This is the best time to write this code notes about a routine and associated instructions. It's a big mistake to think you'll write down the instructions first then, when one code is fully developed, it can be discounted this way if never gets documented.

I know, I know, you're interested and can be called upon to write the comments later, the trouble is there's always something more important to do. Get into the habit of writing comments when you write the instructions. It will soon become second nature and will pay off in the long run.

Comments should never assume what an instruction does from the processor's point of view. This is silly:

LDH R5,-R1,_SCREEN_0:

Comments should describe what is happening in terms of the application the instruction serves. Use this:

LDH R5,-R1,_SCREEN_0:

the operating system so that you can use it straight away.

Since there are 15 registers (R0 - R7 and R9 - R15) that may need to be saved on the stack at any one time the 68000 has a specific instruction for doing this: MOVEW/MOVW/MOVG register. This instruction saves words or longwords but not bytes.

The calling sequence in Figure 2 could be changed by using this command:

MOVEC.L D0/D1/D2/D3,-16(A1)

MOVE.L D1794,00000000

The register list in MOVEW must specify data registers before address registers in the order D0 to D7 then R0 through R15.

If registers are saved around memory like "Data_Screen" it's called when it would make better sense to save your global stack and leave them within the subroutine itself.

TWO AND TWO IS FIVE

The 68000 provides extensive instructions for addition, subtraction, multiplication and division.

See addition instructions page 1: ADD, ADDI, ADC, ADCI, ADDB, ADCB and ADCI.

ADC stands for Add Binary Coded Decimal numbers. Binary coded decimal (BCD) numbers have each nibble coding for a digit between zero and nine. A BCD, therefore, can hold the numbers 0000 to 1111. Although the conversion seems attractive at first sight, there is little use for ADC. In fact, it's best to forget all about it.

ADD is used to add together bytes, words or longs – however, at least one of the operands must be held in a data register.

ADD (ADD Immediate) is used

to add immediate data bytes, words or longs to a data register or to somewhere in RAM addressed by the destination operand. For example, ADD #7,M0H calculates the destination address by adding 7H to a copy of the contents of register R0 then adds 7H to the word found at that address. (R0 is not affected by this instruction of course.) Remember that the high denotes immediate data.

ADCW and ADCIW require a word of immediate data and ADCB requires a longword of immediate data. Since the ADC opcode itself requires a word of machine code then usual 68000LW at occupy four bytes of memory and ADCB occupies six bytes of memory. Fortunately the 68000 provides an add instruction, ADDS, that only takes up two bytes. With this instruction the immediate data is restricted to range from one to eight although this may be added to bytes, words or longs. ADCB stands for BCD-Quick and is much faster than ADCI.

ADCW (ADD to Address register) is used to make an addition to an address register. ADCW, like all other instructions with an address register as a destination, doesn't allow byte-coded operation and instead sends data to the entire length of a signed byte extended as explained in the book. Hence, ADCW #240,4H is interpreted by the 68000 as ADCW #24000000000000000000000000000000. This is done internally in the processor on only the word of immediate data (00000000) appears in the machine code. Similarly ADC #240,4H or ADCW #00000000000000000000000000000000 is interpreted as ADCW #00000000000000000000000000000000. (It was the chip handles negative numbers also explained in the book.)

Finally, all 68000 instructions affect the condition flags. Hence, ADD, ADC, ADCB and ADCI all:

SIGNING ON

The most phenomenally wonderful number system ever invented is known as two's complement. This simple system is used by virtually all computers. Negative numbers are represented by setting their most significant bit (MSB), a place setting indicates a positive number. For bytes bit 7 is the sign bit, for words it is bit 15 and for longwords it is bit 31.

To convert a positive number to its negative counterpart subtract one and invert each bit.

0	0	0	0	0	1	1	0	3
0	0	0	0	0	1	0	1	1
1	1	1	1	1	1	0	1	Invert

Since -3 decimal can be represented by the bytes FF03, the 68000 instruction #FF03,LW,-16,A1 will perform the negative procedure for you.

You can only ADCW/ADCIB/ADCIW/ADCI add one through the answer is saved back, namely, to keep the 1 produced on bit 0 copied in bytes at byte and words as carry. This is apparent in your computer when you add two numbers.

The largest positive number available in a byte is 127 because anything greater would leave the higher set. The most negative number is 128. The bytes can hold 256 unsigned numbers from 0 to

65536 inclusive of 0 but their complement signed numbers from -32768 to +32767. Similarly, unsigned words range from 0 to 65535 (0 to 32768 decimal) and signed words range from -32768 to 32767 (-32768 to 32767).

If you want to convert a signed byte to a signed word then the byte must be sign extended (ie copy the sign bit to the 8th byte) of the word (bit 8 to 15). So 65535 becomes 65535 and 0000 becomes 0000. Similarly, for floating words, to convert words to bits 16 to 31 is needed zeros bits 16 to 31. So -3 is represented as 10000000000000000000000000000000. The 68000 instructions SXTI and SXTL perform these operations.

Now does a typical instruction such as ADCW know whether the data involved is signed or unsigned? For example, if R0 holds 00000001 and R1 holds 0000 will ADCW produce the result 00000001/0000 = 00000001 or will it produce 00000001 + 00000001 = 00000002? It doesn't matter. How can it not matter? You see, simply 00000001 is neither signed nor unsigned. (00000001/00000001 is a complement. They are both identical -00000002.)

It doesn't matter whether you treat data as being unsigned or signed as long as you use the two's complement representation of the items.

- If bit 7 of the result was zero then zero is cleared.
- Set C and Z if a carry occurs.
- Set V if an overflow occurs.
- Set N if the result is negative.

ADCW doesn't affect any flag.

SWOB, SWB, SWBL, SWBL and SWBL work in exactly the same way as the addition instructions, except, of course, they subtract.

YOUR COMPARE TONIGHT...

Suppose we need to test whether the number 47 is present in a data register. We could use:

BEQ 1,1,10

BEQ 1,1,10,10

This is a reasonable thing to do so long as the data in D0 is not needed later as it is changed by SWB #47,00. You could get round this by adding 67 base, but that's a lot more. To get round this the 68000 provides the compare instruction, CMP, which produces the condition flags as if you had subtracted the number, but leaves the data register unchanged.

CMP, ADC, ADCB

ADC, ADCB, ADCI

You can check the address register contents with CMPA, which works on words and longs only, of course.

CMPB (Compare bytes) compares memory words or longs via address register indirect with post-increment addressing. In other English words, if address register points to where the data may be found in memory, and is increased by 1, 2 or 3 or 4, it is offset after the operation so it automatically points to the next data location in memory.

To simplify the mechanism:

Hence, trying to read the word from the effective address (offset) = DB or 2000H by reading – and multiplying it with the word contents of a data register (using the longword result) in the data register. MULU takes no notice of the signs (negative or positive) of the numbers if it's multiplying. MULS is similar but operates on signed data.

DIV and DIVS divide unsigned and signed data respectively. The longword at the destination data register is divided by the source word and the resulting quotient is placed in the lower word of the destination register. The remainder is stored in the higher word of the destination register. (Be sure that the denominator however operated is not zero else "divide by zero exception" will occur - errrrr.)

Mulps take a lot of processing time and have a fixed hard value telling it exactly what it does. But it is 60 times or thereon programming it though.

The clever data bytes in the file called SOURCE3.S which can be assembled to illustrate simple arithmetic. The example programs from last month which use all off the disk are also included.

■ A world of icons
Screenshot with my modifications.

You must have noticed how many games, business packages and even the Freestyle cover disk have customised icons on the Workbench. They aren't essential - the standard Amiga icons are fine - but after a while you get sick of looking at the same boring old icons sitting there on your Workbench. Admittedly your Workbench disk has got an icon designer on it too, called IkonEdit, but you can only draw in four colours. Many packages will be satisfied with that, but you can't live without 16-colour icons and IkonEdit could be the thing for you.

DEW OF THE ICONOLOGIST

What can IkonEdit do that IkonEdit can't? Well lots of things in the short answer, but they don't pay me to come up with big answers like that. To reiterate, standard IkonEdit can produce four colour icons, but IkonEdit can produce them in two, four, eight and 16. Why should you bother with two colours? Because that way less space is taken up by the Workbench which gives you more memory free for programs and applications that you want to use.

Also you can create the alternate icon which appears when the original icon is clicked on; a typical example of which is a disc icon that slides open when you click on it. Both the original icon and the alternate icon can be copied at the same time and are both visible simultaneously.

Icons can be created up to 128 by 128 pixels, approximately a quarter of

is no more than a typical game at around £20. Much more than that and it wouldn't be worth the price, but as Istands it's priced just right. It has some fairly useful features that other disks lack, different, but often while you'll grow bored of designing myless icons, and you'll also make a lot of disk space with large multicoloured icons.

■ IkonEdit icons in IkonPaint's Workbench normal and alternate icons can be designed at the same time.

the screen, icons that size eat up a fair chunk of memory though, especially in 16-colour.

IkonEdit itself can be used to design the icons with no problems, but if you want a more powerful drawing tool you can buy my art package that uses standard PCT format for its pictures or borders. Both can be loaded into IkonEdit, but with pictures you must make sure that the section of image that you want is in the top-left hand corner of the picture. A maximum of 16 colours can be used and font and interface are not supported.

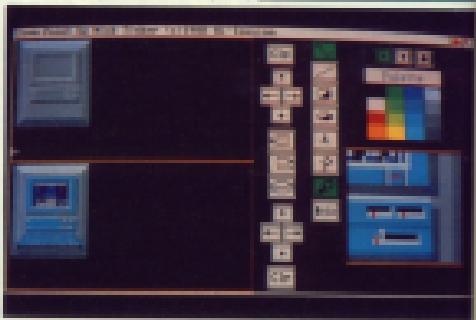

THE PRICE IS RIGHT

One of the most important considerations in any product, especially one with such limited use as an icon designer, is price. Fortunately for IkonEdit the price

INTO THE CLI

It's easy to say that they have better menu commands than those at which others have to use their menus, or which offer more than the Amiga's own menus.

Four of them simply offer the number of colours on the Workbench: 2, 4, 8 or 16. Others have these must be entered in a dialog if you want more than four colour Workbench, but this has been made easier by a single command word already in the CLI.

■ In IkonEdit's terminal window with a maximum of 16-colour icons.

LIFE BEGINS AT THE HOP

Constructing characters and moving them in mysterious ways is the name of the game this month in part three of MARK PICKAVANCE's animation tutorial.

HOW YOU have lived to draw Mickey Mouse? Easy, isn't it? If you are going to create many models of animation within a reasonable time scale then your subject must be easy to draw; this was the thinking behind the design of Mickey. Animators modified his shape and construction to be as simple as possible so that animation can be concentrated on.

Open the page you will see Mickey at various stages of completion, which might give you an idea of how to go about creating a character. To get some practice either copy the design or find yourself a suitable cartoon. The object of the exercise is to produce a still image, so you can use any paint package.

You only need eight colours as it you can get higher repetition by reducing your palette to eight colours than do so. For example ears drawn in Delores Paul because it allows you the highest resolution and colour combination. Disney Animators get colouring with much efficient techniques (and software) to exploit all the original line graphics were created on a 16x16 8-bit using

Free Paint in high resolution monochrome.

HEAD AND SHOULDERS

There wasn't an official way of 'The Art of Drawing Mickey' to get those initial circles the correct size and in the right place. Having an art package which can measure in an advantage. Always draw Mickey's head first. It is the dominant part of his persona and once you can get the head right you are 80% of the way there. Once, when asked how he could draw Bugs Bunny so easily, Chuck Jones said: 'First I draw a carat, then I sketch a rabbit to it, then it becomes'! Chuck wasn't being totally facetious; what he was trying to say was that if characters have a key component from which the rest of the design must relate, he found that by positioning the carat - or the hand holding the stencil - the rest of Bugs fell into place.

There's one last thing to note about Mickey: Like almost all 'toons', Mickey has three fingers and a thumb. This is because Disney's animators could not draw four fingers and a thumb without making the hand look like a bunch of lemons. If they couldn't do it there's no point you attempting it.

MORE YOUR MOVE!

Last month we promised you more movement, so here goes with jumping, skipping and a double bouncy walk. You can copy the designs into whatever software you feel yourself most at ease with. And to prove that colour isn't everything, the jumping and skipping designs were painted in high resolution monochrome.

With a jump the entire body is treated as a bouncing ball. The arms give extra force to the action, project-

the character's weight in the desired direction.

The six drawings overlaid that make up the motion are designed to look so you could repeat them to get a series of jumps across the screen. Another move could involve making the bounces and landing points different heights. This would mean you compressing or expanding the number of frames depending on what you wanted. If you wanted a jump closer you would need to add frames because the character has further to fall.

Since 'jumping' is 'skipping', skipping is not very different from jumping - in fact, it is jumping off one leg. The importance of this is that we very rarely jump with both legs simultaneously. You spring from one leg using the other as a counterbalance. Frame three shows where the key action. The front leg has been accelerated from the point that it was released from the ground. Between frame three and four it crosses the centre of balance. The resulting momentum carries the character off the ground. This is supported by the throwing of the leg into the air, giving additional upward force. The rest of the phases are concerned with maintaining

BACK EXAMINATION

In 1934 Donald Duck had become more popular than Mickey Mouse. His more nervous abilities to get angry, jealous and aggressive soon made people to relate more easily to him. A writer for the Los Angeles Times said of Donald: "Being born in the middle of the last depression, Donald was a child of adversity and like so many of them, made his way by scrapping. The duck was abandoned. Donald was the spirit of fun and fight and good moral principles. I believe in this, but the duck seems to have lost."

SUPPORTING CAST

Mickey could not play centre stage without some support from other characters. The first were Horace Horsecollar and Horatio Coot in *The Wise Guy* (1935). Then came Pluto in *The Chain Gang* (1935), though for reasons referred to as Pluto until 1935 as a dog called *The Mouse Head*. A year later Goofy appeared in *Mickey's Mouse Revue* as an instant success.

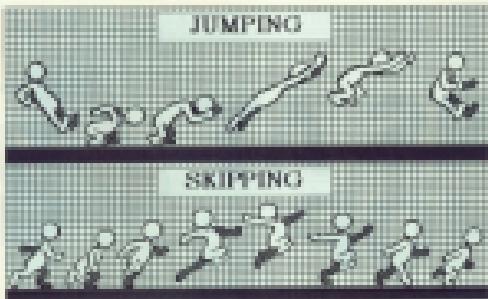

Donald was designed and animated by Art Babbitt who, no doubt, learned some of Richard Williams' animation (they created Roger Rabbit). Art said about his creation, 'Goofy was the kind of character that thought very little and long about everything that he did. And then he did it wrong!'

In 1934 Donald Duck made his first appearance. Originally he was much thinner than the figure of today. Though he did sport the sailor suit and cap which have been his basic mark ever since. Both why he was dressed like this, is anyone's guess. His first story involved swimming and was called *The Three Little Pigs*.

MAKING THE MICK

WALT AND OSCAR

Some animators and directors have tried to claim the title of contribution to the art of motion pictures. Walt Disney was given a staggering 52. The most famous of these was the special award for Snow White - it was one large Oscar and seven little ones.

ing balance for the landing and compensation that follows. If you want to treat this as a step then show only the first seven frames and then move the limb positions so that your character skips alternately on left and right legs.

Note: characters that skip are not usually associated with acts of courage.

ICE SKATING.

You may often want to have characters walking around the screen rather than walking on the spot. Some programmers and designers do not see this as a problem. They just shift the centre a few pixels and leave it at that. This often leads to 'ice skating' where the movement of the feet leaves no relation to ground.

The simple way to deal with this is to use the heel or the foot in contact with the ground as a guide. Unless you are on ice or ice, a foot which is planted on the floor will remain in the same place and tilted. The problem with this is that virtually all animation packages move a single sequence by a set amount each frame. This is not what you want. The only solution is to position each frame by hand or use some way of offsetting each frame by the correct amount.

Characters can build a data table of the correct offsets to make the walk look right, but this often conflicts with the requirements of the game's control. There is no simple answer.

JUST PLANE CRAZY

Mickey Mouse first appeared in 1928. The design originated out of another Tom, Cheetah the Lucky Rabbit. He had underwent a name change from Mortimer to Mickey before the first film, Plane Crazy was released. Plane Crazy was animated by one of the fathers of early animation, Ub Iwerks. He became famous not only for the quality of his animation but also the speed with which he worked. Plane Crazy was completed in under two weeks. At producing over 700 drawings a day.

It was not until Mickey's third film, Steamboat Willie, that Mickey captured the public's affections. The changes that made all the difference was sound, well had been inspired - after seeing The Jazz Singer - to put proportion and adapt for audio. The New York Times thought the film an ingenious piece of work, and renamed 'a new cartoon character destined to be known as Mickey Mouse'.

DOUBLE BOUNCE WALK

Previously you've been shown how to create a walk cycle. A standard variation on this is the double bounce walk. This is the technique Disney animators used to make Mickey's walk more expressive, giving him a more controlled cycle by keeping the head and body in the mid-section.

This double steps occur in these 2 and comes up every 4 frames. The arms are much more expressive though not as often, they only move in the sweep-

over passes. The head bobs twice in the same time as one full on a standard walk. Obviously you're viewing the action from the side - it moves from the front to the arms, going right across the body. The arms are held in a sustained position before moving into the opposing pose.

The hips accumulated all this upper body movement, the greater the displacement of the arms, the more the hips must swing.

MUCKY MARKETING

Marketing folk stuck for a creative idea have always turned to pornographic sex-on messages to sell their products - especially if those products are targeted at men. Advertisements, game titles, computer games and, in some cases, game programs, have all featured their fair share of the erotic. Admittedly, eighteen-year-olds computers weren't able to offer the detailed images possible by game machines like the ST and Amiga, so the on-screen reality was often a far cry when compared to the packaging. But that sort of thing never worries marketing folk...

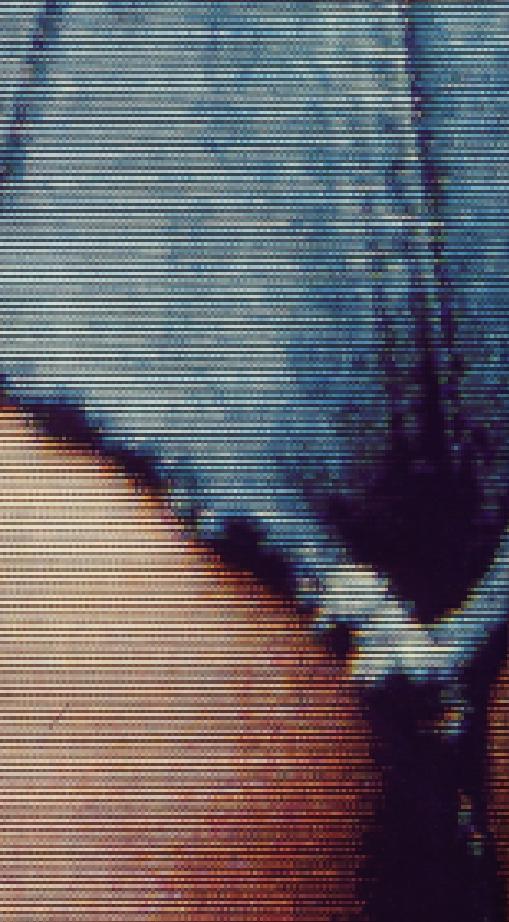

In the case of a straightforward advertising game, the *Play It* possibilities are obvious - and a marketing person's dreams, that is. Not only can you play cards to see more of Maria Whissler's own lingerie charms, or your own pubic hairs, you can drool over the prospects of doing so by reading between the lines of the blurb:

"Braads and broods can be used as a seductive image in advertising for non-sexy games. You'll receive a lot of a viewer should... when they appear in ads, may remark and comment." (Patricia Shandaken, the one saw fit to complain about the sexually-clad home page presented Maria Whissler.)

Well, there is always the option of getting the software itself out of the cupboard. Even basic man-hunting can be done on the web or its cousin, email, and a fair number of visual titillators have been exaggerating the proportions of the female form in the joint names of art and exploitation. From *Barbie Dream Girl* and *Sex*, through to *Dollhouse* or *The Clown*, creators of magazine advertising may have taken the broad, unclad on the underwear compression and inflated it beyond the anatomical limits of the real world.

But, it may well be...

Although one of the elements of amateur photo sessions is to have fun, there's also a desire to impress in any photos to satisfy someone's sense of the steady amateur market has been filled these choices, don't think it's a good idea to print a photo in a magazine or newspaper. On the left page, you can clearly see a copy of *Playboy* magazine at the top. This page is more traditional than those displayed on the sample.

She plays a major part in life, just always has done. Marriages, and in particular, ours, has always been affected by the act which gets her off the planet. Early days, when we had invented a few basic tools which led to increased leisure time, were found by old hand turning to cerebral matters like art, using crude implements - brush and screen of wood for - our cave-dwelling ancestors applied rudimentary pigments in the rocky walls of Chauvet.

And the subject of these early artists? Why man himself! Of course, that going hunting, man carrying with him clubs in the hand, and very machoised man anything on his. When art was born it was delivered into the world with excess, and an enduring tradition was created as man learned new techniques he discovered that there was almost always a sex angle.

Moving on thousands of years, mankind got the language problem sorted out and invented ways of communicating words, to handy surfaces like parchment, leaves of stone and walls. Since, those with creative minds began to think about writing things down that would amuse and entertain anyone smart enough to be able to read. Poetry and prose arrived - along with written artifices and graffiti.

Then the Helium balloons were being let up and everything was being given a Greek name, the word pornography was coined to cover an increasingly popular literary form. (Those with a Classical education along with powers of hyperlogical detection will already know that pornography is derived from two Greek roots, *porno* - prostitute and *grapho* - write.) Fortunately for the sake of sanity, Greek authors with sexual inclinations soon found other things to scribble down, thereby widening the scope of the original term for pornography.)

As the centuries rolled on, the human race developed new technologies, new ways of recording and distributing information, computers and images - printing, sound recording, telegraphy, old photography, movies, television, video, holography... the catalogue continues to grow fast as each new medium evolves. It was coaxed by commercial interests, artistic interests, and by those interested in erotica - or pornography.

Computing technology, of course, offers a medium for the creation, storage and dissemination

POWER FOR STUDS

There's no invasion of strip television or movies. Monopoly which is probably the only reason why the school hasn't had one, as yet been used to jolly up bodies in most pornography or other board games. Every time a new strip poker game arrives in the streets of imagination for review, it is accompanied by a press release which features an interview about the current programming, the many approaches and the all-round merits of the programming aspect responsible. The game plays on accident going to pick the relevant meet. You could almost guess who has the main point of the game is to get the clothes off the back of some strip model body.

Sam Fox, Mario Winograd (in his Children's Box of all images) and David of anonymous female faces featured in photos used prior to strip-television. Perhaps the greatest need yet to be added to a strip poker game appears to bring some queer-pornographic lingerie column that you have to play to the end to discover that there's more than just imagination inside the boxes.)

The motto for the past decade has been "Get out of the pressroom" because German programmers located independent Power. For a long time to get the confirmation of a freedom isn't sufficient enough, a majority family allows the player to obtain even the better viewing of amateur content.

tion of information. As soon as software could be published in hex, and the supposedly cerebral nature of computing didn't stop a reasonable chunk of the software being about sex. The concept of *Pixel Fuck* was probably born in the connaît viewer produced by Epyx's working relays, but Barron's little scope for sex in abstract concepts like numbers, no way that punched cards or paper tape operations could be harvested for the purposes of writing about prostitutes.

To begin with, the exciting potential of the computer as an interactive medium was lost on the predominantly engineers and computer operators, who were prepared to go to great lengths to get what they wanted out of their equipment. Using experimental shading techniques, generated by complicated backtracking and comprising comments programmed into inspectors, heathy calendars were produced in computer rooms throughout the world.

The other band of computer addicts who had access to terminals in the early days began to find ways of entertaining themselves. Games such as Star Trek, from the Magazine and Computer Game Advertiser came into being, but the minimal graphic capabilities of early multi-user mainframe systems meant that entertainment software was usually text-based. Of course, once the first adventure caught on there was no reason to keep things clean...

Around 10 years ago, home computing became popular and as inexpensive machines found their way into homes, people started writing and selling games for them. Soon looking versions of poker were cheeped up, or rather undressed, with mostly matching graphics. Text-based adventures made the transition from mainframes and then were then used, only with titles such as Leather Goddesses of Phedon — and even cartridge-based consoles got a bit of the sex action.

Sexual adventures, with or without graphics, have proved popular and the mainstream respectable companies have been in on the act for some while.

Leather Goddesses, one of the best selling games ever produced by the company Sierra OnLine, has found the current Soft Larry series — substantially the opposite of a gimp — more than a little lucrative. More than a few operations closer to the seedy side of commerce have attempted to cash in on the sex adventure. Unfortunately, speedboat owners may have spent good money on games such as Soho Sex (purely commercially released by a company by the name of Mules), and even today similar offerings are still available. But not everyone wants to make money out of screensex.

In much the same way that there's a whole world of "amateur" material circulating in the form of handbooks, reconditioned or already duplicated dirt, there's a complete underground of amateur art in the computer world. Whatever your machine, whatever the format, there's bound to be some amateur artists in the public domain for you — everything from digitized versions of peeing Page Three layouts to animated sequences. And from hardcore videos. Some of the work is of a professional standard and achieves, even if just that would not a mainstream commercial release, some in terms of obscene — like an early Spectrum joystick yank-hammered by the likes of Eidos — but most of it is just plain crude.

With the advent of 16-bit computers with advanced graphics capabilities and the processing power to achieve stunning animations, screen sex has taken a turn for the erotic. Owners of Shi and Amiga have some truly remarkable software solutions to entertain them. Programmers are doing much more imaginative things than writing about prostitutes.

The opportunities for interactive sex on screen will really take off when technologies like Digital Video Interactive and Compact Disc interactive take off. There's a wealth of programming talent just waiting for the chance to blend code with existing video video footage. ■

TELEPHONE TITILLATION

The suspended jungle of oral advertisements that is the majority of such publications that are the Sunday Sport is not yet confined to the computer press, like there's still points behind the telephone button if you've got a modern and open mind to use it.

Computer bulletin boards offer a major contribution to the computer pornography scene, so much of one in fact, that there are plans afoot to offer the law to make them illegal. Computer users on the BBS we checked often stories ranging from vaguely titillating encounters to explicit adventure games as well as one-to-one personal contacts. You fancy being chased up by a transvestite from there? A pretty young lady from Ireland? They're sitting behind the modems waiting for you to log on. And of course there are phone pictures...

Hardcore porn pictures are being made available on several bulletin boards. Given the fact that animated sequences of滔滔淫秽 pictures are not hard to copy together, it's easy to find badhouse movies to download for free. Fifth have could not find a modern better value membership than their local emporium, despite high telephone charges...

Online sex games in the adventure vein are becoming popular. These days, if you fancy wandering around a fucking world, chasing sexually rampant goddesses (or even gods), getting down to a short bout of brawling, followed by some heavy fucking — then get on the phone.

Bulletin boards cater to the masses but some serve minority groups. Gay boards offer gay meeting areas, gay sex stories and pictures. The Rock, Straight and Lambda all fall into these categories, both providing an area given over to board, although others feature gay sections such as The Connection and Lambda. And Playboy's gay section, up in 1988, is one of the most popular areas of the system.

A little decent slanting should call up even more special boards that support sexual fetishes ranging from bondage to sadomasochism. In TV land we're not talking SKY channel here. Shortly after being propositioned by a transvestite, we'll be led by leg off and out our investigations.

HARDCORE HOBBYSTS

So far there's no real trade in gay porn — some dealers in printed material have experimented with smutty software but there's little demand for it among customers who purchase cheap and mail order services that cater for traditional material. Even though the commercial opportunities are minimal, there's no shortage of home enthusiasts churning out material that spans all genres — from lipless chavs to stuff that would give you a shock if apprehended bringing it into the country.

DIRTY DISKS AND THE LAW

The man who could be described as the founding father of pornography – the author of the most controversial known as *Pornography Bill* – was headed up in front of the authorities and asked to justify his actions in writing what was his final book to describe sex acts in great detail. Pornography, it transpired, had been his motivation – so after an admissions meet, the books he had sold and granted him a pardon from public funds to ensure his name didn't sputter?

Regardless, the powers that be are less likely to be so lenient. Obviously laws lay down serious penalties for authors, artists, publishers and dealers in material deemed to be offensive, and the Video Recordings Act of 1984 clearly covers acceptance of淫秽 publications generated from a computer medium. Such as a floppy disk. Mayer has little leeway with cases to be ruled by the Obscene Publications Board or Public Domain libraries to categorise all their offerings just like a video hire shop. Who knows? The volume of unclassified material on computer storage will soon be attracting the attention of campaigners and the authorities.

One thing's clear though – just because it's on computer doesn't mean the feng shui of the law can't reach it, or indeed you if you're involved in disseminating material that is judged to be obscene.

As a recent European promotional event in Amsterdam, **Microsoft** took the assembled press teams off an isolated island to treat them to the whole range of products coming soon to the Microsoft stable. Many products already discussed on these pages

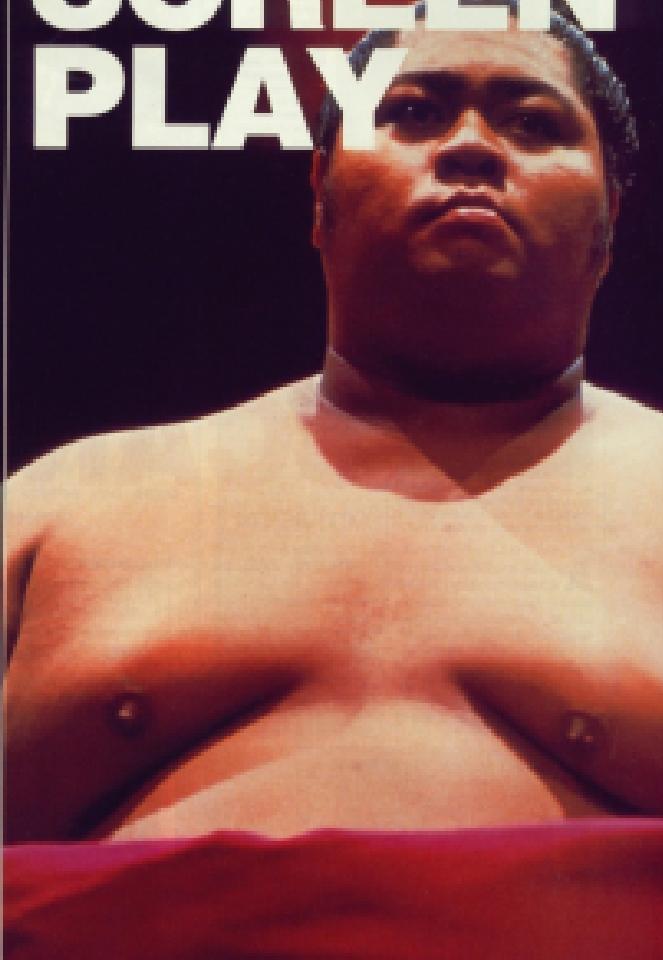

were announced, including **Dark Forces** (definitely one to watch out for), Microsoft are currently setting the famous SimCity team on a task to produce **Xenon II**, an early version of which was also on display there as well as making an appearance at the recent European Press Conference. **DOIT** is another release lined up for the late Christmas period. It's a exclusively Amiga game featuring 4000 levels. But definitely one of the most exciting games on show there was **Games from the Desert**, a game to be released as the spot from where racing goes on and off, which includes the most massive animated cities, looks set to promote this one into mega status. And since Microsoft didn't want there to exceed their products in popularity with **Time and Flight** (above), where more than 100 computer games were on show - but

Time and Flight really took people and over most of the new software reviews and having the photographs taken yet to prove that it really was a working title.

Meanwhile, **Millennium** have been busy doing over the UK software industry. Over the past month may have caused a desktop publisher all incentive software between interactive negotiations to purchase **Talismansoft**. Now we'll finally get to see **Wanted Dreams**

WRESTLING WITH THE ORIENTALS

Lords of the Rising Sun and Battlehawks step into the ring

Adventure is the cornerstone of the 100 greatest titles in the 1980s. The pinball machine has made its way out of the safety barriers of arcade games, however, into ports and cartridges, and may even be found in the instruction media of science fiction.

These three

show the original arcade game on the left, and Activision's conversions on the right.

Additions to original pinball have been included. If you take the ball with your fingers there it has one unique physics level.

Activision's *TimeScanner* is another addition to the already long line of computer pinball games. Such simulations have flooded the computer game arena almost since the computer first developed SHIFT keys, way back in the distant age when bubbles weren't brought up on a diet of glasses.

The backdrops in *TimeScanner* have been very carefully designed to be as interesting as possible and provide the same kind of distractions as those offered in the actual arcade machines. The controllers, however, don't have any switches.

Where the game falls short is its lack of graphics, choices such that the ball hits a player, or more goals. This has been done graphically in three areas. However, this has been well compensated with basic impressive sound effects which maximize rapidly enough to keep your fingers bopping over the keyboard and certainly fitting in mind the real arcade environment.

GRAPHICS AND SOUND

At this different screen includes pyramids and cities and an introduction to a mission mission to those found on the real arcade game.

ACTIVISION

Since the simple bagatelle machines of the 1950s, the pinballs have progressed from simple machines with electric flippers to multi-level monstrosities, boasting all sorts of unusual add-ons.

The home micro version of the pinball machine has always had a bumpy ride. One of the fewest features of any pinball game has to be the ability to map from

side to side as you tap the keypad with basic reflexes. Naturally, it's impossible to achieve this channel effect with the keyboard of any ordinary home machine, so always armchairing off the side when playing.

TimeScanner makes no new innovations in this area but it does offer one of the more realistic simulations of ball movement. Shift

keys are used to control the left and right flippers with the main objective being, as always, to amass great high-scores. Even a 100% rating is available.

Four tables are spot and see so that if you miss one of the four balls then you have a second chance. You can get through to other levels by taking a break through the "Time Scanner".

Peter Field, the team behind ISS, have written *TimeScanner* with the objective being to create the perfect pinball simulation.

The limitations of the game are more likely by any console approach. As the keyboard pin doesn't offer the right sensitivity needed, but that aside, it offers a realistic challenge even though ball movement is often at a standstill.

It's not an original idea but it's still the kind of game that's appeal to anyone who's more than a passing interest in pinball games. Whether it will satisfy the real pinball addict will depend at the mouth every time he sees an idle machine to be potted.

Mark Higham

CONCLUSION

Almost simple enough not because of level of thought - it's in the execution that you'll discover some impossible to negotiate.

GRAPHICS AND SOUND

There was a time in history when matters of great import concerned the world and mankind failed to become a part of it, when wars were fought and not won, but honour was what mattered most. Japan, that strange land bathed by the light of the rising sun, was one such place.

Christopher Long renowned for the acclaimed Defender of the Crown have produced this new interactive movie, set in that 12th century land of honour and dignity.

AIM

The game sees two would-be emperors fighting for domination of an crumbling empire. Yoshimori, the consummate politician and strategist sees the battle-titled Yoshiwaka in a legendary struggle to win control of the Japanese dynasty. You can select to play either of three characters, assuming the various advantages associated with each. The objective is to capture all 19 castles spanning the map of

■ Once an order has been issued to your army, there's no way of cancelling it.

Considering that this type of game is based largely around its strategy elements, the graphics have been remarkable at every turn. There is a remarkable resemblance here with Christopher's previous hit, *Defender of the Crown*, but there's the more interaction with the player. All sorts of animated routines appear at opportune moments, from attacks by a Ninja assassin to fierce battlefield occasions when you must participate in the bloody war.

The superb animation is supplemented in most circumstances by atmospheric musical effects to convey the impression of ancient Japan. Probably one of the best examples of this occurs during the opening credits of the game, although the music at other points is almost as good, if a little repetitive.

Clouds and gulls, and grooms in your own uniforms appear in lines as well as other cool effects to enrich graphics.

■ Block of honor. You can desperation press this button... - but beware, desperation fire is a dangerous tool. If you've caught that you're only one option of rage pulse and that's a really painful way to go.

LORDS RISING

CINEMAWARE/MIRRORSOFT

Japan and still manage to stand up straight afterwards. Along the way you can build up your skill ratings depending on the outcome of battles and your leadership abilities. And to make sure the game isn't all blood and war, you can see the hand - and body - of a beautiful princess if you're lucky.

STRATEGY

The game is arranged as a giant map with mountains, cities, cities and an imperial palace strategically positioned.

■ Preparing the battle. You will decide to arrange your troops to repel your enemies and vice...

■ Get off to your place and participate of battles as soon as possible.

To keep the action going across the whole area, the total take control of three sides who always begin the game in the same location. These is directed around the map a selecting them whenever it comes to a standstill and directing them to their new location. They then follow the short paths either on foot or by boat. If they're besieging their ally they'll stop at a port.

Different locations offer different features; monasteries are neutral territory and can often be visited open or closed.

■ Monks are your place and participate of battles as soon as possible.

■ Yoshiwaka portrait is a static look - you cannot move or interact with him just yet until he turns to move (press control).

■ These maps are four kinds of your country road and sea green tree mostly enough.

SOF THE GSUN

land. Castles can either be attacked or an alliance suggested and the imperial palace is the place to go for imperial might such as the Sacred Land or Castle.

As you make your journey, you encounter other groups at which point you can interfere and suggest forming an alliance with the leader or attacking them. Either is usually a good suggestion since your own castles are often liable to attack if you're not careful.

As you make your journey

there's often the need to stop the field to supply your troops. Visiting one of your own castles or a friendly adversary is advised for this task although the imperial palace is neutral territory and will often give food.

The game is punctuated with moments of interaction where you must participate in all sorts of encounters or attacks. In these moments the map is frozen and you move into the interactive phase where skill is rewarded with extra troops or new territory.

At the Imperial Palace Your enemies can now take action and interact with your forces to affect his surrounding actions.

If you're lucky enough to find your castle under siege then you must pursue the enemy with intent to capture the site.

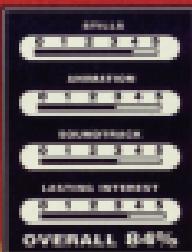

Map of the world Take place on the map where you can choose your troops around 1000 country regions with ease. Many a secret location of the map can be shown on screen at any one time that can be further explored by clicking on the mouse to enter its secret hub or sight.

In its day, Defender of the Cross was reckoned to be one of the best strategy games ever, but much of the fun has been lost to newer titles that provide position. In many ways, Lords could be viewed as the most logical step considering the progression made with the UI and design on the games since their intervening years.

The challenge, as ever in this type of game, is not necessarily to appear unprepared to play for a long time. It's very much of a strategy game so the action moves sufficiently slowly to give you time to think. In moments of tension the click often proves to be too slow despite a speeded option, although a name to click feature is available. The game spans a wider battlefield than Defender ever did, and as such the gameplay is far deeper and potentially more appealing for the end strategists.

With the long shelf-life of this kind of game it's certain to become the same classic which Defender proudly claimed.

CONCLUSION

BATTLE HAWKS

LUCASFILM/LUCAS GOLD

The land of the rising sun meets the home of McDonald's in Lucasfilm's latest game, a flight模拟器 set in World War II.

All of the action takes place in the Pacific during 1942 between Japanese and American forces. You can either play the role of an American and take on a small armful of objectives or try to gain even with the tanks, for the last food and resources of Moonlighting.

There are four options located

on the main menu training, mission, rescue planes and service records. The last of the four options allows you to use the present pilot or start one of your own; a maximum of four can be stored on disk at a time and the record is updated after each mission. If you remove the pilot, then you can look through the two profiles and find out what your friends and foes are like.

Training is a good place to start; you can practice dogfight-

ing, dive bombing and torpedo attacks. The difficulty of the training missions can be easily varied from non-aggressive opponents through to deadly foes. Your plane may be customized to contain extra armor, fuel and more total maneuverability. In addition, the combat skill of your opponents can be adjusted in pilot, gun or reticle level.

As soon as you've finished with the training mission you can head for the skies in an active

If the Nazis are not the ones you want to battle with a number of other nations, you take off in your F4U Corsair to defend the world from invading forces. In air force mode you can fly a B-17 Flying Fortress or a B-52 Stratofortress.

Missions begin with 18 missions total and you can use the same customization methods in these too, but your flight record is not updated so you play the mission without customization. After each mission your record is updated in disk, which you can of course adjust if it's necessary.

Genre: Action/Flight Simulation**

Roll in the Pacific for an American aviator and attempt to your mission in a large formation. Responsibilities mainly revolve in the mission and it is up to you to take on your tasks and places to the series of five objectives and let your experience grow (thankfully the computer will want to stay in one place and not distract you from your planes after your bloodied and plenty of that is done).

GRAPHICS AND SOUND

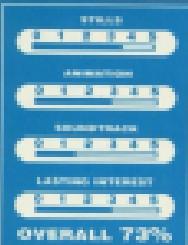

Sound effects are limited to all automated engine noises and bursts of machinegun fire, with an occasional explosion heard in the background. The plane graphics are detailed enough for things to be recognizable, but they're not.

In the cockpit there's plenty of detail and the instrument panel is easy to read, which makes a change. Overall is a little disappointing, the action takes place at a distance and 3D machines are capable of working much harder.

Another nice touch here would be an easy and quick way to save your progress.

Another nice touch here would be an easy and quick way to save your progress.

CONCLUSION

Many flight sims fall into the trap of being far too technical for the first time user, but Battlehawks can just be loaded and played. The control of the plane is possible for those that need it, but beginners only need a mouse to get started. What's also the added advantage that you can shoot down Americans and even be a traitor by pointing down your own aircraft.

With 18 active missions and 12 training missions you have plenty of choices and the customization can be used to make things easier or more difficult. There are plenty of planes to choose from, which adds to the variety. Flight sim users is probably better for beginners, but still fun for more experienced pilots.

eliminate the menace, and 20-40 battle tanks are ideal candidates for doing the destruction.

There are 14 alien space stations heading your way and the only way to destroy them is reach the control center and blow it up. The control center is deep with the space station and you have to blast your way through hordes of alien tanks, gun emplacements, mine traps and barriers before you can get there. Travel between levels is only possible when you have a key to the door and that's found somewhere on the level too.

Even though centers of a space station make some that are not suitable for explosives.

Fast smart shots and shields can be downloaded long enough and improve your survival chances considerably. Small star-like objects can also be found and these are used in-between levels to accelerate your tank with any of the following: extra speed, longer range shots, smart shots, extra shields and more powerful shots.

One or two players can play and this adds to the fun, because not only do you have to decide who gets what objects, but you can also help each other out by shooting each other (it transfers fast from one tank to the other).

There are plenty of levels to go through and the gradual increase in difficulty will keep you busy with Vindictors for many hours.

Gary Bennett

IT - Jaylink Reviewer, 1998.

Age: 14+ Price: £19.99.

And when you've blown a hole in a station that has just returned from the exploded belt, you're the human race's only hope, then you have the job responsibilities!

Space is big, alien even, and so the chances of a particular lump of rock ploughing into a certain planet are very slim. But in an infinite universe there are lots of big lumps of rock floating about and so the chances of being hit by one increases considerably. Earth is one of the lucky planets that just so happens to be in the path of a lump of ice about the size of a city in the outermost belt. After a failed attempt to deflect the 20 billion tonnes asteroid, it punctured into the Pacific Ocean and punched a hole through the sea floor. Melted rock

spewed out and submerged a large portion of the Earth's coast. Life on earth ceased to exist.

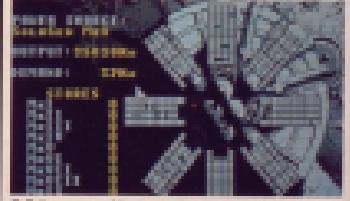

The year is 2300AD and for humanity the Human race (Earth) isn't the only place on which people build. There's a small colony on the Moon. You command the small base colony (Level 1), and must find a way to keep the human race alive.

There are seven sections to the base, each one controlling a different function. The seven areas are energy, life support, research, resources, production, defence and flight deck.

GRAPHICS AND SOUND

Most of the graphics are static screens with a small smile or frown, but many planet and satellite in the system had its own patterns and some are excellently done. When your base is under attack and you launch a fighter, the screen displays changes in a 2D view out of the cockpit with some, but effective 3D30 enemy ships.

Sound effects vary according to which of the many menus that you're accessing. All sound right and add considerably to the atmosphere of the game.

Electricity provides power for the base. There are 10 models of varying power. These provide require the most powerful generator before you can build them.

MILLE

The sections are all interlocked so, for instance, before you can build a spaceship, you first have to research it, then get hold of the materials, to construct it before handing over the problem to production.

All you have to do now is keep an eye on the resources work and take the human race along. You also have a whole solar system to explore, colonise and extract materials from.

With a bit of thought and skill, after a while you'll be rapidly flying through space and going where no man has gone before.

- Research is at every stage. It's part of the basic resources, which you can then use to increase your chances with the production facilities you have to develop.

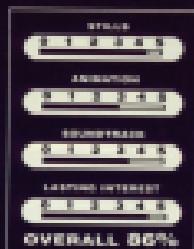

CONCLUSION

■ The flight deck allows up to eight craft each for mining with lasers. Initially you have one a passenger, they have to be researched and built.

■ The action packed with orbital lasers and shields, orbital traps and even pilot weapons that need access lists of enemy ships, objectives are highly must be completed by you and have to choose the money around and have it right.

- Once your world has been developed you can fly to production and then take the necessary materials from resources, providing you have the materials of course.

- The resources section must be in operation before you can build any structures and you will need to have resources first.

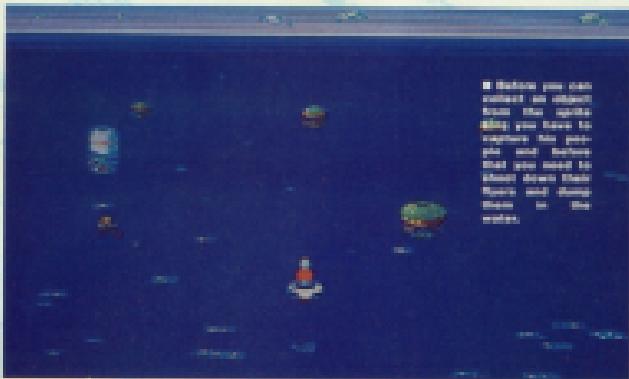

- Little required in combat, but you will need to defend your base. The greatest concern you of how many of your competitors are here to see who gets what.

TYPHOON THOMPSON

DOMARK

Thomas has always been too-headed-and-foolish-trained especially so. The passengers of Flight 296 would agree with that, but unfortunately they're all dead. But about all anyone can recall is how the child survived the crash and is now somewhere on the watery planet of Aguon. The child has been adopted by sea sprites and they won't give him back, you have to rescue the child.

Before the game itself begins a seacreature appears and a raft is dropped out, a door opens, and you walk out and look down. Conversion must run in the family because you can't back inside again, only to be forcibly ejected from the ship by one of a variety of methods. Much better than just starting the game in the vat!

In play there are occasional tides, but no continuous ones. Sound effects are simple, but fun, especially the angry one song long. The graphics are fast, smooth, colourful and most of all cute. There are many subtle touches that make the game more enjoyable to play. The tide歌 song makes very good when he jumps up and down and stamps his feet and your heroic character even shakes the water out of his hair when he appears from an underwater venture.

CONCLUSION

The first couple of levels are very easy to do, but once you get to the third you're problems really begin. There are so many sprites to deal with that you'll find yourself just screaming with frustration. Unfortunately for fortunately you'll end up flooded and there's nothing you can do to stop yourself from playing.

You'll gonna need all those lives to stand any chance on the later stages of the game, and you will eventually capture all those little b****es, but before you do you'll have collected a couple more explosives and trusted your mouse through the waters.

All in all it's an excellent game that will keep you frustrated and amused for a very long time.

Gary Everett

GRAPHICS AND SOUND

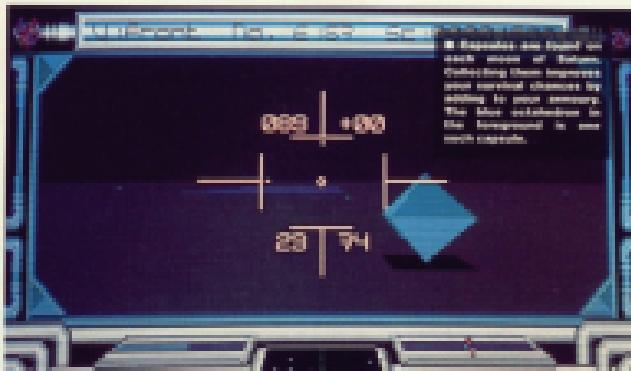

Once you're in your raft head for a nearby pair of islands where you meet the Spirit Guardians of Aguon. They (seems) spirit you a laser cannon and you (or maybe that's demanded) you to fetch a dagger from a set of islands.

If you go to the islands and when you return you have to shoot an island. Out of it comes a fly which is picked by a sea sprite which is deposited in the water and then if you have to do it go and collect the sprite in a little bag. Once these bags full or full turn into a fish and swim back to the island. Once you've collected all the sprites from the islands you then head for the central island and the tidal song will begin not. After a quick look round you jump up and down in an angry frenzy and return back inside the boat. Get him back his sprites and he'll give you the dagger. Return to the Spirit Guardians and you go onto the next level.

This is then repeated until you're looking for another object. Jammer, button or whatever is damage to the raft and you'll be taken back inside. There are more sprites per level and more flys too which makes the process of collecting sprites much more difficult. Later levels also have the added disadvantage that extra flys are added to an island when those pesky fish manage to get back there. All that's left for you to do is to occur the ocean blasting flys and collecting sprites. Just that little child will be in your carrying hands and eat her happy ever after.

VOYAGER

OCEAN

Once upon a time there was a little space-ship called Voyager II that went on a long journey. It left a blue-green planet called Earth and went for a look

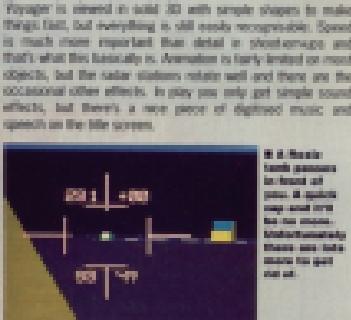

around the solar system. After a while it left the solar system and drifted out into deep space. In the year 2000 it was picked up by a crew of the Space Empire and she

returned to her homeland where Voyager II was regarded with great interest.

Rather than accepting the friendly greeting from the Earth people the Space Empire decided that a bit of conquest was in order and set off to achieve the said objective. They set up base in the vicinity of Saturn where they used its moons to create more and more powerful weapons for Earth's conquest.

Meanwhile, Luke Skywalker was on his way back to Earth after a 10-year personal mission of space exploration. He now wants to go home to freedom only to be subjugated by an alien race and so once Luke became aware of the situation he decided to save the world so that he could have a

Graphics are based on each moon of Saturn. Displaying them improves your survival chances by adding to your memory. The blue rectangles in the foreground is your next capsule.

Voyager looks like Starship and plays a little like Starwars with you moving around a planet, shooting away at aliens and generally causing havoc. With 10-moons to conquer your work is going to be cut out for you, but you'll get plenty of opportunity for gratification.

Space isn't the sort of game that you'll complete or get bored of in an hour, more likely it will take you many weeks to complete and you'll never want to get lots of enjoyment out of it in the meantime.

THUNDERBIRDS

GRANDSLAM

Q Level four sees you riding the Thunderbirds' submarine by operating the tank at its sides. You must shoot down the nuclear reactor.

Q Level three and the objective is to set the train of dynamite and detonate several mines so only the path can move in the first place.

GRAPHICS AND SOUND

The animation in Thunderbirds has been so tastefully polished that every detail has been remembered. When you load up the game one of the first things to strike you will be the way that characters walk, talk, interact with objects, as well as in front of them. This feature even extends to the street guitars which also interact with your character through the holes as he walks past. The effect of this is to give a very real impression of the landscape.

Uniquely pictures make up the start of each level accompanied with sampled sounds taken from the TV series so that the old 'One, two, three, two, one, Thunderbirds are go', grants you increased sound effects are promised for owners of double-sided drives.

Q With much blood you've presented with two objectives and you must collect two objects to carry with you. There are three fire extinguishers for the attack during the game but because there are many red barrels to be found,

G Thunderbird's latest science is going to reveal more news for every self-respecting TV addict. The classic Anderson prompted hit sees its debut on the computer screen in the form of an anti-violence strategy game.

It's split into four levels with a different mission assigned to each. The only way of surviving these is to recognise the official test using the correct object. Each level is played with two characters and at the start of a level you need to collect two objects to carry from a list of six. You can

Q Explosives should be level four. You'll need to detonate the sheet metal to activate the explosive substance.

only carry two objects at any one time so anything you encounter during gameplay must be disposed of for something else you're carrying.

Being a strategy game it takes hours of play to find out what to use and when, but just like in the best matches in level one for example, you'll need to carry the tools with you in order to make your way through any determined player.

Locating objects is essential to survive other difficulties, very much in the same vein as Grandstand's former hit.

Q Level one and the objective is to move the trapped miners.

can be good or bad - one possibility is the unfortunate problem of collecting pots instead of blue iron.

Gradually the game doesn't provide anything particularly startling and sound effects are so repetitive and identical that you turn them off as soon as possible but it's definitely addictive enough

to keep you coming back again and again.

The game is very much in the classic Pacman vein and is best to appeal most to those gamers seeking a rest from the usual intensive alien-copping or strategy elements. It's simple enough to understand and will

Q Dodge the gophers!

SQWEEK

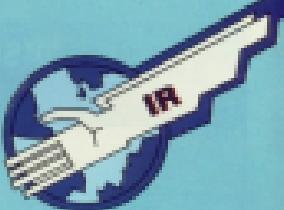

LORICIEL/US GOLD

S Qweek is the first game out of US Gold's new Loriciel stable and offers a fairly strange new addition to reinforce through a mix of levels converting blue tiles into pink ones. You control the mouse in his dubious exploit to end the world of blue tiles but if that sounds easy then there's a host of problems posed in for

good measure. All sorts of icons appear for level elements, granting you additional powers in your desire to change the tiles and dodge them in the process.

These icons give you such features as immunity from attack, the ability to freeze the tiles and even a range of multi-explosives to use as weapons. A chance isn't

THUNDERBIRDS

A This game is played using four characters on board each aircraft. You must drive them at any time but don't have either of them in dangerous positions otherwise you could risk health damage. Likewise, if one character runs out of health then your mission is aborted.

However, however it scratches across a few water tanks, thereby providing a more addictive and longer-lasting challenge.

When Granddad was given command of the Thunderbirds forces, it was understood that they would not use any violence in the game. Faced with this problem they turned to comedy instead and many of the animation routines reflect this. For example, Alan Miller, the leader and gate-keeper, runs away if he's hit. Also, in the second level Gordon must employ his knowledge to get through the human walls and his attempt at climbing seems remarkably similar to a drowning dog.

probably wear the head of Chairman for president, to play because they have neither the self-intelligence or sheer desire to play anything as complex as *Lord of the Rings* or *Blood Money*.

It's annoying that there is no addition to either

B The logic makes it a challenge

C Thunderbirds is arranged in four levels. With each level you complete you are given a reward which will then take you into the next level. This progress may be interrupted until each new game and you'll be transported into the corresponding level. This takes some time to work through each mission mode.

D It's day. Thunderbirds was lauded as a surprising addition and unusual challenge but Thunderbirds is certain to appeal to an even greater audience. With an infusion of amazing graphics, the Thunderbirds characters and an addictive game play with four different missions, it's certain to stand the test of time and become one of the great classics.

If there's any criticism to be levied at Thunderbirds then it must be the complexity which will confound the layman player. It's not the kind of game you'll pick up and win first time around but rather, its appeal is likely to increase the more time you spend tackling the problems.

Thunderbirds doesn't certain to be a hit in which case Granddad has prioritised a version II - we'll keep you posted. In the mean time, Thunderbirds addicts should check out for next month's competition in which you can win Thunderbirds memorabilia, including models of the boppers.

BIO CHALLENGE

PALACE

■ You play a human robot combining the power of man and machine, who takes you into the next level.

GRAPHICS

Movement across the landscape causes the screen to scroll sideways. Your humanoid robot is capable of running although the screen doesn't need to reflect his speed. Features include shooting around looking more like Invaderzine maggots than anything else. However, the end of level predators are bugs and affection.

Sound on the ST version is limited to simple spot effects but the Amiga version allows real position in the area with superior effects including a bonus soundtrack. The graphics and backgrounds are little different on the Amiga version although more colours have been implemented.

■ Shadows can be any of six colours and plus additional patterns such as increasing density and flow.

■ The idea was to create something that would be on top of the game. The ST version has some problems, but the Amiga is a great example of what's possible.

CONCLUSION

What makes Bio Challenge a far better than average game is its unusual playing features. It's not just a shadowmap because it's more complex than that. Action is impressive with a difficult level control to sustain your interest for a long time. Whenever you overcome one obstacle - such as locating the sections of the shield - you immediately faced with another - defeating the end-of-level guardian. Lack of firepower from some passing could be bad against poor computers. Bio Challenge has already done well in France and looks set to be a real hit here with addictive gameplay certain to keep your fingers pulsating with life.

Marc Higham

It's official - there are problems with our games and the human race is getting weaker. Scientists have perfected a technique to graft the human brain into a robot's body - the same operation Norman Rabbit had - and you're to be the recipient.

Your purpose is to collect sections of an armistice and force advance through the levels. The real difference from most multi-level games comes when waves of bee-like aliens appear on the screen. You must spin round faster than a biplane handles an exercise wheel and then touch your infected robot's wings. If you jump at the air at the same time you're able to knock floating platforms to one pole, which is important as the ground monsters are your real enemy. These shuffle around and are killed by the falling platforms, at which point they deposit other metal or sections of the armistice. Once you've accumulated all four sections you move through to the "guardian phase" where any collected metal can be used as firepower to defeat the resident monsters.

DARKSIDE

INCENTIVE

About 250 years have passed since the events that took place in Incentive's previous release, *Dirktor*. Now the Kellers live on the mass Triangle which orbits your home planet of Earth.

On Triangular there has been a built a huge weapon called *Darkside One* (that you

know that Incentive are based at a place called *Darkside One*) with which the Kellers intend to destroy Earth.

AIM

A massive amount of energy is required to fire the weapon and this is collected by a network of

interconnected solar panels called ECO energy collecting devices. All you have to do is destroy the network and save the world.

To help you in your mission you have a jet pack, a laser and a force shield. Unfortunately fuel and shields are in limited supply and you may find a way to replace them during the game.

STRATEGY

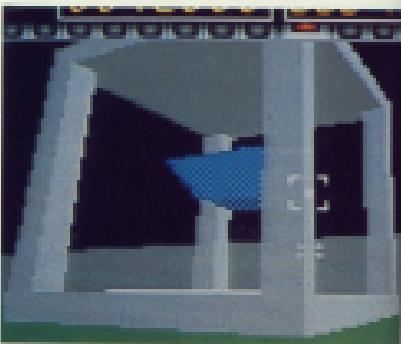

In *Dirktor* the pace of the game was very sedate and you had lots of time to do things. *Darkside* is much faster paced. Initially the ECO network is charging at 100%, and if you're going to stand a chance of all of completing its

GRAPHICS AND SOUND

The static graphics in *Darkside* are very similar to those in *Dirktor*, buildings made up of blocks of colour with extensive use of shading to help enhance the three-dimensional effect. There's more animation in *Darkside* though and more of the Star Force move around rather than just flying there gathering power points. Sound is a real improvement over *Dirktor*'s which was distinctly eight bit. There are not only some very nice sound effects, but also an atmospheric tune that goes off for ages before repeating.

■ A line of ECO blocks in the diagram, but you have to shoot them from right so left to right and repeat, etc again.

■ A power port on the left around the planet quickly.

• Moving some packages after putting them in a container, allows the robot to open the door.

• Watch the player's health bar change to its lowest level and press square to charge your shield if both are activated.

The team behind *Drake and Dantride* are Major Developments. The main members of the brilliant team are Ian (or Aycock) Andrew, Chris (Freecook) Andrew, Sean Ellis, Paul (Stag) Baker and Helen Chapman. All tracked comments are found inside *Dantride* along with digitized pictures of some of the above. Ian doesn't want us to tell you how to find them though, you'll have to do that for yourselves.

Ian came up with the plot for the game and his brother Chris is responsible for designing the Percentage system. Sean Ellis programmed the 16-bit versions of *Dantride* and also wrote STAC, the 3D adventure creation.

Hagan Farley, not sure if that's Hagan the Hobbit, composed the music, as he has done in countless other games and Helen Chapman is responsible for the graphics.

Fantastic sounds will set the mood of Total Eclipse and after that you'll just have to wait and see because the next game is due for release within about three more years.

PLAYERS

game you need to disable as much of the network as possible in the first few minutes of play. *Drake* and *DD* isn't very hard, because you can only disable one of the 16 terminals. CDs are connected to more than one other CD's respectively.

The others haven't left the plate unquainted though. They

want Drake to be in lots little pieces and so tanks, satellites and forces will litter the planet. *Dantride* depletes your energy if you hit them and shoot from tanks and satellites on the same. Running out of fuel can be equally fatal when you're flying, because once gravity gets hold of you it just won't let go until you hit the

ground and go boom.

Apart from disabling the CDs and shooting or destroying the other bases, there are other problems that you'll face; collecting tripped crystals, finding hidden doors and activating switches to get to other sections of the moon.

In some sections of the planet there are sensors which disrupt

graphically. Percentage games have always suffered from a very boring block structure and there's no change here. However, challenging strategy elements definitely keep your mind off of problems in the effects department.

Drake has the one thing that was lacking in *Dantride*, some incentive to drive you forwards and make sure that you don't waste time. The problems are more logical in their solution and the fact that your opponents move around makes for a more challenging and demanding game.

SATURDAY

• It appears like in previous reviews, percentage is the main theme of the Percentage series of adventure games. Total Eclipse.

CONCLUSION

• Please tanks guard certain bases bases and they have to be avoided or destroyed.

• A number of obstacles lie just below the surface. A cable may be moved around the planet.

you in prison and the only way to get out again is by paying a fine. Inside the jail there are two letter-block clients, one takes fuel and the other takes when you shoot the sun. After enough shots have been fired the door will open and you'll leave.

Make sure you choose wisely because the only way out of the jail is by going up through a trapdoor.

To destroy the Shadowlords, you must first know their names. These can be learned by going to one of the three castles that represent the principal that each Shadowlord represents. Once there, ask the master of the castle normally the knight about the Shadowlords. The person will usually tell you where to go and who to ask for more information.

Once you have the name of a Shadowlord, you must then get

the shard of the Gem of Mondain from which that Shadowlord draws its power. It is located in the Underworld. Once you have the Shadowlord's name and where you can return to the castle that the Shadowlord occupies. Go to the Shrine of love for the Shadowed of Rusted, for example and yell the Shadowlord's name. The Shadowlord appears two spaces from you. Throw the shard into the Shrine by using it, and attack the Shadowlord. You should land several fire Fly spells at the

These few tips should help people getting started on War in Middle Earth when game starts move Frodo, Pippin etc in a north/east direction on very hasty setting. If they send the Raugl go and visit towns to the west making sure you stop and item in Radagast etc. By the time you have done this all Raugl should have started retreating back towards Rohan. This allows you to stop and collect all items like books etc on the map back. When all Raugl reach the area just before Rohan they won't but are still there, but the nearest party of Rangers you can control and move them to this area. A battle will start where upon all Raugl will be driven from the field.

When this battle is over the map is clear for your party to go to Rohan where the Fellowship of

CA Shae

If you want to play War in Middle Earth as a game or the book rather than as a

game then follow these simple instructions and Sauron will meet his maker.

The first thing to do is to get Frodo out of Hobbiton, because the Raugl quickly converge on the area. It is essential that you go to Free and meet Raugl, because without him Frodo doesn't stand a chance. As long as the Ring Bearer is in the party led by Raugl, then he will be able to attack almost everything encountered on the road, and to defeat those that can't be evaded, including Raugl.

Once you have joined Raugl, then head for Rohan with all speed. You should not have too much trouble getting there, and joining up with the rest of the party. From there you can follow the road, and take the party down to Lorien, and to Gondor. Send Raugl and Frodo past Minas Tirith, and up to Cirith Ungol. Here Aragorn will kill Shredd, and the way is clear down to Mordor. Once you reach Mount Doom have Raugl fight the fire Wraiths here, while Frodo beats a hasty retreat.

And that's it! Don't expect any spectacular scenes of Arwen flinging the ring down the Coasts of Doom, because there aren't any. No triumphal music, no banners waving, nothing except a view of the party of nine standing on the bridge in Rohan. Quite an anticlimax to an otherwise good game.

Bonnie Stafford
West, Minnesota

Shadowlord, or repeatedly attack it. You might have to use some Head tactics on your characters, since the Shadowlord will select one character and focus all of its attacks on that individual. When you destroy a Shadowlord it is gone forever, and you can then go after the next one.

When all of the Shadowlords are destroyed, you can resume your search for the last Lord of the Rings. Do this by first locating and obtaining the Cores, Scaple and Heads of Lord Boromir. Head into the dungeon called "Doom". Go to the bottom level of the dungeon and enter the Underworld. Search the area being many Black spires and climbing important until you find a large area of lava. Walk through the lava until you find a large area of darkness. Tell the word "Mordorism", and then you can enter the coupon of Doom. The bottom level of the dungeon of Doom is where you will find Lord Boromir. Mordor Cottagers. Entry West Yorkshire

SWORD OF SODA

In general, don't use any potions on levels 1 to 5, save them for later on, especially the last level.

On levels with barrels, back off when you see one approaching. The rocks touching the enemy when you jump over the barrel.

There is no time limit so never rush a level unless you have a power shield activated and you want to use it on the next level.

Level 1

As soon as the level begins, jump forwards until you hear the guard telling you to halt, then begin attacking. Jump forwards to keep an eye to the guards as possible so that they don't stab you.

Level 2

Attack the guard when you are between the single spikes and the double spikes. Avoid following him, instead back off a little then when he approaches you jump forwards than hit him.

Level 3

If the first two men are just a little too ready to be hit with the breeding stick then change to the overhead blow. They will come a little closer above you to get them with the breeding stick.

Attack the guard with the overhead blow. Never jump onto him because his stick will drain your energy considerably.

Level 4

To kill the fat guys, kneel and stab. They will continue to jump into the sword until they die.

Attack the two creatures in a similar way but keep backing off, and constantly walking forwards again to get a few hits in.

Level 5

Kneel down to attack the zombies, this prevents you from being injured by their arms and the stuff they spit at you.

Level 6

Use a power shield, this will stop you falling into the trap. Jump towards the man and continue to hit him. Follow him if he walks away from you.

Level 7

Walk forward until you are in line with the body on the wall. Kill the flying creatures with the overhead blow. Once they fall to the floor use a magic zapper to kill the insect at the end.

Level 8

At first just be prepared to jump the fire that burns along the floor. It begins to get tricky when the walls come down. It is best to listen for the fire and to keep looking at the top of the screen to get an early warning if a wall is about to crush you. When the steel spikes appear, the fire will stop. The spikes are more deadly than the walls, taking a while the away when you are impaled on one, you should therefore concentrate more on avoiding the spikes than the walls.

When you reach the blocks section, walk to the edge of the pool of lava and wait until the first block is almost at the edge, then jump forwards onto it. Jump onto the next

blocks when they are as close as possible to the one you are on. When you are on the final block wait until it is at the very edge of the floor before jumping, because the end of the floor will crumble if you jump too early.

Jump as many drops as possible and be ready to jump the fire. When you reach the final block, stand a little way from it and hit its health to make it slide back, revealing the exit.

Level 9

Kill the two pairs of creatures with the use of the bow and arrow!

Jump over the caterpillar-like creature when its head is as far down as possible. Walk past the potion to get the last three oak boulders and the last will eat the creature. Once the last has finished eating rock to prevent and the water starts to rise. When the water is full before the last's mouth you should begin to jump. Continue jumping until the water is below its mouth. The wall will disappear allowing you to walk forwards again.

At the jets of fire with your sword to prevent them from hitting you. You can increase your hit strength by hitting the grey creatures on top of the wall. When they fly over your head use the overhead blow to get them and your hit strength will increase by one. When the wall disappears walk forwards to find the exit.

What is the single most popular add-on for a computer? A printer maybe? How about a colour monitor or even a modem? Perhaps surprisingly, it is in fact the humble joystick.

There are three different types of joystick, the traditional arcade style stick, the newer, more ergonomic type and the current fad of the month, the 'trendy' hand held variants.

Joystick construction is a very important factor to consider. Most modern joysticks use microswitches to register movement but many older and cheaper models use rather unreliable heat switches which tend to break rather easily. Now do you want a microswitched joystick in a crash? Easy, just move the joystick about and if it makes strange clicking noises, then you know that it is microswitched.

So what should you be looking for when choosing your ideal joystick? And what type of joystick is best suited to the many different types of games available? Well, no one knows more about what joysticks are best for particular games than the programmers themselves. So, why let them do the choosing.

MOVE OVER MOUSE...

Does anyone remember the computer used in the classic arcade game *Space Invaders*? Noooooo! It was called the Atari Computer. It was up to the other underground machine, but...

If you fancy spending one for your £4 pounds in fact - an underground company has gone no way clear to make one. The unit is marketed by Third Edge Communications, based at 124-144, and is in fact a modified

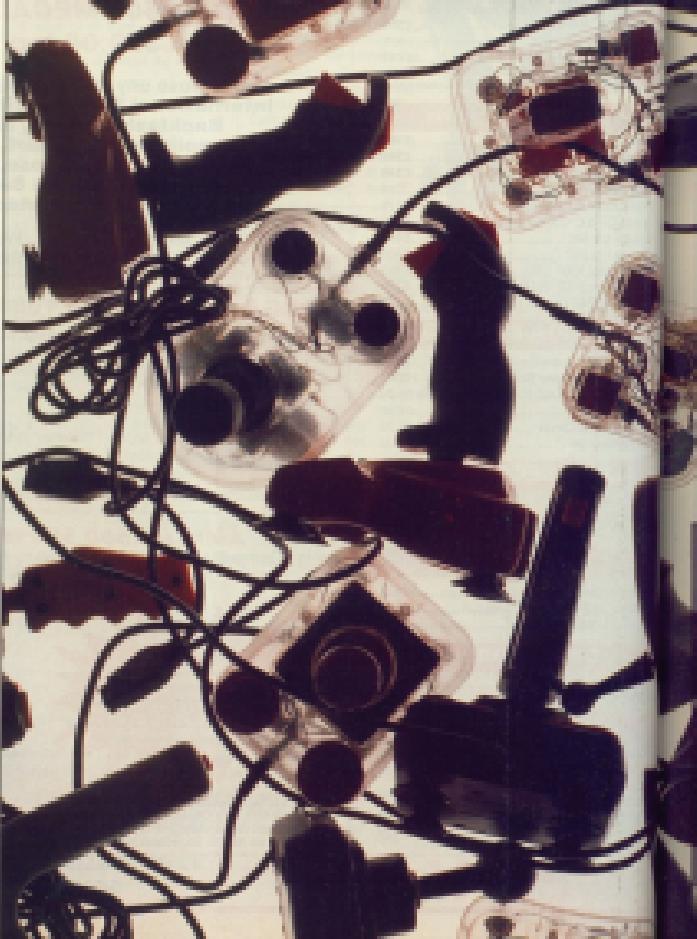

version of the classic Atari Trackball, which was good for use with the old Atari 800 computers.

This new ST version is purely a mouse replacement and cannot be used on any games which require a joystick. But for mouse-controlled games (particularly *President's Choice*, the *TrackBall* is a joy to use). Third Edge Communications can be contacted on 071-2 882775.

JOY DIVISION

Choosing that just-right joystick can be a bewildering experience. JASON HOLBROOK tries not to get confused

PROGRAMMERS' CHOICE

Who better to judge a joystick than the people responsible for its popularity - the game programmers themselves. Format popped the question to some of the big names in games design.

Steve Jones of DMA Design - Steve, programmer of *Blood Money* and *Memento*, is a self-confessed shoot-em-up junkie and for his purposes, the Dynamics Competition Pro 5000 (£14.99) does the job very nicely thank you. (Surprisingly, Steve prefers the four switch variation to the more reliable six-switched model.)

Steve Hale says he's yet to find a stick to match the original Alien model. "If a company produced one like that for under £20 I'd buy it," said Steve.

Tony Lewis of DMA Design - Tony is infected with the same obsession for shoot-em-ups as his partner in crime, Dave Jones. "Steve can keep his Dynamics Pro, I wouldn't swap my Konix Speedster (£11.99) for anything!", says Tony.

Jeff Senn of Argonaut - Jeff, lead programmer on *Manhattan 2*, has always been a great fan of the original Amiga joystick that was released in the States by Amiga, Inc., (picture they were bought up by Commodore).

The unit is a very small device that fits snugly in the palm of your hand and is controlled by your thumbs. Recent faves include the Konix Speedster and Navigator.

Anthony Smith - Anthony's pick of the sticks is the old faithful Spectravideo Quickstick (£14.99), a joystick that many a gameplayer has been weaned on.

Giles Rockwood of Argonaut - "No? I like any large knobby ones". Well, when more can you add to that!

FORMAT FAVOURITES

Richard Maestrali - Our editor has been drooling over joysticks with built-in power for months. This pick of all brands, until refined, is still the Konix Navigator (£14.99) but he has since fallen in love with the Mr Joystick's Crystal Clear Turbo (£19.99).

Aaron Williams - I give my thumbs up Super Pro with auxiliary (£19.99) if you're looking mod-

nality. Mark 80 sticks lack the high pixel precision that game such as *Blood Money* and *Alien* demand. Rapid fire is also a definite necessity.

Howard Aspasia - Howard's choice in joysticks is the Terminator, a now unavailable joystick that's shaped like a hand grenade. "I like the Terminator because it belies the violent side of my nature."

John Stuart - Mark 80 sticks - Mark's a snapper who likes to have complete control at all times, so he likes Richard's choices the Konix Navigator.

Gary Blaister - Gary too, is a fan of the more traditional arcade style stick made famous by companies such as Kempston. Gary's long-time favourite is the Eurostick Pro (£13.99) because of its reflecting

Microprose ■ Amiga & ST ■ £24.95 ■ May

Left's hope that Microprose's programming abilities are much better than their footballing skills after the recent shambles they suffered at the hands of a Future Publishing team. If not then you're gonna step the line with the footy-hunting game, maybe you'll even equal us with a 130 foot score.

■ **Microprose's "Soccer"**, featuring exciting free-kick goals, but will the competition? Microprose seem to have done it very this time?

How we feel, no one can possibly program that badly.

As soon as we get a review copy we'll let you know what it's like. It looks like gold.

Total Eclipse

Incentive ■ ST & Amiga ■ £24.95 ■ Due soon

The final in the line of Incentive games should be with you next month. Deep space has been left behind with the setting now being the middle of the desert. Even more puzzle elements have been included in this one and there is again your greatest enemy. The occasional munition proved to be a problem too.

■ Once again the bite of the water is in your hands. This time it's the curse of a long-dead Egyptian pharaoh which is responsible. Save the world and get home and fortune, or cause it to crash and burn in the midst of the desert.

■ **Mirrorsoft's "Into the '90s"** is probably one of the most interesting titles on the Amiga market. It's a 3D action game set in a futuristic city where you must travel through various levels to rescue your people. You'll need to use your skills to navigate through a variety of obstacles such as the sky train and Amiga cars and you must take care when crossing these roads. Mirrorsoft's offering promises to be a corker like Asteroids.

MIRRORSOFT INTO THE '90s

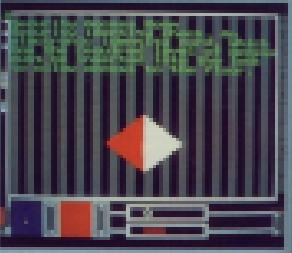

Mirrorsoft are hoping to continue their position as one of the leaders in the Amiga home entertainment market with their range of new products scheduled to appear in the months leading up towards 1990. On show at their recent European promotional event in Amsterdam were a host of games from the pool of programming companies falling under the Mirrorsoft umbrella. Just some of the Mirrorsoft games to watch out for are shown here.

■ This January Mirrorsoft had a phenomenal hit on their hands when they produced the ultimate official soccer - "Kicker" and their follow-up "Kicker II" looks to be far more impressive. Land and sea masters all make up the landscapes and there have been impacted with samples taken from bands like Status, it's likely to appear on the games scene around September.

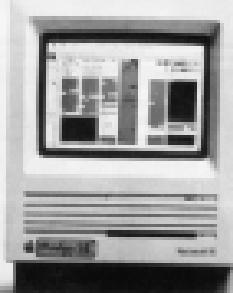

■ **Mirrorsoft's** is an arcade adventure game featuring action, movement and a shooting model. It's heading under the Mirrorsoft banner and when implemented graphics from SuperVideo. The release date has not yet been confirmed but likely to be around September.

■ **Publishers** And of the Shining Stars were given the chance to expand their software and released it in the Amiga format. The original artwork and interface is a hit to overcome the forces of evil. The original idea is that it's a twisted and distorted it to the last level - presumably because he has a headache. But the strange plot aside, the graphics look stunning.

■ **Microprose** is one of those games to really catch on and it could dominate the best-seller chart over half a dozen home computers over 100 million. As long as the programming is good enough to support it then there's a good life for Format Model on other boxes. Microprose should be available around September.

THAT OLD MAC MAGIC

You take one ST with no strings attached, plug in an innocuous looking cartridge, and abracadabra – one fully-fledged Macintosh. STUART ANDERTON tried pulling an Apple out of the hat

INGREDIENTS:

- An Apple one-fifth Mac you will need!
- 1 real Mac
- ST with at least 1MB
- Floppy disk drives or 1 floppy and one hard drive
- Serial cable with the right plugs
- Spectre 128 cartridge
- Additional formats of floppy disks
- Some Mac software including a monitor program
- Iomega flops in your serial drive setting up

MAC MACHISMO

So what's so great about the Mac? The ST has a 1MHz processor, 1MB memory and permanent compressed basic, BASIC.

Anyone who has ever used a Mac will know that agrees with the basic system. It's difficult to put your finger on why the Mac outshines the ST. The Mac just feels like a complete, more professional machine.

One point add up – to move a file from one directory to another, for example (just involves dragging the file from between two windows), no copying then pasting. And you can double click on a file (like a wordprocessed document) and the relevant application will be launched and run the loaded automatically. Together with the lack of a hundred other niggles, the Mac is a much easier working system to work on.

Which leads, however, to the quality of Macintosh software. Especially in strategy publishing and technical computing, there is a vast range of high-quality programs to choose from. No ST programs even come up in a new year package like *MacWise* or *Programmer*.

Then there is one little matter of price. The Macintosh range starts with a single floppy disk, memory upgrade Mac Plus at £3,484. A more practical £6 will get you basic £2,688 or no Macintosh Mac software on an 800K format attractive to the bank.

The Spectre 128 makes a very simple claim: you plug it in to the ST's cartridge port and the ST instantly becomes an Apple Macintosh.

It sounds incredible – particularly if you've experienced PC emulators like PC-DOS which, in all honesty, are slow, clumsy and don't seem as well designed. The ST is a much more sophisticated beast than the PC, so it's only right that you should be dubious of Spectre's claims.

Enclosed in the box is a note from Hillsoft, the distributor, explaining that they want all ST users happy with the set up procedure and the way it is documented. A quick glance through the instruction sheet confirmed this. Oh dear.

FIRST, FIND YOUR MAC

It's not worth discussing the many ways to procedure – that would take two pages to do so. Suffice to say you need an Apple Mac, a serial cable, two different formats of disk, and a patient nature.

The initial problem is that the ST cannot read Mac disk directly. The format Apple chose is utterly different to Atari's – for example an ST disk spins at a constant speed, whereas the Mac disk's speed varies depending on where on the disk the data head is. A device

is required this is in the popular - though expensive - Apple II series.

Because of the problems with disks, all the Mac software you wish to run has to be read from a serial cable from a real Mac. Easy enough; you just run a communication programme on your ST-based Mac and... ah, how do you get the various software onto your ST in the first place? That's where the two different formats come in.

You need the Mac command program along with some vital system files, to the ST as data. Then translate them onto a disc which the Mac emulator can read – no, it can't read ordinary ST format disks. The translator programme can recognise an old-style format (say with a previous version of Spectre called Magic 128). Spectre itself uses a different format again. Confused? You should be.

It'll take a couple hours to get a Spectre-format disk containing a command program, a Mac system file, and Finder (the Mac's version of DOS). So at last, with the Spectre box firmly in the cartridge slot, you're ready to switch on and insert the boot disk. Running a program by the unimaginatively named LSPC 1.18.PDF gives you the configuration options – the default is usually fine. A dialogue box asks for the disk with the

Mac programs, click on OS and... nothing happens. Then, just as you are about to throw the machine against the wall, the screen fades to black and the smiley Mac image appears.

Welcome to Spectre's Macintosh clone on the screen; the ST is transformed into a Mac. The appearance of the desktop is indistinguishable from a real Mac's - Spectre uses the actual Macintosh operating system ROMs. The only difference is the screen area - the ST's screen is 30 per cent bigger than the original's.

WELL, IMPRESSED

With the initial set up out of the way, you can run Mac software down the usual paths with the comfort of home. After a few applications have been run down the row and tested your original doubts about Spectre all vanish.

The emulator works. It works well and it works fast. Nearly per cent of the time you wouldn't know you weren't using the real thing, and the difficulties of the differing hardware are coped with nicely.

For example, the Mac makes extensive use of two unique keys on its keyboard, Command and Option. These are mapped onto Control and Alternate respectively, which works well.

WHAT WORKS?

The vast majority of Mac software hasn't worked fine with the emulator. There is a long list of programs which are claimed to run, and the only difference of opinion with it is the so-called Excel, which apparently refuses to work - although admittedly a different version of the Finder will.

At the major desktop publishing programs run without a hitch. QuarkXPress, PageMaster and Layout Set 6.0 work a treat except for printing out - more on that later. Similarly graphics packages like Illustrator, Freehand and

A Macintosh? No! An Atari ST!

This is really a Mac - spot the differences!

Here's the Apple version of the ST - note the advantage of 320x200.

B The emulator offers you two possibilities: the standard 320x200 pixels or one of two Mac resolutions. Here we larger screens of the Mac.

IN - OUT

With the disk transport disk installed under OS/2 you can't do much to load. To get round this the emulator features "hot" so you when it needs you to return control. Another feature the disk is in the drive would explain it is, is made to write data to itself at odd times. So although it takes some getting used to you need never take a disk out of a drive unless the machine tells you to.

Similarly you must tell all the disks before mounting, otherwise some data may be lost which had no way from memory to the floppy.

Cricket Draw runs well. These graphical applications are the Mac's strong point and the most likely reason for wanting to use Spectre.

Spectre has one problem in the floppy disks - a problem with real Macs. Spectre will run on a single floppy machine, but it is utterly impractical. The problem lies in the way the Mac uses disks - it only loads in the bits of the program and operating system it needs at any one time, so it is continuously accessing the disk drive.

Aside from the disk access problems, Spectre just doesn't feel like an emulator. Some rough time trials show it to be marginally faster than a Macintosh Plus. Spectre runs at a perfectly usable speed.

VERY GOOD BUT...

OK, that's the good part, but what about the down side?

The first disadvantage is the hardware you need to create an interface. Forget using a SCSI. Forget a single disk drive. In fact forget floppies - a hard disk is virtually essential for serious. Moving, you can put your Amiga hard disk if you have one.

Consequently more serious is the problem of putting out your work. Specs are designed to only work with two monitors, the colour VGA monitor and the LaserWriter laser printer. If you have an AppleTalk or Lynx printer - unlikely as they are expensive and only work with Apple - you just plug in and go, otherwise you are stuck. To use a standard Econo-computer printer you need a special port adapter which you have to buy separately for around £30. A driver for the Apple SIM404 laser printer is included.

Getting the high-quality printout of a Laserwriter is more of a problem. Printout to a laser printer uses a custom chip in the Mac that simply isn't there on the ST. The only possible way to get laser quality output from the Spectre is to send your finished files back to the

Mac with the serial cable - clearly impractical for those that very inconvenient use. Alternatively, if you have a monitor you can send the files down the phone line to one of the many local laser-printing bureaux which offer quality services. The real solution is they will only come when the planned add-on to read and write Mac disks is ready. Then you can put lady your friendly neighbourhood Mac owner into printing out the Mac by you.

THE BOTTOM LINE

Spectre 128 provides an excellent Macintosh environment running on an ST. It is highly compatible with the real thing and will happily run most of the software which Macs. The Macintosh such a desirable machine to own. It is fast, and while it's run up to a hard disk, considerably more pleasant to use than the ST's slower 30MHz.

The principal drawbacks are the difficulty of getting high-quality printout and the time and effort it takes to set up.

Together with the promised device to read and write Mac disks, a Spectre 128 with a hard disk running Spectre offers a sensible alternative to a real Mac at a fraction of the price.

- Runs most Macintosh programs.
- Fast and reliable.
- Cheap on the price.
- Well written, commanding manual.

against

- Lousy writing on procedures.
- Doesn't read Mac disks.
- Needs extra software to print out.
- Requires an extra RAM card or hard disk.

THE EMULATION GAME

There are two main standards for "professional" personal computers - the IBM PC and Apple's Macintosh. Because of the vast amount of quantity "professional" software available for these machines several attempts have been made to make the ST run programs designed for them.

Emulating the IBM PC is comparatively slow because the PC's microprocessor is entirely different to the ST's, the instruction codes and memory have to be translated into 6502 code and vice versa. The Apple Macintosh uses the same code as the ST, so it should be readily easy to emulate, right? Wrong! The Mac's unique operating system is stored on top 640K chips and all Mac programs use the machine built into these chips. The only way to get the ST to run Mac programs is to add the Mac ROMs to the Mac BIOS in the Mac. That's what Spectre 128 does.

DESKTOP

The knives are drawn again this month with ST owners battling it out against their machines. On these illustrious pages are so many tips you'll think you've fallen into a box of Liquorice Allsorts. PHILIP BEYON from Leicester wins this month's £50 prize for his musical STOS tip.

THE PRACTICE

ANSWER: FREE RADICALS
All motions are caused by gravitation except that, by the very nature of their storage, generate a large electromagnetic field around them. These losses a tiny exposure to your member is reckoned to be about one millisecond. Exceeding this can cause all manner of short term problems such as headaches, photophobia, and even heart disturbances. At present no one has been able to predict long-term side effects problems but it is noted that distance and genetic details are a possibility.

STDS is a brilliant package offering all sorts of great features for designing games but it has no problems, though most don't have a mediocre game here's a masterpiece and now do you go about integrating these into your next design? Format them? Use any of those ways or use Professional Designer to create your own and then let the STDS-PRO add it in to this file which plays examples, in progress programs. To use it in STDS you'll need to copy this file onto a blank area along with your source. Then just open

In the usual way and after the following process:

Running this program should see your samples loaded into memory and then played at the selected speed. It must be remembered that samples take up disproportionately amounts of memory which should really place them on the hard disk for permanent. This can well prove disastrous for samples taken using either Edision's Processor or Proline 3 from Maxon.

FINDING THE RIGHT FUNCTION

Function key guides are a major assist to anyone who uses their ST for more than just playing games.

The idea is complicated to explain but it basically consists of taking several sheets of A4 size paper and taping them all together using a standard paper binder or the flat kind - ring binders aren't good. When you have made sure that the paper doesn't fall out of the binder, the next step is to rebind it as a paper book. Then all A4 sheets so that they are just under 1.5 cm wide and then trim away all the remaining pages. This ridiculous-looking binder will now fit into the groove just above the ST keyboard and the others of paper can be made to fit close to the function keys.

Using it however you can then create a real set of tables applicable to whatever package you're using at the time. You can then flick through them during use. So, for example, a separate function key guide can be designed for

ST BASIC, ROM BASIC, DIF and Free Basic Editor

You can even use some pages to hold notes - such as the kind put in after a bout of golfing.

As of next month we will be opening up this page as a forum for discussion about your ST problems. We'll try and answer any queries you have about machines (but if the same ones will still be the focus of your posts on STUK, as here, there's a section of C64 for the top of the month), but other problems to Desktop, ST Dodge Forces, 4 Sound Street, Books, All talk, and whatever ST problems you can present over where you want to give us all a good laugh in the Forum section.

SHOWING WHAT YOU'VE GOT

Sometimes on your ST language disk is a very little unnecessary program called the VT52 simulator. It is a program which converts many very simple AT&T assembly language commands into a form which most people understand. In fact it is so simple it hardly any goes past it. The VT52 simulator is designed as a kind of cross-compiler program which takes input from the Pascal port and displays it as ASCII, whilst, at the same time, offering you the opportunity to send your own assembly commands and data. The VT52 simulator is there a very simple terminal program.

As an example it responds to a set of codes which will change the character display so that the cursor can be fixed around the screen, text and background patterns may be displayed and the cursor can even be displayed inverted. There are also a variety of specific features in anyone who deals with the VT52 simulator but where these features can be found is in the use of these codes in standard Pascal files. When you download from the BBSes on a file without PASC or PDS extensions (ie. if it cannot be loaded, you can run the file pull up an application) then you will be presented with the option to BROWSE or PRINT the file. Selecting BROWSE to display standard and compressed text displays of the information but by making clever use of the same codes employed in the VT52 simulator you are able to create all sorts of interesting effects. The codes are as follows and as used in a real file they should be in the type PFS, like where we in the ASCII code of the character listed. (If the code

is BBC, probably one of the simplest ways to do this is to write your text into having free space references you want the command code to go. Save your file and then load Pascal in another file and program and convert all the spaces with your control codes).

The commands listed below cause direct output to all screen output so that when BROWSING the file, the display will be made to look radically different. However, problems will occur if you try to PRINT the file as if you had a BBC-1 environment. The control codes included will prompt some very unusual reactions. Therefore, the codes are only for use along the file in BBC-1 only. It is possible however to implement codes which will affect your printer so that if you PRINT the file then each will affect printer output. In this circumstance, the screen-output is likely to be affected.

IMPLEMENTING PRINTCODES

Printable codes may be included in a code to the BROWSE file codes. A space must be left for each command code and then these can be over-typing using the editor.

So, for example, you could move three spaces in your text and then replace these with the print codes ESC W 1 (PRINT) which sets the printer into景印ing text mode. These codes could then be used at least to provide a decent baseline for your printouts.

VT52 ESCAPE CODES

This function moves the cursor up one line providing it is not already at the top-line. Any text will then continue from this new location.

The entire screen is cleared and text continues from the top-left-hand corner of the screen. Returns the cursor to the top-left corner of the screen without clearing first. This moves the cursor up one line. If it is already at the top then a blank line is inserted. The column position is maintained.

The end of the screen before the cursor is cleared. The cursor position and the remainder of the line is cleared although the cursor does not move position.

A line is inserted and the remainder of the screen is scrolled down. The line with the cursor is cleared and deleted.

This allows you to position the cursor anywhere on-screen. It's structured with the line and column values provided as parameters (and 32 added to each). The result looks in this way:

ESC T C0R0X0Y0 C0R0C0L0

This is the command used to change the colour of all subsequent text output. Only the least four bits are recognised as values in the region 0-15 are acceptable.

This mode changes the background colour in an identical fashion.

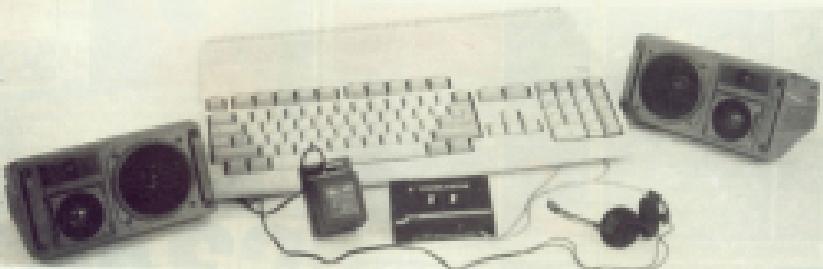

This clears the screen from the top down to the position of the cursor.

Clears the entire site and returns the cursor to the start of that line.

All text output is reversed. ie. black or white text becomes white on black after execution of this escape sequence.

WORKBENCH

PROBLEMATIC PERIPHERAL

I have an old Amiga 500 power strip (sagging) and would like to know if it is possible to connect it to my Amiga 500 better. I consider it to be the darker depths of my cupboard!

Is it possible to obtain a hard disk drive such as the Multiblock 512 for the Amiga?

Is there a difference between a sound digitiser and a sound sampler?

M.J.Physe
Berkhamsted

Amigaon 327: If my memory serves me well, that particular power was designed for use on the Spectrum. There really is no reason why any power cannot be made to work with the 500 or Amiga if you get the correct leads made up. By your local computer store who may offer a lead making service.

Ricardo Palau: producer of the Multiblock 512 cartridges, are considering producing an Amiga version, but nothing is definite. Enquiries can be contacted on 01 290 6670.

There is no difference between a sound digitiser and a sound sampler, both are exactly the same piece of equipment.

I THINK THEREFORE AMIGA.

I am about to buy a computer for home use and the Amiga seems to be ideal for leisure. There is also plenty of business software available for it. However, at what I see as an IBM PC, to write specialist scientific programs using BASIC, C and COBOL, and I would like to use my home machine to do the same.

There would seem to be two

This month, along with the usual helping of handy hints, we introduce a new reader technical help section. JASON HOLBORN sorts out your problems.

options available - use a PC emulator program such as an XT-based scheme or fit an XT-based expansion. How would these options perform? Assuming I fit an external 10.25-inch drive, is the disk format OK for transferring software between my PC and the Amiga?

M.F.Green
Wimborne

The Transformer has now been discontinued. For your particular needs, the XT-based board is most certainly your best bet. The Board is in fact a complete PC computer on a card and comes standard with a 3.5inch PC drive. The board is completely PC compatible and will run happily run software such as BASIC. You will then need to transfer files in and from the Amiga because the included drive reads and writes PC-format disks. For further info on the XT-based board, check out our review in issue 9. The main problem is price - you can buy a real PC for the price of the Transformer.

FLICKY COPY

Since issue 1 I have been backing up my Format disks and have managed to store two Format disks on one blank disk, having first renamed all files to avoid confusion.

However, when I try to load a Read Me file from my backup disk, a system request appears for the original disk to be inserted.

What's wrong?

J. The Workbench's 10FIFO window tells you all that you could possibly want to know about a file.

Please tell me how I can get the 'Read Me' file to access my back-up disk.

Secondly, a friend showed my how to load a BASIC program from floppy disk. He removed the program using the **DISK> REMOVE** option. However, I can't find a way to reinsert this, and thought maybe I might have no backup of this program.

K. Thompson
Gatway Island, Essex

To make the Read Me files work from your backup, you will first have to copy the **MDISK** program from our cover disk to your back-up. Secondly, you will have to change the file name of the icon to **MDISK.MDIR**, where **MDISK** is the name of your backup disk.

This is done via the Workbench. First of all, click on the **Read Me** file's icon and then select **EDIT** from the Workbench menu. After a while, a window will pop up containing loads of really interesting info about that particular file. Somewhere within that window, there is a field called **'FILE'**.

TOOL that will contain something like **MDISK.MDIR**. All you now have to do is no change this and then click on save.

Unfortunately, there is no way of getting your program back to its original, unmodified state. Always remember to keep backups of your own programs as well as format cover discs!

INTRODUCING THE WORKBENCH HELP LINE

Now you get a complete work-out Amiga! As the answer is no, there may not yet be the Amiga facilities, well we intend to put your point of view in our all-new Amiga technical help line.

Every month we'll be going through your problematical pieces, hoping to iron out as many technical queries as possible. Whatever the subject, be it a programme, an Amiga device, fitting the hardware in under pressure, or even just plain general problems and answers packages on the Amiga, our technical 'junkie' will sort it out.

Send your worried words to **WORKBENCH HELP LINE, 22 Amiga Forum, 2 Queen Street, London E1V 1LA**.

Unfortunately we can only answer your queries in print, so if you need any correspondence sorted out, you'll have to use e-mail - we have provided a stamp.

Some a lot and the man report for upgrading ours so that we could produce longer scores and use more instruments. However, we were waiting a week when suddenly we were unable to load any more samples into memory. We checked how much free memory we had left and over 400K was free. Please could you help us.

Stuart Karsner
Lutonshire

All the graphics and sound that you see and hear in your Amiga are generated by the Amiga custom chips Agiles, Chipsets and Pads. On the current release of these chips, you can only access the first 512K of RAM, any extra RAM is only used by the SCSI. Therefore, if the custom chips are to access data such as sound samples, the data must reside in the last 512K block.

Most new programs are written so that the actual program code itself is loaded into expansion RAM (if it is present), leaving the first 512K free to store both sound samples as is possible.

The chip RAM problem will hopefully be solved when Commodore finally get around to releasing the planned Enhanced Chip Set (ECS) upgrade. This new ECS will allow users to raise the ECS RAM barrier from the present 512K level to a full 1 MB. When they do this, you will then be able to load up to 1 MB of RAM plus.

GET YOUR MITS ON THIRTY BIG Ones!

For example, the Amiga buffers are only 16K and therefore don't have enough memory to everything that you could possibly throw at them (the Amiga's cycle frequency isn't fast). Therefore, one of the ways you can increase playability and make on top of the Amiga life worth living is to constantly upgrade and everything that an Amiga owner can find even remotely useful like keep you can catch up with the goods.

"What do I get out of this?" I hear you say. Well, how about instant soundtrack tunes and the possibility of picking up a rather attractive sample of hair about to your head? However? Send your results of wisdom to **WORKSHOP**, 87 Amiga Forum, 4 Queen Street, Bath BA1 1EL.

BEGINNERS' CORNER

In last month's column on using AmigaOS we finally took the plunge and started looking at a couple of the more advanced commands that you will encounter during your C-Living sessions. This month we'll continue where we left off with a look at a couple more AmigaOS commands.

The first thing we must do before we start is to create a more suitable environment for those of you with single drives. Run the CLI and then type in the following commands:

```
TYPE C:\TUTOR\CREATE.COPY.BIN
FORMAT RETURN
FORMAT A:DISK
```

MY TYPE OF COMMANDS

Anyone who has any form of experience with any of the very early public domain disks on the Amiga will know how suddenly they can appear. Probably the most annoying aspect arises when you try to write the contents of a disk file. Just how do you copy a file file and read its contents? Let me introduce you to the TYPE command.

The TYPE command is used to display the contents of an ASCII text file. The format of the command is as follows:

```
TYPE [FILE]RETUR
Now here's what I mean by this procedure. The first thing we need before we can display a file file is to load the file to display (using LOADPRG). Luckily, an early standard Workbench disk (in a little file) has the called a Mountfile, which is located in the BLOAD directory of your boot disk. To display this file, you would enter the following:
```

```
TYPE BLOAD\MOUNTFILE
FORMAT RETURN
```

After a few seconds of disk access, the TYPE command will start to display the contents of the Mountfile. Unfortunately, unless you're a very quick reader, the text will fly at you so quickly before you get a chance to read the first sentence. To pause the display, just press the space key, and to start it again, press the DEL key.

DO THIS COPY

All the moving around disks, displaying the contents of directories and files is all very nice, but sooner or later you may want to start moving files around. This is where the COPY command comes in.

The COPY command, as you've probably already guessed, is a command that allows you to make a copy of a file (or a group of files) and have the results placed in the location of your choice. The format of this copy command is as follows:

```
COPY [SOURCE] [DESTINATION] [DISK]RETUR
FORMAT
```

The copy command is a fairly complex command that can be used in many different ways. For example, if you wanted to make a COPY of the Mountfile

as shown can argue that the Amiga Command Line Interpreter (CLI) is really simple, although newer versions of it are much improved since the original. The aim of creating this post was to illustrate from Workbench, the Workbench files can copy, delete and move files from the CLI you can do the all that you can do the most familiar to Workbench and certain operations to disks and most recent damaged disks. Even experimenting - and keep reading Workbench - and one day all will be clear.

If you have it written to the hard disk, you would enter the following:

COPY BLOAD\CREATE.COPY.BIN

You may have noticed that we haven't actually told the COPY command what filename we would like the file to be stored under. Luckily, the command is fairly intelligent and if you don't specify a filename, it will use the same filename as the source file (in this example, MOUNTFILE), we could have entered RAM MOUNTFILE in the destination filename and had the same effect.

If you wanted to, you could have the source file file stored under a different filename to that of the source. For example, if you wanted the source file file to be called FILE, you would enter:

COPY BLOAD\CREATE.COPY.BIN FILE

ERIN AND GLOWE

It's virtually impossible to get rid of files stored on disk. If you plan to do this from Workbench - the area containing click-select menus and icons - it's simply a matter of displaying the disk's contents and moving the file or files of your choice into the bin.

The first problem, of course, is persuading a directory of contents on the disk - simply, just insert a disk into the drive and double-click on the disk icon when it appears. A window will pop up displaying the disk's contents. You can now highlight the items you want to bin and drag them onto the bin icon (you may need to enable the disk contents selection keys, **CTRL**, **SHIFT**). This operation doesn't mean file completely. It simply removes them from the root directory or chosen. In doing this completely - and free space on the disk - it is necessary to click on the **Empty Bin** icon in the Disk menu (accessed by clicking and holding down the right mouse button). Make sure the trash icon is highlighted before you do this.

However not all files are displayed when you click on view files from Workbench. It is best to copy all the tracking operations from the CLI by entering the command **DIR /T /D** (copied by a filename that is possible to type files. For instance,

DIR /T /D

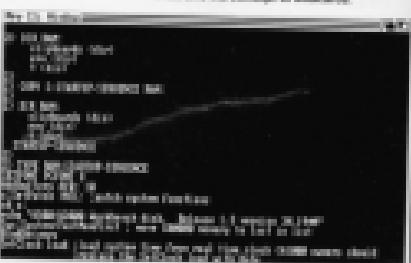

would remove files from the current directory of the disk. It is possible to move from other parts of the disk by using a click-select and choose functions in place of the menu. **DEL**,

DELETE [DISK]\[FILE]

would move anything from within the BLOAD file within the CPS.

HOMEWORK TIME AGAIN!

Thought you had got out easy this month, hasn't the chance. Now that you are able to copy files, display their contents and then delete them, why not try experimenting with these functions? Next month we will introduce a couple of new CLI commands and the concept of subroutines.

Archipelagos

From Logosoft PBP £124.95 Our Price £79.95 (a saving of £150) ST ONLY

In Archipelagos you are building, as it were, floating, above a group of islands known as the Archipelagos - green fields surrounded by sandy yellow beaches in a deep blue sea.

Scattered around the Archipelago are stones, and somewhere there is one special stone - the Obelisk. Embedded in the Obelisk is the power that dispersed the islands of humans in Ancient Times. And the power of the unknown people still comes to claim the land surface.

To remove the power you must destroy the Obelisk. And the only way to do this is to plan every move to the last detail by a continuous landscape, even by building vast bridges from island to island. If that is what is required. Your ability to create the landscapes that will connect the stones is determined by the collection of power pods, which can grow quickly. For as the sky grows dark, the eggs begin to hatch and with a mighty clap of thunder the poison gas released by the serpents will spread like fire. Some eggs will even eat away at the island itself. Lombard/RAC Rally and Pioneer Plague from Mandarin Software.
The RRP for each product is £24.99.
But we are offering the two for only £29.99 (a saving of £5.00)

Lombard/RAC Rally

Rallying is rather different from normal racing, and Lombard/RAC Rally features a variety of inclement weather, from fog to night-driving, together with three stage types, including an impressive mountain track. The object of the rally's 15 stages is to win enough to pay for repairs and keep your car in prime condition. Beating lap-times gets rewards but wealth can be further increased by entering a quiz game. If you want to race, you must first complete all 15 stages against the clock. You can then complete them all again, but in competition.

Pioneer Plague

The Pioneer Probe Mk IV was created to solve Earth's over-population problems. It runs around finding uninhabited planets and terra-forming

them so that they're ready to be colonised. Sounds like a great idea? It might have been. A genetic defect in Mk IV meant that it no longer creates environmental variety — which is a way of explaining the fact that all the game's planet surfaces look identical — turning everything into a large slab. With the Mk IV now out of control, it just makes all planet life without testing to see if it inhabits.

It's up to you to prevent the spread of the Plague. The Lifester will take you around the Universe but the spaceship is your attack vehicle. By selecting a planet with Pioneer Probes in the vicinity, the Lifester will whisk you away to a sub-Euclidean space zone. The quicker you cruise through here the fewer probes you'll need to total when you get to your destination planet.

Once a planet has been cleared it's back to the map to select somewhere else. When all planets have been cleared it's over — and better luck next level!

HISOFT DEVPAC 1

Unleash the power in your machine - teach yourself the fastest programming language there is with ST Amiga Format and HiSoft!

If you're at all interested in programming your ST or Amiga, you may have read a lot about the different languages you can get: BASIC, C, Pascal... maybe all got there first, but for sheer speed there's only one choice: programming directly in 68000 Assembly language.

Starting last month, ST Amiga Format started a regular tutorial series to show you how to program in Assembly. And the systems we've picked to teach you with is HiSoft's Devpac 1 - widely recognised as one of the best assemblers you can buy on.

There was a full colour version on the cover disc for you to get the feel of, but once you decide to get serious and know you'll want to get hold of the full version,

HERE'S WHAT YOU GET

■ HISOFT 'DEMPAK'

Full screen mouse-driven integrated editor and assembler for preparing your programs. Once you've typed the code in, a simple click of a menu command converts your program to a machine code file.

For the programmer, your assembler programs can include macros, conditional assembly and any ST or Amiga operating system call.

■ HISOFT 'MONITOR'

Monitoring program to help you debug your programs when they go wrong. Inspect and change any memory location, watch your pro-

gram running and spot errors as they happen.

Once you're happy with a program, it can be run as a simple standalone assembly file, just like any commercial program you buy.

■ EXTRA DISK

With a full version of Devpac 1, all the library files you need to write any ST or Amiga program, and example files to get you going.

■ COMPREHENSIVE MANUAL

180 page ring-bound documentation with full details of using Devpac 1.

FORMAT LETTERS

SLAPPED WRISTS

I feel severely let down by the first installment of the 60000 programming series. You clearly catch the quality of service to your readers, a poor third to the mutual interests of publishers and the software companies. We were promised a full development environment on the cover disk, when in fact we only get half that. You should MFPD's response a program from its documentation.

Now we have half an assembler, what are you supposed to do with it? Perhaps the price can help. Article? All we get here is a few pretty pictures and little details of OEM assembly language instructions, and 21/2 columns worth of things programmers will already know and beginners will never hear.

'Why not start programming now?' suggests an often-repeated regular. Does anyone in the Amiga office honestly believe we could start programming with this? Of course not. What we can do is pay £25 for the essential documentation of a non-updated program, and buy lots more books of Format.

It seems there are 20 basic instructions for the 60000; is this some cheap trick to keep us filling your pockets for the next six years?

Kenneth Palmer,
Brentwood, London

Searching through the bulging postbag the bulging postman brings in each day brings its little rewards, the gems of wit and insight others call Format Letters. Write to STUART ANDERTON, 4 Queen Street, Bath BA1 1EJ.

We included Beagle on the disk so that readers could try out the multiple programs given in the accompanying feature, and we included enough instructions for you to be able to do that. There didn't seem a lot of point in having pointers about assembly programming if they couldn't try out their new found knowledge.

For sure, if you cannot understand with the tutorial sheet – which tried its patch at it's best the intelligent beginner can understand without having to re-read the sheet each month.

STRONG PROBLEM

I have a small but annoying problem with disks. I take a lot of work on my ST and regularly save documents to disk and on most occasions when taking or copying them like now I have

saved this letter to disk. The problem is that disk labels are a *-----* to remove. The labels always come off in tiny pieces and I end up covering the disk with a big metal disk.

Please could you recommend a way to remove disk labels without removing a layer of plastic or ruining the disk.

Yours hopefully with a few good thoughts,

Nick Colquhoun,
Birkenhead, Lancs

I asked Jason our disk expert about this one, but unfortunately they don't let them have drivers were he lives so he couldn't help.

NAME, NAME, A SERIAL NUMBER

I read David Stowes' letter (March '88) with interest after having used

the Format 11 high capacity disk formatter from disk 400 recently. I have had no problems of loss of data, so I put the motor to the back of my mind and kept using the wonderfully useful formats. It has saved me a lot reading the software. Four 'Second Mous' to the Amiga ST by Andrew Rance. That alone tells most of Chapter 4 is about disks, disk drives, DOS etc. Page 23 details problems of directory corruption which were apparently common place in F1000 I got an ST in 1988.

When the ST suspects you have swapped a disk it monitors the drive with an infrared light. It reads the disk's serial number. This should be a random number varying over a large range and is put on the disk of formatting time. If the number is different to that of the disk the ST last saw in the drive, the RAM contents of the new disk are read into memory. Otherwise the information already held about open directory should still be valid, and the F100 is not used.

All this based on the fact that each of your floppy disks has a unique serial number. If not, you run the risk of your starting ST crashing indiscriminately over your process (or Word Plus Mac).

So I experimented. After formating a new disk with Format 11, I checked their serial numbers

Right of Reply

In last month's Format Letters we printed a fair old slagging-off of Monaco on the ST. As far as most of you, unbiased journalists, and hence we've had a good score, there's what Monaco's programmers have to say about it...

Dear Mr Stevens,

I agree with you wholeheartedly that the ST version of Monaco is crap. What I advise you to do is sell your ST and buy an Amiga.

As for your comments about the graphics, apart from the colour palette they are identical in every way to those on the Amiga.

If you did this and gave the Monaco disk to any friend who likes it (as long as it's not too painful!) all I would do is reformulate them. It's a handy thing to say about my own game, but true.

The reason for it being no bad is simply the ST's hardware. It has none of the features

used in the Amiga version – no blitter, only 16 colours on screen from a palette of 64, and above all, no hardware rendering. The last is the most important since this is what takes the majority of the time on the ST. The game runs at just over four frames per second (at 60MHz). This time means that one frame is devoted to rendering the sprites – if this was done in hardware it would take only about one or two scan lines to do this. The rest of the time is devoted to placing the sprites on the screen. This could be done a lot quicker with a blitter, but

the most deficiency is the keyboard rendering.

Now, on the Amiga version of Monaco, the dual playfield model of racing is used, in that are two physical screens in memory, one centred on the other. It's hard to explain but it's a very useful technique if you want to switch backgrounds every frame and everything else in less than a frame. This could not possibly be done on an ST with the memory 6MHz 60000, simply because it takes too much time to move that amount of memory.

If the hardware just can't cope, the game is bound to suffer – that's why my engineers chose that you sell your ST and buy an Amiga as a good idea. Please don't give me an ST letter, I do enjoy using and programming the ST in the distant future, but it won't be for a game like Blood Money as I think it's almost impossible to make a game like that in any reasonable amount of processing time.

Simon Watson
Programmer for GME Design

I may be taking my ST to my hands here, but don't anyone out there disagree with Simon?

with a good sector scanning program. Sure enough, all the formatted disks had the same number 11554600.

Also, during my experiments, I noticed how slowly these disks were read, probably due to the layout of the 11 sectors on the track. It seems to me that Format 12 is not worth the worry and danger it causes.

My suspicions about all the reading utilities were confirmed, and next on my hobby was DISACC by L. Bunting from disk 480. My fears were confirmed; all formatted disks had the serial number 65536.

Opened lower disk, March 1990 reflected your choice of PC ports were however, as the disks it formats all have different numbers. How you can format 8, 9 or 10 sectors per track, 40, 80 or 160 tracks per disk, and in FDD, HD or IBM format.

LETTER FROM AMERICA

It is ridiculous to feel a magazine that is not marketed in the ST-Austria area. I am tired of the standard arguments of my computer is better than your computer. I mean, it's like saying my 32 Magna is bigger than your 252 Magna. If you get hit by either gun both will burst in very large holes.

The basic question is: What do you want to do with the computer? Who cares which computer is more powerful? After you that measure that you've got to have bragging rights? Only those people who are ignorant about their position or people who did not like the time to look at the strengths and weaknesses of the machines, before they put down

Rude kids

My 6, 4 and most computer shops employ rude, arrogant, ignorant morons who know nothing about computers!

I have a typical example in a well known Taiwanese Court Road shop. I was standing in the shop waiting in a queue to be served. There were two spotty teenagers so-called computer experts serving customers. One had a cigarette hanging out of his mouth, reading what might well have been *The Sun*. A chain in front of me was waiting

Customer service, please.

"Well, M EXTERNAL DISC
What Model You To...
or ... or ... or

One more need story.

Price is not the only consideration when buying a computer or any piece of equipment. The major consideration is what price we can pay the computer can run and does it meet my needs. The idea is to be an educated consumer. Not a person who is forced by advertising hype or someone else's opinion.

I therefore value your magazine for a job-well-done. They your magazine through a local USA computer shop COMPUTER GAMES+, and while it is expensive the magazine is well worth the price when compared to USA computer magazines.

SHOULD I BUY?

I am very interested in program-
ming, last, of course, hacking
and have just saved up around
£120, and want to upgrade.

But that's where the problem
arises. I just can't make my mind
up what to buy. I have been think-
ing of another external disk drive,
an extra £120 expense (although I will probably never get
to use it), or perhaps even some
extra software.

With the experts, what do
you think should be the next

don't know. The conversation I
heard was this:

MARK: Oh, that's such a small
thing.

ASSOCIATE: But it's got a lot
of lots and bytes for memory.

MARK: Please, what's the dif-
ference between a lot and a
byte, or what are they used for
DOS? Is so many bytes and no
one bytes to know.

ASSOCIATE: Oh yeah, well
it's like this, a lot is like a byte
you know it's not saying what's
the difference between the lot and
the rhythm in music!

MARK: Oh, I see.
And all the time I was thinking
what a load.

upgrade idea for me?

Martin Rodgers,
West, Essex

Which upgrade to go for depends
on what you want to use the
machine for. Some games
require a megabyte, but most can
happily live on a single disk 400K
bt if you want to play, buy more
software. For programming, how-
ever, hardware add on comes
into its own. Two choices are a
real hard, but a RAM drive could
be just as effective if you upgrade
the memory. Personally though,
I just couldn't live with a
single floppy disk.

Thomas A. Murray,

Would it be possible via the RS232-C port and a
modem to communicate with a fax machine?
If so how? And what software would do this?
Simon David Greenway,
Shirehampton, Bristol

Interesting idea. Of course the problem is
that it is of fairly low quality as I don't
want to insult you as output device, but
as a scanner it has much more potential. As
I understand if there's one standard encoding
system, as it should be possible. If any
one out there knows how it can be done,
please tell.

How about a feature on assembly programming? Also, what processor do PCs and Apple Macs have?

I would like to say thanks for such a thoughtful mag, without which, 16-bit computing would be pointless.

Love and kisses,
Giles Cheshire,

What are you up? Whatever it is I want some. Anyway, you'll find the third episode of the assembly language tape starts on page 47. As to processors, the original PC used an Intel 8080, but nowadays you'll find 8086, 80286, 80386... and any day now 80486s lurking away in poly boxes. The Amiga uses the good old Motorola 68000, just like your ST. You're too young to have Madonna's phone number, you'll just have to play Teenage Queen instead.

PROTECTION RACKET

Speaking from experience, copy protection schemes implemented by most software companies are just not adequate to stop pirates. When I say "speaking from experience" I don't mean I'm a pirate, I merely analyse the dealer networks out of pure curiosity.

The one company who has done the need for copy protection is Microsoft. Backup copies of their games are very easily made but the manual is needed to

access the game using pictures associated with it. For example *Saint Seiya* has destroyers to identify and *Death Fighter* (unfortunately the level game) has never played more aircraft; this doesn't detract from the game, in my opinion, but adds to the flavor of it. Program making experts wouldn't find it feasible to copy the entire manual nor would they.

Paul Broadbent,
Glasgow, Scotland

Yes, totally agree.

PCW PROBLEMS

Currently using a 1128 expanded Amiga PCW256 for wordprocessing, I intend to switch over to Prestel 4 on the Amiga 6000 (expanded to 10M8) very shortly. However, at the first instance I have been faced on 24 floppy compact diskettes. I would like to convert to the Amiga 312/313 disk and in a format that Prestel can understand.

Locating disks have the facility to make an ASCII file of a particular document, though certain special characters (such as open and closed quotation marks) do not appear as they should on screen. Is there some way of connecting the two machines together in order that this ASCII file be transferred to the Amiga?

Matt Forman,
Leeds, North

It shouldn't be too difficult to do. You'll need a cable to link the

serial ports of the two machines and some control software to run on both ends. Basic things like baud rate, parity, etc., are set the same on both machines and fit them fine at the Amiga end.

Another possibility is using one of the many data transfer adapters, what'd do the job for you. One such is Transport Communications at 0125 242513.

LEAD OF ZAR

I am writing to complain type, composed about issue 104 Disk Extra section. It was an utter disgrace. You say that the demo of *Zar*, *McRabbit* and the *Alien Mathematics* is playable. *McRabbit* isn't! All I have been able to do is look and watch! Can take me an hour of the game. Please replace your blunder! Was it meant to be your first April Fool joke?

Robert Macdonald,

Burnham, West Glamorgan

As we explained last month, the playable Zar demo we were expecting to put on the disk turned up after we'd gone to print and was, as you all now know, not playable at all. Factors beyond our control, etc, etc.

SPREE STAKES

When discussing why the same game on the Amiga often runs more slowly than on the ST, people make much of the slightly lower clock frequency of the Amiga (1.2MHz vs. 8MHz). Has no one considered that a more

significant reason is that the Amiga has 32 colours and hence four bytes per pixel to manipulate, whereas the ST has only 16 colours and four bitplanes?

It is possible that if two machines only used four bitplanes, the custom graphics chips of the Amiga could store more than make up for its slower clock rate. Has anyone ever performed any benchmarks?

John Sutcliffe,
Sandbach, Cheshire

Hi.

THREE-D TELLY

I was really disappointed by the *Software Show* on the BBC.

At the start I thought it would be about games and all the things you cover but no. They decided to be totally staff and visitors related non-software and CDTV with a few bits of test watching. I think if this is the way the BBC want to show a computer show I'll stick to reading magz like yours.

Robert Brand,

Lindisfarne

The BBC have consistently failed to produce a show which appeals to the many thousands of computer users across the country. But they do have their own programme, the BBC micro, Master 128 and Acornsoft 3000 aimed to look after, and indeed their own computer may 100. Acorn said, all of which are heavily biased towards education - hence the bias in their programmes.

ST AMIGA FORMAT VOUCHERS

How the scheme works

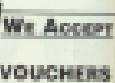

- The ST Amiga Format voucher scheme is a special 1989 promotion to encourage you to buy the magazine regularly.

- It offers you savings of up to £1.7 when you buy goods through the magazine.

- The vouchers are not limited to specific items - you can save on any purchase from one of the participating advertisers.

- Most small order advertisers in this magazine are taking part in the scheme - just look for this sign. →

- Remember, the use of just one voucher could more than recoup the price of the magazine.

THE FIVE SIMPLE RULES

1. Your voucher can be used to obtain discounts on purchases of goods advertised in this issue of ST Amiga Format, provided that they are bought directly from an advertiser taking part in the scheme. The vouchers are valid only for those advertisements which say 'We Accept Format Vouchers'.

2. Each voucher entitles you to a discount at the voucher's face value, provided that your overall order total is higher than the figure indicated on the back of the voucher.

3. To use a voucher, simply enclose it with your discounted payment when you order. You may use only one voucher in any one order.

4. The order including the voucher must be received by the advertiser before the closing date printed on the voucher.

5. You must fill in the details requested on the voucher.
